20101. * Ecmascript compliant [[GetOwnProperty]](P), for internal use only. * * If property is found: * - Fills descriptor fields to 'out_desc' * - If DUK_GETDESC_FLAG_PUSH_VALUE is set, pushes a value related to the * property onto the stack ('undefined' for accessor properties). * - Returns non-zero * * If property is not found: * - 'out_desc' is left in untouched state (possibly garbage) * - Nothing is pushed onto the stack (not even with DUK_GETDESC_FLAG_PUSH_VALUE * set) * - Returns zero * * Notes: * * - Getting a property descriptor may cause an allocation (and hence * GC) to take place, hence reachability and refcount of all related * values matter. Reallocation of value stack, properties, etc may * invalidate many duk_tval pointers (concretely, those which reside * in memory areas subject to reallocation). However, heap object * pointers are never affected (heap objects have stable pointers). * * - The value of a plain property is always reachable and has a non-zero * reference count. * * - The value of a virtual property is not necessarily reachable from * elsewhere and may have a refcount of zero. Hence we push it onto * the valstack for the caller, which ensures it remains reachable * while it is needed. * * - There are no virtual accessor properties. Hence, all getters and * setters are always related to concretely stored properties, which * ensures that the get/set functions in the resulting descriptor are * reachable and have non-zero refcounts. Should there be virtual * accessor properties later, this would need to change.

label: code-design

20208. x <- y * z

20209. * Note: assuming new_a_size == 0, and that entry part contains * no conflicting keys, refcounts do not need to be adjusted for * the values, as they remain exactly the same. * * The keys, however, need to be interned, incref'd, and be * reachable for GC. Any intern attempt may trigger a GC and * claim any non-reachable strings, so every key must be reachable * at all times. * * A longjmp must not occur here, as the new_p allocation would * be freed without these keys being decref'd, hence the messy * decref handling if intern fails.

20210. **comment:** * 'props' contains {key,value,flags} entries, optional array entries, and * an optional hash lookup table for non-array entries in a single 'sliced' * allocation. There are several layout options, which differ slightly in * generated code size/speed and alignment/padding; duk_features.h selects * the layout used. * * Layout 1 (DUK_USE_HOBJECT_LAYOUT_1): ** e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * * Layout 2 (DUK_USE_HOBJECT_LAYOUT_2): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_uint8_t) + pad bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * * Layout 3 (DUK_USE_HOBJECT_LAYOUT_3): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * * In layout 1, the 'e_next' count is rounded to 4 or 8 on platforms * requiring 4 or 8 byte alignment. This ensures proper alignment * for the entries, at the cost of memory footprint. However, it's * probably preferable to use another layout on such platforms instead. * * In layout 2, the key and value parts are swapped to avoid padding * the key array on platforms requiring alignment by 8. The flags part * is padded to get alignment for array entries. The 'e_next' count does * not need to be rounded as in layout 1. * * In layout 3, entry values and array values are always aligned properly, * and assuming pointers are at most 8 bytes, so are the entry keys. Hash * indices will be properly aligned (assuming pointers are at least 4 bytes). * Finally, flags don't need additional alignment. This layout provides * compact allocations without padding (even on platforms with alignment * requirements) at the cost of a bit slower lookups. * * Objects with few keys don't have a hash index; keys are looked up linearly, * which is cache efficient because the keys are consecutive. Larger objects * have a hash index part which contains integer indexes to the entries part. * * A single allocation reduces memory allocation overhead but requires more * work when any part needs to be resized. A sliced allocation for entries * makes linear key matching faster on most platforms (more locality) and * skimps on flags size (which would be followed by 3 bytes of padding in * most architectures if entries were placed in a struct). * * 'props' also contains internal properties distinguished with a non-BMP * prefix. Often used properties should be placed early in 'props' whenever * possible to make accessing them as fast as possible.

20290. Potential direct eval call detected, flag the CALL * so that a run-time "direct eval" check is made and * special behavior may be triggered. Note that this * does not prevent 'eval' from being register bound.
20291. prefer jump
20292. **comment:** * Arithmetic, binary, and logical helpers. * * Note: there is no opcode for logical AND or logical OR; this is on * purpose, because the evalution order semantics for them make such * opcodes pretty pointless: short circuiting means they are most * comfortably implemented as jumps. However, a logical NOT opcode * is useful. * * Note: careful with duk_tval pointers here: they are potentially * invalidated by any DECREF and almost any API call. It's still * preferable to work without making a copy but that's not always * possible.
 label: code-design
20293. automatic length update

20294. args
20295. 'String'
20296. With ROM-based strings, heap->strs[] and thr->strs[] are omitted * so nothing to initialize for str[].
20297. * Note: prototype chain is followed BEFORE first comparison. This * means that the instanceof lval is never itself compared to the * rval.prototype property. This is apparently intentional, see E5 * Section 15.3.5.3, step 4.a. ** Also note: ** js>(function() {}) instanceof Function * true * js> Function instanceof Function * true ** For the latter, h_proto will be Function.prototype, which is the * built-in Function prototype. Because Function.[[Prototype]] is * also the built-in Function prototype, the result is true.
20298. not a vararg function
20299. Shouldn't happen but check anyway.
20300. E5 Sections 11.8.3, 11.8.5; x <= y --> not (x > y) --> not (y < x)
20301. Used by duk_emit*() calls so that we don't shuffle the loadints that * are needed to handle indirect opcodes.
20302. No strs[] pointer.
20303. **comment:** XXX: assertion that entries >= old_len are already unused
label: code-design
20304. e.g. DUK_OP_PREINCR
20305. eat 'while'
20306. nuke values at idx_rebase to get the first retval (initially * at idx_rcbase) to idx_rebase
20307. input radix
20308. char: use int cast
20309. result
20310. exponent digit
20311. **comment:** This is a cleaner approach and also produces smaller code than * the other alternative. Use duk_require_string() for format * safety (although the source property should always exist).
label: code-design
20312. defprop_flags
20313. s <- 2
20314. spaces (nargs - 1) + newline
20315. * Parse inner function
20316. if accessor without getter, return value is undefined
20317. **comment:** * For non-ASCII strings, we need to scan forwards or backwards * from some starting point. The starting point may be the start * or end of the string, or some cached midpoint in the string * cache. ** For "short" strings we simply scan without checking or updating * the cache. For longer strings we check and update the cache as * necessary, inserting a new cache entry if none exists.
label: code-design
20318. XXX: len >= 0x80000000 won't work below because we need to be * able to represent -len.

20338. * Init the heap thread
20339. XXX: need a duk_require_func_or_lfunc_coerce()
20340. avoid referencing, invalidated
20341. Don't support "straddled" source now.
20342. * Object compaction. * * Compaction is assumed to never throw an error.
20343. [arg1 ... argN this loggerLevel loggerName]
20344. duk_tval intentionally skipped
20345. * Since built-ins are not often extended, compact them.
20346. * Compilation
20347. Push a new ArrayBuffer (becomes view .buffer)
20348. idx_start
20349. Note: we rely on the _Varmap having a bunch of nice properties, like: * - being compacted and unmodified during this process * - not containing an array part * - having correct value types
20350. **comment:** XXX: return indication of "terminalness" (e.g. a 'throw' is terminal)
label: code-design
20351. may be NULL if no constants or inner funcs
20352. Equivalent year for DST calculations outside [1970,2038[range, see * E5 Section 15.9.1.8. Equivalent year has the same leap-year-ness and * starts with the same weekday on Jan 1. * https://bugzilla.mozilla.org/show_bug.cgi?id=351066
20353. empty expressions can be detected conveniently with nud/led counts
20354. There are at most 7 args, but we use 8 here so that also * DUK_DATE_IDX_WEEKDAY gets initialized (to zero) to avoid the potential * for any Valgrind gripes later.
20355. [...] val callback thisArg val i obj]
20356. [...] this tracedata sep this str1 ... strN]
20357. important chosen base types
20358. Digit count indicates number of fractions (i.e. an absolute * digit index instead of a relative one). Used together with * DUK_N2S_FLAG_FIXED_FORMAT for toFixed().

20359. must also check refzero_list
20360. MEMBER/NEW/CALL EXPRESSIONS
20361. **comment:** XXX: add flag to indicate whether caller cares about return value; this * affects e.g. handling of assignment expressions. This change needs API * changes elsewhere too.
label: code-design
20362. Fast jumps (which avoid longjmp) jump directly to the jump sites * which are always known even while the iteration/switch statement * is still being parsed. A final peephole pass "straightens out" * the jumps.
20363. [... func]
20364. * Function gets no new environment when called. This is the * case for global code, indirect eval code, and non-strict * direct eval code. There is no direct correspondence to the * E5 specification, as global/eval code is not exposed as a * function.
20365. Wrappers for calling standard math library methods. These may be required * on platforms where one or more of the math built-ins are defined as macros * or inline functions and are thus not suitable to be used as function pointers.
20366. **comment:** Throwing an error this deep makes the error rather vague, but * saves hundreds of bytes of code.
label: code-design
20367. This is not strictly necessary, but avoids compiler warnings; e.g. * gcc won't reliably detect that no uninitialized data is read below.
20368. Trigger at zero or below
20369. Custom coercion for API
20370. **comment:** Note: cannot read more than 24 bits without possibly shifting top bits out. * Fixable, but adds complexity.
label: code-design
20371. Almost all global level Function objects are constructable * but not all: Function.prototype is a non-constructable, * callable Function.
20372. source ends before dest starts
20373. * Statement terminator check, including automatic semicolon * handling. After this step, 'curr_tok' should be the first * token after a possible statement terminator.
20374. * Exposed string-to-number API * * Input: [string] * Output: [number] * * If number parsing fails, a NaN is pushed as the result. If number parsing * fails due to an internal error, an InternalError is thrown.
20375. 64-bit OK because always ≥ 0
20376. reg/const for switch value
20377. **comment:** When formatting an argument to a string, errors may happen from multiple * causes. In general we want to catch obvious errors like a toLogString() * throwing an error, but we don't currently try to catch every possible * error. In particular, internal errors (like out of memory or stack) are * not caught. Also, we expect Error.toString() to not throw an error.
label: code-design
20378. Each round of finalizer execution may spawn new finalizable objects * which is normal behavior for some applications. Allow multiple * rounds of finalization, but use a shrinking limit based on the * first round to detect the case where a runaway finalizer creates * an unbounded amount of new finalizable objects. Finalizer rescue * is not supported: the semantics are unclear because most of the * objects being finalized here are already reachable. The finalizer * is given a boolean to indicate that rescue is not possible. * * See discussion in: <https://github.com/svaarala/duktape/pull/473>
20379. no prototype, updated below
20380. unwind to 'resume' caller
20381. 0xf0-0xff
20382. **comment:** XXX: missing trap result validation for non-configurable target keys * (must be present), for non-extensible target all target keys must be * present and no extra keys can be present. * <http://www.ecma-international.org/ecma-262/6.0/#sec-proxy-object-internal-methods-and-internal-slots-ownpropertykeys>
label: code-design
20383. **comment:** NOTE: lightfuncs are coerced to full functions because * lightfuncs don't fit into a property value slot. This * has some side effects, see test-dev-lightfunc-accessor.js.
label: code-design
20384. IdentityEscape, with dollar added as a valid additional * non-standard escape (see test-regexp-identity-escape-dollar.js). * Careful not to match end-of-buffer (<0) here.
20385. 1st related value (type specific)
20386. The caller is responsible for being sure that bytecode being loaded * is valid and trusted. Invalid bytecode can cause memory unsafe * behavior directly during loading or later during bytecode execution * (instruction validation would be quite complex to implement). * * This signature check is the only sanity check for detecting * accidental invalid inputs. The initial 0xFF byte ensures no * ordinary string will be accepted by accident.
20387. Shared object part
20388. always throw ReferenceError for unresolvable
20389. * Mark roots, hoping that recursion limit is not normally hit. * If recursion limit is hit, run additional reachability rounds * starting from "temproots" until marking is complete. * * Marking happens in two phases: first we mark actual reachability * roots (and run "temproots" to complete the process). Then we * check which objects are unreachable and are finalizable; such * objects are marked as FINALIZABLE and marked as reachability * (and "temproots" is run again to complete the process). * * The heap finalize_list must also be marked as a reachability root. * There may be objects on the list from a previous round if the * previous run had finalizer skip flag.
20390. Shift to sign extend.
20391. '^'
20392. required_desc_flags
20393. **comment:** Stack indices for better readability
label: code-design
20394. * Try registers
20395. no prototype or class yet
20396. shadowed; update value
20397. E5 Section 8.6.2 + custom classes
20398. **comment:** Lookup current thread; use the stable 'entry_thread' for this to * avoid clobber warnings. Any valid, reachable 'thr' value would be * fine for this, so using 'entry_thread' is just to silence warnings.
label: code-design
20399. RELATIONAL EXPRESSION
20400. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property existence check right now.
20401. These are just convenience "wiping" of state. Side effects should * not be an issue here: thr->heap and thr->heap->lj have a stable * pointer. Finalizer runs etc capture even out-of-memory errors so * nothing should throw here.
20402. Zero escape (also allowed in non-strict mode)
20403. roughly 64 bytes
20404. XXX: this doesn't actually work properly for tail calls, so * tail calls are disabled when DUK_USE_NONSTD_FUNC_CALLER_PROPERTY * is in use.
20405. * Dragon4 slow path (binary) digit generation. * An extra digit is generated for rounding.
20406. this is a bit approximate (errors out before max is reached); this is OK
20407. **comment:** * Parse a function-body-like expression (FunctionBody or Program * in E5 grammar) using a two-pass parse. The productions appear * in the following contexts: * * - function expression * - function statement * - function declaration * - getter in object literal * - setter in object literal * - global code * - eval code * - Function constructor body * * This function only parses the statement list of the body; the argument * list and possible function name must be initialized by the caller. * For instance, for Function constructor, the argument names are originally * on the value stack. The parsing of statements ends either at an EOF or * a closing brace; this is controlled by an input flag. * * Note that there are many differences affecting parsing and even code * generation: * * - Global and eval code have an implicit return value generated * by the last statement; function code does not * * - Global code, eval code, and Function constructor body end in * an EOF, other bodies in a closing brace ('}') * * Upon entry, 'curr_tok' is ignored and the function will pull in the * first token on its own. Upon exit, 'curr_tok' is the terminating * token (EOF or closing brace).
label: code-design
20408. When torture not enabled, can just use the same helper because * 'reg' won't get spilled.

20409. Note: actual update happens once write has been completed * without error below. The write should always succeed * from a specification viewpoint, but we may e.g. run out * of memory. It's safer in this order.

20410. Convert buffer to result string.

20411. default prototype (Note: 'thr' must be reachable)

20412. we know these because enum objects are internally created

20413. **comment:** XXX: error message is a bit misleading: we reached a recursion * limit which is also essentially the same as a C callstack limit * (except perhaps with some relaxed threading assumptions).
label: code-design

20414. **comment:** Direct eval requires that there's a current * activation and it is an Ecmascript function. * When Eval is executed from e.g. cooperate API * call we'll need to do an indirect eval instead.
label: code-design

20415. 1 = num actual 'return values'

20416. should never happen

20417. '-' verbatim

20418. Regexp tokens

20419. avoid attempt to compact the current object

20420. DUK_TOK_TRUE

20421. idx_bottom and idx_retval are only used for book-keeping of * Ecmascript-initiated calls, to allow returning to an Ecmascript * function properly. They are duk_size_t to match the convention * that value stack sizes are duk_size_t and local frame indices * are duk_idx_t.

20422. **comment:** This loop is optimized for size. For speed, there should be * two separate loops, and we should ensure that memcmp() can be * used without an extra "will searchstring fit" check. Doing * the preconditioning for 'p' and 'p_end' is easy but cpos * must be updated if 'p' is wound back (backward scanning).
label: code-design

20423. min(incl)

20424. may be equal

20425. traceback depth ensures fits into 16 bits

20426. * Get the values onto the stack first. It would be possible to cover * some normal cases without resorting to the value stack. * * The right hand side could be a light function (as they generally * behave like objects). Light functions never have a 'prototype' * property so E5.1 Section 15.3.5.3 step 3 always throws a TypeError. * Using duk_require_hobject() is thus correct (except for error msg).

20427. DUK_TOK_GET

20428. * Various

20429. Module has now evaluated to a wrapped module function. Force its * .name to match module.name (defaults to last component of resolved * ID) so that it is shown in stack traces too. Note that we must not * introduce an actual name binding into the function scope (which is * usually the case with a named function) because it would affect the * scope seen by the module and shadow accesses to globals of the same name. * This is now done by compiling the function as anonymous and then forcing * its .name without setting a "has name binding" flag.

20430. Characters outside BMP cannot be escape()'d. We could * encode them as surrogate pairs (for codepoints inside * valid UTF-8 range, but not extended UTF-8). Because * escape() and unescape() are legacy functions, we don't.

20431. trailer

20432. * Check whether we need to abandon an array part (if it exists)

20433. [... env callee]

20434. **comment:** These is not 100% because format would need to be non-portable "long long". * Also print out as doubles to catch cases where the "long" type is not wide * enough; the limits will then not be printed accurately but the magnitude * will be correct.
label: code-design

20435. an Ecmascript function

20436. **comment:** avoid pressure to add/remove strings, invalidation of call data argument, etc.
label: code-design

20437. end of bytecode

20438. key is 'length', cannot match argument exotic behavior

20439. * First check whether property exists; if not, simple case. This covers * steps 1-4.

20440. * Do-while statement is mostly trivial, but there is special * handling for automatic semicolon handling (triggered by the * DUK__ALLOW_AUTO_SEMI_ALWAYS) flag related to a bug filed at: * * https://bugs.ecmascript.org/show_bug.cgi?id=8 * * See doc/compiler.rst for details.

20441. must be found: was found earlier, and cannot be inherited

20442. Input value should be on stack top and will be coerced and * popped. Refuse to update an Array's 'length' to a value * outside the 32-bit range. Negative zero is accepted as zero.

20443. shift in zeroes

20444. free object and all auxiliary (non-heap) allocs

20445. Useful for internal call sites where we either expect an object (function) * or a lightfunc. Returns NULL for a lightfunc.

20446. bytes in dest

20447. stack[0] = regexp * stack[1] = string

20448. flags

20449. Check for maximum buffer length.

20450. Thread'

20451. **comment:** Pointer to bytecode executor's 'curr_pc' variable. Used to copy * the current PC back into the topmost activation when activation * state is about to change (or "syncing" is otherwise needed). This * is rather awkward but important for performance, see execution.rst.
label: code-design

20452. The Quote(value) operation: quote a string. * * Stack policy: [] -> [].

20453. Output #2: last component name

20454. tc1 = false, tc2 = false

20455. 0

20456. Exponent without a sign or with a +/- sign is accepted * by all call sites (even JSON.parse()).

20457. 0x90-0x9f

20458. **comment:** XXX: Shuffling support could be implemented here so that LDINT+LDINTX * would only shuffle once (instead of twice). The current code works * though, and has a smaller compiler footprint.
label: code-design

20459. * Write to entry part

20460. To use the shared helper need the virtual index.

20461. * Slow delete, but we don't care as we're already in a very slow path. * The delete always succeeds: key has no exotic behavior, property * is configurable, and no resize occurs.

20462. LAYOUT 1

20463. For len == 0, i is initialized to len - 1 which underflows. * The condition (i < len) will then exit the for-loop on the * first round which is correct. Similarly, loop termination * happens by i underflowing.

20464. Raw internal valstack access macros: access is unsafe so call site * must have a guarantee that the index is valid. When that is the case, * using these macro results in faster and smaller code than duk_get_tval(). * Both 'ctx' and 'idx' are evaluated multiple times, but only for asserts.

20465. * Node.js Buffer.isEncoding()

20466. array entries are all plain values

20467. **comment:** Buffer values are encoded in (lowercase) hex to make the * binary data readable. Base64 or similar would be more * compact but less readable, and the point of JX/JC * variants is to be as useful to a programmer as possible.
label: code-design

20468. **comment:** XXX: the helper currently assumes stack top contains new * 'length' value and the whole calling convention is not very * compatible with what we need.
label: code-design

20469. Coerce to number before validating pointers etc so that the * number coercions in duk_hbufferobject_validated_write() are * guaranteed to be side effect free and not invalidate the * pointer checks we do here.

20470. Mark-and-sweep interval is relative to combined count of objects and * strings kept in the heap during the latest mark-and-sweep pass. * Fixed point .8 multiplier and .0 adder. Trigger count (interval) is * decreased by each (re)allocation attempt (regardless of size), and each * refzero processed object. ** 'SKIP' indicates how many (re)allocations to wait until a retry if * GC is skipped because there is no thread do it with yet (happens * only during init phases).

20471. XXX: assert 'c' is an enumerator

20472. two special escapes: "\ and "", other printables as is

20473. for indexOf, ToInteger(undefined) would be 0, i.e. correct, but * handle both indexOf and lastIndexOf specially here.

20474. DUK_USE_AUGMENT_ERROR_THROW

20475. * Exponent notation for non-base-10 numbers isn't specified in EcmaScript * specification, as it never explicitly turns up: non-decimal numbers can * only be formatted with Number.prototype.toString([radix]) and for that, * behavior is not explicitly specified. ** Logical choices include formatting the exponent as decimal (e.g. binary * 100000 as 1e+5) or in current radix (e.g. binary 100000 as 1e+101). * The Dragon4 algorithm (in the original paper) prints the exponent value * in the target radix B. However, for radix values 15 and above, the * exponent separator 'e' is no longer easily parseable. Consider, for * instance, the number "1.faecee+1c".

20476. Template functions are not strictly constructable (they don't * have a "prototype" property for instance), so leave the * DUK_HOBJECT_FLAG_CONSTRUCTABLE flag cleared here.

20477. **comment:** Most practical strings will go here.
label: code-design

20478. non-strict eval: env is caller's env or global env (direct vs. indirect call) * global code: env is is global env

20479. **comment:** XXX: use the exactly same arithmetic function here as in executor
label: code-design

20480. -> [... lval new_rval]

20481. sep (even before first one)

20482. **comment:** XXX: use advancing pointers instead of index macros -> faster and smaller?
label: code-design

20483. 0x7F is special

20484. IEEE requires that zeros compare the same regardless * of their signed, so if both x and y are zeroes, they * are caught above.

20485. Signed integers always map to 4 bytes now.

20486. Resolve Proxy targets until Proxy chain ends. No explicit check for * a Proxy loop: user code cannot create such a loop without tweaking * internal properties directly.

20487. estimate is valid

20488. Note: it's nice if size is 2^N (not 4x4 = 16 bytes on 32 bit)

20489. always true, arg is unsigned

20490. ArrayBuffer: unlike any other argument variant, create * a view into the existing buffer.

20491. DUK_TOK_DO

20492. * Slow path: potentially requires function calls for coercion

20493. 'ArrayBuffer'

20494. Initialize index so that we skip internal control keys.

20495. flags have been already cleared

20496. * ArrayBuffer, DataView, and TypedArray constructors

20497. **comment:** * XXX: for now, indicate that an expensive catch binding * declarative environment is always needed. If we don't * need it, we don't need the const_varname either.
label: code-design

20498. -> [... this timeval_new timeval_new]

20515. Shared helper for match() steps 3-4, search() steps 3-4.

20516. dummy

20517. Just call the "original" Object.defineProperties() to * finish up.

20518. Although these could be parsed as PatternCharacters unambiguously (here), * E5 Section 15.10.1 grammar explicitly forbids these as PatternCharacters.

20519. line terminator will be handled on next round

20520. * Debug dumping

20521. x in [2**31, 2**32[

20522. Error path.

20523. if a site already exists, nop: max one label site per statement

20524. Flag ORed to err_code to indicate __FILE__ / __LINE__ is not * blamed as source of error for error fileName / lineNumber.

20525. Start in paused state.

20526. **comment:** XXX: much to improve (code size)
label: code-design

20527. [regexp string res_arr]

20528. range conversion with a "skip"

20529. **comment:** Update function min/max line from current token. Needed to improve * function line range information for debugging, so that e.g. opening * curly brace is covered by line range even when no opcodes are emitted * for the line containing the brace.
label: code-design

20530. * Regular expression structs, constants, and bytecode defines.
20531. **comment:** should never be zero, because we (Duktape.Thread.yield) are on the stack
 label: code-design
20532. **comment:** XXX: This will now return false for non-numbers, even though they would * coerce to NaN (as a general rule). In particular, duk_get_number() * returns a NaN for non-numbers, so should this function also return * true for non-numbers?
 label: code-design
20533. **comment:** The handler is looked up with a normal property lookup; it may be an * accessor or the handler object itself may be a proxy object. If the * handler is a proxy, we need to extend the valstack as we make a * recursive proxy check without a function call in between (in fact * there is no limit to the potential recursion here). ** (For sanity, proxy creation rejects another proxy object as either * the handler or the target at the moment so recursive proxy cases * are not realized now.)
 label: code-design
20534. Flag handling currently assumes that flags are consistent. This is OK * because the call sites are now strictly controlled.
20535. DUK_TOK_DEFAULT
20536. [key value] or [key undefined]
20537. Pad significand with "virtual" zero digits so that Dragon4 will * have enough (apparent) precision to work with.
20538. * Set lexer input position and reinitialize lookup window.
20539. nargs
20540. With lightfuncs, act 'func' may be NULL
20541. return ('?:')
20542. DUK_USE_REFZERO_FINALIZER_TORTURE
20543. next to use, highest used is top - 1
20544. **comment:** XXX: actually single step levels would work just fine, clean up
 label: code-design
20545. * DUK_CALL_FLAG_IGNORE_RECLIMIT causes duk_handle_call() to ignore C * recursion depth limit (and won't increase it either). This is * dangerous, but useful because it allows the error handler to run * even if the original error is caused by C recursion depth limit. ** The heap level DUK_HEAP_FLAG_ERRHANDLER_RUNNING is set for the * duration of the error handler and cleared afterwards. This flag * prevents the error handler from running recursively. The flag is * heap level so that the flag properly controls even coroutines * launched by an error handler. Since the flag is heap level, it is * critical to restore it correctly. ** We ignore errors now: a success return and an error value both * replace the original error value. (This would be easy to change.)
20546. **comment:** XXX: remove heap->dbg_exec_counter, use heap->inst_count_interrupt instead?
 label: code-design
20547. DUK_USE_JSON_DECSTRING_FASTPATH
20548. The actual detached_cb call is postponed to message loop so * we don't need any special precautions here (just skip to EOM * on the already closed connection).
20549. arg2 would be clobbered so reassign it to a temp.
20550. standard behavior, step 3.f.i
20551. avoid degenerate cases, so that (len - 1) won't underflow
20552. Note: %06d for positive value, %07d for negative value to include * sign and 6 digits.
20553. 'let'
20554. * Halt execution helper
20555. 1110 xxxx; 3 bytes
20556. ch1 = (r_increment << 8) + byte
20557. variable name reg/const, if variable not register-bound
20558. Cast converts magic to 16-bit signed value
20559. * Remove the object from the refzero list. This cannot be done * before a possible finalizer has been executed; the finalizer * may trigger a mark-and-sweep, and mark-and-sweep must be able * to traverse a complete refzero_list.
20560. Argument variants. When the argument is an ArrayBuffer a view to * the same buffer is created; otherwise a new ArrayBuffer is always * created.
20561. entry part size
20562. * Property not found in prototype chain.
20563. function executes in strict mode
20564. 'data' is reachable through every compiled function which * contains a reference.
20565. Caller must trigger recomputation of active breakpoint list. To * ensure stale values are not used if that doesn't happen, clear the * active breakpoint list here.
20566. * Longjmp types, also double as identifying continuation type for a rethrow (in 'finally')
20567. note: long live range
20568. * Object will be kept; queue object back to heap_allocated (to tail)
20569. no change

20634. E5 Section 10.4.3
20635. No built-in functions are constructable except the top * level ones (Number, etc).
20636. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'd, * and we're in an infinite loop.
20637. Raw helper for getting a value from the stack, checking its tag. * The tag cannot be a number because numbers don't have an internal * tag in the packed representation.
20638. Bernstein hash init value is normally 5381
20639. * DECLVAR * * See E5 Sections: * 10.4.3 Entering Function Code * 10.5 Declaration Binding Instantiation * 12.2 Variable Statement * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * * Variable declaration behavior is mainly discussed in Section 10.5, * and is not discussed in the execution semantics (Sections 11-13). * * Conceptually declarations happen when code (global, eval, function) * is entered, before any user code is executed. In practice, register- * bound identifiers are 'declared' automatically (by virtue of being * allocated to registers with the initial value 'undefined'). Other * identifiers are declared in the function prologue with this primitive. * * Since non-register bindings eventually back to an internal object's * properties, the 'prop_flags' argument is used to specify binding * type: * * - Immutable binding: set DUK_PROPDESC_FLAG_WRITABLE to false * - Non-deletable binding: set DUK_PROPDESC_FLAG_CONFIGURABLE to false * - The flag DUK_PROPDESC_FLAG_ENUMERABLE should be set, although it * doesn't really matter for internal objects * * All bindings are non-deletable mutable bindings except: * * - Declarations in eval code (mutable, deletable) * - 'arguments' binding in strict function code (immutable) * - Function name binding of a function expression (immutable) * * Declarations may go to declarative environment records (always * so for functions), but may also go to object environment records * (e.g. global code). The global object environment has special * behavior when re-declaring a function (but not a variable); see * E5.1 specification, Section 10.5, step 5.e. * * Declarations always go to the 'top-most' environment record, i.e. * we never check the record chain. It's not an error even if a * property (even an immutable or non-deletable one) of the same name * already exists. * * If a declared variable already exists, its value needs to be updated * (if possible). Returns 1 if a PUTVAR needs to be done by the caller; * otherwise returns 0.
20640. **comment:** duk_handle_call_xxx: call ignores C recursion limit (for errhandler calls)
 label: code-design

label: code-design
20803. at least one opcode emitted
20804. Slice offsets are element (not byte) offsets, which only matters * for TypedArray views, Node.js Buffer and ArrayBuffer have shift * zero so byte and element offsets are the same. Negative indices * are counted from end of slice, crossed indices are allowed (and * result in zero length result), and final values are clamped * against the current slice. There's intentionally no check * against the underlying buffer here.
20805. side effects, in theory (referenced by global env)
20806. * Object.seal() and Object.freeze() (E5 Sections 15.2.3.8 and 15.2.3.9) * * Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. * * Note: virtual (non-concrete) properties which are non-configurable but * writable would pose some problems, but such properties do not currently * exist (all virtual properties are non-configurable and non-writable). * If they did exist, the non-configurability does NOT prevent them from * becoming non-writable. However, this change should be recorded somehow * so that it would turn up (e.g. when getting the property descriptor), * requiring some additional flags in the object.
20807. additional flags which are passed in the same flags argument as property * flags but are not stored in object properties.
20808. **comment:** XXX: Is this INCREF necessary? 'func' is always a borrowed * reference reachable through the value stack? If changed, stack * unwind code also needs to be fixed to match.
label: code-design
20809. **comment:** XXX: shared decoding of 'b' and 'c'?
label: code-design
20810. **comment:** The fast path for array property put is not fully compliant: * If one places conflicting number-indexed properties into * Array.prototype (for example, a non-writable Array.prototype[7]) * the fast path will incorrectly ignore them. * * This fast path could be made compliant by falling through * to the slow path if the previous value was UNUSED. This would * also remove the need to check for extensibility. Right now a * non-extensible array is slower than an extensible one as far * as writes are concerned. * * The fast path behavior is documented in more detail here: * tests/ecmascript/test-misc-array-fast-write.js
label: code-design
20811. **comment:** XXX: because we unwind stacks above, thr->heap->curr_thread is at * risk of pointing to an already freed thread. This was indeed the * case in test-bug-multithread-valgrind.c, until duk_handle_call() * was fixed to restore thr->heap->curr_thread before rethrowing an * uncaught error.
label: code-design
20812. Allow naked fraction (e.g. ".123")
20813. * Rate limit check for sending status update or peeking into * the debug transport. Both can be expensive operations that * we don't want to do on every opcode. * * Making sure the interval remains reasonable on a wide variety * of targets and bytecode is difficult without a timestamp, so * we use a Date-provided timestamp for the rate limit check. * But since it's also expensive to get a timestamp, a bytecode * counter is used to rate limit getting timestamps.
20814. >>> struct.unpack('>d', '4000112233445566'.decode('hex')) * (2.008366013071895)
20815. Other longjmp types are handled by executor before propagating * the error here.
20816. * E5 Section 11.8.6 describes the main algorithm, which uses * [[HasInstance]]. [[HasInstance]] is defined for only * function objects: * * - Normal functions: * E5 Section 15.3.5.3 * - Functions established with Function.prototype.bind(): * E5 Section 15.3.4.5.3 * * For other objects, a TypeError is thrown. * * Limited Proxy support: don't support 'getPrototypeOf' trap but * continue lookup in Proxy target if the value is a Proxy.
20817. * Ecmascript/native function call or lightfunc call
20818. Halt execution and enter a debugger message loop until execution is resumed * by the client. PC for the current activation may be temporarily decremented * so that the "current" instruction will be shown by the client. This helper * is callable from anywhere, also outside bytecode executor.
20819. computed live
20820. **comment:** Load a function from bytecode. The function object returned here must * match what is created by duk_js_push_closure() with respect to its flags, * properties, etc. * * NOTE: there are intentionally no input buffer length / bound checks. * Adding them would be easy but wouldn't ensure memory safety as untrusted * or broken bytecode is unsafe during execution unless the opcodes themselves * are validated (which is quite complex, especially for indirect opcodes).
label: code-design
20821. * For an external string, the NUL-terminated string data is stored * externally. The user must guarantee that data behind this pointer * doesn't change while it's used.
20822. Note: masking of 'x' is not necessary because of * range check and shifting -> no bits overlapping * the marker should be set.
20823. **comment:** * Object.defineProperty() related helper (E5 Section 15.2.3.6) * * Inlines all [[DefineOwnProperty]] exotic behaviors. * * Note: Ecmascript compliant [[DefineOwnProperty]](P, Desc, Throw) is not * implemented directly, but Object.defineProperty() serves its purpose. * We don't need the [[DefineOwnProperty]] internally and we don't have a * property descriptor with 'missing values' so it's easier to avoid it * entirely. * * Note: this is only called for actual objects, not primitive values. * This must support virtual properties for full objects (e.g. Strings) * but not for plain values (e.g. strings). Lightfuncs, even though * primitive in a sense, are treated like objects and accepted as target * values.

