1. **summary:** RPM Packages should display the GNU/Linux distribution they are supposed to be installed on  
**description:** Resulting packages have the exact same file name and this is terribly confusing when juggling with different OS/versions/arch. So this ticket is about adding the dist tag to RPMs. We can add a similar thing to DEB once we support multiple debian/ubuntu GNU/Linux distributions.
2. **summary:** RPM Packages should display the GNU/Linux distribution they are supposed to be installed on

**description:** Resulting packages have the exact same file name and this is terribly confusing when juggling with different OS/versions/arch. So this ticket is about adding the dist tag to RPMs. We can add

a similar thing to DEB once we support multiple debian/ubuntu GNU/Linux distributions.

**jira\_issues\_comments:**

1. Here is a patch
2. **body:** +1 Note this will not work on openSuse/SLES without modifying or adding a macro somewhere for rpm.  
**label:** code-design
3. correct. Then, let's make it work everywhere first. Let me update the patch with something else
4. +1
5. Actually, let's get this in now for the release. So at least it can help on some of the platforms. We can always fix it later on for openSUSE/SLES
