1. Generate web app sources
2. Make it so assembly:single does nothing in here
3. Always skip the second part executions, since we only run simple unit tests in this module
4. Add the generated sources
5. Make a jar and put the sources in the jar
6. **comment:** Skip the tests in this module

1. **summary:** Create hbase-thrift module
description: We should create an hbase-thrift module. Right now if users want to use mapreduce they need to include hbase-server module. That module has waaay too many dependencies. One of the most problematic is thrift. Users could be using a different version of thrift on mr.

jira_issues_comments:

1. Here's a patch that moves thrift into hbase-thrift module.
2. The patch is huge but it's pretty much all moves with one change assembly's xml and a new pom.
3. This right? + <directory>\${project.basedir}/../hbase-thrift/target/hbase-webapps</directory> + <outputDirectory>hbase-webapps</outputDirectory> + <fileMode>0644</fileMode> + <directoryMode>0755</directoryMode> +1 if hadoopqa passes and if it runs on a cluster.

7. I had missed a plugin to add the jsp source. Here's the patch that I plan on committing.
8. Thanks for the review [~stack]
9. Want to extract out hbase-rest while you're at it?
10. I thought about it, but I wasn't sure that it would help in removing the dependencies in hbase-server. My thought was that we'll still have jetty for info server and the json stuff is inside of get/result. I can take a look at it though.