20825. A...P
20826. Module table: * - module.exports: initial exports table (may be replaced by user) * - module.id is non-writable and non-configurable, as the CommonJS * spec suggests this if possible * - module.filename: not set, defaults to resolved ID if not explicitly * set by modSearch() (note capitalization, not .fileName, matches Node.js) * - module.name: not set, defaults to last component of resolved ID if * not explicitly set by modSearch()
20827. String constructor needs to distinguish between an argument not given at all * vs. given as 'undefined'. We're a vararg function to handle this properly.
20828. Explicit length is only needed if it differs from 'nargs'.
20829. Force restart caused by a function return; must recheck * debugger breakpoints before checking line transitions, * see GH-303. Restart and then handle interrupt_counter * zero again.
20830. Decode 'bits' bits from the input stream (bits must be 1...24). * When reading past bitstream end, zeroes are shifted in. The result * is signed to match duk_bd_decode_flagged.
20831. (?:
20832. Must be restored here to handle e.g. yields properly.
20833. The base ID of the current require() function, resolution base
20834. non-Reference deletion is always 'true', even in strict mode
20835. jump to next loop, using reg_v34_iter as iterated value
20836. Scan error: this shouldn't normally happen; it could happen if * string is not valid UTF-8 data, and clen/blen are not consistent * with the scanning algorithm.
20837. max possible
20838. punctuators (unlike the spec, also includes "/" and "/=")
20839. DUK_BUFOBJ_FLOAT32ARRAY
20840. [... ptr]
20841. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property delete right now.
20842. 12: getDate
20843. * Helper for valstack space ** Caller of DUK_ASSERT_VALSTACK_SPACE() estimates the number of free stack entries * required for its own use, and any child calls which are not (a) Duktape API calls * or (b) Duktape calls which involve extending the valstack (e.g. getter call).
20844. 'modLoaded'
20845. * Assertions before
20846. **comment:** * Buffer writer (dynamic buffer only) ** Helper for writing to a dynamic buffer with a concept of a "spare" area * to reduce resizes. You can ensure there is enough space beforehand and * then write for a while without further checks, relying on a stable data * pointer. Spare handling is automatic so call sites only indicate how * much data they need right now. ** There are several ways to write using bufwriter. The best approach * depends mainly on how much performance matters over code footprint. * The key issues are (1) ensuring there is space and (2) keeping the 'p' pointers consistent. Fast code should ensure space for multiple writes * with one ensure call. Fastest inner loop code can temporarily borrow * the 'p' pointer but must write it back eventually. * Be careful to ensure all macro arguments (other than static pointers like * 'thr' and 'bw_ctx') are evaluated exactly once, using temporaries if * necessary (if that's not possible, there should be a note near the macro). * Buffer write arguments often contain arithmetic etc so this is * particularly important here.
label: code-design
20847. Ordering should not matter (E5 Section 11.8.5, step 3.a) but * preserve it just in case.
20848. for zero size, don't push anything on valstack
20849. Here we'd have the option of decoding unpadded base64 * (e.g. "xxxxyy" instead of "xxxxyy==". Currently not * accepted.
20850. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway
20851. * Conceptually, we look for the identifier binding by starting from * 'env' and following to chain of environment records (represented * by the prototype chain). ** If 'env' is NULL, the current activation does not yet have an * allocated declarative environment record; this should be treated * exactly as if the environment record existed but had no bindings * other than register bindings. ** Note: we assume that with the DUK_HOBJECT_FLAG_NEWENV cleared * the environment will always be initialized immediately; hence * a NULL 'env' should only happen with the flag set. This is the * case for: (1) function calls, and (2) strict, direct eval calls.
20852. heap level "stash" object (e.g., various reachability roots)
20853. * For global or eval code this is straightforward. For functions * created with the Function constructor we only get the source for * the body and must manufacture the "function ..." part. ** For instance, for constructed functions (v8): * * > a = new Function("foo", "bar", "print(foo)"); * [Function] * > a.toString() * 'function anonymous(foo,bar) {\nprint(foo)\n}' * Similarly for e.g. getters (v8): * * > x = { get a(foo,bar) { print(foo); } } * { a: [Getter] } * > Object.getOwnPropertyDescriptor(x, 'a').get.toString() * 'function a(foo,bar) { print(foo); }'
20854. c recursion check
20855. XXX: optimize by adding the token numbers directly into the * always interned duk_hstring objects (there should be enough * flag bits free for that)?
20856. Continue parsing after padding, allows concatenated, * padded base64.
20857. Check that 'this' is a duk_hbufferobject and return a pointer to it * (NULL if not).
20858. idx_step is +1 for indexOf, -1 for lastIndexOf
20859. is a setter/getter
20860. env created above to stack top
20861. cannot be e.g. arguments exotic, since exotic 'traits' are mutually exclusive
20862. DUK_TOK_LNOT
20863. XXX: sufficient to check 'strict', assert for 'is function'
20864. check final character validity
20865. * Init lexer context
20866. * Inref and decref functions. ** Decref may trigger immediate refzero handling, which may free and finalize * an arbitrary number of objects. *
20867. Generate pc2line data for an instruction sequence, leaving a buffer on stack top.
20868. a dummy undefined value is pushed to make valstack * behavior uniform for caller
20869. idx_step is +1 for reduce, -1 for reduceRight
20870. PatternCharacter, all excluded characters are matched by cases above
20871. Note: -nargs alone would fail for nargs == 0, this is OK
20872. curr and desc are accessors
20873. * Throw the error in the resumed thread's context; the * error value is pushed onto the resumee valstack. ** Note: the callstack of the target may empty in this case * too (i.e. the target thread has never been resumed). The * value stack will contain the initial function in that case, * which we simply ignore.
20874. For string-to-number, pretend we never have the lowest mantissa as there * is no natural "precision" for inputs. Having lowest_mantissa == 0, we'll * fall into the base cases for both e >= 0 and e < 0.
20875. Number built-in accepts a plain number or a Number object (whose * internal value is operated on). Other types cause TypeError.
20876. Encode to extended UTF-8; 'out' must have space for at least * DUK_UNICODE_MAX_XUTF8_LENGTH bytes. Allows encoding of any * 32-bit (unsigned) codepoint.
20877. func.prototype.constructor = func
20878. Accept any pointer-like value; for 'object' dvalue, read * and ignore the class number.
20879. **comment:** Clone the properties of the ROM-based global object to create a * fully RAM-based global object. Uses more memory than the inherit * model but more compliant.
label: code-design
20880. prev value can be garbage, no decref
20881. **comment:** * For/for-in statement is complicated to parse because * determining the statement type (three-part for vs. a * for-in) requires potential backtracking. ** See the helper for the messy stuff.
label: code-design
20882. Stepped? Step out is handled by callstack unwind.
20883. Copy values, the copy method depends on the arguments. ** Copy mode decision may depend on the validity of the underlying * buffer of the source argument; there must be no harmful side effects * from there to here for copy_mode to still be valid.

20884. fills window
20885. Caller must check character offset to be inside the string.
20886. valstack will be unbalanced, which is OK
20887. conservative
20888. unconditional
20889. DUK_USE_FASTINT && DUK_USE_PACKED_TVAL
20890. * NEXTENUM checks whether the enumerator still has unenumerated * keys. If so, the next key is loaded to the target register * and the next instruction is skipped. Otherwise the next instruction * will be executed, jumping out of the enumeration loop.
20891. **comment:** Providing access to e.g. act->lex_env would be dangerous: these * internal structures must never be accessible to the application. * Duktape relies on them having consistent data, and this consistency * is only asserted for, not checked for.
label: code-design
20892. Duktape.modSearch
20893. Set .buffer to the argument ArrayBuffer.
20894. * Parse a function-like expression: * - function expression * - function declaration * - function statement (non-standard) * - setter/getter * * Adds the function to comp_ctx->curr_func function table and returns the * function number. * * On entry, curr_token points to: * - the token after 'function' for function expression/declaration/statement * - the token after 'set' or 'get' for setter/getter
20895. * Match loop. * * Try matching at different offsets until match found or input exhausted.

20909. 'buf' contains the string to write, 'sz_buf' contains the length * (which may be zero).
20910. '
20911. hobject management functions
20912. Convert day from one-based to zero-based (internal). This may * cause the day part to be negative, which is OK.
20913. 1111 10xx 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx [26 bits]
20914. There is no need to check the first character specially here * (i.e. reject digits): the caller only accepts valid initial * characters and won't call us if the first character is a digit. * This also ensures that the plain string won't be empty.
20915. '\xffBytecode'
20916. Catch a double-to-int64 cast issue encountered in practice.
20917. * DumpHeap command
20918. **comment:** * Lexer for source files, ToNumber() string conversions, RegExp expressions, * and JSON. * * Provides a stream of Ecmascript tokens from an UTF-8/CESU-8 buffer. The * caller can also rewind the token stream into a certain position which is * needed by the compiler part for multi-pass scanning. Tokens are * represented as duk_token structures, and contain line number information. * Token types are identified with DUK_TOK_* defines. * * Characters are decoded into a fixed size lookup window consisting of * decoded Unicode code points, with window positions past the end of the * input filled with an invalid codepoint (-1). The tokenizer can thus * perform multiple character lookups efficiently and with few sanity * checks (such as access outside the end of the input), which keeps the * tokenization code small at the cost of performance. * * Character data in tokens, such as identifier names and string literals, * is encoded into CESU-8 format on-the-fly while parsing the token in * question. The string data is made reachable to garbage collection by * placing the token-related values in value stack entries allocated for * this purpose by the caller. The characters exist in Unicode code point * form only in the fixed size lookup window, which keeps character data * expansion (of especially ASCII data) low. * * Token parsing supports the full range of Unicode characters as described * in the E5 specification. Parsing has been optimized for ASCII characters * because ordinary Ecmascript code consists almost entirely of ASCII * characters. Matching of complex Unicode codepoint sets (such as in the * IdentifierStart and IdentifierPart productions) is optimized for size, * and is done using a linear scan of a bit-packed list of ranges. This is * very slow, but should never be entered unless the source code actually * contains Unicode characters. * * Ecmascript tokenization is partially context sensitive. First, * additional future reserved words are recognized in strict mode (see E5 * Section 7.6.1.2). Second, a forward slash character ('/') can be * recognized either as starting a RegExp literal or as a division operator, * depending on context. The caller must provide necessary context flags * when requesting a new token. * * Future work: * * * Make line number tracking optional, as it consumes space. * * * Add a feature flag for disabling UTF-8 decoding of input, as most * source code is ASCII. Because of Unicode escapes written in ASCII, * this does not allow Unicode support to be removed from e.g. * duk_unicode_is_identifier_start() nor does it allow removal of CESU-8 * encoding of e.g. string literals. * * * Add a feature flag for disabling Unicode compliance of e.g. identifier * names. This allows for a build more than a kilobyte smaller, because * Unicode ranges needed by duk_unicode_is_identifier_start() and * duk_unicode_is_identifier_part() can be dropped. String literals * should still be allowed to contain escaped Unicode, so this still does * not allow removal of CESU-8 encoding of e.g. string literals. * * * Character lookup tables for codepoints above BMP could be stripped. * * * Strictly speaking, E5 specification requires that source code consists * of 16-bit code units, and if not, must be conceptually converted to * that format first. The current lexer processes Unicode code points * and allows characters outside the BMP. These should be converted to * surrogate pairs while reading the source characters into the window, * not after tokens have been formed (as is done now). However, the fix * is not trivial because two characters are decoded from one codepoint. * * * Optimize for speed as well as size. Large if-else ladders are (at * least potentially) slow.
label: code-design
20919. [... buf loop]
20920. **comment:** * Heap object representation. * * Heap objects are used for Ecmascript objects, arrays, and functions, * but also for internal control like declarative and object environment * records. Compiled functions, native functions, and threads are also * objects but with an extended C struct. * * Objects provide the required Ecmascript semantics and exotic behaviors * especially for property access. * * Properties are stored in three conceptual parts: * * 1. A linear 'entry part' contains ordered key-value-attributes triples * and is the main method of string properties. * * 2. An optional linear 'array part' is used for array objects to store a * (dense) range of [0,N[array indexed entries with default attributes * (writable, enumerable, configurable). If the array part would become * sparse or non-default attributes are required, the array part is * abandoned and moved to the 'entry part'. * * 3. An optional 'hash part' is used to optimize lookups of the entry * part; it is used only for objects with sufficiently many properties * and can be abandoned without loss of information. * * These three conceptual parts are stored in a single memory allocated area. * This minimizes memory allocation overhead but also means that all three * parts are resized together, and makes property access a bit complicated.

20953. as is
20954. Step 1 is not necessary because duk_call_method() will take * care of it.
20955. * Code emission helpers ** Some emission helpers understand the range of target and source reg/const * values and automatically emit shuffling code if necessary. This is the * case when the slot in question (A, B, C) is used in the standard way and * for opcodes the emission helpers explicitly understand (like DUK_OP_CALL). ** The standard way is that: * - slot A is a target register * - slot B is a source register/constant * - slot C is a source register/constant * * If a slot is used in a non-standard way the caller must indicate this * somehow. If a slot is used as a target instead of a source (or vice * versa), this can be indicated with a flag to trigger proper shuffling * (e.g. DUK_EMIT_FLAG_B_IS_TARGET). If the value in the slot is not * register/const related at all, the caller must ensure that the raw value * fits into the corresponding slot so as to not trigger shuffling. The * caller must set a "no shuffle" flag to ensure compilation fails if * shuffling were to be triggered because of an internal error. ** For slots B and C the raw slot size is 9 bits but one bit is reserved for * the reg/const indicator. To use the full 9-bit range for a raw value, * shuffling must be disabled with the DUK_EMIT_FLAG_NO_SHUFFLE_{B,C} flag. * Shuffling is only done for A, B, and C slots, not the larger BC or ABC slots. ** There is call handling specific understanding in the A-B-C emitter to * convert call setup and call instructions into indirect ones if necessary.

21005. enum_index

21006. XXX: clarify on when and where DUK_CONST_MARKER is allowed

21007. * Error helpers

21008. * Data following the header depends on the DUK_HBUFFER_FLAG_DYNAMIC * flag. * * If the flag is clear (the buffer is a fixed size one), the buffer * data follows the header directly, consisting of 'size' bytes. * * If the flag is set, the actual buffer is allocated separately, and * a few control fields follow the header. Specifically: * * - a "void *" pointing to the current allocation * - a duk_size_t indicating the full allocated size (always >= 'size') * * If DUK_HBUFFER_FLAG_EXTERNAL is set, the buffer has been allocated * by user code, so that Duktape won't be able to resize it and won't * free it. This allows buffers to point to e.g. an externally * allocated structure such as a frame buffer. * * Unlike strings, no terminator byte (NUL) is guaranteed after the * data. This would be convenient, but would pad aligned user buffers * unnecessarily upwards in size. For instance, if user code requested * a 64-byte dynamic buffer, 65 bytes would actually be allocated which * would then potentially round upwards to perhaps 68 or 72 bytes.

21009. 'new'

21010. evaluate to plain value, no forced register (temp/bound reg both ok)

21334. enable manually for dumping
21335. (?=
21336. require to be safe
21337. Parser part count.
21338. for side effects, result ignored
21339. Now we can check offset validity.
21340. Milliseconds between status notify and transport peeks.
21341. Matching separator index is used in the control table
21342. rehash even if old and new sizes are the same to get rid of * DELETED entries.
21343. * Two pass approach to processing the property descriptors. * On first pass validate and normalize all descriptors before * any changes are made to the target object. On second pass * make the actual modifications to the target object. * * Right now we'll just use the same normalize/validate helper * on both passes, ignoring its outputs on the first pass.
21344. * Stringify implementation.
21345. ToNumber() for a double is a no-op.
21346. default: char escape (two chars)
21347. * Hobject allocation. * * Provides primitive allocation functions for all object types (plain object, * compiled function, native function, thread). The object return is not yet * in "heap allocated" list and has a refcount of zero, so caller must careful.
21348. Check actual underlying buffers for validity and that they * cover the copy. No side effects are allowed after the check * so that the validity status doesn't change.
21349. * Special parser for character classes; calls callback for every * range parsed and returns the number of ranges present.
21350. negate result
21351. * Lightfunc
21352. **comment:** * Refzero handling is skipped entirely if (1) mark-and-sweep is * running or (2) execution is paused in the debugger. The objects * are left in the heap, and will be freed by mark-and-sweep or * eventual heap destruction. * * This is necessary during mark-and-sweep because refcounts are also * updated during the sweep phase (otherwise objects referenced by a * swept object would have incorrect refcounts) which then calls here. * This could be avoided by using separate decref macros in * mark-and-sweep; however, mark-and-sweep also calls finalizers which * would use the ordinary decref macros anyway and still call this * function. * * This check must be enabled also when mark-and-sweep support has been * disabled: the flag is also used in heap destruction when running * finalizers for remaining objects, and the flag prevents objects from * being moved around in heap linked lists.
 label: code-design
21353. XXX: len >= 0x80000000 won't work below because a signed type * is needed by qsort.
21354. Special handling for year sign.
21355. [arg1 ... argN obj length new_length]
21356. The algorithm in E5.1 Section 15.9.1.12 normalizes month, but * does not normalize the day-of-month (nor check whether or not * it is finite) because it's not necessary for finding the day * number which matches the (year,month) pair. * * We assume that duk_day_from_year() is exact here. * * Without an explicit infinity / NaN check in the beginning, * day_num would be a bogus integer here. * * It's possible for 'year' to be out of integer range here. * If so, we need to return NaN without integer overflow. * This fixes test-bug-setyear-overflow.js.
21357. * Node.js Buffer.prototype.slice([start], [end]) * ArrayBuffer.prototype.slice(begin, [end]) * TypedArray.prototype.slice(begin, [end]) * * The API calls are almost identical; negative indices are counted from end * of buffer, and final indices are clamped (allowing crossed indices). Main * differences: * * - Copy/view behavior; Node.js .slice() and TypedArray .subarray() create * views, ArrayBuffer .slice() creates a copy * * - Resulting object has a different class and prototype depending on the * call (or 'this' argument) * * - TypedArray .subarray() arguments are element indices, not byte offsets
21358. **comment:** When alloc_size == 0 the second allocation may not * actually exist.

21606. e.g. require('/foo'), empty terms not allowed
21607. string is internal
21608. * Parse regexp Disjunction. Most of regexp compilation happens here. * * Handles Disjunction, Alternative, and Term productions directly without * recursion. The only constructs requiring recursion are positive/negative * lookaheads, capturing parentheses, and non-capturing parentheses. * * The function determines whether the entire disjunction is a 'simple atom' * (see doc/regexp.rst discussion on 'simple quantifiers') and if so, * returns the atom character length which is needed by the caller to keep * track of its own atom character length. A disjunction with more than one * alternative is never considered a simple atom (although in some cases * that might be the case). * * Return value: simple atom character length or < 0 if not a simple atom. * Appends the bytecode for the disjunction matcher to the end of the temp * buffer. * * Regexp top level structure is: * * Disjunction = Term* * | Term* | Disjunction * * Term = Assertion * | Atom * | Atom Quantifier * * An empty Term sequence is a valid disjunction alternative (e.g. /|||c||/). * * Notes: * * * Tracking of the 'simple-ness' of the current atom vs. the entire * disjunction are separate matters. For instance, the disjunction * may be complex, but individual atoms may be simple. Furthermore, * simple quantifiers are used whenever possible, even if the * disjunction as a whole is complex. * * * The estimate of whether an atom is simple is conservative now, * and it would be possible to expand it. For instance, captures * cause the disjunction to be marked complex, even though captures * -can- be handled by simple quantifiers with some minor modifications. * * * Disjunction 'tainting' as 'complex' is handled at the end of the * main for loop collectively for atoms. Assertions, quantifiers, * and '| tokens need to taint the result manually if necessary. * Assertions cannot add to result char length, only atoms (and * quantifiers) can; currently quantifiers will taint the result * as complex though.
21609. Get a pointer to the current buffer contents (matching current allocation * size). May be NULL for zero size dynamic/external buffer.

21689. **comment:** If thr != NULL, the thr may still be in the middle of * initialization. * XXX: Improve the thread viability test.
 label: code-design
21690. [value offset end]
21691. Relies on NULL encoding to zero.
21692. **comment:** XXX: the current implementation works but is quite clunky; it compiles * to almost 1,4kB of x86 code so it needs to be simplified (better approach, * shared helpers, etc). Some ideas for refactoring: * * - a primitive to convert a string into a regexp matcher (reduces matching * code at the cost of making matching much slower) * - use replace() as a basic helper for match() and split(), which are both * much simpler * - API call to get_prop and to_boolean
 label: code-design
21693. * Compilation and evaluation
21694. Note: Identifier rejects reserved words
21695. -> [obj trap_result]
21696. * Unicode letter is now taken to be the categories: * * Lu, Ll, Lt, Lm, Lo * * (Not sure if this is exactly correct.) * * The ASCII fast path consists of: * * 0x0041 ... 0x005a ['A' ... 'Z'] * 0x0061 ... 0x007a ['a' ... 'z']
21697. caller ensures
21698. * Not found (in registers or record objects). Declare * to current variable environment.
21699. **comment:** 'this' binding is not needed here
 label: requirement
21700. no need to check callable; duk_call() will do that
21701. mark finalizer work list as reachability roots
21702. Initial '{' has been checked and eaten by caller.
21703. '\xffMap'
21704. The directive prologue flag is cleared by default so that it is * unset for any recursive statement parsing. It is only "revived" * if a directive is detected. (We could also make directives only * allowed if 'allow_source_elem' was true.)
21705. 'NaN'
21706. unsigned 31-bit range
21707. DUK_USE_EXPLICIT_NULL_INIT
21708. valgrind whine without this
21709. **comment:** * Helper for calling a user error handler. * * 'thr' must be the currently active thread; the error handler is called * in its context. The valstack of 'thr' must have the error value on * top, and will be replaced by another error value based on the return * value of the error handler. * * The helper calls duk_handle_call() recursively in protected mode. * Before that call happens, no longjumps should happen; as a consequence, * we must assume that the valstack contains enough temporary space for * arguments and such. * * While the error handler runs, any errors thrown will not trigger a * recursive error handler call (this is implemented using a heap level * flag which will "follow" through any coroutines resumed inside the * error handler). If the error handler is not callable or throws an * error, the resulting error replaces the original error (for Duktape * internal errors, duk_error_throw.c further substitutes this error with * a DoubleError which is not ideal). This would be easy to change and * even signal to the caller. * * The user error handler is stored in 'Duktape.errCreate' or * 'Duktape.errThrow' depending on whether we're augmenting the error at * creation or throw time. There are several alternatives to this approach, * see doc/error-objects.rst for discussion. * * Note: since further longjmp()s may occur while calling the error handler * (for many reasons, e.g. a labeled 'break' inside the handler), the * caller can make no assumptions on the thr->heap->lj state after the * call (this affects especially duk_error_throw.c). This is not an issue * as long as the caller writes to the lj state only after the error handler * finishes.
 label: code-design
21710. * Exposed calls
21711. key encountered as a setter
21712. Don't need to sync curr_pc here; duk_new() will do that * when it augments the created error.
21713. one i_step over
21714. Shared prefix for all buffer types.
21715. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. * * Delayed creation (on demand) is handled in duk_js_var.c.
21716. Reject a proxy object as the target because it would need * special handler in property lookups. (ES6 has no such restriction)
21717. must restore reliably before returning
21718. * Basic context initialization. * * Some init values are read from the bytecode header * whose format is (UTF-8 codepoints): * * uint flags * uint nsaved (even, 2n+2 where n = num captures)
21719. return 'res_arr' or 'null'
21720. **comment:** This would be nice, but parsing is faster without resetting the * value slots. The only side effect is that references to temporary * string values may linger until lexing is finished; they're then * freed normally.
 label: code-design
21721. break jump
21722. "123"

21943. [... arg1 ... argN]
21944. executor interrupt running (used to avoid nested interrupts)
21945. [... func this]
21946. Constants: variable size encoding.
21947. * Variable declarations. * * Unlike function declarations, variable declaration values don't get * assigned on entry. If a binding of the same name already exists, just * ignore it silently.
21948. **comment:** XXX: duk_small_uint_t would be enough for this loop
label: code-design
21949. no res->strs[]
21950. * Debug dumping of duk_heap.
21951. Detach a debugger if attached (can be called multiple times) * safely.
21952. if 1, doing a string-to-number; else doing a number-to-string
21953. **comment:** Faster alternative: avoid making a temporary copy of tvptr_dst and use * fast incref/decref macros.
label: code-design
21954. * duk_hbuffer allocation and freeing.
21955. stash to bottom of value stack to keep new_env reachable for duration of eval
21956. step 4.a
21957. Handle a RETURN opcode. Avoid using longjmp() for return handling because * it has a measurable performance impact in ordinary environments and an extreme * impact in Emscripten (GH-342). Return value is on value stack top.
21958. exports
21959. Note: must behave like a no-op with NULL and any pointer * returned from malloc/realloc with zero size.
21960. **comment:** XXX: use duk_is_valid_index() instead?
label: code-design
21961. eat closing bracket
21962. * Object.isSealed() and Object.isFrozen() (E5 Sections 15.2.3.11, 15.2.3.13) * * Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. * * Note: all virtual (non-concrete) properties are currently non-configurable * and non-writable (and there are no accessor virtual properties), so they don't * need to be considered here now.
21963. * The switch statement is pretty messy to compile. * See the helper for details.
21964. re_ctx->captures at start and end of atom parsing. * Since 'captures' indicates highest capture number emitted * so far in a DUK_REOP_SAVE, the captures numbers saved by * the atom are:]start_captures,end_captures].
21965. Loop check using a hybrid approach: a fixed-size visited[] array * with overflow in a loop check object.
21966. first value: comma must not precede the value
21967. actually used, non-NULL keys
21968. r <- (2 * b) * f
21969. [... re_obj input bc saved_buf res_obj]
21970. * Create wrapper object and serialize
21971. t1 <- t1 - s
21972. * Label handling * * Labels are initially added with flags prohibiting both break and continue. * When the statement type is finally uncovered (after potentially multiple * labels), all the labels are updated to allow/prohibit break and continue.
21973. 112.5%, i.e. new size less than 12.5% higher -> fast resize
21974. * URI handling
21975. * ASCII character constants * * C character literals like 'x' have a platform specific value and do * not match ASCII (UTF-8) values on e.g. EBCDIC platforms. So, use * these (admittedly awkward) constants instead. These constants must * also have signed values to avoid unexpected coercions in comparisons. * * <http://en.wikipedia.org/wiki/ASCII>
21976. 32-bit value
21977. string intern table (weak refs)
21978. **comment:** * Shared error message strings * * To minimize code footprint, try to share error messages inside Duktape * code. Modern compilers will do this automatically anyway, this is mostly * for older compilers.
label: code-design
21979. Convert indices to byte offsets.
21980. T'
21981. Fast path: source is a TypedArray (or any bufferobject).
21982. Note: object cannot be a finalizable unreachable object, as * they have been marked temporarily reachable for this round, * and are handled above.
21983. 'var'
21984. [args(n) [crud] formals arguments map mappednames]
21985. **comment:** Note: 'this' is not necessarily an Array object. The push() * algorithm is supposed to work for other kinds of objects too, * so the algorithm has e.g. an explicit update for the 'length' * property which is normally "magical" in arrays.
label: code-design
21986. **comment:** * XXX: array indices are mostly typed as duk_uint32_t here; duk_uarridx_t * might be more appropriate.
label: code-design
21987. 'pointer'
21988. Return value would be pointless: because throw_flag==1, we always * throw if the identifier doesn't resolve.
21989. PC points to next instruction, find offending PC, * PC == 0 for native code.
21990. DUK_UNICODE_H_INCLUDED
21991. **comment:** dead code, but ensures portability (see Linux man page notes)
label: code-design
21992. DUK__ALLOW_AUTO_SEMI_ALWAYS workaround
21993. end of valstack allocation (exclusive)
21994. previous value is assumed to be garbage, so don't touch it
21995. * Scan number and setup for Dragon4. * * The fast path case is detected during setup: an integer which * can be converted without rounding, no net exponent. The fast * path could be implemented as a separate scan, but may not really * be worth it: the multiplications for building 'f' are not * expensive when 'f' is small. * * The significand ('f') must contain enough bits of (apparent) * accuracy, so that Dragon4 will generate enough binary output digits. * For decimal numbers, this means generating a 20-digit significand, * which should yield enough practical accuracy to parse IEEE doubles. * In fact, the Ecmascript specification explicitly

allows an * implementation to treat digits beyond 20 as zeroes (and even * to round the 20th digit upwards). For non-decimal numbers, the * appropriate number of digits has been precomputed for comparable * accuracy. ** Digit counts: * [dig_lzero] * | * .+---[dig_prec]---. * | || | * 0000123.45678901234567890123456 * | | | | * `--+-'`----[dig_frac]-----`-+-`* | | * [dig_whole] [dig_expt] * * dig_frac and dig_expt are -1 if not present * dig_lzero is only computed for whole number part * * Parsing state * * Parsing whole part dig_frac < 0 AND dig_expt < 0 * Parsing fraction part dig_frac >= 0 AND dig_expt < 0 * Parsing exponent part dig_expt >= 0 (dig_frac may be < 0 or >= 0) * * Note: in case we hit an implementation limit (like exponent range), * we should throw an error, NOT return NaN or Infinity. Even with * very large exponent (or significand) values the final result may be * finite, so NaN/Infinity would be incorrect.

21996. **comment:** suppress warning, not used

label: code-design

21997. Buffer/string -> compare contents.

21998. * Update cache entry (allocating if necessary), and move the * cache entry to the first place (in an "LRU" policy).

21999. finished jump

22000. string is ASCII, clen == blen

22001. DUK_USE_HOBJECT_HASH_PART || DUK_USE_STRTAB_PROBE

22002. * Since character data is only generated by decoding the source or by * the compiler itself, we rely on the input codepoints being correct * and avoid a check here.

* * Character data can also come here through decoding of Unicode * escapes ("udead\ubeef") so all 16-bit unsigned values can be * present, even when the source file itself is strict UTF-8.

22003. **comment:** XXX: more emergency behavior, e.g. find smaller hash sizes etc

label: code-design

22004. * Copy array elements to new array part.

22005. For strings, special form for short lengths.

22006. Setup function properties.

22007. **comment:** * In a fast check we assume old_size equals old_used (i.e., existing * array is fully dense). ** Slow check if: * * (new_size - old_size) / old_size > limit * new_size - old_size > limit * old_size * new_size > (1 + limit) * old_size || limit' is 3 bits fixed point * new_size > (1 + (limit' / 8)) * old_size || * 8 * 8 * new_size > (8 + limit') * old_size || : 8 * new_size > (8 + limit') * (old_size / 8) * new_size > limit' * (old_size / 8) || limit" = 9 -> max 25% increase * arr_idx + 1 > limit" * (old_size / 8) ** This check doesn't work well for small values, so old_size is rounded * up for the check (and the '+ 1' of arr_idx can be ignored in practice): * * arr_idx > limit" * ((old_size + 7) / 8)

label: code-design

22008. **comment:** * A few notes on the algorithm: ** - Terms are not allowed to begin with a period unless the term * is either '.' or '..'. This simplifies implementation (and * is within CommonJS modules specification). ** - There are few output bound checks here. This is on purpose: * the resolution input is length checked and the output is never * longer than the input. The resolved output is written directly * over the input because it's never longer than the input at any * point in the algorithm. ** - Non-ASCII characters are processed as individual bytes and * need no special treatment. However, U+0000 terminates the * algorithm; this is not an issue because U+0000 is not a * desirable term character anyway.

label: code-design

22009. * Utilities

22010. * Helpers ** The fast path checks are done within a macro to ensure "inlining" * while the slow path actions use a helper (which won't typically be * inlined in size optimized builds).

