1. **summary:** List of collations are wrong parsed in SpellCheckResponse
description: When I do a search query which `{{spellcheck=on}}` I get more then one collation in the solr response: `{{<str name="collation">kaart</str>}} {{<str name="collation">maat</str>}} {{<str name="collation">vaart</str>}} {{<str name="collation">staart</str>}} {{<str name="collation">baart</str>}} {{<str name="collation">komkaart</str>}} {{<str name="collation">dagvaart</str>}}` The SpellCheckResponse gives me only the collation 'dagvaart': `{{getCollatedResults()}}` gives a list of 7 items that contains only Collation objects with 'dagvaart'. `{{getCollatedResult()}}` gives a string with the value 'dagvaart'.

jira_issues_comments:

1. **body:** `setCollationQueryString((String) *sugg.getVal(i*))`; should become `setCollationQueryString((String) *o*)`;
label: code-design
2. This same bug was previously mentioned on the User List. See thread: <http://lucene.472066.n3.nabble.com/SpellCheck-Print-Multiple-Collations-td3358391.html> Thank you Bastiaan for opening this issue and providing a patch. Your fix is indeed correct. In case you haven't noticed, you can work around this issue for now by specifying `spellcheck.collateExtendedResults=true`, as the separate branch in SpellCheckResponse for extended results does not have the bug. While I hope a committer will take this one up sometime soon for both 4.x and 3.x, I wouldn't classify this as "Major" in priority as there is a good workaround.
3. nice catch guys... would you be able to provide a testcase for this too?
4. **body:** Here is an updated patch with a unit test.
label: test
5. bq. Here is an updated patch with a unit test. looks good - I will take it
6. committed to trunk and 3.x. I also added a changes.txt entry. thank you Bastiaan & James
7. Bulk close after 3.5 is released
