1. **summary:** Kafka serialize/deserialize properties are inconsistently named
description: There are 3 pairs of serializer/deserialiser properties on the Kafka component. The inconsistent parts of the names are highlighted ||Consumer||Producer||Type||
|*kafka*HeaderDeserializer|*kafka*HeaderSerializer|Bean| |keyDeserializer|keySerializer*Class*|String FQN| |*value*Deserializer|serializer*Class*|String FQN| I think it would be worth making these names consistent. ||Current||Proposed|| |kafkaHeaderDeserializer|headerDeserializer|
|kafkaHeaderSerializer|headerSerializer| |keyDeserializer|keyDeserializer |
|keySerializerClass|keySerializer| |valueDeserializer|valueDeserializer| |serializerClass|valueSerializer| It looks like there was an intent to denote the key- and value- properties as expecting a class FQN string by appending 'Class' to the name. I don't see any other properties that do this so I think the consistent approach is to leave it off. I've made an assumption that valueDeserializer & serializerClass are a pair, as the descriptions don't match. It would be good to take the opportunity to make all six descriptions consistent.

jira_issues_comments:

1. **body:** On the camel side this is done. I need to do more work on SB and examples around. Also add some migration and update documentation. The codebase in main camel is done.