22011. **comment:** If the platform doesn't support the entire Ecmascript range, we need * to return 0 so that the caller can fall back to the default formatter. ** For now, assume that if time_t is 8 bytes or more, the whole Ecmascript * range is supported. For smaller time_t values (4 bytes in practice), * assumes that the signed 32-bit range is supported. ** XXX: detect this more correctly per platform. The size of time_t is * probably not an accurate guarantee of strftime() supporting or not * supporting a large time range (the full Ecmascript range).

label: code-design

22012. **comment:** XXX: now that pc2line is used by the debugger quite heavily in * checked execution, this should be optimized to avoid value stack * and perhaps also implement some form of pc2line caching (see * future work in debugger.rst).

label: code-design

22013. * Case clause. ** Note: cannot use reg_case as a temp register (for SEQ target) * because it may be a constant.

22014. **comment:** XXX: not sure what the correct semantic details are here, * e.g. handling of missing values (gaps), handling of non-array * trap results, etc. ** For keys, we simply skip non-string keys which seems to be * consistent with how e.g. Object.keys() will process proxy trap * results (ES6, Section 19.1.2.14).

label: code-design

22015. **comment:** XXX: 'copy properties' API call?

22028. Overestimate required size; debug code so not critical to be tight.

22029. **comment:** no special formatting

label: code-design

22030. proplist is very rare

22031. * Handling DUK_OP_ADD this way is more compact (experimentally) * than a separate case with separate argument decoding.

22032. currently processing messages or breakpoints: don't enter message processing recursively (e.g. no breakpoints when processing debugger eval)

22033. DUK_USE_JC

22034. function refers to 'arguments' identifier

22035. don't want an intermediate exposed state with invalid pc

22036. Use loop to minimize code size of relookup after bound function case

22037. 'Undefined'

22038. **comment:** * Variable already declared, ignore re-declaration. * The only exception is the updated behavior of E5.1 for * global function declarations, E5.1 Section 10.5, step 5.e. * This behavior does not apply to global variable declarations.

label: code-design

22039. **comment:** Avoid fake finalization for the duk_refcount_fake_finalizer function * itself, otherwise we're in infinite recursion.

label: code-design

22040. **comment:** Borrow is detected based on wrapping which relies on exact 32-bit * types.

label: code-design

22041. if abandon_array, new_a_size must be 0

22042. Parse enumeration target and initialize enumerator. For 'null' and 'undefined', * INITENUM will creates a 'null' enumerator which works like an empty enumerator * (E5 Section 12.6.4, step 3). Note that INITENUM requires the value to be in a * register (constant not allowed).

22043. pointer is aligned, guaranteed for fixed buffer

22044. See MPUTOBJ comments above.

22045. Pause on the next opcode executed. This is always safe to do even * inside the debugger message loop: the interrupt counter will be reset * to its proper value when the message loop exits.

22046. Ensure there is internal valstack spare before we exit; this may * throw an alloc error. The same guaranteed size must be available * as before the call. This is not optimal now: we store the valstack * allocated size during entry; this value may be higher than the * minimal guarantee for an application.

22047. \xffPc2line'

22048. **comment:** XXX: better coercion
label: code-design

22049. guaranteed to finish, as hash is never full

22050. shared flags for a subset of types

22051. nothing to incref

22052. The short string/integer initial bytes starting from 0x60 don't have * defines now.

22053. **comment:** XXX: use a helper for prototype traversal; no loop check here
label: code-design

22054. FunctionDeclaration: not strictly a statement but handled as such. * * O(depth^2) parse count for inner functions is handled by recording a * lexer offset on the first compilation pass, so that the function can * be efficiently skipped on the second pass. This is encapsulated into * duk_parse_func_like_fnum().

22055. unpack args

22056. hash lookup

22057. * Cleanup: restore original function, restore valstack state.

22058. don't touch property attributes or hash part

22059. Note: duk_uint8_t type yields larger code

22060. * The error object has been augmented with a traceback and other * info from its creation point -- usually another thread. The * error handler is called here right before throwing, but it also * runs in the resumer's thread. It might be nice to get a traceback * from the resumee but this is not the case now.

22061. Push function object, init flags etc. This must match * duk_js_push_closure() quite carefully.

22062. return arg as-is

22063. NULL accepted

22064. Lightfunc, not blamed now.

22065. 0 = no throw

22066. **comment:** XXX: macros
label: code-design

22067. Interrupt counter for triggering a slow path check for execution * timeout, debugger interaction such as breakpoints, etc. The value * is valid for the current running thread, and both the init and * counter values are copied whenever a thread switch occurs. It's * important for the counter to be conveniently accessible for the * bytecode executor inner loop for performance reasons.

22068. start value for current countdown

22069. maximum recursion depth for loop detection stacks

22070. us

22071. [... holder name val]

22072. Allow automatic detection of hex base ("0x" or "0X" prefix), * overrides radix argument and forces integer mode.

22073. * Init arguments properties, map, etc.

22074. **comment:** NUL terminator handling doesn't matter here
label: code-design

22075. **comment:** XXX: error handling is incomplete. It would be cleanest if * there was a setjmp catchpoint, so that all init code could * freely throw errors. If that were the case, the return code * passing here could be removed.

22774. keep key reachable for GC etc; guaranteed not to fail
22775. generate mantissa with a single leading whole number digit
22776. * Complex case conversion helper which decodes a bit-packed conversion * control stream generated by unicode/extract_caseconv.py. The conversion * is very slow because it runs through the conversion data in a linear * fashion to save space (which is why ASCII characters have a special * fast path before arriving here). * * The particular bit counts etc have been determined experimentally to * be small but still sufficient, and must match the Python script *(src/extract_caseconv.py). * * The return value is the case converted codepoint or -1 if the conversion * results in multiple characters (this is useful for regexp Canonicalization * operation). If 'buf' is not NULL, the result codepoint(s) are also * appended to the hbuffer. * * Context and locale specific rules must be checked before consulting * this function.
22777. Stored in duk_heapdr unused flags.
22778. **comment:** * Augmenting errors at their creation site and their throw site. * * When errors are created, traceback data is added by built-in code * and a user error handler (if defined) can process or replace the * error. Similarly, when errors are thrown, a user error handler * (if defined) can process or replace the error. * * Augmentation and other processing at error creation time is nice * because an error is only created once, but it may be thrown and * rethrown multiple times. User error handler registered for processing * an error at its throw site must be careful to handle rethrowing in * a useful manner. * * Error augmentation may throw an internal error (e.g. alloc error). * * Ecmascript allows throwing any values, so all values cannot be * augmented. Currently, the built-in augmentation at error creation * only augments error values which are Error instances (= have the * built-in Error.prototype in their prototype chain) and are also * extensible. User error handlers have no limitations in this respect.
label: code-design
22779. **comment:** * Emit initializers in sets of maximum max_init_values. * Corner cases such as single value initializers do not have * special handling now. * * Elided elements must not be emitted as 'undefined' values, * because such values would be enumerable (which is incorrect). * Also note that trailing elisions must be reflected in the * length of the final array but cause no elements to be actually * inserted.
label: code-design

22785. may have side effects
22786. increases key refcount
22787. on first round, skip
22788. **comment:** * Ecmascript specification algorithm and conversion helpers. * * These helpers encapsulate the primitive Ecmascript operation * semantics, and are used by the bytecode executor and the API * (among other places). Note that some primitives are only * implemented as part of the API and have no "internal" helper. * (This is the case when an internal helper would not really be * useful; e.g. the operation is rare, uses value stack heavily, * etc.) * * The operation arguments depend on what is required to implement * the operation: * * - If an operation is simple and stateless, and has no side * effects, it won't take an duk_hthread argument and its * arguments may be duk_tval pointers (which are safe as long * as no side effects take place). * * - If complex coercions are required (e.g. a "ToNumber" coercion) * or errors may be thrown, the operation takes an duk_hthread * argument. This also implies that the operation may have * arbitrary side effects, invalidating any duk_tval pointers. * * - For operations with potential side effects, arguments can be * taken in several ways: * * a) as duk_tval pointers, which makes sense if the "common case" * can be resolved without side effects (e.g. coercion); the * arguments are pushed to the valstack for coercion if * necessary * * b) as duk_tval values * * c) implicitly on value stack top * * d) as indices to the value stack * * Future work: * * - Argument styles may not be the most sensible in every case now. * * - In-place coercions might be useful for several operations, if * in-place coercion is OK for the bytecode executor and the API.
label: code-design
22789. Note: may be triggered even if minimal new_size would not reach the limit, * plan limit accordingly (taking DUK_VALSTACK_GROW_STEP into account).
22790. **comment:** A little tricky string approach to provide the flags string. * This depends on the specific flag values in duk_regex.h, * which needs to be asserted for. In practice this doesn't * produce more compact code than the easier approach in use.
label: code-design
22791. Note: intentionally use approximations to shave a few instructions: * a_used = old_used (accurate: old_used + 1) * a_size = arr_idx (accurate: arr_idx + 1)
22792. Slot C is used in a non-standard fashion (range of regs), * emitter code has special handling for it (must not set the * "no shuffle" flag).
22793. Note: if atom were to contain e.g. captures, we would need to * re-match the atom to get correct captures. Simply quantifiers * do not allow captures in their atom now, so this is not an issue.
22794. * Criteria for augmenting: * * - augmentation enabled in build (naturally) * - error value internal prototype chain contains the built-in * Error prototype object (i.e. 'val instanceof Error') * * - Additional criteria for built-in augmenting: * * - error value is an extensible object
22795. **comment:** XXX: solve into closed form (smaller code)

22796. * Check the function type, handle bound function chains, and prepare * parameters for the rest of the call handling. Also figure out the * effective 'this' binding, which replaces the current value at * idx_func + 1. * * If the target function is a 'bound' one, follow the chain of 'bound' * functions until a non-bound function is found. During this process, * bound arguments are 'prepended' to existing ones, and the "this" * binding is overridden. See E5 Section 15.3.4.5.1. * * If the final target function cannot be handled by an ecma-to-ecma * call, return to the caller with a return value indicating this case. * The bound chain is resolved and the caller can resume with a plain * function call.
22797. must be signed for loop structure
22798. is_extra
22799. **comment:** * Memory calls: relative to heap, GC interaction, but no error throwing. * * XXX: Currently a mark-and-sweep triggered by memory allocation will run * using the heap->heap_thread. This thread is also used for running * mark-and-sweep finalization; this is not ideal because it breaks the * isolation between multiple global environments. * * Notes: * * - DUK_FREE() is required to ignore NULL and any other possible return * value of a zero-sized alloc/realloc (same as ANSI C free()). * * - There is no DUK_REALLOC_ZEROED because we don't assume to know the * old size. Caller must zero the reallocated memory. * * - DUK_REALLOC_INDIRECT() must be used when a mark-and-sweep triggered * by an allocation failure might invalidate the original 'ptr', thus * causing a realloc retry to use an invalid pointer. Example: we're * reallocating the value stack and a finalizer resizes the same value * stack during mark-and-sweep. The indirect variant requests for the * current location of the pointer being reallocated using a callback * right before every realloc attempt; this circuitous approach is used * to avoid strict aliasing issues in a more straightforward indirect * pointer (void ***) approach. Note: the pointer in the storage * location is read but is NOT updated; the caller must do that.

23023. * Object's finalizer was executed on last round, and * object has been happily rescued.
23024. embed: 0 or 1 (false or true)
23025. Labels can be used for iteration statements but also for other statements, * in particular a label can be used for a block statement. All cases of a * named label accept a 'break' so that flag is set here. Iteration statements * also allow 'continue', so that flag is updated when we figure out the * statement type.
23026. string 2 of token (borrowed, stored to ctx->slot2_idx)
23027. UNARY EXPRESSIONS
23028. * Not found (even in global object). * * In non-strict mode this is a silent SUCCESS (!), see E5 Section 11.4.1, * step 3.b. In strict mode this case is a compile time SyntaxError so * we should not come here.
23029. should actually never happen, but check anyway
23030. input offset for window leading edge (not window[0])
23031. * Init object properties * * Properties should be added in decreasing order of access frequency. * (Not very critical for function templates.)
23032. [... fallback constructor fallback(this) arg1 ... argN]; * Note: idx_cons points to first 'fallback', not 'constructor'.
23033. **comment:** * Canonicalize a range, generating result ranges as necessary. * Needs to exhaustively scan the entire range (at most 65536 * code points). If 'direct' is set, caller (lexer) has ensured * that the range is already canonicalization compatible (this * is used to avoid unnecessary canonicalization of built-in * ranges like \W, which are not affected by canonicalization). * * NOTE: here is one place where we don't want to support chars * outside the BMP, because the exhaustive search would be * massively larger.
 label: code-design
23034. continuation byte
23035. Note: the realloc may have triggered a mark-and-sweep which may * have resized our valstack internally. However, the mark-and-sweep * MUST NOT leave the stack bottom/top in a different state. Particular * assumptions and facts: * * - The thr->valstack pointer may be different after realloc, * and the offset between thr->valstack_end <-> thr->valstack * may have changed. * - The offset between thr->valstack_bottom <-> thr->valstack * and thr->valstack_top <-> thr->valstack MUST NOT have changed, * because mark-and-sweep must adhere to a strict stack policy. * In other words, logical bottom and top MUST NOT have changed. * - All values above the top are unreachable but are initialized * to UNDEFINED, up to the post-realloc valstack_end. * - 'old_end_offset' must be computed after realloc to be correct.
23036. Note: hstring is in heap but has refcount zero and is not strongly reachable. * Caller should increase refcount and make the hstring reachable before any * operations which require allocation (and possible gc).
23037. **comment:** * "name" is a non-standard property found in at least V8, Rhino, smjs. * For Rhino and smjs it is non-writable, non-enumerable, and non-configurable; * for V8 it is writable, non-enumerable, non-configurable. It is also defined * for an anonymous function expression in which case the value is an empty string. * We could also leave name 'undefined' for anonymous functions but that would * differ from behavior of other engines, so use an empty string. * * XXX: make optional? costs something per function.
 label: code-design
23038. **comment:** * duk_hbuffer operations such as resizing and inserting/appending data to * a dynamic buffer. * * Append operations append to the end of the buffer and they are relatively * efficient: the buffer is grown with a "spare" part relative to the buffer * size to minimize reallocations. Insert operations need to move existing * data forward in the buffer with memmove() and are not very efficient. * They are used e.g. by the regexp compiler to "backpatch" regexp bytecode.

23223. **comment:** code emission temporary
label: code-design

23224. * TypedArray.prototype.set() ** TypedArray set() is pretty interesting to implement because: ** - The source argument may be a plain array or a typedarray. If the * source is a TypedArray, values are decoded and re-encoded into the * target (not as a plain byte copy). This may happen even when the * element byte size is the same, e.g. integer values may be re-encoded * into floats. ** - Source and target may refer to the same underlying buffer, so that * the set() operation may overlap. The specification requires that this * must work as if a copy was made before the operation. Note that this * is NOT a simple memmove() situation because the source and target * byte sizes may be different -- e.g. a 4-byte source (Int8Array) may * expand to a 16-byte target (Uint32Array) so that the target overlaps * the source both from beginning and the end (unlike in typical memmove). ** - Even if 'buf' pointers of the source and target differ, there's no * guarantee that their memory areas don't overlap. This may be the * case with external buffers. ** Even so, it is nice to optimize for the common case: ** - Source and target separate buffers or non-overlapping. ** - Source and target have a compatible type so that a plain byte copy * is possible. Note that while e.g. uint8 and int8 are compatible * (coercion one way or another doesn't change the byte representation), * e.g. int8 and uint8clamped are NOT compatible when writing int8 * values into uint8clamped typedarray (-1 would clamp to 0 for instance). ** See test-bi-typedarray-proto-set.js.

23225. (quotient-remainder (* r B) s) using a dummy subtraction loop

23226. Note: either pointer may be NULL (at entry), so don't assert

23227. String-number-buffer/object -> coerce object to primitive (apparently without hint), then try again.

23228. * Property handling ** The API exposes only the most common property handling functions. * The caller can invoke Ecmascript built-ins for full control (e.g. * defineProperty, getOwnPropertyDescriptor).

23229. Format of magic, bits: * 0...1: elem size shift (0-3) * 2...5: elem type (DUK_HBUFFEROBJECT_ELEM_xxx)

23230. **comment:** Slow gathering of value using either 64-bit arithmetic * or IEEE doubles if 64-bit types not available. Handling * of negative numbers is a bit non-obvious in both cases.
label: code-design

23231. Built-in 'name' is not writable by default. Function '.name' * is writable to allow user code to set a '.name' on a native * function.

23232. reuse last emitted atom for remaining 'infinite' quantifier

23233. TypeError if rval is not an object (or lightfunc which should behave * like a Function instance).

23234. * Dragon4 slow path digit generation.

23235. Rule control flags.

23236. USE_PROP_HASH_PART

23237. don't compact objects; needed during object property allocation resize

23238. r <- (remainder (* r B) s)

23239. [... error arr]

23240. String is an own (virtual) property of a lightfunc.

23241. 16: getHours

23242. 'debugger'

23243. * String manipulation

23244. fmod() return value has same sign as input (negative) so * the result here will be in the range]-2,0], 1 indicates * odd. If x is -Infinity, NaN is returned and the odd check * always concludes "not odd" which results in desired outcome.

23245. DUK_USE_DEBUGGER_INSPECT

23246. Lookup 'key' from arguments internal 'map', perform a variable write if mapped. * Used in E5 Section 10.6 algorithm for [[DefineOwnProperty]] (used by [[Put]]). * Assumes stack top contains 'put' value (which is NOT popped).

23247. * Macro for object validity check ** Assert for currently guaranteed relations between flags, for instance.

23248. **comment:** Process debug messages until we are no longer paused.

label: code-design

23362. periods

23363. idx of first argument on stack

23364. Add trailer if: * a) non-empty input * b) empty input and no (zero size) match found (step 11)

23365. check stack first

23366. mod_id may be NULL

23367. http://en.wikipedia.org/wiki/ANSI_escape_code

23368. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway

23369. DUK_TOK_SET

23370. * Lookup variable and update in-place if found.

23371. 'Int8Array'

23372. Last component name in resolved path

23373. Must match src/extract_chars.py, generate_match_table3().

23374. Resize target buffer for requested size. Called by the macro only when the * fast path test (= there is space) fails.

23375. Ready to make the copy. We must proceed element by element * and must avoid any side effects that might cause the buffer * validity check above to become invalid. * * Although we work through the value stack here, only plain * numbers are handled which should be side effect safe.

23376. **comment:** * Compared to a direct macro expansion this wrapper saves a few * instructions because no heap dereferencing is required.
label: code-design

23377. Force pause if we were doing "step into" in another activation.

23378. allow fmt==NULL

23379. **comment:** * Reallocate property allocation, moving properties to the new allocation. * * Includes key compaction, rehashing, and can also optionally abandoning * the array part, 'migrating' array entries into the beginning of the * new entry part. Arguments are not validated here, so e.g. new_h_size * MUST be a valid prime. * * There is no support for in-place reallocation or just compacting keys * without resizing the property allocation. This is intentional to keep * code size minimal. * * The implementation is relatively straightforward, except for the array * abandonment process. Array abandonment requires that new string keys * are interned, which may trigger GC. All keys interned so far must be * reachable for GC at all times; valstack is used for that now. * * Also, a GC triggered during this reallocation process must not interfere * with the object being resized. This is currently controlled by using * heap->mark_and_sweep_base_flags to indicate that no finalizers will be * executed (as they can affect ANY object) and no objects are compacted * (it would suffice to protect this particular object only, though). * * Note: a non-checked variant would be nice but is a bit tricky to * implement for the array abandonment process. It's easy for * everything else. * * Note: because we need to potentially resize the valstack (as part * of abandoning the array part), any tval pointers to the valstack * will become invalid after this call.

23480. Exponent handling: if exponent format is used, record exponent value and * fake k such that one leading digit is generated (e.g. digits=123 -> "1.23"). * * toFixed() prevents exponent use; otherwise apply a set of criteria to * match the other API calls (toString(), toPrecision, etc).

23481. **comment:** We want the argument expression value to go to "next temp" * without additional moves. That should almost always be the * case, but we double check after expression parsing. ** This is not the cleanest possible approach.

label: code-design

23482. seconds, doesn't fit into 16 bits

23483. unreferenced w/o tracebacks

23484. We want to avoid making a copy to process set() but that's * not always possible: the source and the target may overlap * and because element sizes are different, the overlap cannot * always be handled with a memmove() or choosing the copy * direction in a certain way. For example, if source type is * uint8 and target type is uint32, the target area may exceed * the source area from both ends! ** Note that because external buffers may point to the same * memory areas, we must ultimately make this check using * pointers. ** NOTE: careful with side effects: any side effect may cause * a buffer resize (or external buffer pointer/length update)!

23485. **comment:** NEXTENUM needs a jump slot right after the main instruction. * When the JUMP is taken, output spilling is not needed so this * workaround is possible. The jump slot PC is exceptionally * plumbed through comp_ctx to minimize call sites.

label: code-design

23486. must be updated to work properly (e.g. creation of 'arguments')

23487. Unescaped '/' ANYWHERE in the regexp (in disjunction, * inside a character class, ...) => same escape works.

23488. 1:1 or special conversions, but not locale/context specific: script generated rules

23489. roughly 0.5 kB

23490. * Value stack resize and stack top adjustment helper. ** XXX: This should all be merged to duk_valstack_resize_raw().

23491. **comment:** * Macro support functions for reading/writing raw data. ** These are done using mempcy to ensure they're valid even for unaligned * reads/writes on platforms where alignment counts. On x86 at least gcc * is able to compile these into a bswap+mov. "Always inline" is used to * ensure these macros compile to minimal code. ** Not really bufwriter related, but currently used together.

label: code-design

23492. If tracebacks are enabled, the '_Tracedata' property is the only * thing we need: 'fileName' and 'lineNumber' are virtual properties * which use '_Tracedata'.

23493. **comment:** XXX: could duk_is_undefined() provide defaulting undefined to 'len' * (the upper limit)?

label: code-design

23494. DUK_TOK_WITH

23495. 0xa0-0xaf

23496. * Table for base-64 decoding

23497. **comment:** XXX: duk_xdef_prop_index_wec() would be more appropriate * here but it currently makes some assumptions that might * not hold (e.g. that previous property is not an accessor).

label: code-design

23498. [... buf]

23499. * Regexp compilation. ** See doc/regexp.rst for a discussion of the compilation approach and * current limitations. ** Regexp bytecode assumes jumps can be expressed with signed 32-bit * integers. Consequently the bytecode size must not exceed 0x7fffffffL. * The implementation casts duk_size_t (buffer size) to duk_(u)int32_t * in many places. Although this could be changed, the bytecode format * limit would still prevent regexps exceeding the signed 32-bit limit * from working. ** XXX: The implementation does not prevent bytecode from exceeding the * maximum supported size. This could be done by limiting the maximum * input string size (assuming an upper bound can be computed for number * of bytecode bytes emitted per input byte) or checking buffer maximum * size when emitting bytecode (slower).

23500. Production allows 'DecimalDigits', including leading zeroes

23501. Note: must coerce to a (writable) temp register, so that e.g. "!x" where x * is a reg-mapped variable works correctly (does not mutate the variable register).

23502. [] -> []

23503. key

23504. * Exception for Duktape internal throws when C++ exceptions are used * for long control transfers. ** Doesn't inherit from any exception base class to minimize the chance * that user code would accidentally catch this exception.

23505. -> [array totalLength buf]
23506. Maximum prototype traversal depth. Sanity limit which handles e.g. * prototype loops (even complex ones like 1->2->3->4->2->3->4).
23507. is valid size
23508. [O Properties obj]
23509. extra coercion of strings is OK
23510. **comment:** XXX: increase ctx->expr_tokens here for every consumed token * (this would be a nice statistic)?
 label: code-design
23511. FAIL
23512. Two digit octal escape, digits validated. * * The if-condition is a bit tricky. We could catch e.g. * '\039' in the three-digit escape and fail it there (by * validating the digits), but we want to avoid extra * additional validation code.
23513. For n == 0, Node.js ignores totalLength argument and * returns a zero length buffer.
23514. * Push result object and init its flags
23515. number of continuation (non-initial) bytes in [0x80,0xbf]
23516. External buffer with 'curr_alloc' managed by user code and pointing to an * arbitrary address. When heap pointer compression is not used, this struct * has the same layout as duk_hbuffer_dynamic.
23517. **comment:** Note: we can reuse 'desc' here
 label: code-design
23518. empty statement with an explicit semicolon
23519. * Constructor
23520. * Array exotic behaviors can be implemented at this point. The local variables * are essentially a 'value copy' of the input descriptor (Desc), which is modified * by the Array [[DefineOwnProperty]] (E5 Section 15.4.5.1).
23521. * Expression parsing. * * Upon entry to 'expr' and its variants, 'curr_tok' is assumed to be the * first token of the expression. Upon exit, 'curr_tok' will be the first * token not part of the expression (e.g. semicolon terminating an expression * statement).
23522. The index range space is conceptually the array part followed by the * entry part. Unlike normal enumeration all slots are exposed here as * is and return 'unused' if the slots are not in active use. In particular * the array part is included for the full a_size regardless of what the * array .length is.
23523. * toString()
23524. shuffle registers if large number of regs/consts
23525. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8
23526. **comment:** XXX: add support for variables to not be register bound always, to * handle cases with a very large number of variables?
 label: code-design
23527. entry_top + 2
23528. [result]
23529. * Determine call type, then finalize activation, shift to * new value stack bottom, and call the target.
23530. [source]
23531. * Arguments object creation. * * Creating arguments objects involves many small details, see E5 Section * 10.6 for the specific requirements. Much of the arguments object exotic * behavior is implemented in duk_hobject_props.c, and is enabled by the * object flag DUK_HOBJECT_FLAG_EXOTIC_ARGUMENTS.
23532. **comment:** XXX: space in valstack? see discussion in duk_handle_call_xxx().
 label: code-design
23533. combines steps 2 and 5; -len ensures max() not needed for step 5
23534. for register-bound and declarative env identifiers
23535. bound functions are never in act 'func'
23536. Lightfuncs cannot be bound.
23537. **comment:** The resulting buffer object gets the same class and prototype as * the buffer in 'this', e.g. if the input is a Node.js Buffer the * result is a Node.js Buffer; if the input is a Float32Array, the * result is a Float32Array. * * For the class number this seems correct. The internal prototype * is not so clear: if 'this' is a bufferobject with a non-standard * prototype object, that value gets copied over into the result * (instead of using the standard prototype for that object type).
 label: code-design
23538. Don't allow mixed padding and actual chars.
23539. reject RegExp literal on next advance() call; needed for handling IdentifierName productions
23540. DUK_TOK_CONTINUE
23541. unbalanced stack on purpose
23542. arguments MUST have an initialized lexical environment reference
23543. **comment:** XXX: sanitize to printable (and maybe ASCII)
 label: code-design
23544. tags
23545. regexp compiler should catch these
23546. **comment:** Current 'this' binding is the value just below idx_bottom. * Previously, 'this' binding was handled with an index to the * (calling) valstack. This works for everything except tail * calls, which must not "cumulate" valstack temps.
 label: code-design
23547. * ctx->prev_token token to process with duk__expr_nud() * ctx->curr_token updated by caller * * Note: the token in the switch below has already been eaten.
23548. -> [... voidp true]
23549. The E5.1 specification does not seem to allow IdentifierPart characters * to be used as identity escapes. Unfortunately this includes '\$', which * cannot be escaped as '\$'; it needs to be escaped e.g. as '\u0024'. * Many other implementations (including V8 and Rhino, for instance) do * accept '\$' as a valid identity escape, which is quite pragmatic. * See: test-regexp-identity-escape-dollar.js.
23550. mp <- b/(e+1)
23551. * Debugger handling for executor restart * * Check for breakpoints, stepping, etc, and figure out if we should execute * in checked or normal mode. Note that we can't do this when an activation * is created, because breakpoint status (and stepping status) may change * later, so we must recheck every time we're executing an activation. * This primitive should be side effect free to avoid changes during check.
23552. at most sizeof(buf) - 1
23553. val
23554. Old solution: don't iterate, incorrect
23555. * API calls related to general value stack manipulation: resizing the value * stack, pushing and popping values, type checking and reading values, * coercing values, etc. * * Also contains internal functions (such as duk_get_tval()), defined * in duk_api_internal.h, with semantics similar to the public API.
23556. No BC shuffling now.
23557. syntactically left-associative but parsed as right-associative
23558. * Local result type for duk_get_identifier_reference() lookup.
23559. **comment:** XXX: would be nice to enumerate an object at specified index
 label: code-design
23560. ''
23561. * Heap stringtable handling, string interning.
23562. By default the global object is read-only which is often much * more of an issue than having read-only built-in objects (like * RegExp, Date, etc). Use a RAM-based copy of the global object * and the global environment object for convenience.
23563. Creation time error augmentation
23564. The casts through duk_intr_pt is to avoid the following GCC warning: * * warning: cast from pointer to integer of different size [-Wpointer-to-int-cast] * * This still generates a /Wp64 warning on VS2010 when compiling for x86.
23565. **comment:** * Note: currently register bindings must be fixed for the entire * function. So, even though the catch variable is in a register * we know, we must use an explicit environment record and slow path * accesses to read/write the catch binding to make closures created * within the catch clause work correctly. This

restriction should * be fixable (at least in common cases) later. ** See: test-bug-catch-binding-2.js. ** XXX: improve to get fast path access to most catch clauses.

label: code-design

23566. check that byte has the form 10xx xxxx

23567. * Memory constants

23568. return 'res' (of right part) as our result

23569. -> [func funcname env]

23570. this variant is used when an assert would generate a compile warning by * being always true (e.g. ≥ 0 comparison for an unsigned value

23571. Stringcache is used for speeding up char-offset-to-byte-offset * translations for non-ASCII strings.

23572. **comment:** Note: strictness is *not* inherited from the current Duktape/C. * This would be confusing because the current strictness state * depends on whether we're running inside a Duktape/C activation * (= strict mode) or outside of any activation (= non-strict mode). * See tests/api/test-eval-strictness.c for more discussion.

label: code-design

23573. * Finalizer check. * * Note: running a finalizer may have arbitrary side effects, e.g. * queue more objects on refzero_list (tail), or even trigger a * mark-and-sweep.

* * Note: quick reject check should match vast majority of * objects and must be safe (not throw any errors, ever).

23574. Get Proxy target object. If the argument is not a Proxy, return it as is. * If a Proxy is revoked, an error is thrown.

23575. * Assertion helpers.

23576. is_setget

23577. * Compute new alloc size and alloc new area. * * The new area is allocated as a dynamic buffer and placed into the * valstack for reachability. The actual buffer is then detached at * the end. * * Note: heap_mark_and_sweep_base_flags are altered here to ensure * no-one touches this object while we're resizing and rehashing it. * The flags must be reset on every exit path after it. Finalizers * and compaction is prevented currently for all objects while it * would be enough to restrict it only for the current object.

23578. replacer function

23579. [...]

23720. * Preliminaries
23721. count is already incremented, take into account
23722. **comment:** * Setters. * * Setters are a bit more complicated than getters. Component setters * break down the current time value into its (normalized) component * parts, replace one or more components with -unnormalized- new values, * and the components are then converted back into a time value. As an * example of using unnormalized values: * * var d = new Date(1234567890); * * is equivalent to: * * var d = new Date(0); * d.setUTCSeconds(1234567890); * * A shared native helper to provide almost all setters. Magic value * contains a set of flags and also packs the "maxnargs" argument. The * helper provides: * * setMilliseconds() * setUTCSeconds() * setUTCMinutes() * setHours() * setUTCHours() * setDate() * setUTCDate() * setMonth() * setUTCMonth() * setFullYear() * setUTCFullYear() * setYear() * * Notes: * * - Date.prototype.setYear() (Section B addition): special year check * is omitted. NaN / Infinity will just flow through and ultimately * result in a NaN internal time value. * * - Date.prototype.setYear() does not have optional arguments for * setting month and day-in-month (like setFullYear()), but we indicate * 'maxnargs' to be 3 to get the year written to the correct component * index in duk__set_part_helper(). The function has nargs == 1, so only * the year will be set regardless of actual argument count.

