

Item 215

git_comments:

1. Don't perform casting from varchar to varchar This produced things like CAST("mycolumn" AS VARCHAR(10) CHARACTER SET "ISO-8859-1") = 'this value' which is not always supported, besides being unnecessary
2. lname is declared as VARCHAR(30), comparing it with a string longer than 30 characters would introduce a cast to the least restrictive type, thus lname would be cast to a varchar(40) in this case. These sorts of casts are removed though when constructing the jdbc sql, since e.g. HSQLDB does not support them.

git_commits:

1. **summary:** jdbc: do not add varchar-to-varchar casts
message: jdbc: do not add varchar-to-varchar casts
