jira_issues_comments:

1. Most of the fixes here were just to the test logic. Not sure these were working correctly and when going through a refactor these tests should be seriously looked at.
2. There is one test that is still failing when run in the test suite. Investigating now
3. **body:** The main issue is that the tests have illogical parts that need to be carefully reviewed before we can consider registration fully tested. Currently many tests try to test additional functionality when really it should be a separate test. Ideally the tests would also be clearer as to what we should be testing in each case. If something is testing two things, modify the name to show that it is testing two things.