23724. DUK_USE_JX && DUK_USE_JC
23725. **comment:** XXX: ideally this would be just one flag (maybe a derived one) so * that a single bit test is sufficient to check the condition.
label: test
23726. [key] (coerced)
23727. **comment:** XXX: no optimized variants yet
label: requirement
23728. Encode a double (checked by caller) from stack top. Stack top may be * replaced by serialized string but is not popped (caller does that).
23729. This function is only called for objects with array exotic behavior. * The [[DefineOwnProperty]] algorithm for arrays requires that * 'length' can never have a value outside the unsigned 32-bit range, * attempt to write such a value is a RangeError. Here we can thus * assert for this. When Duktape internals go around the official * property write interface (doesn't happen often) this assumption is * easy to accidentally break, so such code must be written carefully. * See test-bi-array-push-maxlen.js.
23730. **comment:** DUK__ADVANCECHARS(lex_ctx, 2) would be correct here, but it unnecessary
label: code-design
23731. 'base64'
23732. [sep ToObject(this) len sep]
23733. **comment:** * Various sanity checks for typing
label: code-design
23734. Check whether statement list ends.
23735. invalidates tv1, tv2
23736. Note: MUST NOT wipe_and_return here, as heap->lj must remain intact
23737. -> sets 'f' and 'e'
23738. Check for maximum string length
23739. * Parse an individual source element (top level statement) or a statement. ** Handles labeled statements automatically (peeling away labels before * parsing an expression that follows the label(s)). ** Upon entry, 'curr Tok' contains the first token of the statement (parsed * in "allow regexp literal" mode). Upon exit, 'curr Tok' contains the first * token following the statement (if the statement has a terminator, this is * the token after the terminator).
23740. **comment:** loop_stack_index could be perhaps be replaced by 'depth', but it's nice * to not couple these two mechanisms unnecessarily.
label: code-design
23741. * Fast path for defining array indexed values without interning the key. * This is used by e.g. code for Array prototype and traceback creation so * must avoid interning.

23993. now expected to fit into a 32-bit integer

23994. Duktape.modSearch(resolved_id, fresh_require, exports, module).

23995. bits 0...1: shift

23996. Architecture, OS, and compiler strings

23997. overflow

23998. must fit into duk_small_int_t

23999. 'continue'

24000. 'value'

24001. Non-critical.

24002. **comment:** XXX: tail call: return duk_push_false(ctx)

label: code-design

24003. **comment:** * Sweep garbage and remove marking flags, and move objects with * finalizers to the finalizer work list. ** Objects to be swept need to get their refcounts finalized before * they are swept. In other words, their target object refcounts * need to be decreased. This has to be done before freeing any * objects to avoid dereferencing dangling pointers (which may happen * even without bugs, e.g. with reference loops) ** Because strings don't point to other heap objects, similar * finalization is not necessary for strings.

label: code-design

24004. Note: target registers a and a+1 may overlap with DUK_REGCONSTP(b) * and DUK_REGCONSTP(c). Careful here.

24005. DUK_USE_DATE_NOW_GETTIMEofday

24006. **comment:** XXX: what's the safest way of creating a negative zero?

label: code-design

24007. **comment:** XXX: several nice-to-have improvements here: * - Use direct reads avoiding value stack operations * - Avoid triggering getters, indicate getter values to debug client * - If side effects are possible, add error catching

label: code-design

24008. ptr may be NULL

24009. E5 Sections 15.10.2.8, 7.3

24010. Target must be stored so that we can recheck whether or not * keys still exist when we enumerate. This is not done if the * enumeration result comes from a proxy trap as there is no * real object to check against.

24011. * Note: currently no fast path for array index writes. * They won't be possible anyway as strings are immutable.

24012. Important to do a fastint check so that constants are * properly read back as fastints.

24013. remove artificial bump

24014. important to use normalized NaN with 8-byte tagged types

24015. Only objects in heap_allocated may have finalizers. Check that * the object itself has a _Finalizer property (own or inherited) * so that we don't execute finalizers for e.g. Proxy objects.

24016. crossed offsets or zero size

24017. [... escaped_source bytecode]

24018. * E5 Section 11.4.8

24019. * Manipulate valstack so that args are on the current bottom and the * previous caller's 'this' binding (which is the value preceding the * current bottom) is replaced with the new 'this' binding: ** [... this_old | (crud) func this_new arg1 ... argN] * --> [... this_new | arg1 ... argN] ** For tail calling to work properly, the valstack bottom must not grow * here; otherwise crud would accumulate on the valstack.

24020. * ToInteger() (E5 Section 9.4)

24021. invalidates tv

24022. * Fatal error * * There are no fatal error macros at the moment. There are so few call * sites that the fatal error handler is called directly.

24023. num_stack_args
24024. property is virtual: used in duk_propdesc, never stored * (used by e.g. buffer virtual properties)
24025. '\xffVarmap'
24026. Compute (extended) utf-8 length without codepoint encoding validation, * used for string interning. ** NOTE: This algorithm is performance critical, more so than string hashing * in some cases. It is needed when interning a string and needs to scan * every byte of the string with no skipping. Having an ASCII fast path * is useful if possible in the algorithm. The current algorithms were * chosen from several variants, based on x64 gcc -O2 testing. See: * <https://github.com/svaarala/duktape/pull/422> ** NOTE: must match src/dukutil.py:duk_unicode_unvalidated_utf8_length().
24027. Only allow Duktape.Buffer when support disabled.
24028. * Digit generation loop. ** Different termination conditions: * * 1. Free format output. Terminate when shortest accurate * representation found. * * 2. Fixed format output, with specific number of digits. * Ignore termination conditions, terminate when digits * generated. Caller requests an extra digit and rounds. * * 3. Fixed format output, with a specific absolute cut-off * position (e.g. 10 digits after decimal point). Note * that we always generate at least one digit, even if * the digit is below the cut-off point already.
24029. number of digits changed
24030. **comment:** re-lookup to update curr.flags * XXX: would be faster to update directly
 label: code-design
24031. * Heap Buffer object representation. Used for all Buffer variants.
24032. **comment:** Note: reuse variables
 label: code-design
24033. _Varmap
24034. = 1 + arg count
24035. * Tables generated with src/gennumdigits.py. ** duk__str2num_digits_for_radix indicates, for each radix, how many input * digits should be considered significant for string-to-number conversion. * The input is also padded to this many digits to give the Dragon4 * conversion enough (apparent) precision to work with. ** duk__str2num_exp_limits indicates, for each radix, the radix-specific * minimum/maximum exponent values (for a Dragon4 integer mantissa) * below and above which the number is guaranteed to underflow to zero * or overflow to Infinity. This allows parsing to keep bigint values * bounded.
24036. 'case'
24037. num_pairs and temp_start reset at top of outer loop
24038. Because size > 0, NULL check is correct
24039. 17: getUTCHours
24040. [... enum] -> [... next_key]
24041. if density < L, abandon array part, L = 3-bit fixed point, e.g. 2 -> 2/8 = 25%
24042. Encode to CESU-8; 'out' must have space for at least * DUK_UNICODE_MAX_CESU8_LENGTH bytes; codepoints above U+10FFFF * will encode to garbage but won't overwrite the output buffer.
24043. * Finalize stack
24044. Only a reg fits into 'A' so coerce 'res' into a register * for PUTVAR. ** XXX: here the current A/B/C split is suboptimal: we could * just use 9 bits for reg_res (and support constants) and 17 * instead of 18 bits for the varname const index.
24045. * Helper for setting up var_env and lex_env of an activation, * assuming it does NOT have the DUK_HOBJECT_FLAG_NEWENV flag.
24046. no need for 'caller' post-check, because 'key' must be an array index
24047. [arg undefined]
24048. "
24049. * String-to-number conversion
24050. We can't shortcut zero here if it goes through special formatting * (such as forced exponential notation).
24051. 0x10...0x1f
24052. Main operation
24053. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8CLAMPED * Note: INT8 is -not- copy compatible, e.g. -1 would coerce to 0x00.
24054. invalidated
24055. DUK_USE_CPP_EXCEPTIONS
24056. max(incl)
24057. * Arguments objects have exotic [[DefineOwnProperty]] which updates * the internal 'map' of arguments for writes to currently mapped * arguments. More concretely, writes to mapped arguments generate * a write to a bound variable. ** The [[Put]] algorithm invokes [[DefineOwnProperty]] for existing * data properties and new properties, but not for existing accessors. * Hence, in E5 Section 10.6 ([[DefinedOwnProperty]] algorithm), we * have a Desc with 'Value' (and possibly other properties too), and * we end up in step 5.b.i.
24058. A top-level assignment is e.g. "x = y;". For these it's safe * to use the RHS as-is as the expression value, even if the RHS * is a reg-bound identifier. The RHS ('res') is right associative * so it has consumed all other assignment level operations; the * only relevant lower binding power construct is comma operator * which will ignore the expression value provided here. Usually * the top level assignment expression value is ignored, but it * is relevant for e.g. eval code.
24059. **comment:** XXX: use helper for size optimization
 label: code-design
24060. 'ignoreCase'
24061. Note: env_thr != thr is quite possible and normal, so careful * with what thread is used for valstack lookup.
24062. frozen and sealed
24063. tv -> value just before prev top value; must relookup
24064. * Found existing inherited plain property. * Do an access control check, and if OK, write * new property to 'orig'.
24065. initial estimate for ASCII only codepoints
24066. Parser separator masks.
24067. just in case callback is broken and won't write 'x'
24068. **comment:** NEXTENUM needs a jump slot right after the main opcode. * We need the code emitter to reserve the slot: if there's * target shuffling, the target shuffle opcodes must happen * after the jump slot (for NEXTENUM the shuffle opcodes are * not needed if the enum is finished).
 label: code-design
24069. then to a register
24070. retval to result[i]
24071. Sanity limit on max number of properties (allocated, not necessarily used). * This is somewhat arbitrary, but if we're close to 2**32 properties some * algorithms will fail (e.g. hash size selection, next prime selection). * Also, we use negative array/entry table indices to indicate 'not found', * so anything above 0x80000000 will cause trouble now.
24072. expect EOF instead of {
24073. resizing parameters
24074. value from target
24075. this is especially critical to avoid another write call in detach1()
24076. **comment:** Stripping the filename might be a good idea * ("foo/bar/quux.js" -> logger name "quux"), * but now used verbatim.
 label: code-design
24077. return the argument object
24078. new buffer of specified size
24079. * Conversion helpers
24080. %x; only 16 bits are guaranteed
24081. mix-in value for computing string hashes; should be reasonably unpredictable
24082. 'debug'
24083. keep default instance
24084. Make buffer compact, matching current written size.
24085. explicit semi follows
24086. * Packed 8-byte representation

24087. **comment:** XXX: currently no handling for non-allowed identifier characters, * e.g. a '{' in the function name.
label: code-design
24088. No support for lvalues returned from new or function call expressions. * However, these must NOT cause compile-time SyntaxErrors, but run-time * ReferenceErrors. Both left and right sides of the assignment must be * evaluated before throwing a ReferenceError. For instance: ** f() = g(); ** must result in f() being evaluated, then g() being evaluated, and * finally, a ReferenceError being thrown. See E5 Section 11.13.1.
24089. **comment:** XXX: awkward helpers
label: code-design
24090. advance, expecting current token to be a specific token; parse next token in regexp context
24091. stack prepped for func call: [... trap handler]
24092. '{"_nan":true}'
24093. tagged null pointers should never occur
24094. * Heap header definition and assorted macros, including ref counting. * Access all fields through the accessor macros.
24095. * Finally, longjmp
24096. e.g. DUK_OP_POSTINCP
24097. Allow leading minus sign
24098. copy to buffer with spare to avoid Valgrind gripes from strftime
24099. throw
24100. 4: toLocaleDateString
24101. eat 'with'
24102. [... this func]
24103. setters
24104. step 4.c
24105. Note: cannot assume that a non-zero return value of signbit() would * always be the same -- hence cannot (portably) use something like: ** signbit(x) == signbit(y)
24106. check func supports [[HasInstance]] (this is checked for every function * in the bound chain, including the final one)
24107. There is no need to NUL delimit the sscanf() call: trailing garbage is * ignored and there is always a NUL terminator which will force an error * if no error is encountered before it. It's possible that the scan * would scan further than between [js_ctx->p,p[though and we'd advance * by less than the scanned value. * * Because pointers are platform specific, a failure to scan a pointer * results in a null pointer which is a better placeholder than a missing * value or an error.
24108. **comment:** XXX: relocate
label: code-design
24109. match fail
24110. * Make a value copy of the input val. This ensures that * side effects cannot invalidate the pointer.
24111. DUK_USE_DATE_TZO_GMTIME
24112. Treat like debugger statement: nop
24113. Get valstack index for the func argument or throw if insane stack.
24114. **comment:** 'd3' is never NaN, so no need to normalize
label: code-design
24115. XXX: push_uint_string / push_u32_string
24116. return value from Duktape.Thread.resume()
24117. For the case n==1 Node.js doesn't seem to type check * the sole member but we do it before returning it. * For this case only the original buffer object is * returned (not a copy).
24118. end of loop (careful with len==0)
24119. Result is always fastint compatible.
24120. Handle a BREAK/CONTINUE opcode. Avoid using longjmp() for BREAK/CONTINUE * handling because it has a measurable performance impact in ordinary * environments and an extreme impact in Emscripten (GH-342).
24121. DUK_TOK_TRY
24122. Optional UTC conversion.
24123. 6
24124. [requested_id require require.id resolved_id last_comp Duktape Duktape.modLoaded undefined fresh_require exports module]
24125. * Self test main
24126. prototype is lex_env before catcher created
24127. ToInteger() coercion; NaN -> 0, infinities are clamped to 0 and 10
24128. Keep throwing an error whenever we get here. The unusual values * are set this way because no instruction is ever executed, we just * throw an error until all try/catch/finally and other catchpoints * have been exhausted. Duktape/C code gets control at each protected * call but whenever it enters back into Duktape the RangeError gets * raised. User exec timeout check must consistently indicate a timeout * until we've fully bubbled out of Duktape.
24129. tc1 = true, tc2 = false
24130. no need to handle thread state book-keeping here
24131. Not found. Empty string case is handled specially above.
24132. 4 low bits
24133. **comment:** XXX: option to pretend property doesn't exist if sanity limit is * hit might be useful.
label: code-design
24134. Use explicit steps in computation to try to ensure that * computation happens with intermediate results coerced to * double values (instead of using something more accurate). * E.g. E5.1 Section 15.9.1.11 requires use of IEEE 754 * rules (= EcmaScript '+' and '*' operators). * * Without 'volatile' even this approach fails on some platform * and compiler combinations. For instance, gcc 4.8.1 on Ubuntu * 64-bit, with -m32 and without -std=c99, test-bi-date-canceling.js * would fail because of some optimizations when computing tmp_time * (MakeTime below). Adding 'volatile' to tmp_time solved this * particular problem (annoyingly, also adding debug prints or * running the executable under valgrind hides it).
24135. **comment:** Smaller heaphdr than for other objects, because strings are held * in string intern table which requires no link pointers. Much of * the 32-bit flags field is unused by flags, so we can stuff a 16-bit * field in there.
label: code-design
24136. **comment:** Delete semantics are a bit tricky. The description in E5 specification * is kind of confusing, because it distinguishes between resolvability of * a reference (which is only known at runtime) seemingly at compile time * (= SyntaxError throwing).
label: code-design
24137. [... enum] -> [...]
24138. * Augment an error being created using Duktape specific properties * like _Tracedata or .fileName/.lineNumber.
24139. misc constants and helper macros
24140. zero-based day
24141. 28: setMinutes
24142. non-object base, no offending virtual property
24143. Fixed seed value used with ROM strings.
24144. duk_parse_stmts() expects curr_tok to be set; parse in "allow regexp literal" mode with current strictness
24145. E5 Sections 11.8.1, 11.8.5; x < y
24146. may be < thr->catchstack initially
24147. complex, multicharacter conversion
24148. Not enough data to provide a full window, so "scroll" window to * start of buffer and fill up the rest.
24149. E5.1 Section 15.1.3.1: uriReserved + '#'
24150. **comment:** XXX: should there be an error or an automatic detach if * already attached?
label: code-design

24151. For user code this could just return 1 (strict) always * because all Duktape/C functions are considered strict, * and strict is also the default when nothing is running.
* However, Duktape may call this function internally when * the current activation is an Ecmascript function, so * this cannot be replaced by a 'return 1' without fixing * the internal call sites.

24152. "" was eaten by caller

24153. expression is left-hand-side compatible

24154. string is a reserved word (strict)

24155. **comment:** XXX: Output type could be encoded into native function 'magic' value to * save space. For setters the stridx could be encoded into 'magic'.
label: code-design

24156. **comment:** * Manipulation of thread stacks (valstack, callstack, catchstack). * * Ideally unwinding of stacks should have no side effects, which would * then favor separate unwinding and shrink check primitives for each * stack type. A shrink check may realloc and thus have side effects. * * However, currently callstack unwinding itself has side effects, as it * needs to DECREF multiple objects, close environment records, etc. * Stacks must thus be unwound in the correct order by the caller. * * (XXX: This should be probably reworked so that there is a shared * unwind primitive which handles all stacks as requested, and knows * the proper order for unwinding.) * * Valstack entries above 'top' are always kept initialized to * "undefined unused". Callstack and catchstack entries above 'top' * are not zeroed and are left as garbage. * * Value stack handling is mostly a part of the API implementation.
label: code-design

24157. Step 9: copy elements-to-be-deleted into the result array

24158. 0x30-0x3f

24159. 2 bits for heap type

24160. setjmp/catchpoint setup

24161. **comment:** not sure whether or not needed; Thursday
label: requirement

24162. emergency mode: try extra hard

24163. Set object 'length'.

24164. byte index limit for element access, exclusive

24165. We could rely on max temp/const checks: if they don't exceed BC * limit, nothing here can either (just asserts would be enough). * Currently we check for the limits, which provides additional * protection against creating invalid bytecode due to compiler * bugs.

24166. require initializer for var/const

24167. DUK_TOK_FALSE

24168. fall-through control flow patchup; note that pc_prevstmt may be * < 0 (i.e. no case clauses), in which case this is a no-op.

24169. [... eval "eval" eval_input level]

24170. * ToObject() (E5 Section 9.9) * * ==> implemented in the API.

24171. DUK_USE_MARKANDSWEEP_FINALIZER_TORTURE

24172. **comment:** * Handle integers in 32-bit range (that is, [-(2**32-1),2**32-1]) * specially, as they're very likely for embedded programs. This * is now done for all radix values. We must be careful not to use * the fast path when special formatting (e.g. forced exponential) * is in force. * * XXX: could save space by supporting radix 10 only and using * sprintf "%lu" for the fast path and for exponent formatting.
label: code-design

24173. !(p < r)

24174. Maximum exponent value when parsing numbers. This is not strictly * compliant as there should be no upper limit, but as we parse the * exponent without a bigint, impose some limit.

24175. num_stack_args

24176. **comment:** Executor interrupt counter check, used to implement breakpoints, * debugging interface, execution timeouts, etc. The counter is heap * specific but is maintained in the current thread to make the check * as fast as possible. The counter is copied back to the heap struct * whenever a thread switch occurs by the DUK_HEAP_SWITCH_THREAD() macro.
label: code-design

24177. complete 'sub atom'

24178. * Intern key via the valstack to ensure reachability behaves * properly. We must avoid longjmp's here so use non-checked * primitives. * * Note: duk_check_stack() potentially reallocs the valstack, * invalidating any duk_tval pointers to valstack. Callers * must be careful.

24179. round out to 8 bytes

24180. for convenience

24181. buffer limits

24182. Handle TypedArray vs. Node.js Buffer arg differences

24183. DUK_TOK_WHILE

24184. offset/value order different from Node.js

24185. * Other cases (function declaration, anonymous function expression, * strict direct eval code). The "outer" environment will be whatever * the caller gave us.

24186. * Setup environment record properties based on the template and * its flags. * * If DUK_HOBJECT_HAS_NEWENV(fun_temp) is true, the environment * records represent identifiers "outside" the function; the * "inner" environment records are created on demand. Otherwise, * the environment records are those that will be directly used * (e.g. for declarations). * * _Lexenv is always set; _Varenv defaults to _Lexenv if missing, * so _Varenv is only set if _Lexenv != _Varenv. * * This is relatively complex, see doc/identifier-handling.rst.

24187. * Detach actual buffer from dynamic buffer in valstack, and * pop it from the stack. * * XXX: the buffer object is certainly not reachable at this point, * so it would be nice to free it forcibly even with only * mark-and-sweep enabled. Not a big issue though.

24188. continue matched this label -- we can only continue if this is the empty * label, for which duplication is allowed, and thus there is hope of * finding a match deeper in the label stack.

24189. Plus sign must be accepted for positive exponents * (e.g. '1.5e+2'). This clause catches NULs.

24190. DUK_TOK_VOID

24191. DUK_USE_PC2LINE

24192. DUK_HOBJECT_FLAG_STRICT varies

24193. [... errval errhandler]

24194. **comment:** XXX: Valstack, callstack, and catchstack are currently assumed * to have non-NULL pointers. Relaxing this would not lead to big * benefits (except perhaps for terminated threads).
label: code-design

24195. serialize the wrapper with empty string key

24196. * Free a heap object. * * Free heap object and its internal (non-heap) pointers. Assumes that * caller has removed the object from heap allocated list or the string * intern table, and any weak references (which strings may have) have * been already dealt with.

24197. BITWISE EXPRESSIONS

24198. **comment:** * Copy some internal properties directly * * The properties will be writable and configurable, but not enumerable.
label: code-design

24199. Valstack resize flags

24200. **comment:** XXX: Hex encoded, length limited buffer summary here?
label: code-design

24201. finish up pending jump and split for last alternative

24202. nop

24203. * Local declarations.

24204. stack[0] = object (this) * stack[1] = ToUint32(length) * stack[2] = elem at index 0 (retval)

24205. A finalizer is looked up from the object and up its prototype chain * (which allows inherited finalizers). A prototype loop must not cause * an error to be thrown here; duk_hobject_hasprop_raw() will ignore a * prototype loop silently and indicate that the property doesn't exist.

24206. **comment:** XXX: coerce to regs? it might be better for enumeration use, where the * same PROP ivalue is used multiple times. Or perhaps coerce PROP further * there?
label: code-design

24207. $x > y \rightarrow y < x$

24208. * Found existing accessor property (own or inherited). * Call setter with 'this' set to orig, and value as the only argument. * Setter calls are OK even for ROM objects. * * Note: no exotic arguments object behavior, because [[Put]] never * calls [[DefineOwnProperty]] (E5 Section 8.12.5, step 5.b).

24209. resumee: [... initial_func] (currently actually: [initial_func])

24210. Lookup 'key' from arguments internal 'map', and leave replacement value * on stack top if mapped (and return non-zero). * Used in E5 Section 10.6 algorithm for [[GetOwnProperty]] (used by [[Get]]).

24211. proto can also be NULL here (allowed explicitly)

24212. * split()

24213. Validate that the whole slice [0,length[is contained in the underlying * buffer. Caller must ensure 'buf' != NULL.

24214. could also just pop?

24215. Parser part indices.

24216. Compiler SyntaxError (or other error) gets the primary blame. * Currently no flag to prevent blaming.

24217. We don't check the zero padding bytes here right now * (that they're actually zero). This seems to be common * behavior for base-64 decoders.

24218. An object may be in heap_allocated list with a zero * refcount if it has just been finalized and is waiting * to be collected by the next cycle.

24219. * Local prototypes

24220. low-level property functions

24221. helpers for defineProperty() and defineProperties()

24222. w/o refcounts

24223. Skip dvalues to EOM.

24224. all native functions have NEWENV

24225. +1, right after inserted jump

24226. only accept lowercase 'utf8' now.

24227. **comment:** XXX: duplicates should be eliminated here
label: code-design

24228. **comment:** XXX: block removal API primitive
label: code-design

24229. LOGICAL EXPRESSIONS

24230. %lf, %ld etc

24231. * Switch is pretty complicated because of several conflicting concerns: * * - Want to generate code without an intermediate representation, * i.e., in one go * * - Case selectors are expressions, not values, and may thus e.g. throw * exceptions (which causes evaluation order concerns) * * - Evaluation semantics of case selectors and default clause need to be * carefully implemented to provide correct behavior even with case value * side effects * * - Fall through case and default clauses; avoiding dead JUMPs if case * ends with an unconditional jump (a break or a continue) * * - The same case value may occur multiple times, but evaluation rules * only process the first match before switching to a "propagation" mode * where case values are no longer evaluated * * See E5 Section 12.11. Also see doc/compiler.rst for compilation * discussion.

24232. 8: getFullYear

24233. * Debug connection peek and flush primitives

24234. 'do'

24235. duk_xdef_prop() will define an own property without any array * special behaviors. We'll need to set the array length explicitly * in the end. For arrays with elisions, the compiler will emit an * explicit SETALEN which will update the length.

24236. exponential notation forced

24237. NB: 'val' may be invalidated here because put_value may realloc valstack, * caller beware.

24238. Here we'd have the option to normalize -0 to +0.

24239. **comment:** XXX: share helper from lexer; duk_lexer.c / hexval().
label: code-design

24240. **comment:** * Create an internal enumerator object E, which has its keys ordered * to match desired enumeration ordering. Also initialize internal control * properties for enumeration. * * Note: if an array was used to hold enumeration keys instead, an array * scan would be needed to eliminate duplicates found in the prototype chain.
label: code-design

24241. **comment:** This is essentially the 'scale' algorithm, with recursion removed. * Note that 'k' is either correct immediately, or will move in one * direction in the loop. There's no need to do the low/high checks * on every round (like the Scheme algorithm does). * * The scheme algorithm finds 'k' and updates 's' simultaneously, * while the logical algorithm finds 'k' with 's' having its initial * value, after which 's' is updated separately (see the Burger-Dybvig * paper, Section 3.1, steps 2 and 3). * * The case where m+ == m- (almost always) is optimized for, because * it reduces the bigint operations considerably and almost always * applies. The scale loop only needs to work with m+, so this works.
label: code-design

24242. A -> flags * BC -> regCatch; base register for two registers used both during * trycatch setup and when catch is triggered * * If DUK_BC_TRYCATCH_FLAG_CATCH_BINDING set: * regCatch + 0: catch binding variable name (string). * Automatic declarative environment is established for * the duration of the 'catch' clause. * * If DUK_BC_TRYCATCH_FLAG_WITH_BINDING set: * regCatch + 0: with 'target value', which is coerced to * an object and then used as a bindind object for an * environment record. The binding is initialized here, for * the 'try' clause. * * Note that a TRYCATCH generated for a 'with' statement has no * catch or finally parts.

24243. default: false

24244. **comment:** fill new_h with u32 0xff = UNUSED
label: code-design

24245. A non-extensible object cannot gain any more properties, * so this is a good time to compact.

24246. if direct eval, calling activation must exist

24247. **comment:** XXX: because of the final check below (that the literal is not * followed by a digit), this could maybe be simplified, if we bail * out early from a leading zero (and if there are no periods etc). * Maybe too complex.
label: code-design

24248. * Create escaped RegExp source (E5 Section 15.10.3). * * The current approach is to special case the empty RegExp * (" -> '(?:')") and otherwise replace unescaped '/' characters * with '\/' regardless of where they occur in the regexp. * * Note that normalization does not seem to be necessary for * RegExp literals (e.g. '/foo/') because to be acceptable as * a RegExp literal, the text between forward slashes must * already match the escaping requirements (e.g. must not contain * unescaped forward slashes or be empty). Escaping IS needed * for expressions like 'new RegExp("...","")' however. * Currently, we re-escape in either case. * * Also note that we process the source here in UTF-8 encoded * form. This is correct, because any non-ASCII characters are * passed through without change.

24249. Value stack is used to ensure reachability of constants and * inner functions being loaded. Require enough space to handle * large functions correctly.

24250. **comment:** Automatic defaulting of logger name from caller. This would * work poorly with tail calls, but constructor calls are currently * never tail calls, so tail calls are not an issue now.
label: code-design

24251. Fast check for extending array: check whether or not a slow density check is required.

24252. **comment:** XXX: using duk_put_prop_index() would cause obscure error cases when Array.prototype * has write-protected array index named properties. This was seen as DoubleErrors * in e.g. some test262 test cases. Using duk_xdef_prop_index() is better and heavier. * The best fix is to fill in the tracedata directly into the array part. There are * no side effect concerns if the array part is allocated directly and only INCREFs * happen after that.
label: code-design

24253. filename may be NULL in which case file/line is not recorded

24254. unsigned

24255. **comment:** XXX: function flag to make this automatic?
label: requirement

24256. Must have array part and no conflicting exotic behaviors. * Doesn't need to have array special behavior, e.g. Arguments * object has array part.

24257. Breakpoint entries above the used area are left as garbage.

24258. allow_source_elem

24259. JSON parsing code is allowed to read [p_start,p_end]: p_end is * valid and points to the string NUL terminator (which is always * guaranteed for duk_hstrings).
24260. fall through if overflow etc
24261. inner function numbering
24262. **comment:** XXX: could write output in chunks with fewer ensure calls, * but relative benefit would be small here.
 label: code-design
24263. Assumes that saved[0] and saved[1] are always * set by regexp bytecode (if not, char_end_offset * will be zero). Also assumes clen reflects the * correct char length.
24264. **comment:** XXX: V8 throws a TypeError for negative values. Would it * be more useful to interpret negative offsets here from the * end of the buffer too?
 label: code-design
24265. function needs shuffle registers
24266. The compiler should never emit DUK_OP_REGEXP if there is no * regexp support.
24267. invalid padding
24268. Note: here we must be wary of the fact that a pointer may be * valid and be a NULL.
24269. **comment:** Here we can choose either to end parsing and ignore * whatever follows, or to continue parsing in case * multiple (possibly padded) base64 strings have been * concatenated. Currently, keep on parsing.
 label: code-design
24270. [requested_id require require.id resolved_id last_comp]
24271. advance to get one step of lookup
24272. Write signed 32-bit integer
24273. * Canonicalize() abstract operation needed for canonicalization of individual * codepoints during regexp compilation and execution, see E5 Section 15.10.2.8. *
 Note that codepoints are canonicalized one character at a time, so no context * specific rules can apply. Locale specific rules can apply, though.
24274. This should not be necessary because no-one should tamper with the * regexp bytecode, but is prudent to avoid potential segfaults if that * were to happen for some reason.
24275. Needs lookahead
24276. * Churn refzero_list until empty
24277. Note: 'q_instr' is still used below

24330. false

24331. * Built-in strings

24332. * Clear (reachable) flags of finalize_list * * We could mostly do in the sweep phase when we move objects from the * heap into the finalize_list. However, if a finalizer run is skipped * during a mark-and-sweep, the objects on the finalize_list will be marked * reachable during the next mark-and-sweep. Since they're already on the * finalize_list, no-one will be clearing their REACHABLE flag so we do it * here. (This now overlaps with the sweep handling in a harmless way.)

24333. * Variant 3

24334. * On second pass, skip the function.

24335. Note: key issue here is to re-lookup the base pointer on every attempt. * The pointer being reallocated may change after every mark-and-sweep.

24336. -> [... key val toJSON val]

24337. **comment:** XXX: It would be nice to build the string directly but ToUint16() * coercion is needed so a generic helper would not be very * helpful (perhaps coerce the value stack first here and then * build a string from a duk_tval number sequence in one go?).**label:** code-design

24338. Note: getprop may invoke any getter and invalidate any * duk_tval pointers, so this must be done first.

24339. [obj trap_result res_arr proppname]

24340. split1: prefer direct execution (no jump)

24341. in resumer's context

24342. Conceptually we'd extract the plain underlying buffer * or its slice and then do a type mask check below to * see if we should reject it. Do the mask check here * instead to avoid making a copy of the buffer slice.

24343. 'try'

24344. -> [in_val]

24345. **comment:** Currently all built-in native functions are strict. * This doesn't matter for many functions, but e.g. * String.prototype.charAt (and other string functions) * rely on being strict so that their 'this' binding is * not automatically coerced.**label:** code-design24346. **comment:** * Helper for handling an Ecmascript-to-Ecmascript call or an Ecmascript * function (initial) Duktape.Thread.resume(). * * Compared to normal calls handled by duk_handle_call(), there are a * bunch of differences: * * - the call is never protected * - there is no C recursion depth increase (hence an "ignore recursion * limit" flag is not applicable) * - instead of making the call, this helper just performs the thread * setup and returns; the bytecode executor then restarts execution * internally * - ecmascript functions are never 'vararg' functions (they access * varargs through the 'arguments' object) * * The callstack of the target contains an earlier Ecmascript call in case * of an Ecmascript-to-Ecmascript call (whose idx_retval is updated), or * is empty in case of an initial Duktape.Thread.resume(). * * The first thing to do here is to figure out whether an ecma-to-ecma * call is actually possible. It's not always the case if the target is * a bound function; the final function may be native. In that case, * return an error so caller can fall back to a normal call path.**label:** code-design

24347. Note: 0xff != DUK_BC_B_MAX

24348. * Unions and structs for self tests

24349. Note: masking is done for 'i' to deal with negative numbers correctly

24350. * For property layout 1, tweak e_size to ensure that the whole entry * part (key + val + flags) is a suitable multiple for alignment * (platform specific). * * Property layout 2 does not require this tweaking and is preferred * on low RAM platforms requiring alignment.

24351. don't run finalizers; queue finalizable objects back to heap_allocated

24352. val1 = count

24353. * Function declaration, function expression, or (non-standard) * function statement. * * The E5 specification only allows function declarations at * the top level (in "source elements"). An ExpressionStatement * is explicitly not allowed to begin with a "function" keyword * (E5 Section 12.4). Hence any non-error semantics for such * non-top-level statements are non-standard. Duktape semantics * for function statements are modelled after V8, see * test-dev-func-decl-outside-top.js.

24354. Get minimum array part growth for a certain size.

24355. **comment:** XXX: very slow - better to bulk allocate a gap, and copy * from args_array directly (we know it has a compact array * part, etc).**label:** code-design

24356. 'enumerate'

24357. DUK_TOK_RSHIFT

24358. roughly 256 bytes

24359. **comment:** For now, just use duk_safe_call() to wrap duk_new(). We can't * simply use a protected duk_handle_call() because there's post * processing which might throw. It should be possible to ensure * the post processing never throws (except in internal errors and * out of memory etc which are always allowed) and then remove this * wrapper.**label:** code-design

24360. object is now reachable

24361. flags: "im"

24362. Copy trap result keys into the enumerator object.

24363. * Mark-and-sweep flags * * These are separate from heap level flags now but could be merged. * The heap structure only contains a 'base mark-and-sweep flags' * field and the GC caller can impose further flags.

24364. Success path.

24365. * If entering a 'catch' block which requires an automatic * catch variable binding, create the lexical environment. * * The binding is mutable (= writable) but not deletable. * Step 4 for the catch production in E5 Section 12.14; * no value is given for CreateMutableBinding 'D' argument, * which implies the binding is not deletable.

24366. t1 <- (* r B)

24367. DUK_BUFOBJ_UINT8ARRAY

24368. Accept any duk_hbufferobject, though we're only normally * called for Duktape.Buffer values.

24369. Lenient: allow function declarations outside top level in * non-strict mode but reject them in strict mode.

24370. assertions: env must be closed in the same thread as where it runs

24371. EOF (-1) will be cast to an unsigned value first * and then re-cast for the switch. In any case, it * will match the default case (syntax error).

24372. refzero not running -> must be empty

24373. **comment:** XXX: differentiate null pointer from empty string?**label:** code-design

24374. Normal object which doesn't get automatically coerced to a * primitive value. Functions are checked for specially. The * primitive value coercions for Number, String, Pointer, and * Boolean can't result in functions so suffices to check here.

24458. Module object containing module.exports, etc

24459. 'prototype' property for all built-in objects (which have it) has attributes: * [[Writable]] = false, * [[Enumerable]] = false, * [[Configurable]] = false

24460. stack[0] = start * stack[1] = deleteCount * stack[2...nargs-1] = items * stack[nargs] = ToObject(this) -3 * stack[nargs+1] = ToUint32(length) -2 * stack[nargs+2] = result array -1

24461. -> [... escaped_source bytecode]

24462. * Write to array part? ** Note: array abandoning requires a property resize which uses * 'rechecks' valstack for temporaries and may cause any existing * valstack pointers to be invalidated. To protect against this, * tv_obj, tv_key, and tv_val are copies of the original inputs.

24463. copy existing entries as is

24464. 5: toLocaleTimeString

24465. mark-and-sweep: children not processed

24466. Catches EOF of JSON input.

24467. radix

24468. **comment:** XXX: when optimizing for guaranteed property slots, use a guaranteed * slot for internal value; this call can then access it directly.

label: code-design

24469. no wrapping

24470. **comment:** * Create and throw an error (originating from Duktape internally) ** Push an error object on top of the stack, possibly throw augmenting * the error, and finally longjmp. ** If an error occurs while we're dealing with the current error, we might * enter an infinite recursion loop. This is prevented by detecting a * "double fault" through the heap->handling_error flag; the recursion * then stops at the second level.

label: code-design

24471. if property key begins with underscore, encode it with * forced quotes (e.g. "_Foo") to distinguish it from encoded * internal properties (e.g. \xffBar -> _Bar).

24472. object or array

24473. no need to check now: both success and error are OK

24474. Note: allow backtracking from p == ptr_end

24475. Relookup if relocated

24476. module.filename for .fileName, default to resolved ID if * not present.

24477. -> [... toLocaleString ToObject(val)]

24478. DUK_TOK_LBRACKET already eaten, current token is right after that

24479. **comment:** * Array needs to grow, but we don't want it becoming too sparse. * If it were to become sparse, abandon array part, moving all * array entries into the entries part (for good). ** Since we don't keep track of actual density (used vs. size) of * the array part, we need to estimate somehow. The check is made * in two parts: * * - Check whether the resize need is small compared to the * current size (relatively); if so, resize without further * checking (essentially we assume that the original part is * "dense" so that the result would be dense enough). * * - Otherwise, compute the resize using an actual density * measurement based on counting the used array entries.

label: code-design

24480. Restore stack top after unbalanced code paths.

24481. position of highest digit changed

24482. * duk_heap allocation and freeing.

24483. Careful with borrow condition: * - If borrow not subtracted: 0x12345678 - 0 - 0xffffffff = 0x12345679 (> 0x12345678) * - If borrow subtracted: 0x12345678 - 1 - 0xffffffff = 0x12345678 (== 0x12345678)

24484. no statement value (unlike function expression)

24485. Three digit octal escape, digits validated.

24486. **comment:** * Addition operator is different from other arithmetic * operations in that it also provides string concatenation. * Hence it is implemented separately. ** There is a fast path for number addition. Other cases go * through potentially multiple coercions as described in the * E5 specification. It may be possible to reduce the number * of coercions, but this must be done carefully to preserve * the exact semantics. ** E5 Section 11.6.1. ** Custom types also have special behavior implemented here.

label: code-design

24487. Quite approximate but should be useful for little and big endian.

24488. For X <op>= Y we need to evaluate the pre-op * value of X before evaluating the RHS: the RHS * can change X, but when we do <op> we must use * the pre-op value.

24489. Count is incremented before DUK_DRAGON4_OUTPUT_PREINC() call * on purpose, which is taken into account by the macro.

24490. NUL also comes here. Comparison order matters, 0x20 * is most common whitespace.

24491. retval for success path

24492. * Wrapping duk_safe_call() will mangle the stack, just return stack top

24493. * Node.js Buffer.prototype: toJSON()

24494. We'll need to interrupt early so recompute the init * counter to reflect the number of bytecode instructions * executed so that step counts for e.g. debugger rate * limiting are accurate.

24495. 'fileName'

24496. * Convert duk_compiler_func to a function template and add it * to the parent function table.

24497. parse args starting from "next temp"

24498. This seems like a good overall approach. Fast path for ASCII in 4 byte * blocks.

24499. * Mark-and-sweep garbage collection.

24500. **comment:** * Object compaction (emergency only). ** Object compaction is a separate step after sweeping, as there is * more free memory for it to work with. Also, currently compaction * may insert new objects into the heap allocated list and the string * table which we don't want to do during a sweep (the reachability * flags of such objects would be incorrect). The objects inserted * are currently: * * - a temporary duk_hbuffer for a new properties allocation * - if array part is abandoned, string keys are interned * * The object insertions go to the front of the list, so they do not * cause an infinite loop (they are not compacted).

label: code-design

24501. **comment:** unnecessary div for last byte
label: code-design

24502. buffer values are coerced first to string here

24503. sanity limit for function pointer size

24504. [sep ToObject(this) len sep str0 ... str(count-1)]

24505. DUK_TOK_YIELD

24506. **comment:** XXX: is valstack top best place for argument?

24511. negative -> no atom matched on previous round

24512. [... name]

24513. Note: may be NULL if first call

24514. unresolvable, no stack changes

24515. **comment:** The DataView .buffer property is ordinarily set to the argument * which is an ArrayBuffer. We accept any duk_hbufferobject as * an argument and .buffer will be set to the argument regardless * of what it is. This may be a bit confusing if the argument * is e.g. a DataView or another TypedArray view. ** XXX: Copy .buffer property from a DataView/TypedArray argument? * Create a fresh ArrayBuffer for Duktape.Buffer and Node.js Buffer * arguments? See: test-bug-dataview-buffer-prop.js.
label: code-design

24516. DUK_USE_DATE_NOW_TIME

24517. XXX: valstack handling is awkward. Add a valstack helper which * avoids dup():ing; valstack_copy(src, dst)?

24518. On entry, item at idx_func is a bound, non-lightweight function, * but we don't rely on that below.

24519. * Reference counting implementation.

24520. use strict equality instead of non-strict equality

24521. This assert depends on the input parts representing time inside * the Ecmascript range.

24522. controls for minimum array part growth

24523. -> [... key]

24524. * Returns non-zero if a key and/or value was enumerated, and: * * [enum] -> [key] (get_value == 0) * [enum] -> [key value] (get_value == 1) * * Returns zero without pushing anything on the stack otherwise.

24525. allow basic ASCII whitespace

24526. Heap allocated: return heap pointer which is NOT useful * for the caller, except for debugging.

24527. activation is a direct eval call

24528. current lex_env of the activation (created for catcher)

24529. **comment:** Figure out all active breakpoints. A breakpoint is * considered active if the current function's fileName * matches the breakpoint's fileName, AND there is no * inner function that has matching line numbers * (otherwise a breakpoint would be triggered both * inside and outside of the inner function which would * be confusing). Example: * * function foo() { * print('foo'); * function bar() { <-, breakpoints in these * print('bar'); | lines should not affect * } <- 'foo()' execution * bar(); * } * * We need a few things that are only available when * debugger support is enabled: (1) a line range for * each function, and (2) access to the function * template to access the inner functions (and their * line ranges). * * It's important to have a narrow match for active * breakpoints so that we don't enter checked execution * when that's not necessary. For instance, if we're * running inside a certain function and there's * breakpoint outside in (after the call site), we * don't want to slow down execution of the function.
label: code-design

24530. start byte offset of token in lexer input

24531. * Note: lj.value1 is 'value', lj.value2 is 'resume'. * This differs from YIELD.

24532. curr_token = get/set name

24533. Initial '|' has been checked and eaten by caller.

24534. Thread may have changed, e.g. YIELD converted to THROW.

24535. Lookup to encode one byte directly into 2 characters: * * def genhextab(bswap): * for i in xrange(256): * t = chr(i).encode('hex') * if bswap: * t = t[1] + t[0] * print('0x' + t.encode('hex') + 'U') * print('big endian'); genhextab(False) * print('little endian'); genhextab(True)

24536. * 64-bit arithmetic * * There are some platforms/compilers where 64-bit types are available * but don't work correctly. Test for known cases.

24537. be paranoid for 32-bit time values (even avoiding negative ones)

24538. * Node.js Buffer.byteLength()

24539. emit instruction; could return PC but that's not needed in the majority * of cases.

24540. Fast write calls which assume you control the spare beforehand. * Multibyte write variants exist and use a temporary write pointer * because byte writes alias with anything: with a stored pointer * explicit pointer load/stores get generated (e.g. gcc -Os).

24541. All the flags fit in 16 bits, so will fit into duk_bool_t.

24542. flags: "g"

24543. For cross-checking during development: ensure dispatch count * matches cumulative interrupt counter init value sums.

24544. valstack should not need changes

24545. end of _Varmap

24546. **comment:** Certain boxed types are required to go through * automatic unboxing. Rely on internal value being * sane (to avoid infinite recursion).

24549. 'Arguments'

24550. [key getter this] -> [key retval]

24551. Retry allocation after mark-and-sweep for this * many times. A single mark-and-sweep round is * not guaranteed to free all unreferenced memory * because of finalization (in fact, ANY number of * rounds is strictly not enough).

24552. only functions can have arguments

24553. E5 Section 9.3.1

24554. * GETVAR * * See E5 Sections: * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * 11.13.1 Simple Assignment [example of where the Reference is GetValue'd] * 8.7.1 GetValue (V) * 8.12.1 [[GetOwnProperty]] (P) * 8.12.2 [[GetProperty]] (P) * 8.12.3 [[Get]] (P) * * If 'throw' is true, always leaves two values on top of stack: [val this]. * * If 'throw' is false, returns 0 if identifier cannot be resolved, and the * stack will be unaffected in this case. If identifier is resolved, returns * 1 and leaves [val this] on top of stack. * * Note: the 'strict' flag of a reference returned by GetIdentifierReference * is ignored by GetValue. Hence we don't take a 'strict' parameter. * * The 'throw' flag is needed for implementing 'typeof' for an unreferenced * identifier. An unreferenced identifier in other contexts generates a * ReferenceError.

24555. **comment:** XXX: top of stack must contain value, which helper doesn't touch, * rework to use tv_val directly?
label: code-design

24556. * Executor interrupt handling * * The handler is called whenever the interrupt countdown reaches zero * (or below). The handler must perform whatever checks are activated, * e.g. check for cumulative step count to impose an execution step * limit or check for breakpoints or other debugger interaction. * * When the actions are done, the handler must reinvoke the interrupt * init and counter values. The 'init' value must indicate how many * bytecode instructions are executed before the next interrupt. The * counter must interface with the bytecode executor loop. Concretely, * the new init value is normally one higher than the new counter value. * For instance, to execute exactly one bytecode instruction the init * value is set to 1 and the counter to 0. If an error is thrown by the * interrupt handler, the counters are set to the same value (e.g. both * to 0 to cause an interrupt when the next bytecode instruction is about * to be executed after error handling). * * Maintaining the init/counter value properly is important for accurate * behavior. For instance, executor step limit needs a cumulative step * count which is simply computed as a sum of 'init' values. This must * work accurately even when single stepping.

24619. * Poppers
24620. DUK_HOBJECT_H_INCLUDED
24621. always at least the header
24622. A -> target register * B -> bytecode (also contains flags) * C -> escaped source
24623. Fast path, decode as is.
24624. * "/" followed by something in regexp mode. See E5 Section 7.8.5. * * RegExp parsing is a bit complex. First, the regexp body is delimited * by forward slashes, but the body may also contain forward slashes as * part of an escape sequence or inside a character class (delimited by * square brackets). A mini state machine is used to implement these. * * Further, an early (parse time) error must be thrown if the regexp * would cause a run-time error when used in the expression new RegExp(...). * Parsing here simply extracts the (candidate) regexp, and also accepts * invalid regular expressions (which are delimited properly). The caller * (compiler) must perform final validation and regexp compilation. * * RegExp first char may not be '/' (single line comment) or '*' (multi- * line comment). These have already been checked above, so there is no * need below for special handling of the first regexp character as in * the E5 productions. * * About unicode escapes within regexp literals: * * E5 Section 7.8.5 grammar does NOT accept '\uHHHH escapes. * However, Section 6 states that regexps accept the escapes, * see paragraph starting with "In string literals...". * The regexp grammar, which sees the decoded regexp literal * (after lexical parsing) DOES have a '\uHHHH unicode escape. * So, for instance: * * \u1234/* should first be parsed by the lexical grammar as: * * '\u' RegularExpressionBackslashSequence * '1'

RegularExpressionNonTerminator * '2' RegularExpressionNonTerminator * '3' RegularExpressionNonTerminator * '4' RegularExpressionNonTerminator * * and the escape itself is then parsed by the regexp engine. * This is the current implementation. * * Minor spec inconsistency: * * E5 Section 7.8.5
RegularExpressionBackslashSequence is: * * \ RegularExpressionNonTerminator * * while Section A.1 RegularExpressionBackslashSequence is: * * \ NonTerminator * * The latter is not normative and a typo. *

24625. 'break'

24626. in yielder's context

24627. * E5 Section 15.4.5.1, steps 3.k - 3.n. The order at the end combines * the error case 3.l.iii and the success case 3.m-3.n. * * Note: 'length' is always in entries part, so no array abandon issues for * 'writable' update.

24628. * Avoid a GC if GC is already running. This can happen at a late * stage in a GC when we try to e.g. resize the stringtable * or compact objects.

24629. Reject attempt to change virtual properties: not part of the * standard algorithm, applies currently to e.g. virtual index * properties of buffer objects (which are virtual but writable). * (Cannot "force" modification of a virtual property.)

24630. MakeDay

24631. Push 'this' binding, check that it is a Date object; then push the * internal time value. At the end, stack is: [... this timeval]. * Returns the time value. Local time adjustment is done if requested.

24632. Cannot use duk_to_string() on the buffer because it is usually * larger than 'len'. Also, 'buf' is usually a stack buffer.

24633. non-leap year: sunday, monday, ...

24634. activation has tail called one or more times

24635. extended types: custom encoding

24636. reg

24637. -> [... enum key val]

24639. XXX: optimize value stack operation

24640. * Proxy object handling

24641. * Then decode the builtins init data (see genbuiltins.py) to * init objects

24642. mark as complex (capture handling)

24643. string is a reserved word (non-strict)

24644. s <- b^(1-e) * 2

24645. * Object inspection commands: GetHeapObjInfo, GetObjPropDesc, * GetObjPropDescRange

24646. * Unreachable object about to be swept. Finalize target refcounts * (objects which the unreachable object points to) without doing * refzero processing. Recursive decrefs are also prevented when * refzero processing is disabled. * * Value cannot be a finalizable object, as they have been made * temporarily reachable for this round.

24647. Map DUK_FLX_xxx to byte size.

24648. Note that we currently parse -bytes-, not codepoints. * All non-ASCII extended UTF-8 will encode to bytes >= 0x80, * so they'll simply pass through (valid UTF-8 or not).

24649. * Get/require

24650. key, getter and setter, now reachable through object

24651. **comment:** * Finalize objects in the finalization work list. Finalized * objects are queued back to heap_allocated with FINALIZED set. * * Since finalizers may cause arbitrary side effects, they are * prevented during string table and object property allocation * resizing using the DUK_MS_FLAG_NO_FINALIZERS flag in * heap->mark_and_sweep_base_flags. In this case the objects * remain in the finalization work list after mark-and-sweep * exits and they may be finalized on the next pass. * * Finalization currently happens inside "MARKANDSWEET_RUNNING" * protection (no mark-and-sweep may be triggered by the * finalizers). As a side effect: * * 1) an out-of-memory error inside a finalizer will not * cause a mark-and-sweep and may cause the finalizer * to fail unnecessarily * 2) any temporary objects whose refcount decreases to zero * during finalization will not be put into refzero_list; * they can only be collected by another mark-and-sweep * * This is not optimal, but since the sweep for this phase has * already happened, this is probably good enough for now.

label: code-design

24652. * A Dragon4 number-to-string variant, based on: * * Guy L. Steele Jr., Jon L. White: "How to Print Floating-Point Numbers * Accurately" * * Robert G. Burger, R. Kent Dybvig: "Printing Floating-Point Numbers * Quickly and Accurately" * * The current algorithm is based on Figure 1 of the Burger-Dybvig paper, * i.e. the base implementation without logarithm estimation speedups * (these would increase code footprint considerably). Fixed-format output * does not follow the suggestions in the paper; instead, we generate an * extra digit and round-with-carry. * * The same algorithm is used for number parsing (with b=10 and B=2) * by generating one extra digit and doing rounding manually. * * See doc/number-conversion.rst for limitations.

24653. holder will be set to the target object, not the actual object * where the property was found (see duk_get_identifier_reference()).

24654. 'Array'

24655. * INITSET/INITGET are only used to initialize object literal keys. * The compiler ensures that there cannot be a previous data property * of the same name. It also ensures that setter and getter can only * be initialized once (or not at all).

24656. extended utf-8 not allowed for URIs

24657. * E5 Section 15.7.2.1 requires that the constructed object * must have the original Number.prototype as its internal * prototype. However, since Number.prototype is non-writable * and non-configurable, this doesn't have to be enforced here: * The default object (bound to 'this') is OK, though we have * to change its class. * * Internal value set to ToNumber(arg) or +0; if no arg given, * ToNumber(undefined) = NaN, so special treatment is needed * (above). String internal value is immutable.

24658. bytecode limits

24659. guaranteed to find an empty slot

24660. Because 'day since epoch' can be negative and is used to compute weekday * using a modulo operation, add this multiple of 7 to avoid negative values * when year is below 1970 epoch. Ecmascript time values are restricted to * +/- 100 million days from epoch, so this adder fits nicely into 32 bits. * Round to a multiple of 7 (= floor(100000000 / 7) * 7) and add margin.

24661. Allow trailing garbage (e.g. treat "123foo" as "123")

24662. **comment:** XXX: Are steps 6 and 7 in E5 Section 15.11.4.4 duplicated by * accident or are they actually needed? The first ToString() * could conceivably return 'undefined'.

24670. * ArrayBuffer.isView()

24671. Magically bound variable cannot be an accessor. However, * there may be an accessor property (or a plain property) in * place with magic behavior removed. This happens e.g. when * a magic property is redefined with defineProperty(). * Cannot assert for "not accessor" here.

24672. * We could clear the book-keeping variables for the topmost activation, * but don't do so now.

24673. * Debugging enabled

24674. * E5 Section 7.4, allow SourceCharacter (which is any 16-bit * code point).

24675. **comment:** XXX: duk_set_length

label: code-design

24676. **comment:** XXX: which lists should participate? to be finalized?

label: code-design

24677. XXXXXX-- -----

24678. * Bitstream decoder.
24679. * The handling here is a bit tricky. If a previous ']' has been processed, * we have a pending split1 and a pending jump (for a previous match). These * need to be back-patched carefully. See docs for a detailed example.
24680. Step 16: update length; note that the final length may be above 32 bit range * (but we checked above that this isn't the case here)
24681. **comment:** XXX: 'internal error' is a bit of a misnomer
 label: code-design
24682. **comment:** In compatible mode and standard JSON mode, output * something useful for non-BMP characters. This won't * roundtrip but will still be more or less readable and * more useful than an error.
 label: code-design
24683. A debugger forced interrupt check is not needed here, as * problematic safe calls are not caused by side effects.
24684. Real world behavior for map(): trailing non-existent * elements don't invoke the user callback, but are still * counted towards result 'length'.
24685. Ensure argument name is not a reserved word in current * (final) strictness. Formal argument parsing may not * catch reserved names if strictness changes during * parsing. * * We only need to do this in strict mode because non-strict * keyword are always detected in formal argument parsing.
24686. retval (sub-atom char length) unused, tainted as complex above
24687. no pre-checks now, assume a previous yield() has left things in * tip-top shape (longjmp handler will assert for these).
24688. * Peephole optimizer for finished bytecode. * * Does not remove opcodes; currently only straightens out unconditional * jump chains which are generated by several control structures.
24689. should not happen
24690. Avoid doing an actual write callback with length == 0, * because that's reserved for a write flush.
24691. DUK_TOK_REGEXP
24692. * Peephole optimize JUMP chains.
24693. * Execution timeout check
24694. Recursive value reviver, implements the Walk() algorithm. No C recursion * check is done here because the initial parsing step will already ensure * there is a reasonable limit on C recursion depth and hence object depth.
24695. type to represent a reg/const reference during compilation
24696. **comment:** Indent helper. Calling code relies on js_ctx->recursion_depth also being * directly related to indent depth.
 label: code-design
24697. DUK_TOK_PUBLIC
24698. E5 Sections 11.8.4, 11.8.5; x >= y --> not (x < y)
24699. 'get'
24700. **comment:** function name (borrowed reference), ends up in _name
 label: code-design
24701. repl_value
24702. quotes
24703. 'undefined' already on stack top
24704. 'res' is used for "left", and 'tmp' for "right"
24705. def_value
24706. Delete elements required by a smaller length, taking into account * potentially non-configurable elements. Returns non-zero if all * elements could be deleted, and zero if all or some elements could * not be deleted. Also writes final "target length" to 'out_result_len'. * This is the length value that should go into the 'length' property * (must be set by the caller). Never throws an error.
24707. * duk_handle_call_protected() and duk_handle_call_unprotected(): * call into a Duktape/C or an Ecmascript function from any state. * * [func this arg1 ... argN] * * Output stack (thr): * * [retv] (DUK_EXEC_SUCCESS) * [errobj] (DUK_EXEC_ERROR (normal error), protected call) * * Even when executing a protected call an error may be thrown in rare cases * such as an insane num_stack_args argument. If there is no catchpoint for * such errors, the fatal error handler is called. * * The error handling path should be error free, even for out-of-memory * errors, to ensure safe sandboxing. (As of Duktape 1.4.0 this is not * yet the case, see XXX notes below.)
24708. **comment:** XXX: skip null filename?
 label: code-design
24709. avoid multiply
24710. New require() function for module, updated resolution base
24711. **comment:** * Function pointers * * Printing function pointers is non-portable, so we do that by hex printing * bytes from memory.
 label: code-design
24712. "-Infinity", '-' has been eaten
24713. make absolute
24714. 'act' already set above
24715. DUK_BUFOBJ_UINT8CLAMPEDARRAY
24716. **comment:** XXX: turkish / azeri, lowercase rules
 label: code-design
24717. **comment:** Coerce like a string. This makes sense because addition also treats * buffers like strings.
 label: code-design
24718. Non-zero refcounts should not happen for unreachable strings, * because we refcount finalize all unreachable objects which * should have decreased unreachable string refcounts to zero * (even for cycles).
24719. no comma
24720. strict outer context
24721. jump for 'finally' case or end (if no finally)
24722. * Structs
24723. DUK__L0 -> '\ char * DUK__L1 ... DUK__L5 -> more lookup
24724. from next pc
24725. If the value happens to be 0xFFFFFFFF, it's not a valid array index * but will then match DUK__NO_ARRAY_INDEX.
24726. use 'left' as a temp
24727. JSON
24728. binary arithmetic; DUK_OP_ADD, DUK_OP_EQ, other binary ops
24729. Innermost fast path processes 4 valid base-64 characters at a time * but bails out on whitespace, padding chars ('=') and invalid chars. * Once the slow path segment has been processed, we return to the * inner fast path again. This handles e.g. base64 with newlines * reasonably well because the majority of a line is in the fast path.
24730. Key and value indices are either (-2, -1) or (-1, -2). Given idx_key, * idx_val is always (idx_key ^ 0x01).
24731. * Pointer built-ins
24732. Zero length string is not accepted without quotes
24733. [key] -> []
24734. No activation, no variable access. Could also pretend * we're in the global program context and read stuff off * the global object.
24735. current function being compiled (embedded instead of pointer for more compact access)
24736. Note: src_data may be NULL if input is a zero-size * dynamic buffer.
24737. Note: 'this' may be bound to any value, not just an object
24738. **comment:** XXX: Not needed for now, so not implemented. Note that * function pointers may have different size/layout than * a void pointer.
 label: requirement
24739. out of spec, don't care
24740. **comment:** XXX: idx_val would fit into 16 bits, but using duk_small_uint_t * might not generate better code due to casting.
 label: code-design
24741. used by e.g. duk_regexp_executor.c, string built-ins

24742. **comment:** XXX: could also copy from template, but there's no way to have any * other value here now (used code has no access to the template).
label: code-design

24743. Share yield longjmp handler.

24744. curr_token slot2 (matches 'lex' slot2_idx)

24745. Error message doesn't matter: the error is ignored anyway.

24746. Have a calling activation, check for direct eval (otherwise * assume indirect eval).

24747. **comment:** Compact but lots of churn.
label: code-design

24748. Output shuffling: only one output register is realistically possible. * * (Zero would normally be an OK marker value: if the target register * was zero, it would never be shuffled. But with DUK_USE_SHUFFLE_TORTURE * this is no longer true, so use -1 as a marker instead.)

24749. **comment:** actually used
label: code-design

24750. rule match

24751. * Helper structs

24752. terminating conditions

24753. see below

24754. allow automatic semicolon even without lineterm (compatibility)

24755. Outside any activation -> put to global.

24756. +0 = break, +1 = continue

24757. try locale specific formatter; if it refuses to format the * string, fall back to an ISO 8601 formatted value in local * time.

24758. -> [val arr]

24759. * Byte matching for back-references would be OK in case- * sensitive matching. In case-insensitive matching we need * to canonicalize characters, so back-reference matching needs * to be done with codepoints instead. So, we just decode * everything normally here, too. * * Note: back-reference index which is 0 or higher than * NCapturingParens (= number of capturing parens in the * -entire- regexp) is a compile time error. However, a * backreference referring to a valid capture which has * not matched anything always succeeds! See E5 Section * 15.10.2.9, step 5, sub-step 3.

24760. this is needed for regexp mode

24761. jump to next case clause

24762. pop plain buffer, now reachable through h_bufres

24763. * PUTPROP: Ecmascript property write. * * Unlike Ecmascript primitive which returns nothing, returns 1 to indicate * success and 0 to indicate failure (assuming throw is not set). * * This is an extremely tricky function. Some examples: * * * Currently a decref may trigger a GC, which may compact an object's * property allocation. Consequently, any entry indices (e_idx) will * be potentially invalidated by a decref. * * * Exotic behaviors (strings, arrays, arguments object) require, * among other things: * * - Preprocessing before and postprocessing after an actual property * write. For example, array index write requires pre-checking the * array 'length' property for access control, and may require an * array 'length' update after the actual write has succeeded (but * not if it fails). * * - Deletion of multiple entries, as a result of array 'length' write. * * * Input values are taken as pointers which may point to the valstack. * If valstack is resized because of the put (this may happen at least * when the array part is abandoned), the pointers can be invalidated. * (We currently make a copy of all of the input values to avoid issues.)

24764. add AD*2^16

24765. Proxy handler

24766. **comment:** * Tailcall handling * * Although the callstack entry is reused, we need to explicitly unwind * the current activation (or simulate an unwind). In particular, the * current activation must be closed, otherwise something like * test-bug-reduce-judofy.js results. Also catchstack needs be unwound * because there may be non-error-catching label entries in valid tail calls.
label: code-design

24767. **comment:** Should not be required because the code below always sets both high * and low parts, but at least gcc-4.4.5 fails to deduce this correctly * (perhaps because the low part is set (seemingly) conditionally in a * loop), so this is here to avoid the bogus warning.
label: code-design

24768. Impose a maximum string length for now. Restricted artificially to * ensure adding a heap header length won't overflow size_t. The limit * should be synchronized with DUK_HBUFFER_MAX_BYTelen. * * E5.1 makes provisions to support strings longer than 4G characters. * This limit should be eliminated on 64-bit platforms (and increased * closer to maximum support on 32-bit platforms).

24769. relookup exports from module.exports in case it was changed by modSearch

24770. * Indexed read/write helpers (also used from outside this file)

24771. adv = 2 - 1 default OK

24772. **comment:** XXX: the key in 'key in obj' is string coerced before we're called * (which is the required behavior in E5/E5.1/E6) so the key is a string * here already.
label: code-design

24773. **comment:** XXX: side effect handling is quite awkward here
label: code-design

24774. act->func

24775. **comment:** Set stack top within currently allocated range, but don't reallocate. * This is performance critical especially for call handling, so whenever * changing, profile and look at generated code.
label: code-design

24776. **comment:** Neutered checks not necessary here: neutered buffers have * zero 'length' so we'll effectively skip them.
label: code-design

24777. Call setup checks callability.

24778. **comment:** Flags for intermediate value coercions. A flag for using a forced reg * is not needed, the forced_reg argument suffices and generates better * code (it is checked as it is used).
label: code-design

24779. **comment:** Non-ASCII slow path (range-by-range linear comparison), very slow
label: code-design

24780. Contract, either: * - Push value on stack and return 1 * - Don't push anything on stack and return 0

24781. 0: not IdentifierStart or IdentifierPart * 1: IdentifierStart and IdentifierPart * -1: IdentifierPart only

24782. DUK_BUFOBJ_UINT32ARRAY

24783. * Restore 'caller' property for non-strict callee functions.

24784. ($\geq e 0$) AND ($\neq f (\text{expt } b (- p 1))$) * * be <- (expt b e) == b^e * r <- (* f be 2) == 2 * f * b^e [if $b==2 \rightarrow f * b^{(e+1)}$] * s <- 2 * m+ <- be == b^e * m- <- be == b^e * k <- 0 * B <- B * low_ok <- round * high_ok <- round

24785. A -> unused (reserved for flags, for consistency with DUK_OP_CALL) * B -> target register and start reg: constructor, arg1, ..., argN * (for DUK_OP_NEWI, 'b' is indirect) * C -> num args (N)

24786. 0x60...0x6f

24787. ≥ 0

24788. mimic semantics for strings

24789. Parse a single statement. * * Creates a label site (with an empty label) automatically for iteration * statements. Also "peels off" any label statements for explicit labels.

24790. DUK__FLD_8BIT

24791. [key]

24792. normal key/value

24793. mm <- b^e

24794. steps 4.a and 4.b are tricky

24795. The external string struct is defined even when the feature is inactive.

24796. fixed arg count

24797. A -> flags * B -> return value reg/const * C -> currently unused

24798. **comment:** Because there are quite many call sites, pack error code (require at most * 8-bit) into a single argument.

label: code-design

24799. Raw helper to extract internal information / statistics about a value. * The return values are version specific and must not expose anything * that would lead to security issues (e.g. exposing compiled function * 'data' buffer might be an issue). Currently only counts and sizes and * such are given so there should not be a security impact.

24800. -> [... closure template newobj]

24801. XXX: This causes recursion up to inner function depth * which is normally not an issue, e.g. mark-and-sweep uses * a recursion limiter to avoid C stack issues. Avoiding * this would mean some sort of a work list or just refusing * to serialize deep functions.

24802. * Size-optimized pc->line mapping.

24803. return as is

24804. value1 -> resume value, value2 -> resume thread, iserror -> error/normal

24805. function: create binding for func name (function templates only, used for named function expressions)

24806. The low 8 bits map directly to duk_hobject.h DUK_PROPDESC_FLAG_xxx. * The remaining flags are specific to the debugger.

24807. **comment:** XXX: copy from caller?

label: code-design

24808. always for register bindings

24809. **comment:** XXX: optimize: allocate an array part to the necessary size (upwards * estimate) and fill in the values directly into the array part; finally * update 'length'.

label: code-design

24810. heap->dbg_udata: keep

24811. If input_offset were assigned a negative value, it would * result in a large positive value. Most likely it would be * larger than input_length and be caught here. In any case * no memory unsafe behavior would happen.

24812. IdentifierStart production with Letter, ASCII, and non-BMP excluded

24813. **comment:** * Custom formatter for debug printing, allowing Duktape specific data * structures (such as tagged values and heap objects) to be printed with * a nice format string. Because debug printing should not affect execution * state, formatting here must be independent of execution (see implications * below) and must not allocate memory. * * Custom format tags begin with '%!'. To safely distinguish them from * standard format tags. The following conversions are supported: * * %!T tagged value (duk_tval *) * %!O heap object (duk_heapobj *) * %!I decoded bytecode instruction * %!C bytecode instruction opcode name (arg is long) * * Everything is serialized in a JSON-like manner. The default depth is one * level, internal prototype is not followed, and internal properties are not * serialized. The following modifiers change this behavior: * * @ print pointers * # print binary representations (where applicable) * d deep traversal of own properties (not prototype) * p follow prototype chain (useless without 'd') * i include internal properties (other than prototype) * x hexdump buffers * h heavy formatting * * For instance, the following serializes objects recursively, but does not * follow the prototype chain nor print internal properties: "%!do". * * Notes: * * * Standard snprintf return value semantics seem to vary. This * implementation returns the number of bytes it actually wrote * (excluding the null terminator). If retv == buffer size, * output was truncated (except for corner cases). * * * Output format is intentionally different from Ecmascript * formatting requirements, as formatting here serves debugging * of internals. * * * Depth checking (and updating) is done in each type printer * separately, to allow them to call each other freely. * * * Some pathological structures might take ages to print (e.g. * self recursion with 100 properties pointing to the object * itself). To guard against these, each printer also checks * whether the output buffer is full; if so, early exit. * * * Reference loops are detected using a loop stack.

label: code-design

24814. dummy value used as marker

24815. never here, but fall through

24816. **comment:** * duk_handle_safe_call(): make a "C protected call" within the * current activation. * * The allowed thread states for making a call are the same as for * duk_handle_call_xxx(). * * Error handling is similar to duk_handle_call_xxx(); errors may be thrown * (and result in a fatal error) for insane arguments.

label: code-design

24817. must never longjmp

24818. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside object 'a_size'.

24819. Must set 'length' explicitly when using duk_xdef_prop_xxx() to * set the values.

24820. heapobj size and additional allocation size, followed by * type specific stuff (with varying value count)

24821. stack top contains 'true'

24822. callbacks and udata; dbg_read_cb != NULL is used to indicate attached state

24823. '\xffHandler'

24824. Note: string is a terminal heap object, so no depth check here

24825. 0x80-0x8f

24826. * Internal helper for defining an accessor property, ignoring * normal semantics such as extensibility, write protection etc. * Overwrites any existing value and attributes. This is called * very rarely, so the implementation first sets a value to undefined * and then changes the entry to an accessor (this is to save code space).

24827. Debug print which visualizes the qsort partitioning process.

24828. XXX: this placeholder is not always correct, but use for now. * It will fail in corner cases; see test-dev-func-cons-args.js.

24829. r <- (2 * f) * b^e

24830. unreferenced with some options

24831. always terminates led()

24832. (reference is valid as long activation exists)

24833. don't report __FILE__ / __LINE__ as fileName/lineNumber

24834. **comment:** Note: don't bail out early, we must read all the ranges from * bytecode. Another option is to skip them efficiently after * breaking out of here. Prefer smallest code.

label: code-design

24835. Pause for all step types: step into, step over, step out. * This is the only place explicitly handling a step out.

24836. awkward; we assume there is space for this

24837. Peek ahead in the stream one byte.

24838. * Breakpoint management

24839. * Compact an object

24840. slot B is both a target and a source (used by extraops like DUK_EXTRAOP_INSTOF

24841. alias for above

24842. handle comma and closing brace

24843. shrink case; leave some spare

24844. strictness is not inherited, intentional

24845. only Array.prototype matches

24846. Parse a function-like expression, assuming that 'comp_ctx->curr_func' is * correctly set up. Assumes that curr_token is just after 'function' (or * 'set'/get' etc).

24847. function: always register bound

24848. **comment:** XXX: fast primitive to set a bunch of values to UNDEFINED

label: code-design

24849. Buffer size needed for duk_bi_date_format_timeval(). * Accurate value is 32 + 1 for NUL termination: * >>> len('+123456-01-23T12:34:56.123+12:34') * 32 * Include additional space to be safe.

24850. We want to compare the slice/view areas of the arguments. * If either slice/view is invalid (underlying buffer is shorter) * ensure equals() is false, but otherwise the only thing that * matters is to be memory safe.

24851. This seems reasonable overall.

24852. Loop prevention

24853. 'throw'

24854. we're running inside the caller's activation, so no change in call/catch stack or valstack bottom

24855. Assume that the native representation never contains a closing * parenthesis.

24856. varargs marker
24857. entry level reached
24858. Current strictness flag: affects API calls.
24859. Because value stack init policy is 'undefined above top', * we don't need to write, just assert.
24860. '*'
24861. call is from executor, so we know we have a jmpbuf
24862. Yield/resume book-keeping.
24863. finally part will catch
24864. Quite lenient, e.g. allow empty as zero, but don't allow trailing * garbage.
24865. IEEE requires that NaNs compare false
24866. Load inner functions to value stack, but don't yet copy to buffer.
24867. [start end]
24868. **comment:** Try to make do with a stack buffer to avoid allocating a temporary buffer. * This works 99% of the time which is quite nice.
label: code-design
24869. This testcase fails when Emscripten-generated code runs on Firefox. * It's not an issue because the failure should only affect packed * duk_tval representation, which is not used with Emscripten.
24870. **comment:** XXX: keys is an internal object with all keys to be processed * in its (gapless) array part. Because nobody can touch the keys * object, we could iterate its array part directly (keeping in mind * that it can be reallocated).
label: code-design
24871. Return value is like write(), number of bytes written. * The return value matters because of code like: * "off += buf.copy(...)".
24872. Exponent without digits (e.g. "1e" or "1e+"). If trailing garbage is * allowed, ignore exponent part as garbage (= parse as "1", i.e. exp 0).
24873. DUK_TOK_THROW
24874. **comment:** Note: not a typo, "object" is returned for a null value
label: documentation
24875. atom_char_length, atom_start_offset, atom_start_offset reflect the * atom matched on the previous loop. If a quantifier is encountered * on this loop, these are needed to handle the quantifier correctly. * new_atom_char_length etc are for the atom parsed on this round; * they're written to atom_char_length etc at the end of the round.
24876. Original idiom used, minimal code size.
24877. **comment:** 'fun' is quite rarely used, so no local for it
label: code-design
24878. **comment:** XXX: fastint
label: code-design
24879. Note: in integer arithmetic, (x / 4) is same as floor(x / 4) for non-negative * values, but is incorrect for negative ones.
24880. normal
24881. Careful with wrapping (left shifting idx would be unsafe).
24882. **comment:** XXX: for negative input offsets, 'offset' will be a large * positive value so the result here is confusing.
label: code-design
24883. no overflow
24884. "+11:22|0"
24885. borrowed: function being executed; for bound function calls, this is the final, real function, NULL for lightfuncs
24886. **comment:** * Augment error (throw time), unless alloc/double error
label: code-design
24887. -> [... ToObject(this) ToUint32(length) arg[i]]
24888. The specification has quite awkward order of coercion and * checks for toPrecision(). The operations below are a bit * reordered, within constraints of observable side effects.
24889. caller
24890. match followed by capture(s)
24891. return input buffer, converted to a Duktape.Buffer object * if called as a constructor (no change if called as a * function).
24892. We could use a switch-case for the class number but it turns out * a small if-else ladder on class masks is better. The if-ladder * should be in order of relevancy.
24893. * New length is smaller than old length, need to delete properties above * the new length. * * If array part exists, this is straightforward: array entries cannot * be non-configurable so this is guaranteed to work. * * If array part does not exist, array-indexed values are scattered * in the entry part, and some may not be configurable (preventing length * from becoming lower than their index + 1). To handle the algorithm * in E5 Section 15.4.5.1, step 1 correctly, we scan the entire property * set twice.
24894. 'ptr' is evaluated both as LHS and RHS.
24895. * Ecmascript [[Class]]
24896. **comment:** Quick reject of too large or too small exponents. This check * would be incorrect for zero (e.g. "0e1000" is zero, not Infinity) * so zero check must be above.
label: code-design
24897. finalize_list will always be processed completely
24898. **comment:** XXX: exposed duk_debug_read_pointer
label: code-design
24899. -> [... key val replacer holder]
24900. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside bufferobject length.
24901. open scope information, for compiled functions only
24902. Handle empty separator case: it will always match, and always * triggers the check in step 13.c.iii initially. Note that we * must skip to either end of string or start of first codepoint, * skipping over any continuation bytes! * * Don't allow an empty string to match at the end of the input.
24903. temp reg handling
24904. * Parse function body
24905. x <- y - z
24906. 'Pointer'
24907. relookup if changed
24908. **comment:** * Augment an error at creation time with _Tracedata/fileName/lineNumber * and allow a user error handler (if defined) to process/replace the error. * The error to be augmented is at the stack top. * * thr: thread containing the error value * thr_callstack: thread which should be used for generating callstack etc. * c_filename: C __FILE__ related to the error * c_line: C __LINE__ related to the error * noblame_fileline: if true, don't fileName/line as error source, otherwise use traceback * (needed because user code filename/line are reported but internal ones * are not) * * XXX: rename noblame_fileline to flags field; combine it to some existing * field (there are only a few call sites so this may not be worth it).
label: code-design
24909. throw_flag
24910. * Else, must be one of: * - ExpressionStatement, possibly a directive (String) * - LabelledStatement (Identifier followed by ':') * * Expressions beginning with 'function' keyword are covered by a case * above (such expressions are not allowed in standard E5 anyway). * Also expressions starting with '{' are interpreted as block * statements. See E5 Section 12.4. * * Directive detection is tricky; see E5 Section 14.1 on directive * prologue. A directive is an expression statement with a single * string literal and an explicit or automatic semicolon. Escape * characters are significant and no parens etc are allowed: * * 'use strict'; // valid 'use strict' directive * 'use\u0020strict'; // valid directive, not a 'use strict' directive * ('use strict'); // not a valid directive * * The expression is determined to consist of a single string literal * based on duk_expr_nud() and duk_expr_led() call counts. The string literal * of a 'use strict' directive is determined to lack any escapes based * num_escapes count from the lexer. Note that other directives may be * allowed to contain escapes, so a directive with escapes does not * terminate a directive prologue. * * We rely on the fact that the expression parser will not emit any * code for a single token expression. However, it will generate an * intermediate value which we will then successfully ignore. * * A similar approach is used for labels.

24911. The act->prev_caller should only be set if the entry for 'caller' * exists (as it is only set in that case, and the property is not * configurable), but handle all the cases anyway.

24912. break/continue without label

24913. **comment:** XXX: the best typing needs to be validated by perf measurement: * e.g. using a small type which is the cast to a larger duk_idx_t * may be slower than declaring the variable as a duk_idx_t in the * first place.
label: code-design

24914. **comment:** XXX: conversion errors should not propagate outwards. * Perhaps values need to be coerced individually?
label: code-design

24915. XXX: here we need to know if 'left' is left-hand-side compatible. * That information is no longer available from current expr parsing * state; it would need to be carried into the 'left' ivalue or by * some other means.

24916. non-global regexp: lastIndex never updated on match

24917. Note: undefined from Section 11.8.5 always results in false * return (see e.g. Section 11.8.3) - hence special treatment here.

24918. If there's no catch block, rc_varname will be 0 and duk_patch_tryCatch() * will replace the LDCONST with a NOP. For any actual constant (including * constant 0) the DUK_CONST_MARKER flag will be set in rc_varname.

24919. exposed because lexer needs these too

24920. empty match (may happen with empty separator) -> bump and continue

24921. As with all inspection code, we rely on the debug client providing * a valid, non-stale pointer: there's no portable way to safely * validate the pointer here.

24922. Set up curr_pc for opcode dispatch.

24923. [... pattern flags escaped_source]

24924. **comment:** The 'magic' field allows an opaque 16-bit field to be accessed by the * Duktape/C function. This allows, for instance, the same native function * to be used for a set of very similar functions, with the 'magic' field * providing the necessary non-argument flags / values to guide the behavior * of the native function. The value is signed on purpose: it is easier to * convert a signed value to unsigned (simply AND with 0xffff) than vice * versa. * * Note: cannot place nargs/magic into the heapdr flags, because * duk_hobject takes almost all flags already (and needs the spare).
label: code-design

24925. Get minimum entry part growth for a certain size.

24926. valstack index of start of args (arg1) (relative to entry valstack_bottom)

24927. [ToObject(this) item1 ... itemN arr item(i) item(i)[j]]

24928. thr->heap->lj.value2 is 'thread', will be wiped out at the end

24929. break/continue with label (label cannot be a reserved word, production is 'Identifier')

24930. property access

24931. Coerce all finite parts with ToInteger(). ToInteger() must not * be called for NaN/Infinity because it will convert e.g. NaN to * zero. If ToInteger() has already been called, this has no side * effects and is idempotent. * * Don't read dparts[DUK_DATE_IDX_WEEKDAY]; it will cause Valgrind * issues if the value is uninitialized.

24932. internal property functions

24933. Report thrown value to client coerced to string

24934. **comment:** ArrayBuffer argument is handled specially above; the rest of the * argument variants are handled by shared code below.
label: code-design

24935. DUK_USE_USER_INITJS

24936. Range limited to [0, 0x7fffffff] range, i.e. range that can be * represented with duk_int32_t. Use this when the method doesn't * handle the full 32-bit unsigned range correctly.

24937. 110x xxxx 10xx xxxx

24938. Sanity limits for stack sizes.

24939. **comment:** Linear scan: more likely because most objects are small. * This is an important fast path. * * XXX: this might be worth inlining for property lookups.
label: code-design

24940. XXX: will need a force flag if garbage collection is triggered * explicitly during paused state.

24941. Array length is larger than 'asize'. This shouldn't * happen in practice. Bail out just in case.

24942. No net refcount change.

24943. * Assert context is valid: non-NULL pointer, fields look sane. * * This is used by public API call entrypoints to catch invalid 'ctx' pointers * as early as possible; invalid 'ctx' pointers cause very odd and difficult to * diagnose behavior so it's worth checking even when the check is not 100%.

24944. * Setup value stack: clamp to 'nargs', fill up to 'nregs'

24945. This should not happen because DUK_TAG_OBJECT case checks * for this already, but check just in case.

24946. result array is already at the top of stack

24947. args go here as a comma expression in parens

24948. [... source? filename? &comp_args] (depends on flags)

24949. no extra padding

24950. Start position (inclusive) and end position (exclusive)

24951. tentative, checked later

24952. slot A is a source (default: target)

24953. indexed by recursion_depth

24954. * Fixed buffer helper useful for debugging, requires no allocation * which is critical for debugging.

24955. Order of unwinding is important

24956. * Final sigma context specific rule. This is a rather tricky * rule and this handling is probably not 100% correct now. * The rule is not locale/language specific so it is supported.

24957. tracks maximum initialized index + 1

24958. **comment:** first register that is a temporary (below: variables)
label: code-design

24959. A -> register of target object * B -> first register of value data (start_index, value1, value2, ..., valueN) * C -> number of key/value pairs (N)

24960. Just skip, leaving zeroes in the result.

24961. [... arr]

24962. Note: successive characters could be joined into string matches * but this is not trivial (consider e.g. '/xyz+/'; see docs for * more discussion).

24963. Coerce an duk_ivalue to a register or constant; result register may * be a temp or a bound register. * * The duk_ivalue argument ('x') is converted into a regconst as a * side effect.

24964. bytes in source

24965. no voluntary gc

24966. A -> result reg * B -> object reg * C -> key reg/const

24967. An object may have FINALIZED here if it was finalized by mark-and-sweep * on a previous run and refcount then decreased to zero. We won't run the * finalizer again here.

24968. **comment:** XXX: allow object to be a const, e.g. in 'foo'.toString()? * On the other hand, DUK_REGCONSTP() is slower and generates * more code.
label: code-design

24969. refcount

24970. regexp res_obj is at index 4

24971. stack[0] = callback fn * stack[1] = initialValue * stack[2] = object (coerced this) * stack[3] = length (not needed, but not popped above) * stack[4] = accumulator

24972. **comment:** Node.js Buffer variable width integer field. We don't really * care about speed here, so aim for shortest algorithm.
label: code-design

24973. The spec algorithm first does "R = ToString(separator)" before checking * whether separator is undefined. Since this is side effect free, we can * skip the ToString() here.

24974. ']'

24975. NULL with zero length represents an empty string; NULL with higher * length is also now treated like an empty string although it is * a bit dubious. This is unlike duk_push_string() which pushes a '*' if the input string is a NULL.

24976. -> [func funcname env funcname func]

24977. true, because v[1] has at least one bit set

24978. bp to use when parsing a top level Expression

24979. Caller will finish the marking process if we hit a recursion limit.

24980. y

24981. **comment:** * E5 Section 7.6: ** IdentifierStart: * UnicodeLetter * \$ * _ * \ UnicodeEscapeSequence ** IdentifierStart production has one multi-character production: ** \ UnicodeEscapeSequence ** The '\' character is -not- matched by this function. Rather, the caller * should decode the escape and then call this function to check whether the * decoded character is acceptable (see discussion in E5 Section 7.6). ** The "UnicodeLetter" alternative of the production allows letters * from various Unicode categories. These can be extracted with the * "src/extract_chars.py" script. ** Because the result has hundreds of Unicode codepoint ranges, matching * for any values >= 0x80 are done using a very slow range-by-range scan * and a packed range format. ** The ASCII portion (codepoints 0x00 ... 0x7f) is fast-patched below because * it matters the most. The ASCII related ranges of IdentifierStart are: * * 0x0041 ... 0x005a ['A' ... 'Z'] * 0x0061 ... 0x007a ['a' ... 'z'] * 0x0024 ['\$'] * 0x005f ['_']

label: code-design

24982. Must be an object, otherwise TypeError (E5.1 Section 8.10.5, step 1).

24983. TypeError if fails

24984. * Entries part

24985. * Delayed env creation check

24986. insert 'undefined' values at idx_rbase to get the * return values to idx_retbase

24987. xxx -> DUK_HBUFFEROBJECT_ELEM_INT8

24988. guarantees entry_callstack_top - 1 >= 0

24989. no code needs to be emitted, the regs already have values

24990. magic: 0=getter call, 1=Object.getPrototypeOf

24991. PC is unsigned. If caller does PC arithmetic and gets a negative result, * it will map to a large PC which is out of bounds and causes a zero to be * returned.

24992. * Debug connection write primitives

24993. **comment:** XXX: join these ops (multiply-accumulate), but only if * code footprint decreases.

label: code-design

24994. module.name for .name, default to last component if * not present.

24995. * Exposed debug macros: debugging enabled

24996. Object.defineProperty() calls [[DefineOwnProperty]] with Throw=true

24997. 0xe0-0xef

24998. compact the prototype

24999. XXX: default priority for infix operators is duk__expr_lbp(tok) -> get it here?

25000. read header

25001. prop index in 'hash part', < 0 if not there

25002. This is based on Rhino EquivalentYear() algorithm: *

<https://github.com/mozilla/rhino/blob/f99cc11d616f0cdda2c42bde72b3484df6182947/src/org.mozilla/javascript/NativeDate.java>

25003. **comment:** Clamping to zero makes the API more robust to calling code * calculation errors.

label: code-design

25004. Surround with parentheses like in JX, ensures NULL pointer * is distinguishable from null value ("null" vs "null").

25005. Attempt to write 'stack', 'fileName', 'lineNumber' works as if * user code called Object.defineProperty() to create an overriding * own property. This allows user code to overwrite .fileName etc * intuitively as e.g. "err.fileName = 'dummy'" as one might expect. * See <https://github.com/svaarala/duktape/issues/387>.

25006. object is a native function (duk_hnativefunction)

25007. [... error func fileName lineNumber]

25008. 21 bits

25009. **comment:** XXX: thread selection for mark-and-sweep is currently a hack. * If we don't have a thread, the entire mark-and-sweep is now * skipped (although we could just skip finalizations).

label: code-design

25010. embed: duk_hstring ptr

25011. enumeration

25012. * Free memory

25013. Maximum value check ensures 'nbytes' won't wrap below.

25014. Use existing env (e.g. for non-strict eval); cannot have * an own 'arguments' object (but can refer to an existing one).

25015. currently, even for Array.prototype

25016. unsigned intentionally

25017. DUK_TOK_SNEQ

25018. only outer_lex_env matters, as functions always get a new * variable declaration environment.

25019. No need to assert, buffer size maximum is 0xffff.

25020. default is explicit index read/write copy

25021. not enumerable

25022. * Exposed data

25023. avoid problems if p == h->prototype

25024. DUK_USE_PROVIDE_DEFAULT_ALLOC_FUNCTIONS

25025. Output shuffle needed after main operation

25026. For native calls must be NULL so we don't sync back

25027. **comment:** XXX: very basic optimization -> duk_get_prop_stridx_top

label: code-design

25028. omitted

25029. 'toGMTString'

25030. * Object related * * Note: seal() and freeze() are accessible through EcmaScript bindings, * and are not exposed through the API.

25031. * ISO 8601 subset parser.

25032. Internal keys are prefixed with 0xFF in the stringtable * (which makes them invalid UTF-8 on purpose).

25033. without explicit non-BMP support, assume non-BMP characters * are always accepted as identifier characters.

25034. [res]

25035. dash is already 0

25036. Object flag. There are currently 26 flag bits available. Make sure * this stays in sync with debugger object inspection code.

25037. This may only happen if built-ins are being "torn down". * This behavior is out of specification scope.

25038. Not possible because array object 'length' is present * from its creation and cannot be deleted, and is thus * caught as an existing property above.

25039. Note: strictness is not inherited from the current Duktape/C * context. Otherwise it would not be possible to compile * non-strict code inside a Duktape/C activation (which is * always strict now). See tests/api/test-eval-strictness.c * for discussion.

25040. A -> flags * B -> base register for call (base -> func, base+1 -> this, base+2 -> arg1 ... base+2+N-1 -> argN) * (for DUK_OP_CALLI, 'b' is indirect) * C -> nargs

25041. * Wrapper for jmp_buf. * * This is used because jmp_buf is an array type for backward compatibility. * Wrapping jmp_buf in a struct makes pointer references, sizeof, etc, * behave more intuitively. * * http://en.wikipedia.org/wiki/Setjmp.h#Member_types

25042. * This is a bit tricky to implement portably. The result depends * on the timestamp (specifically, DST depends on the timestamp). * If e.g. UNIX APIs are used, they'll have portability issues with * very small and very large years. * * Current approach: * * - Stay within portable UNIX limits by using equivalent year mapping. * Avoid year 1970 and 2038 as some conversions start to fail, at * least on some platforms. Avoiding 1970 means that there are * currently DST discrepancies for 1970. * * - Create a UTC and local time breakdowns from 't'. Then create * a time_t using gmtime() and localtime() and compute the time *

difference between the two. ** Equivalent year mapping (E5 Section 15.9.1.8): ** If the host environment provides functionality for determining * daylight saving time, the implementation of ECMAScript is free * to map the year in question to an equivalent year (same * leap-year-ness and same starting week day for the year) for which * the host environment provides daylight saving time information. * The only restriction is that all equivalent years should produce * the same result. ** This approach is quite reasonable but not entirely correct, e.g. * the specification also states (E5 Section 15.9.1.8): ** The implementation of ECMAScript should not try to determine * whether the exact time was subject to daylight saving time, but * just whether daylight saving time would have been in effect if * the _current daylight saving time algorithm_ had been used at the * time. This avoids complications such as taking into account the * years that the locale observed daylight saving time year round. ** Since we rely on the platform APIs for conversions between local * time and UTC, we can't guarantee the above. Rather, if the platform * has historical DST rules they will be applied. This seems to be the * general preferred direction in Ecmascript standardization (or at least * implementations) anyway, and even the equivalent year mapping should * be disabled if the platform is known to handle DST properly for the * full Ecmascript range. ** The following has useful discussion and links: ** https://bugzilla.mozilla.org/show_bug.cgi?id=351066

25043. keep val_highest

25044. **comment:** XXX: limit to quoted strings only, to save keys from being cluttered?

comment: alloc temp just in case, to update max temp
label: code-design
25136. * An array must have a 'length' property (E5 Section 15.4.5.2). * The special array behavior flag must only be enabled once the * length property has been added. * * The internal property must be a number (and preferably a * fastint if fastint support is enabled).
25137. * Create a hstring and insert into the heap. The created object * is directly garbage collectable with reference count zero. * * The caller must place the interned string into the stringtable * immediately (without chance of a longjmp); otherwise the string * is lost.
25138. Note: this is correct even for default clause statements: * they participate in 'fall-through' behavior even if the * default clause is in the middle.
25139. exposed, used by e.g. duk.bi.date.c
25140. * Parsing of ints and floats
25141. flags: "gi"
25142. For TypedArrays 'undefined' return value is specified * by ES6 (matches V8).
25143. * Return target object
25144. side effects
25145. [... result]
25146. only objects have finalizers
25147. interpret e.g. '0x' and '0xg' as a NaN (= parse error)
comment: * Get and call the finalizer. All of this must be wrapped * in a protected call, because even getting the finalizer * may trigger an error (getter may throw one, for instance).
label: code-design
25149. **comment:** * String/JSON conversions * * Human readable conversions are now basically ISO 8601 with a space * (instead of 'T') as the date/time separator. This is a good baseline * and is platform independent. * * A shared native helper to provide many conversions. Magic value contains * a set of flags. The helper provides: * * toString() * toDateString() * toTimeString() * toLocaleString() * toLocaleDateString() * toLocaleTimeString() * toUTCString() * toISOString() * * Notes: * * - Date.prototype.toGMTString() and Date.prototype.toUTCString() are * required to be the same EcmaScript function object (!), so it is * omitted from here. * * - Date.prototype.toUTCString(): E5.1 specification does not require a * specific format, but result should be human readable. The * specification suggests using ISO 8601 format with a space (instead of 'T') separator if a more human readable format is not available. * * - Date.prototype.toISOString(): unlike other conversion functions, * toISOString() requires a RangeError for invalid date values.
label: code-design
25150. * Thread support.
25151. bytecode start offset of the atom parsed in this loop * (allows quantifiers to copy the atom bytecode)
25152. temp copy, write back for next loop
25153. char loop
25154. basic platform types
25155. we currently assume virtual properties are not configurable (as none of them are)
25156. Stage 1: find highest preventing non-configurable entry (if any). * When forcing, ignore non-configurability.
25157. **comment:** XXX: keep property attributes or tweak them here? * Properties will now be non-configurable even when they're * normally configurable for the global object.
label: code-design
25158. address
25159. * Property already exists. Steps 5-6 detect whether any changes need * to be made.
25160. may be NULL
25161. * Parse EcmaScript source InputElementDiv or InputElementRegExp * (E5 Section 7), skipping whitespace, comments, and line terminators. * * Possible results are: * (1) a token * (2) a line terminator (skipped) * (3) a comment (skipped) * (4) EOF * * White space is automatically skipped from the current position (but * not after the input element). If input has already ended, returns * DUK_TOK_EOF indefinitely. If a parse error occurs, uses an DUK_ERROR0 * macro call (and hence a longjmp through current heap longjmp context). * Comments and line terminator tokens are automatically skipped. * * The input element being matched is determined by regexp_mode; if set, * parses a InputElementRegExp, otherwise a InputElementDiv. The * difference between these are handling of productions starting with a * forward slash. * * If strict_mode is set, recognizes additional future reserved words * specific to strict mode, and refuses to parse octal literals. * * The matching strategy below is to (currently) use a six character * lookup window to quickly determine which production is the -longest- * matching one, and then parse that. The top-level if-else clauses * match the first character, and the code blocks for each clause * handle -all- alternatives for that first character. EcmaScript

* specification uses the "longest match wins" semantics, so the order * of the if-clauses matters. ** Misc notes: *** Ecmascript numeric literals do not accept a sign character. * Consequently e.g. "-1.0" is parsed as two tokens: a negative * sign and a positive numeric literal. The compiler performs * the negation during compilation, so this has no adverse impact. *** There is no token for "undefined": it is just a value available * from the global object (or simply established by doing a reference * to an undefined value). *** Some contexts want Identifier tokens, which are IdentifierNames * excluding reserved words, while some contexts want IdentifierNames * directly. In the latter case e.g. "while" is interpreted as an * identifier name, not a DUK_TOK_WHILE token. The solution here is * to provide both token types: DUK_TOK_WHILE goes to 't' while * DUK_TOK_IDENTIFIER goes to 't_nores', and 'slot1' always contains * the identifier / keyword name. *** Directive prologue needs to identify string literals such as * "use strict" and 'use strict', which are sensitive to line * continuations and escape sequences. For instance, "use\u0020strict" * is a valid directive but is distinct from "use strict". The solution * here is to decode escapes while tokenizing, but to keep track of the * number of escapes. Directive detection can then check that the * number of escapes is zero. *** Multi-line comments with one or more internal LineTerminator are * treated like a line terminator to comply with automatic semicolon * insertion.

25162. IEEE double is approximately 16 decimal digits; print a couple extra

25163. * Resizing and hash behavior

25164. String sanitizer which escapes ASCII control characters and a few other * ASCII characters, passes Unicode as is, and replaces invalid UTF-8 with * question marks. No errors are thrown for any input string, except in out * of memory situations.

25165. **comment:** Try to optimize X <op>= Y for reg-bound * variables. Detect side-effect free RHS * narrowly by seeing whether it emits code. * If not, rewind the code emitter and overwrite * the unnecessary temp reg load.

Adding macros here only makes sense if there * are enough call sites to get concrete benefits.
label: code-design

25394. digit count

25395. * Hobject property set/get functionality. ** This is very central functionality for size, performance, and compliance. * It is also rather intricate; see hobject-algorithms.rst for discussion on * the algorithms and memory-management.rst for discussion on refcounts and * side effect issues. ** Notes: * * - It might be tempting to assert "refcount nonzero" for objects * being operated on, but that's not always correct: objects with * a zero refcount may be operated on by the refcount implementation * (finalization) for instance. Hence, no refcount assertions are made. * * - Many operations (memory allocation, identifier operations, etc) * may cause arbitrary side effects (e.g. through GC and finalization). * These side effects may invalidate duk_tval pointers which point to * areas subject to reallocation (like value stack). Heap objects * themselves have stable pointers. Holding heap object pointers or * duk_tval copies is not problematic with respect to side effects; * care must be taken when holding and using argument duk_tval pointers. * * - If a finalizer is executed, it may operate on the same object * we're currently dealing with. For instance, the finalizer might * delete a certain property which has already been looked up and * confirmed to exist. Ideally finalizers would be disabled if GC * happens during property access. At the moment property table realloc * disables finalizers, and all DECREFS may cause arbitrary changes so * handle DECREF carefully. * * - The order of operations for a DECREF matters. When DECREF is executed, * the entire object graph must be consistent; note that a refzero may * lead to a mark-and-sweep through a refcount finalizer.

25396. **comment:** * Compact the closure, in most cases no properties will be added later. * Also, without this the closures end up having unused property slots * (e.g. in Duktape 0.9.0, 8 slots would be allocated and only 7 used). * A better future solution would be to allocate the closure directly * to correct size (and setup the properties directly without going * through the API).
label: code-design

25397. 2^3 -> 1/8 = 12.5% min growth

25398. * Reference count updates ** Note: careful manipulation of refcounts. The top is * not updated yet, so all the activations are reachable * for mark-and-sweep (which may be triggered by decref). * However, the pointers are NULL so this is not an issue.

25399. 'hex'

25400. borrowed label name

25401. * String table algorithm: closed hashing with a probe sequence ** This is the default algorithm and works fine for environments with * minimal memory constraints.

25402. Longjmp state is kept clean in success path

25403. Longjmp callers are required to sync-and-null thr->ptr_curr_pc * before longjmp.

25404. Return invalid index; if caller uses this without checking * in another API call, the index won't map to a valid stack * entry.

25405. **comment:** XXX: faster internal way to get this
label: code-design

25406. old value is number: no refcount

25407. Using classification has smaller footprint than direct comparison.

25408. DUK_USE_ROM_GLOBAL_CLONE || DUK_USE_ROM_GLOBAL_INHERIT

25409. leading byte of match string

25410. **comment:** * Formal argument list ** We don't check for prohibited names or for duplicate argument * names here, because we don't yet know whether the function will * be strict. Function body parsing handles this retroactively.
label: code-design

25411. canonicalized by compiler

25412. [source template closure this]
25413. initial index
25414. 5 heap flags
25415. DUK_TOK_FUNCTION
25416. exponent for 'f'
25417. * Duktape includes (other than duk_features.h) ** The header files expect to be included in an order which satisfies header * dependencies correctly (the headers themselves don't include any other * includes). Forward declarations are used to break circular struct/typedef * dependencies.
25418. always 1 arg
25419. helpers
25420. ignore result
25421. DUK_JMPBUF_H_INCLUDED
25422. 'static'
25423. * sort() ** Currently qsort with random pivot. This is now really, really slow, * because there is no fast path for array parts. ** Signed indices are used because qsort() leaves and degenerate cases * may use a negative offset.
25424. extended types: compatible encoding
25425. **comment:** not allowed in strict mode, regardless of whether resolves; * in non-strict mode DELVAR handles both non-resolving and * resolving cases (the specification description is a bit confusing).
label: code-design
25426. valstack limit caller has check, prevents wrapping
25427. Note that byte order doesn't affect this test: all bytes in * 'test' will be 0xFF for two's complement.
25428. Note: number has no explicit tag (in 8-byte representation)
25429. * Calendar helpers ** Some helpers are used for getters and can operate on normalized values * which can be represented with 32-bit signed integers. Other helpers are * needed by setters and operate on un-normalized double values, must watch * out for non-finite numbers etc.
25430. Unlike year, the other parts fit into 16 bits so %d format * is portable.
25431. reg/const for case value
25432. Equivalent year mapping, used to avoid DST trouble when platform * may fail to provide reasonable DST answers for dates outside the * ordinary range (e.g. 1970-2038). An equivalent year has the same * leap-year-ness as the original year and begins on the same weekday * (Jan 1). ** The year 2038 is avoided because there seem to be problems with it * on some platforms. The year 1970 is also avoided as there were * practical problems with it; an equivalent year is used for it too, * which breaks some DST computations for 1970 right now, see e.g. * test-bi-date-tzoffset-brute-fi.js.
25433. signed integer encoding needed to work with UTF-8
25434. Here val would be potentially invalid if we didn't make * a value copy at the caller.
25435. '&'
25436. jump is inserted here (variant 3)
25437. * Closing environment records. ** The environment record MUST be closed with the thread where its activation * is. In other words (if 'env' is open): ** - 'thr' must match _env.thread * - 'func' must match _env.callee * - 'regbase' must match _env.regbase ** These are not looked up from the env to minimize code size. * * XXX: should access the own properties directly instead of using the API
25438. resume: [... initial_func undefined(= this) resume_value]
25439. ignore relimit, not constructor
25440. '\xffCallee'
25441. is normalized
25442. Variant for writing duk_tvals so that any heap allocated values are * written out as tagged heap pointers.
25443. Coerce like boolean
25444. mark-and-sweep marking reached a recursion limit and must use multi-pass marking
25445. [(builtin objects)]
25446. **comment:** XXX: tv_func is not actually needed
label: requirement
25447. * Source filename (or equivalent), for identifying thrown errors.
25448. '_proto'_
25449. **comment:** XXX: this is probably a useful shared helper: for a * duk_hbufferobject, get a validated buffer pointer/length.
label: code-design
25450. parent env is the prototype
25451. get varenv for varname (callee's declarative lexical environment)
25452. Use a new environment and there's an 'arguments' object. * We need to initialize it right now.
25453. The timevalue must be in valid Ecmascript range, but since a local * time offset can be applied, we need to allow a +/- 24h leeway to * the value. In other words, although the UTC time is within the * Ecmascript range, the local part values can be just outside of it.
25454. Note: can be safely scanned as bytes (undecoded)
25455. ======
25456. No activation matches, use undefined for both .fileName and * .lineNumber (matches what we do with a _Tracedata based * no-match lookup).
25457. also goes into flags
25458. UnaryExpression
25459. **comment:** XXX: return something more useful, so that caller can throw?
label: code-design
25460. Tailcalls are handled by back-patching the TAILCALL flag to the * already emitted instruction later (in return statement parser). * Since A and C have a special meaning here, they cannot be "shuffled".
25461. all virtual properties are non-configurable and non-writable
25462. [obj trap_result res_arr]
25463. **comment:** * The string conversion here incorporates all the necessary Ecmascript * semantics without attempting to be generic. nc_ctx->digits contains * nc_ctx->count digits (>= 1), with the topmost digit's 'position' * indicated by nc_ctx->k as follows: ** digits="123" count=3 k=0 --> 0.123 * digits="123" count=3 k=1 --> 1.23 * digits="123" count=3 k=5 --> 12300 * digits="123" count=3 k=-1 --> 0.0123 ** Note that the identifier names used for format selection are different * in Burger-Dybvig paper and Ecmascript specification (quite confusingly * so, because e.g. 'k' has a totally different meaning in each). See * documentation for discussion. ** Ecmascript doesn't specify any specific behavior for format selection * (e.g. when to use exponent notation) for non-base-10 numbers. ** The bigint space in the context is reused for string output, as there * is more than enough space for that (>1kB at the moment), and we avoid * allocating even more stack.
label: code-design
25464. depth check is done when printing an actual type
25465. Preinc/predec for object properties.
25466. * duk_re_range_callback for generating character class ranges. ** When ignoreCase is false, the range is simply emitted as is. * We don't, for instance, eliminate duplicates or overlapping * ranges in a character class. ** When ignoreCase is true, the range needs to be normalized through * canonicalization. Unfortunately a canonicalized version of a * continuous range is not necessarily continuous (e.g. [x-{ } is * continuous but [X-{ } is not). The current algorithm creates the * canonicalized range(s) space efficiently at the cost of compile * time execution time (see doc/regexp.rst for discussion). ** Note that the ctx->nranges is a context-wide temporary value * (this is OK because there cannot be multiple character classes * being parsed simultaneously).
25467. init function state: init valstack allocations
25468. **comment:** Currently about 7*152 = 1064 bytes. The space for these * duk_bignints is used also as a temporary buffer for generating * the final string. This is a bit awkward; a union would be * more correct.
label: code-design
25469. Check statement type based on the first token type. ** Note: expression parsing helpers expect 'curr_tok' to * contain the first token of the expression upon entry.
25470. **comment:** * The 'in' operator requires an object as its right hand side, * throwing a TypeError unconditionally if this is not the case. ** However, lightfuncs need to behave like fully fledged objects * here to be maximally transparent, so we need to handle them * here.

label: code-design

25471. * Number-to-string conversion. The semantics of these is very tightly * bound with the EcmaScript semantics required for call sites.

25472. **comment:** SCANBUILD: with suitable dmin/dmax limits 'd' is unused**label:** code-design

25473. 0xff => 255 - 256 = -1; 0x80 => 128 - 256 = -128

25474. DUK_USE_PARANOID_ERRORS

25475. Does not assume that jump_pc contains a DUK_OP_JUMP previously; this is intentional * to allow e.g. an INVALID opcode be overwritten with a JUMP (label management uses this).

25476. A 32-bit unsigned integer formats to at most 32 digits (the * worst case happens with radix == 2). Output the digits backwards, * and use a memmove() to get them in the right place.

25477. Without ROM objects "needs refcount update" == is heap allocated.

25478. **comment:** Note: 'act' is dangerous here because it may get invalidated at many * points, so we re-lookup it multiple times.**label:** code-design25479. **comment:** XXX: Add a flag to reject an attempt to re-attach? Otherwise * the detached callback may immediately reattach.**label:** code-design

25480. side effects -> don't use tv_x, tv_y after

25481. [... enum]

25482. if gap is empty, behave as if not given at all

25483. When JX/JC not in use, the type mask above will avoid this case if needed.

25484. DUK_TOK_LT

25485. no value

25486. * HASVAR: check identifier binding from a given environment record * without traversing its parents. * * This primitive is not exposed to user code as such, but is used * internally for e.g. declaration binding instantiation. * * See E5 Sections: * 10.2.1.1 HasBinding(N) * 10.2.1.2.1 HasBinding(N) * * Note: strictness has no bearing on this check. Hence we don't take * a 'strict' parameter.

25487. hash probe sequence

25488. * Make the C call

25489. DUK_USE_NONSTD_FUNC_STMT

25490. has access to 'this' binding

25491. **comment:** Create a temporary enumerator to get the (non-duplicated) key list; * the enumerator state is initialized without being needed, but that * has little impact.**label:** code-design25492. **comment:** XXX: optimize for string inputs: no need to coerce to a buffer * which makes a copy of the input.**label:** code-design

25493. initial size guess

25494. Buffer writes are often integers.

25495. env[funcname] = closure

25496. Safe to call multiple times.

25497. Default variants. Selection depends on speed/size preference. * Concretely: with gcc 4.8.1 -Os x64 the difference in final binary * is about +1kB for _FAST variants.

25498. formatted result limited

25499. [] -> [res]

25500. may be NaN

25501. 'undefined', artifact of lookup

25502. assume array part is comprehensive (contains all array indexed elements * or none of them); hence no need to check the entries part here.

25503. lj value1: value

25504. pushes function template

25505. Identifier, i.e. don't allow reserved words

25506. **comment:** Parse an inner function, adding the function template to the current function's * function table. Return a function number to be used by the outer function. * * Avoiding O(depth^2) inner function parsing is handled here. On the first pass, * compile and register the function normally into the 'funcs' array, also recording * a lexer point (offset/line) to the closing brace of the function. On the second * pass, skip the function and return the same 'fnum' as on the first pass by using * a running counter. * * An unfortunate side effect of this is that when parsing the inner function, almost * nothing is known of the outer function, i.e. the inner function's scope. We don't * need that information at the moment, but it would allow some optimizations if it * were used.**label:** code-design

25507. [arg toLogString]

25508. out_token->lineterm set by caller

25509. note: any entries above the catchstack top are garbage and not zeroed

25510. Error code also packs a tracedata related flag.

25511. enumerator must have no keys deleted

25512. Stack size increases or stays the same.

25513. known to be number; in fact an integer

25514. avail_bytes += need_bytes

25515. **comment:** XXX: this illustrates that a C catchpoint implemented using duk_safe_call() * is a bit heavy at the moment. The wrapper compiles to ~180 bytes on x64. * Alternatives would be nice.**label:** code-design

25516. temp variable to pass constants and flags to shared code

25517. char length of the atom parsed in this loop

25518. -> [... fn x y]

25519. **comment:** ToBoolean() does not require any operations with side effects so * we can do it efficiently. For footprint it would be better to use * duk_js_tobool()

and then push+replace to the result slot.

label: code-design

25520. -> [...]

25521. topmost activation idx_retval is considered garbage, no need to init

25522. * Delayed activation environment record initialization (for functions * with NEWENV). * * The non-delayed initialization is handled by duk_handle_call().

25523. ref.value, ref.this.binding invalidated here by getprop call

25524. * Field accessor macros

25525. [... buf]

25526. idx_base and idx_base+1 get completion value and type

25527. integer number in range

25528. **comment:** XXX: duk_xdef_prop_index_wec() would be more appropriate * here but it currently makes some assumptions that might * not hold (e.g. that previous property is not an accessor). * * Using duk_put_prop() works incorrectly with '__proto__' * if the own property with that name has been deleted. This * does not happen normally, but a clever reviver can trigger * that, see complex reviver case in: test-bug-json-parse-__proto__.js.**label:** code-design

25529. Force interrupt right away if we're paused or in "checked mode". * Step out is handled by callstack unwind.

25530. check stack before interning (avoid hanging temp)

25531. The extra (+4) is tight.

25532. Send version identification and flush right afterwards. Note that * we must write raw, unframed bytes here.

25533. DUK_TOK_STATIC

25534. No pointer compression because pointer is potentially outside of * Duktape heap.

25535. 'null'
25536. pc2line
25537. always normalized
25538. JUMP L1 omitted
25539. **comment:** writable, not configurable
 label: code-design
25540. * Init/assert flags, copying them where appropriate. Some flags * (like NEWENV) are processed separately below.
25541. big endian
25542. entry_top + 3
25543. must match bytecode defines now; build autogenerate?
25544. Although NAMEBINDING is not directly needed for using * function instances, it's needed by bytecode dump/load * so copy it too.
25545. ''
25546. * Automatically generated by genbuiltins.py, do not edit!
25547. * Debug connection read primitives
25548. Note: when parsing a formal list in non-strict context, e.g. * "implements" is parsed as an identifier. When the function is * later detected to be strict, the argument list must be rechecked * against a larger set of reserved words (that of strict mode). * This is handled by duk_parse_func_body(). Here we recognize * whatever tokens are considered reserved in current strictness * (which is not always enough).
25549. **comment:** XXX: optimize with more direct internal access
 label: code-design
25550. __proto__ setter returns 'undefined' on success unlike the * setPrototypeOf() call which returns the target object.
25551. 0x00-0x0f
25552. * String comparison (E5 Section 11.8.5, step 4), which * needs to compare codepoint by codepoint. * * However, UTF-8 allows us to use strcmp directly: the shared * prefix will be encoded identically (UTF-8 has unique encoding) * and the first differing character can be compared with a simple * unsigned byte comparison (which strcmp does). * * This will not work properly for non-xutf-8 strings, but this * is not an issue for compliance.
25553. DUK_TOK_BOR_EQ
25554. Argument must be a string, e.g. a buffer is not allowed.
25555. Note: val is a stable duk_tval pointer. The caller makes * a value copy into its stack frame, so 'tv_val' is not subject * to side effects here.
25556. number of formal arguments
25557. register, constant, or value
25558. Note: intentionally allow leading zeroes here, as the * actual parser will check for them.
25559. Impose a maximum buffer length for now. Restricted artificially to * ensure resize computations or adding a heap header length won't * overflow size_t and that a signed duk_int_t can hold a buffer * length. The limit should be synchronized with DUK_HSTRING_MAX_BYTELEN.
25560. h_code: held in bw_code
25561. * Forward declarations.
25562. heap pointer comparison suffices
25563. Note: 'count' is currently not adjusted by rounding (i.e. the * digits are not "chopped off". That shouldn't matter because * the digit position (absolute or relative) is passed on to the * convert-and-push function.
25564. **comment:** The variable environment for magic variable bindings needs to be * given by the caller and recorded in the arguments object. * * See E5 Section 10.6, the creation of setters/getters. * * The variable environment also provides access to the callee, so * an explicit (internal) callee property is not needed.
 label: code-design
25565. All components default to 0 except day-of-month which defaults * to 1. However, because our internal day-of-month is zero-based, * it also defaults to zero here.
25566. Backtrack.
25567. **comment:** XXX: code duplication
 label: code-design
25568. arg count
25569. **comment:** Switch to caller's setjmp() catcher so that if an error occurs * during error handling, it is always propagated outwards instead * of causing an infinite loop in our own handler.
 label: code-design
25570. [... number] -> [... string]
25571. 'data' (and everything in it) is reachable through h_res now
25572. Fast path.
25573. called as a normal function: return new Date().toString()
25574. -----XX
25575. must be computed after realloc
25576. 'join'
25577. Get the value represented by an duk_ispec to a register or constant. * The caller can control the result by indicating whether or not: * * (1) a constant is allowed (sometimes the caller needs the result to * be in a register) * * (2) a temporary register is required (usually when caller requires * the register to be safely mutable; normally either a bound * register or a temporary register are both OK) * * (3) a forced register target needs to be used * * Bytecode may be emitted to generate the necessary value. The return * value is either a register or a constant.
25578. **comment:** XXX: FP_ZERO check can be removed, the else clause handles it * correctly (preserving sign).
 label: code-design
25579. **comment:** XXX: the string shouldn't appear twice, but we now loop to the * end anyway; if fixed, add a looping assertion to ensure there * is no duplicate.
 label: code-design
25580. re-lookup first char on first loop
25581. [... buf loop (proplist)]
25582. DUK_BUFOBJ_INT16ARRAY
25583. No net refcount changes.
25584. DUK_USE_DATE_FMT_STRFTIME
25585. eat the right paren
25586. **comment:** A straightforward 64-byte lookup would be faster * and cleaner, but this is shorter.
 label: code-design
25587. For this to work, DATEMSK must be set, so this is not very * convenient for an embeddable interpreter.
25588. Fixed buffer; data follows struct, with proper alignment guaranteed by * struct size.
25589. **comment:** * Call handling. * * Main functions are: * * - duk_handle_call_unprotected(): unprotected call to Ecmascript or * Duktape/C function * - duk_handle_call_protected(): protected call to Ecmascript or * Duktape/C function * - duk_handle_safe_call(): make a protected C call within current * activation * - duk_handle_ecma_call_setup(): Ecmascript-to-Ecmascript calls * (not always possible), including tail calls and coroutine resume * * See 'execution.rst'. * * Note: setjmp() and local variables have a nasty interaction, * see execution.rst; non-volatile locals modified after setjmp() * call are not guaranteed to keep their value.
 label: code-design
25590. -1 if disjunction is complex, char length if simple
25591. noblame_fileline
25592. Backtrack to previous slash or start of buffer.
25593. func limits
25594. This is a rare property helper; it sets the global thrower (E5 Section 13.2.3) * setter/getter into an object property. This is needed by the 'arguments' * object creation code, function instance creation code, and Function.prototype.bind().
25595. For anything other than an Error instance, we calculate the error * location directly from the current activation.
25596. **comment:** Workaround for some exotic platforms where NAN is missing * and the expression (0.0 / 0.0) does NOT result in a NaN. * Such platforms use the global 'duk_computed_nan' which must * be initialized at runtime. Use 'volatile' to ensure that * the compiler will actually do the computation and not try * to do

constant folding which might result in the original * problem.

label: code-design

25597. A -> target register (A, A+1) for call setup * (for DUK_OP_CSREGI, 'a' is indirect) * B -> register containing target function (not type checked here)

25598. Return the Buffer to allow chaining: b.fill(0x11).fill(0x22, 3, 5).toString()

25599. **comment:** code_idx: not needed

label: requirement

25600. keep func->h_funcs; inner functions are not reparsed to avoid O(depth^2) parsing

25601. load factor min 25%

25602. 1111 0xxx 10xx xxxx 10xx xxxx 10xx xxxx

25603. Note: peek cannot currently trigger a detach * so the dbg_detaching == 0 assert outside the * loop is correct.

25604. Assume interrupt init/counter are properly initialized here.

25605. * Parse a case or default clause.

25606. **comment:** XXX: when this error is caused by a nonexistent * file given to duk_peval_file() or similar, the * error message is not the best possible.

label: code-design

25607. impose a reasonable exponent limit, so that exp * doesn't need to get tracked using a bigint.

25608. marker value; in E5 2^32-1 is not a valid array index (2^32-2 is highest valid)

25609. maxval

25610. valstack space allocated especially for proxy lookup which does a * recursive property lookup

25611. Accept ASCII strings which conform to identifier requirements * as being emitted without key quotes. Since we only accept ASCII * there's no need for actual decoding: 'p' is intentionally signed * so that bytes >= 0x80 extend to negative values and are rejected * as invalid identifier codepoints.

25612. The Str(key, holder) operation. * * Stack policy: [... key] -> [...]

25613. * Bitstream encoder

25614. -> [sep ToObject(this) len str sep]

25615. Decrement PC if that was requested, this requires a PC sync.

25616. Array properties have exotic behavior but they are concrete, * so no special handling here. * * Arguments exotic behavior (E5 Section 10.6, [[GetOwnProperty]] * is only relevant as a post-check implemented below; hence no * check here.

25617. XXX: request a "last statement is terminal" from duk_parse_stmt() and duk_parse_stmts(); * we could avoid the last RETURN if we could ensure there is no way to get here * (directly or via a jump)

25618. [... key_obj key key flags]

25619. no side effects

25620. INACTIVE: no activation, single function value on valstack

25621. Equality may be OK but >length not. Checking * this explicitly avoids some overflow cases * below.

25622. this cannot initiate a detach

25623. done so that duk_mark_heapHdr() works correctly

25624. if highest bit of a register number is set, it refers to a constant instead

25625. **comment:** Slow variants, call to a helper to reduce code size. * Can be used explicitly when size is always more important than speed.

label: code-design

25626. DUK_USE_REFERENCE_COUNTING

25627. Caller ensures space for at least DUK_JSON_MAX_ESC_LEN.

25628. byte offset to buf

25629. * The catch variable must be updated to reflect the new allocated * register for the duration of the catch clause. We need to store * and restore the original value for the varmap entry (if any).

25630. **comment:** unused now

label: code-design

25631. **comment:** stack[0] = callback * stack[1] = thisArg * stack[2] = object * stack[3] = ToUInt32(length) (unused, but avoid unnecessary pop) * stack[4] = result array (or undefined)

25632. still in prologue

25633. heap->dbg_processing: keep on purpose to avoid debugger re-entry in detaching state

25634. fixed-format termination conditions

25635. DUK_TOK_ELSE

25636. * Add line number to a compiler error.

25637. array of function templates: [func1, offset1, line1, func2, offset2, line2] * offset/line points to closing brace to allow skipping on pass 2

25638. Ensure copy is covered by underlying buffers.

25639. longjmp state

25640. * Note: * * - Intentionally attempt (empty) match at char_offset == k_input->clen * * - Negative char_offsets have been eliminated and char_offset is duk_uint32_t * -> no need or use for a negative check

25641. Expression, terminates at a ')

25642. can't happen when keeping current stack size

25643. Special handling for CALL/NEW/MPUTOBJ/MPUTARR shuffling. * For each, slot B identifies the first register of a range * of registers, so normal shuffling won't work. Instead, * an indirect version of the opcode is used.

25644. DUK_TOK_FOR

25645. Miscellaneous.

25646. -> [... retval]

25647. If a setter/getter is missing (undefined), the descriptor must * still have the property present with the value 'undefined'.

25648. -> [timeval this]

25649. **comment:** Clean up stack

label: code-design

25650. **comment:** dump all allocated entries, unused entries print as 'unused', * note that these may extend beyond current 'length' and look * a bit funny.

label: code-design

25651. unwind to 'yield' caller

25652. How much stack to require on entry to object/array decode

25653. (e.g. k=3, digits=2 -> "12X")

25654. Note: changing from writable to non-writable is OK

25655. unwinds valstack, updating refcounts

25656. For JX, expressing the whole unsigned 32-bit range matters.

25657. r <- 2 * f

25658. currently active breakpoints: NULL term, borrowed pointers

25659. conversions, coercions, comparison, etc

25660. [key val] -> [key]

25661. use stack allocated buffer to ensure reachability in errors (e.g. intern error)

25662. **comment:** * Manually optimized double-to-fastint downgrade check. * * This check has a large impact on performance, especially for fastint * slow paths, so must be changed carefully. The code should probably be * optimized for the case where the result does not fit into a fastint, * to minimize the penalty for "slow path code" dealing with fractions etc. * * At least on one tested soft float ARM platform double-to-int64 coercion * is very slow (and sometimes produces incorrect results, see self tests). * This algorithm combines a fastint compatibility check and extracting the * integer value from an IEEE double for setting the tagged fastint. For * other platforms a more naive approach might be better. * * See doc/fastint.rst for details.

label: code-design

25663. * Misc support functions

25664. ch is a literal character here or -1 if parsed entity was * an escape such as "'s".
25665. Code emission flags, passed in the 'opcode' field. Opcode + flags * fit into 16 bits for now, so use duk_small_uint.t.
25666. array of formal argument names (-> _Formals)
25667. [...] func this arg1 ... argN]
25668. * Simple atom ** If atom_char_length is zero, we'll have unbounded execution time for e.g. */()*/x/.exec('x'). We can't just skip the match because it might have some * side effects (for instance, if we allowed captures in simple atoms, the * capture needs to happen). The simple solution below is to force the * quantifier to match at most once, since the additional matches have no effect. ** With a simple atom there can be no capture groups, so no captures need * to be reset.
25669. key encountered as a getter
25670. **comment:** XXX: typing
 label: code-design
25671. catches EOF (NUL)
25672. 'act' is no longer accessed, scanbuild fix
25673. **comment:** XXX: Array size is known before and (2 * re_ctx.nsaved) but not taken * advantage of now. The array is not compacted either, as regexp match * objects are usually short lived.
 label: code-design
25674. Ecmascript activation + Duktape.Thread.yield() activation
25675. **comment:** Presence of 'fun' is config based, there's a marginal performance * difference and the best option is architecture dependent.
 label: code-design
25676. [...] RegExp]
25677. DUK_TOK_DECREMENT
25678. [...] errhandler undefined errval]
25679. **comment:** The target for this LDCONST may need output shuffling, but we assume * that 'pc_ldconst' will be the LDCONST that we can patch later. This * should be the case because there's no input shuffling. (If there's * no catch clause, this LDCONST will be replaced with a NOP.)
 label: code-design

25739. accept anything, expect first value (EOF will be * caught by key parsing below.
25740. unknown, ignore
25741. * Note: fmax() does not match the E5 semantics. E5 requires * that if -any- input to Math.max() is a NaN, the result is a * NaN. fmax() will return a NaN only if both- inputs are NaN. * Same applies to fmin(). * * Note: every input value must be coerced with ToNumber(), even * if we know the result will be a NaN anyway: ToNumber() may have * side effects for which even order of evaluation matters.
25742. [... v1 v2 name filename]
25743. !DUK_USE_PANIC_HANDLER
25744. **comment:** XXX: inlined DECREF macro would be nice here: no NULL check, * refzero queueing but no refzero algorithm run (= no pointer * instability), inline code.
label: code-design
25745. expected ival
25746. **comment:** A 16-bit listlen makes sense with 16-bit heap pointers: there * won't be space for 64k strings anyway.
label: code-design
25747. * Finalize refcounts for heap elements just about to be freed. * This must be done for all objects before freeing to avoid any * stale pointer dereferences. * * Note that this must deduce the set of objects to be freed * identically to duk_sweep_heap().
25748. no sce, or sce scan not best
25749. caller must have decref'd values above new_a_size (if that is necessary)
25750. [... buf loop (proplist) (gap)]
25751. **comment:** XXX: duk_hobject_hasprop() would be correct for * non-Proxy objects too, but it is about ~20-25% * slower at present so separate code paths for * Proxy and non-Proxy now.
label: code-design
25752. Coercion may be needed, the helper handles that by pushing the * tagged values to the stack.
25753. checked by caller
25754. 'Int16Array'
25755. res->strs16[] is zeroed and zero decodes to NULL, so no NULL inits.
25756. entry part must not contain any configurable properties, or * writable properties (if is_frozen).
25757. thread; minimizes argument passing
25758. step 4.d
25759. **comment:** * The Number constructor uses ToNumber(arg) for number coercion * (coercing an undefined argument to NaN). However, if the * argument is not given at all, +0 must be used instead. To do * this, a vararg function is used.
label: code-design
25760. one operator (= assign)
25761. no need to init reg, it will be undefined on entry
25762. string objects must not created without internal value
25763. eat backslash on entry
25764. * Cached module check. * * If module has been loaded or its loading has already begun without * finishing, return the same cached value ('exports'). The value is * registered when module load starts so that circular references can * be supported to some extent.
25765. * Setup a preliminary activation and figure out nargs/nregs. * * Don't touch valstack_bottom or valstack_top yet so that Duktape API * calls work normally.
25766. **comment:** XXX: Rework to use an always-inline function?
label: code-design
25767. **comment:** * Common heap header * * All heap objects share the same flags and refcount fields. Objects other * than strings also need to have a single or double linked list pointers * for insertion into the "heap allocated" list. Strings are held in the * heap-wide string table so they don't need link pointers. * * Technically, 'h_refcount' must be wide enough to guarantee that it cannot * wrap (otherwise objects might be freed incorrectly after wrapping). This * means essentially that the refcount field must be as wide as data pointers. * On 64-bit platforms this means that the refcount needs to be 64 bits even * if an 'int' is 32 bits. This is a bit unfortunate, and compromising on * this might be reasonable in the future. * * Heap header size on 32-bit platforms: 8 bytes without reference counting, * 16 bytes with reference counting.
label: code-design
25768. We're a varargs function because we need to detect whether * initialValue was given or not.
25769. cannot be strict (never mapped variables)
25770. Avoid recursive re-entry; enter when we're attached or * detaching (to finish off the pending detach).
25771. DUK_DEBUGGER_H_INCLUDED
25772. Maximum length of CommonJS module identifier to resolve. Length includes * both current module ID, requested (possibly relative) module ID, and a * slash in between.
25773. **comment:** * Property count check. This is the only point where we ensure that * we don't get more (allocated) property space that we can handle. * There aren't hard limits as such, but some algorithms fail (e.g. * finding next higher prime, selecting hash part size) if we get too * close to the 4G property limit. * * Since this works based on allocation size (not actually used size), * the limit is a bit approximate but good enough in practice.
label: code-design
25774. This loop intentionally does not ensure characters are valid * ([0-9a-fA-F]) because the hex decode call below will do that.
25775. 0 if no used entries
25776. * Basic double / byte union memory layout.
25777. copy values (no overlap even if to_ctx == from_ctx; that's not * allowed now anyway)
25778. Use match charlen instead of bytelen, just in case the input and * match codepoint encodings would have different lengths.
25779. **comment:** Count actually used array part entries and array minimum size. * NOTE: 'out_min_size' can be computed much faster by starting from the * end and breaking out early when finding first used entry, but this is * not needed now.
label: code-design
25780. if new_p == NULL, all of these pointers are NULL
25781. -> [... obj retrval/error]
25782. [... holder key] -> [... holder]
25783. 'this' binding is just before current activation's bottom
25784. **comment:** * Error handling macros, assertion macro, error codes. * * There are three level of 'errors': * * 1. Ordinary errors, relative to a thread, cause a longjmp, catchable. * 2. Fatal errors, relative to a heap, cause fatal handler to be called. * 3. Panic errors, unrelated to a heap and cause a process exit. * * Panics are used by the default fatal error handler and by debug code * such as assertions. By providing a proper fatal error handler, user * code can avoid panics in non-debug builds.

label: code-design

26402. Valstack should suffice here, required on function valstack init
26403. duk_hnativefunction specific fields.
26404. r <- (* f b2) [if b==2 -> (* f 4)] * s <- (* (expt b (- 1 e)) 2) == b^(1-e) * 2 [if b==2 -> b^(2-e)] * m+ <- b == 2 * m- <- 1 * k <- 0 * B <- B * low_ok <- round * high_ok <- round
26405. Insert bytes in the middle of the buffer from an external buffer.
26406. identifier names (E5 Section 7.6)
26407. * Set up the resolution input which is the requested ID directly * (if absolute or no current module path) or with current module * ID prepended (if relative and current module path exists). * * Suppose current module is 'foo/bar' and relative path is '/quux'. * The 'bar' component must be replaced so the initial input here is * 'foo/bar/..//quux'.
26408. A non-Array object should not have an array part in practice. * But since it is supported internally (and perhaps used at some * point), check and abandon if that's the case.
26409. keep heap->dbg_detached_cb
26410. For tv1 == tv2, both pointing to stack top, the end result * is same as duk_pop(ctx).
26411. If input_offset were assigned a negative value, it would * result in a large positive value. Most likely it would be * larger than input_length and be caught here. In any case * no memory unsafe behavior would happen.
26412. During parsing, month and day are one-based; set defaults here.
26413. **comment:** * Logger arguments are: * * magic: log level (0-5) * this: logger * stack: plain log args * * We want to minimize memory churn so a two-pass approach * is used: first pass formats arguments and computes final * string length, second pass copies strings either into a * pre-allocated and reused buffer (short messages) or into a * newly allocated fixed buffer. If the backend function plays * nice, it won't coerce the buffer to a string (and thus * intern it).
 label: code-design
26414. Non-zero refcounts should not happen because we refcount * finalize all unreachable objects which should cancel out * refcounts (even for cycles).
26415. token allows automatic semicolon insertion (eof or preceded by newline)
26416. Use special opcodes to load short strings
26417. * Add .fileName and .lineNumber to an error on the stack top.
26418. * CommonJS require() and modules support
26419. * Lexing helpers
26420. * Create built-in objects by parsing an init bitstream generated * by genbuiltins.py.
26421. explicit PropertyList
26422. Special handling for call setup instructions. The target * is expressed indirectly, but there is no output shuffling.
26423. * Create mantissa
26424. NOTE: act may be NULL if an error is thrown outside of any activation, * which may happen in the case of, e.g. syntax errors.
26425. ToNumber() for a fastint is a no-op.
26426. [key] -> [undefined] (default value)
26427. traceback depth fits into 16 bits
26428. [thisArg arg1 ... argN func boundFunc argArray]
26429. * Parser duk__advance() token eating functions
26430. **comment:** cleanup varmap from any null entries, compact it, etc; returns number * of final entries after cleanup.
 label: code-design
26431. **comment:** * Needs a save of multiple saved[] entries depending on what range * may be overwritten. Because the regexp parser does no such analysis, * we currently save the entire saved array here. Lookaheads are thus * a bit expensive. Note that the saved array is not needed for just * the lookahead sub-match, but for the matching of the entire sequel. * * The temporary save buffer is pushed on to the valstack to handle * errors correctly. Each lookahead causes a C recursion and

pushes * more stuff on the value stack. If the C recursion limit is less * than the value stack spare, there is no need to check the stack. * We do so regardless, just in case.

26460. Math.pow(-0,y) where y<0 should be: * - -Infinity if y<0 and an odd integer * - Infinity otherwise * NetBSD pow() returns -Infinity for all finite y<0. The * if- clause also catches y == -Infinity (which works even * without the fix).

26461. **comment:** XXX: add temporary duk_p pointer here too; sharing

label: code-design

26462. not minimum exponent

26463. * Avoid nested calls. Concretely this happens during debugging, e.g. * when we eval() an expression. * * Also don't interrupt if we're currently doing debug processing * (which can be initiated outside the bytecode executor) as this * may cause the debugger to be called recursively. Check required * for correct operation of throw intercept and other "exotic" halting * scenarios.

26464. Because new_size > duk_count_used_probe(heap), guaranteed to work

26465. bump refcount to prevent refzero during finalizer processing

26466. * Pointers to function data area for faster access. Function * data is a buffer shared between all closures of the same * "template" function. The data buffer is always fixed (non- * dynamic, hence stable), with a layout as follows: * * constants (duk_tval) * inner functions (duk_hobject *) * bytecode (duk_instr_t) * * Note: bytecode end address can be computed from 'data' buffer * size. It is not strictly necessary functionally, assuming * bytecode never jumps outside its allocated area. However, * it's a safety/robustness feature for avoiding the chance of * executing random data as bytecode due to a compiler error. * * Note: values in the data buffer must be incref'd (they will * be decref'd on release) for every compiledfunction referring * to the 'data' element.

26467. **comment:** * Advance lookup window by N characters, filling in new characters as * necessary. After returning caller is guaranteed a character window of * at least DUK_LEXER_WINDOW_SIZE characters. * * The main function duk_advance_bytes() is called at least once per every * token so it has a major lexer/compiler performance impact. There are two * variants for the main duk_advance_bytes() algorithm: a sliding window * approach which is slightly faster at the cost of larger code footprint, * and a simple copying one. * * Decoding directly from the source string would be another lexing option. * But the lookup window based approach has the advantage of hiding the * source string and its encoding effectively which gives more flexibility * going forward to e.g. support chunked streaming of source from flash. * * Decodes UTF-8/CESU-8 leniently with support for code points from U+0000 to * U+10FFFF, causing an error if the input is unparseable. Leniency means: * * * Unicode code point validation is intentionally not performed, * except to check that the codepoint does not exceed 0x10ffff. * * * In particular, surrogate pairs are allowed and not combined, which * allows source files to represent all SourceCharacters with CESU-8. * Broken surrogate pairs are allowed, as Ecmascript does not mandate * their validation. * * * Allow non-shortest UTF-8 encodings. * * Leniency here causes few security concerns because all character data is * decoded into Unicode codepoints before lexer processing, and is then * re-encoded into CESU-8. The source can be parsed as strict UTF-8 with * a compiler option. However, Ecmascript source characters include -all- * 16-bit unsigned integer codepoints, so leniency seems to be appropriate. * * Note that codepoints above the BMP are not strictly SourceCharacters, * but the lexer still accepts them as such. Before ending up in a string * or an identifier name, codepoints above BMP are converted into surrogate * pairs and then CESU-8 encoded, resulting in 16-bit Unicode data as * expected by Ecmascript. * * An alternative approach to dealing with invalid or partial sequences * would be to skip them and replace them with e.g. the Unicode replacement * character U+FFFD. This has limited utility because a replacement character * will most likely cause a parse error, unless it occurs inside a string. * Further, Ecmascript source is typically pure ASCII. * * See: * * <http://en.wikipedia.org/wiki=UTF-8> * <http://en.wikipedia.org/wiki/CESU-8> * <http://tools.ietf.org/html/rfc3629> * http://en.wikipedia.org/wiki/UTF-8#Invalid_byte_sequences * * Future work: * * * Reject other invalid Unicode sequences (see Wikipedia entry for examples) * in strict UTF-8 mode. * * * Size optimize. An attempt to use a 16-byte lookup table for the first * byte resulted in a code increase though. * * * Is checking against maximum 0x10ffff really useful? 4-byte encoding * imposes a certain limit anyway. * * * Support chunked streaming of source code. Can be implemented either * by streaming chunks of bytes or chunks of codepoints.

label: code-design
26618. * Get starting character offset for match, and initialize 'sp' based on it. * * Note: lastIndex is non-configurable so it must be present (we check the * internal class of the object above, so we know it is). User code can set * its value to an arbitrary (garbage) value though; E5 requires that lastIndex * be coerced to a number before using. The code below works even if the * property is missing: the value will then be coerced to zero. * * Note: lastIndex may be outside Uint32 range even after ToInteger() coercion. * For instance, ToInteger(+Infinity) = +Infinity. We track the match offset * as an integer, but pre-check it to be inside the 32-bit range before the loop. * If not, the check in E5 Section 15.10.6.2, step 9.a applies.
26619. avoid side effect issues
26620. * Setup call: target and 'this' binding. Three cases: * * 1. Identifier base (e.g. "foo()") * 2. Property base (e.g. "foo.bar()") * 3. Register base (e.g. "foo()0"; i.e. when a return value is a function)
26621. SHIFT EXPRESSION
26622. overflow, fall through
26623. restored if ecma-to-ecma setup fails
26624. Match labels starting from latest label because there can be duplicate empty * labels in the label set.
26625. If debugger is paused, garbage collection is disabled by default.
26626. DUK_ERR_REFERENCE_ERROR: no macros needed
26627. XXX: shared helper for duk_push_hobject_or_undefined()
26628. * Strings have no internal references but do have "weak" * references in the string cache. Also note that strings * are not on the heap_allocated list like other heap * elements.
26629. unconditionally
26630. **comment:** XXX: At the moment Duktape accesses internal keys like _Finalizer using a * normal property set/get which would allow a proxy handler to interfere with * such behavior and to get access to internal key strings. This is not a problem * as such because internal key strings can be created in other ways too (e.g. * through buffers). The best fix is to change Duktape internal lookups to * skip proxy behavior. Until that, internal property accesses bypass the * proxy and are applied to the target (as if the handler did not exist). * This has some side effects, see test-bi-proxy-internal-keys.js.
label: code-design
26631. Get local time offset (in seconds) for a certain (UTC) instant 'd'.
26632. **comment:** Can be called multiple times with no harm. Mark the transport * bad (dbg_read_cb == NULL) and clear state except for the detached * callback and the udata field. The detached callback is delayed * to the message loop so that it can be called between messages; * this avoids corner cases related to immediate debugger reattach * inside the detached callback.

26782. currently running thread

26783. temproots

26784. Tail call check: if last opcode emitted was CALL(I), and * the context allows it, change the CALL(I) to a tail call. * This doesn't guarantee that a tail call will be allowed at * runtime, so the RETURN must still be emitted. (Duktape * 0.10.0 avoided this and simulated a RETURN if a tail call * couldn't be used at runtime; but this didn't work * correctly with a thread yield/resume, see * test-bug-tailcall-thread-yield-resume.js for discussion.) * * In addition to the last opcode being CALL, we also need to * be sure that 'rc_val' is the result register of the CALL(I). * For instance, for the expression 'return 0, (function () { return 1; })', 2' the last opcode emitted is CALL (no * bytecode is emitted for '2') but 'rc_val' indicates * constant '2'. Similarly if '2' is replaced by a register * bound variable, no opcodes are emitted but tail call would * be incorrect. * * This is tricky and easy to get wrong. It would be best to * track enough expression metadata to check that 'rc_val' came * from that last CALL instruction. We don't have that metadata * now, so we check that 'rc_val' is a temporary register result * (not a constant or a register bound variable). There should * be no way currently for 'rc_val' to be a temporary for an * expression following the CALL instruction without emitting * some opcodes following the CALL. This proxy check is used * below. * * See: test-bug-comma-expr-gh131.js. * * The non-standard 'caller' property disables tail calls * because they pose some special cases which haven't been * fixed yet.

26785. * Helper: handle Array object 'length' write which automatically * deletes properties, see E5 Section 15.4.5.1, step 3. This is * quite tricky to get right. * * Used by duk_hobject_putprop().

26786. vararg

26787. Use 'res' as the expression value (it's side effect * free and may be a plain value, a register, or a * constant) and write it to the LHS binding too.

26984. Flags for duk_push_string_file_raw()
26985. Duktape debug protocol version used by this build.
26986. **comment:** DUK_COMPILE_xxx bits 0-2 are reserved for an internal 'nargs' argument * (the nargs value passed is direct stack arguments + 1 to account for an * internal extra argument).
label: code-design
26987. fixed or dynamic, garbage collected byte buffer
26988. * Thread management
26989. * Double NaN manipulation macros related to NaN normalization needed when * using the packed duk_tval representation. NaN normalization is necessary * to keep double values compatible with the duk_tval format. * * When packed duk_tval is used, the NaN space is used to store pointers * and other tagged values in addition to NaNs. Actual NaNs are normalized * to a specific quiet NaN. The macros below are used by the implementation * to check and normalize NaN values when they might be created. The macros * are essentially NOPs when the non-packed duk_tval representation is used. * * A FULL check is exact and checks all bits. A NOTFULL check is used by * the packed duk_tval and works correctly for all NaNs except those that * begin with 0x7ff0. Since the 'normalized NaN' values used with packed * duk_tval begin with 0x7ff8, the partial check is reliable when packed * duk_tval is used. The 0x7ff8 prefix means the normalized NaN will be a * quiet NaN regardless of its remaining lower bits. * * The ME variant below is specifically for ARM byte order, which has the * feature that while doubles have a mixed byte order (32107654), unsigned * long long values has a little endian byte order (76543210). When writing * a logical double value through a ULL pointer, the 32-bit words need to be * swapped; hence the #ifdefs below for ULL writes with DUK_USE_DOUBLE_ME. * This is not full ARM support but suffices for some environments.
26990. either not a NaN
26991. convert time value to local time
26992. not directly applicable, byte order differs from a double
26993. end "C" wrapper
26994. * Object operations
26995. set writable (effective if DUK_DEFPROP_HAVE_WRITABLE set)

26996. UnsupportedError

26997. **comment:** Internal API call flags, used for various functions in this file. * Certain flags are used by only certain functions, but since the flags * don't overlap, a single flags value can be passed around to multiple * functions. * * The unused top bits of the flags field are also used to pass values * to helpers (duk_get_part_helper() and duk_set_part_helper()). * * (Must be in-sync with genbuiltins.py.)

label: code-design

26998. There are currently no native functions to yield/resume, due to the internal * limitations on coroutine handling. These will be added later.

26999. Concrete macros for NaN handling used by the implementation internals. * Chosen so that they match the duk_tval representation: with a packed * duk_tval, ensure NaNs are properly normalized; with a non-packed duk_tval * these are essentially NOPs.

27000. (internal) no source string on stack

27001. * Function (method) calls

27002. plain

27003. Ecmascript string: CESU-8 / extended UTF-8 encoded

27004. internal flag: don't zero allocated buffer

27005. use strict (outer) context for global, eval, or function code

27006. in non-packed representation we don't care about which NaN is used

27007. * Union for accessing double parts, also serves as packed duk_tval

27008. include date part in string conversion result

27009. internal flag: dynamic buffer

27010. Ecmascript null

27011. enumerate non-enumerable properties in addition to enumerable

27012. **comment:** XXX: replace with RangeError?

label: code-design

27013. * Push operations * * Push functions return the absolute (relative to bottom of frame) * position of the pushed value for convenience. * * Note: duk_dup() is technically a push.

27014. string

27015. * ROM pointer compression

27016. * Union to access IEEE double memory representation, indexes for double * memory representation, and some macros for double manipulation. * * Also used by packed duk_tval. Use a union for bit manipulation to * minimize aliasing issues in practice. The C99 standard does not * guarantee that this should work, but it's a very widely supported * practice for low level manipulation. * * IEEE double format summary: * * seeeeeeee eeeeefff ffffffff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H * * s sign bit * eee... exponent field * fff... fraction * * See http://en.wikipedia.org/wiki/Double_precision_floating-point_format. * * NaNs are represented as exponent 0x7ff and mantissa != 0. The NaN is a * signaling NaN when the highest bit of the mantissa is zero, and a quiet * NaN when the highest bit is set. * * At least three memory layouts are relevant here: * * A B C D E F G H Big endian (e.g. 68k) DUK_USE_DOUBLE_BE * H G F E D C B A Little endian (e.g. x86) DUK_USE_DOUBLE_LE * D C B A H G F E Mixed/cross endian (e.g. ARM) DUK_USE_DOUBLE_ME * * ARM is a special case: ARM double values are in mixed/cross endian * format while ARM duk_uint64_t values are in standard little endian * format (H G F E D C B A). When a double is read as a duk_uint64_t * from memory, the register will contain the (logical) value * E F G H A B C D. This requires some special handling below. * * Indexes of various types (8-bit, 16-bit, 32-bit) in memory relative to * the logical (big endian) order: * * byte order duk_uint8_t duk_uint16_t duk_uint32_t * BE 01234567 0123 01 * LE 76543210 3210 10 * ME (ARM) 32107654 1032 01 * * Some processors may alter NaN values in a floating point load+store. * For instance, on X86 a FLD + FSTP may convert a signaling NaN to a * quiet one. This is catastrophic when NaN space is used in packed * duk_tval values. See: misc/clang_aliasing.c.

27017. * Helper macros for reading/writing memory representation parts, used * by duk_numconv.c and duk_tval.h.

27018. string conversion: use 'T' instead of '' as a separator

27019. Ecmascript number: double

27020. TypeError

27021. Support array for ROM pointer compression. Only declared when ROM * pointer compression is active.

27022. **comment:** Although extra/top could be an unsigned type here, using a signed type * makes the API more robust to calling code calculation errors or corner * cases (where caller might occasionally come up with negative values). * Negative values are treated as zero, which is better than casting them * to a large unsigned number. (This principle is used elsewhere in the * API too.)

label: code-design

27023. * Misc conversion

27024. Ecmascript object: includes objects, arrays, functions, threads

27025. URIError

27026. all doubles are considered normalized

27027. AUTHORS.rst

27028. day within month: 0 to 30

27029. setter: call is a time setter (affects hour, min, sec, ms); otherwise date setter (affects year, month, day-in-month)

27030. (internal) no filename on stack

27031. compile eval code (instead of global code)

27032. One problem with this macro is that expressions like the following fail * to compile: "(void) duk_error(...)". But because duk_error() is noreturn, * they make little sense anyway.

27033. set setter (given on value stack)

27034. prefer number, unless input is a Date, in which * case prefer string (E5 Section 8.12.8)

27035. Part indices for internal breakdowns. Part order from DUK_DATE_IDX_YEAR * to DUK_DATE_IDX_MILLISECOND matches argument ordering of Ecmascript API * calls (like Date constructor call). Some functions in duk_bi_date.c * depend on the specific ordering, so change with care. 16 bits are not * enough for all parts (year, specifically). * * (Must be in-sync with genbuiltins.py.)

27036. E == 0x7ff, F == 8 => normalized NaN

27037. Enumeration flags for duk_enum()

27038. year

27039. * Other state related functions

27040. Shared helper to generate DUK_OPT_xxx and DUK_USE_xxx documentation. XXX: unfinished placeholder

27041. Add a header snippet for detecting presence of DUK_OPT_xxx feature options which will be removed in Duktape 2.x.

27042. Add a header snippet for providing a __OVERRIDE_DEFINES__ section.

27043. XXX: unsigned constants?

27044. Globals holding scanned metadata, helper snippets, etc

27045. verbatim text for the entire line

27046. **comment:** Derived defines (DUK_USE_INTEGER_LE, etc) from DUK_USE_BYTEORDER. Duktape internals currently rely on the derived defines. This is after sanity checks because the derived defines are marked removed.

label: code-design

27047. Add original snippets. This fills in the required nodes recursively.

27048. **comment:** DUK_OPT_xxx always come from outside

label: code-design

27049. print('#snippet ' + sub_fn)

27050. already present

27051. **comment:** XXX: more checks

label: code-design

27052. Assume these provides come from outside.

27053. Feature selection, system include, Date provider Most #include statements are here

27054. Remaining tags in alphabetic order

27055. Automatic DUK_OPT_xxx feature option handling

27056. key is known

27057. Byte order and alignment defines are allowed to be missing, a fill-in will handle them. This is necessary because for some architecture byte order and/or alignment may vary between targets and may be software configurable.

27058. integer value

27059. Figure out fill-ins by looking for snippets not in original list and without any unserialized dependent nodes.

27060. **comment:** Autogeneration of option documentation
label: documentation

27061. duk_config.h generation

27062. print(repr(graph)) print(repr(snlist)) print('Resolved helper defines: %r' % resolved)

27063. Detect and reject 'fast math'

27064. **comment:** XXX: conditional warning, happens in some normal cases print('WARNING: define %r required, not provided so far' % k)
label: code-design

27065. Helper for building a text file from individual lines, injected files, etc. Inserted values are converted to Snippets so that their provides/requires information can be tracked. When non-C outputs are created, these will be bogus but ignored.

27066. Don't allow e.g. DUK_USE_ which results from matching DUK_USE_xxx

27067. NOTE: careful with Python equality, e.g. "0 == False" is true.

27068. Metadata to scan from config files.

27069. Generate a duk_config.h where platform, architecture, and compiler are all either autodetected or specified by user. Autodetection is based on a configured list of supported platforms, architectures, and compilers. For example, platforms.yaml defines the supported platforms and provides a helper define (DUK_F_xxx) to use for detecting that platform, and names the header snippet to provide the platform-specific definitions. Necessary dependencies (DUK_F_xxx) are automatically pulled in. Automatic "fill ins" are used for mandatory platform, architecture, and compiler defines which have a reasonable portable default. This reduces e.g. compiler-specific define count because there are a lot compiler macros which have a good default.

27070. **comment:** XXX: require automatic detection to be signaled? e.g. define DUK_USE_ALIGN_BY -1 define DUK_USE_BYTE_ORDER -1
label: code-design

27071. Development time helper: add DUK_ACTIVE which provides a runtime C string indicating what DUK_USE_xxx config options are active at run time. This is useful in genconfig development so that one can e.g. diff the active run time options of two headers. This is intended just for genconfig development and is not available in normal headers.

27072. Default value is false, and caller has emitted an unconditional #undef, so don't emit a duplicate

27073. Platform, architecture, compiler fillins. These are after all detection so that e.g. DUK_SPRINTF() can be provided by platform or compiler before trying a fill-in.

27074. Main

27075. **comment:** XXX: indicate feature option support, sanity checks enabled, etc in general summary of options, perhaps genconfig command line?

label: code-design

27078. **comment:** XXX: better to lookup compilers metadata
label: code-design

27079. Compiler files must provide at least these (additional checks in validate_compiler_file()). Fill-ins provide missing optionals.

27080. Header snippet representation: lines, provides defines, requires defines.

27081. **comment:** Find a header snippet which provides the missing define. Some DUK_F_xxx files provide multiple defines, so we don't necessarily know the snippet filename here.
label: code-design

27082. signal to fillin

27083. print('Tags: %r' % use_tags_list)

27084. must be #define'd

27085. Compatibility with Duktape 1.3

27086. compiling Duktape from a single source file (duktape.c) version compiling Duktape (not user application) artifact, include guard

27087. Forced options from multiple sources are gathered into a shared list so that the override order remains the same as on the command line.

27088. Avoid ambiguous hex escapes

27089. Snippet provides it's own require; omit

27090. print('config option %s not covered by manual snippets, emitting default automatically' % k)

27091. **comment:** XXX: rst or other format
label: code-design

27092. C string value

27093. Platform files must provide at least these (additional checks in validate_platform_file()). Fill-ins provide missing optionals.

27094. shallow copy

27095. Architecture files must provide at least these (additional checks in validate_architecture_file()). Fill-ins provide missing optionals.

27096. Generate a duk_config.h header with platform, compiler, and architecture either autodetected (default) or specified by user. Support for autogenerated DUK_OPT_xxx flags is also selected by user.

27097. **comment:** XXX: aware of target version
label: code-design

27098. Preferred tags first

27099. snippet list

27100. **comment:** XXX: better to lookup architectures metadata
label: code-design

27101. graph[A] = [B, ...] <-> B, ... provide something A requires.

27102. x is a Snippet

27103. Helper headers snippets.

27104. lines of text and/or snippets map from define to 'True' for now map from define to 'True' for now

27105. **comment:** Insert missing define dependencies into index 'idx_deps' repeatedly until no unsatisfied dependencies exist. This is used to pull in the required DUK_F_xxx helper defines without pulling them all in. The resolution mechanism also ensures dependencies are pulled in the correct order, i.e. DUK_F_xxx helpers may depend on each other (as long as there are no circular dependencies). XXX: this can be simplified a lot
label: code-design

27106. strip last newline to avoid empty line

27107. **comment:** DUK_USE_xxx are internal and they should not be 'requirements'
label: code-design

27108. This is a fallback in case config option metadata is wrong.

27109. byteorder provided by all architecture files alignment provided by all architecture files packed tval provided by all architecture files

27110. print('Autoscanning snippet: %s' % fn)

27111. for printing only

27112. **comment:** XXX: detect and handle loops cleanly
label: code-design

27113. Emit a default #define / #undef for an option based on a config option metadata node (parsed YAML doc).

27114. Object layout

27115. Careful with order, snippet may self-reference its own defines in which case there's no outward dependency. (This is not 100% because the order of require/provide matters and this is not handled now.) Also, some snippets may #undef/#define another define but they don't "provide" the define as such. Such redefinitions are marked /* redefine */ in the snippets. They're best avoided (and not currently needed in Duktape 1.4.0).

27116. **comment:** Add a header snippet for checking consistency of DUK_USE_xxx config options, e.g. inconsistent options, invalid option values.

label: code-design

27117. Helpers for duk_config.h generation

27118. must be #define'd may be #undef'd, as long as provided may be #undef'd, as long as provided

27119. Snippet may have further unresolved provides; add recursively

27120. For some options like DUK_OPT_PACKED_TVAL the default comes from platform definition.

27121. **comment:** XXX: assume no newlines etc

label: code-design

27122. Date provider snippet is after custom header and overrides, so that the user may define e.g. DUK_USE_DATE_NOW_GETTIMEOFDAY in their custom header.

27123. **comment:** /usr/bin/env python2 Process Duktape option metadata and produce various useful outputs: - duk_config.h with specific or autodetected platform, compiler, and architecture; forced options; sanity checks; etc - option documentation for Duktape 1.x feature options (DUK_OPT_xxx) - option documentation for Duktape 1.x/2.x config options (DUK_USE_xxx) Genconfig tries to build all outputs based on modular metadata, so that managing a large number of config options (which is hard to avoid given the wide range of targets Duktape supports) remains maintainable. Genconfig does *not* try to support all exotic platforms out there. Instead, the goal is to allow the metadata to be extended, or to provide a reasonable starting point for manual duk_config.h tweaking. For Duktape 1.3 release the main goal was to autogenerate a Duktape 1.2 compatible "autodetect" header from legacy snippets, with other outputs being experimental. For Duktape 1.4 duk_config.h is always created from modular sources.

label: code-design

27124. **comment:** Not exact but close enough. Doesn't handle string literals etc, but these are not a concrete issue for scanning preprocessor #define references. Comment contents are stripped of any DUK_ prefixed text to avoid incorrect requires/provides detection. Other comment text is kept; in particular a /* redefine */ comment must remain intact here. (The 'redefine' hack is not actively needed now.) Avoid Python 2.6 vs. Python 2.7 argument differences.

label: code-design

27125. If manually-edited snippets don't #define or #undef a certain config option, emit a default value here. This is useful to fill-in for new config options not covered by manual snippets (which is intentional).

27126. position where to emit DUK_F_xxx dependencies

27127. **comment:** XXX: platform/compiler could provide types; if so, need some signaling defines like DUK_F_TYPEDEFS_DEFINED

label: code-design

27128. **comment:** Compilers need a lot of defines; missing defines are automatically filled in with defaults (which are mostly compiler independent), so the requires define list is not very large.

label: code-design

27129. **comment:** C preprocessor '#warning' is often supported

label: code-design

27130. print('Resolving %r' % k)

27131. Miscellaneous helpers

27132. If a related feature option exists, it can be used to force enable/disable the target feature. If neither feature option (DUK_OPT_xxx or DUK_OPT_NO_xxx) is given, revert to default.

27133. print('Deleting temporary directory: %r' % dirname)

27134. at least one other node provides 'k'

27135. Preferred tag order for generated C header files.

27136. **comment:** XXX: better plumbing for lookup path

label: code-design

27137. Add automatic DUK_OPT_XXX and DUK_OPT_NO_XXX handling for backwards compatibility with Duktape 1.2 and before.

27138. DUK_SETJMP, DUK_LONGJMP, DUK_JMPBUF_TYPE are optional, fill-in provides if none defined.

27139. for trailing newline

27140. Forced options, last occurrence wins (allows a base config file to be overridden by a more specific one).

27141. DUK_F_xxx snippets

27142. emit tag heading only if there are subsections

27143. **comment:** XXX: placeholder, need to decide on markup conventions for YAML files

label: code-design

27144. Number types

27145. print('REQUIRES: %r' % m)

27146. **comment:** XXX: better to lookup platforms metadata

label: code-design

27147. verbatim value

27148. **comment:** uppercase only, don't match DUK_USE_xxx for example

label: code-design

27149. **comment:** XXX: assume no newlines etc XXX: support compiler specific warning mechanisms

label: code-design

27150. print('Effective tag order: %r' % tags)

27151. **comment:** Don't allow e.g. DUK_USE_ which results from matching DUK_USE_xxx print('PROVIDES: %r' % m.group(1))

label: code-design

27152. DUK_F_UCLIBC is special because __UCLIBC__ is provided by an #include file, so the check must happen after platform includes. It'd be nice for this to be automatic (e.g. DUK_F_UCLIBC.h.in could indicate the dependency somehow).

27153. Emit forced options. If a corresponding option is already defined by a snippet above, #undef it first.

27154. DLL build affects visibility attributes on Windows but unfortunately cannot be detected automatically from preprocessor defines or such. DLL build status is hidden behind DUK_F_DLL_BUILD and there are two ways for that to be set: - Duktape 1.3 backwards compatible DUK_OPT_DLL_BUILD - Genconfig --dll option

27155. Preferred tag order for option documentation.

27156. XXX: check that YAML parses

27157. Pretty print a debugger command.

27158. Duktape internal class numbers, must match C headers

27159. Write a string into a buffer interpreting codepoints U+0000...U+00FF * as bytes. Drop higher bits.

27160. **comment:** XXX: add constants inline to preformatted output (e.g. for strings, add a short escaped snippet as a comment on the line after the compact argument list).

label: code-design

27161. absFn -> true

27162. Errors

27163. true

27164. We shouldn't come here, but if we do, JSON is a reasonable default.

27165. Could emit a 'debug-value' event here, but that's not necessary because the receiver will just collect statistics which can also be done using the finished message.

27166. **comment:** XXX: move this to the web UI so that the UI can control what locals are listed (or perhaps show locals for all levels with an expandable tree view).

label: code-design

27167. There is no close() or destroy() for a passthrough stream, so just close the outputParser which will cancel timers etc.

27168. Raw bytes Unicode string

27169. Still waiting for version identification to complete.

27170. **comment:** Pending flags are used to avoid requesting the same thing twice while a previous request is pending. The flag-based approach is quite awkward. Rework to use promises.

label: code-design

27171. 2-byte string

27172. undefined

27173. * JSON debug proxy
27174. msg.varname is a proper Unicode strings here, and needs to be converted into a protocol string (U+0000...U+00FF).
27175. new object, old may be in circulation for a while
27176. list of command names, merged client/target
27177. XXX: normalize last newline (i.e. force a newline if contents don't end with a newline)?
27178. accumulate data accumulated message until EOM
27179. A PutVar call quite possibly changes the local variables so always re-read locals afterwards. We don't need to wait for PutVar to complete here; the requests will pipeline automatically and be executed in order.
27180. 2-byte buffer
27181. './foo/bar.js' -> 'foo/bar.js'
27182. whole
27183. Commands initiated by Duktape
27184. Not all streams will emit this.
27185. Pretty print a dvalue. Useful for dumping etc.
27186. Could also check for an empty request queue, but that's probably too strict?
27187. Technically we should wait for each delbreak reply but because target processes the requests in order, it doesn't matter.
27188. Protocol version handling. When dumping an output stream, the caller gives a non-null protocolVersion so we don't read one here.
27189. **comment:** Check if 'msg' would encode to the same JSON which was previously sent to the web client. The caller then avoid resending unnecessary stuff.
 label: code-design
27190. Up-to-date list of breakpoints on target
27191. **comment:** XXX: do pretty printing in debug client for now
 label: code-design
27192. console.log(JSON.stringify(msg));
27193. Duktape heapdrt type constants, must match C headers
27194. * Debugger implementation * * A debugger instance communicates with the debug target and maintains * persistent debug state so that the current state can be resent to the * socket.io client (web UI) if it reconnects. Whenever the debugger state * is changed an event is generated. The socket.io handler will listen to * state change events and push the necessary updates to the web UI, often * in a rate limited fashion or using a client pull to ensure the web UI * is not overloaded. * * The debugger instance assumes that if the debug protocol connection is * re-established, it is always to the same target. There is no separate * abstraction for a debugger session.
27195. error
27196. Decode and normalize source file contents: UTF-8, tabs to 8, * CR LF to LF.
27197. **comment:** unused/none
 label: code-design

27200. Shouldn't come here.
27201. 4-byte signed integer
27202. For the unquoted version we don't need to escape single or double quotes.
27203. unsigned
27204. msg.input is a proper Unicode strings here, and needs to be converted into a protocol string (U+0000...U+00FF).
27205. nop: no callback
27206. <https://github.com/ryanmcgrath/wrench-js>
27207. varvalue is JSON parsed by the web UI for now, need special string encoding here.
27208. Command line options (defaults here, overwritten if necessary)
27209. truncate higher bits
27210. No actual requests sent by the target right now (just notifies).
27211. Encode an ordinary Unicode string into a dvalue compatible format, i.e. * into a byte array represented as codepoints U+0000...U+00FF. Concretely, * encode with UTF-8 and then represent the bytes with U+0000...U+00FF.
27212. console.log('Received json proxy input line: ' + line.toString('utf8'));
27213. * Miscellaneous helpers
27214. indicate 'v' is actually set
27215. Dump effective options. Also provides a list of option names.
27216. Although the underlying transport may not have a close() or destroy() method or even a 'close' event, this method is always available and will generate a 'transport-close'. The caller is responsible for closing the underlying stream if that is necessary.
27217. A byline-parser is simple and good enough for now (assume compact JSON with no newlines).
27218. override
27219. update run state now that we're paused
27220. duk_tval number, any IEEE double decode into hex big endian ieee double
27221. just trigger a sync, gets rate limited
27222. **comment:** Convert a buffer into a string using Unicode codepoints U+0000...U+00FF. * This is the NodeJS 'binary' encoding, but since it's being deprecated, * reimplement it here. We need to avoid parsing strings as e.g. UTF-8: * although Duktape strings are usually UTF-8/CESU-8 that's not always the * case, e.g. for internal strings. Buffer values are also represented as * strings in the debug protocol, so we must deal accurately with arbitrary * byte arrays.
 label: code-design
27223. Marker objects for special protocol values
27224. Fetch basic info right away
27225. **comment:** Pretty print a dvalue for UI usage. Everything comes out as a ready-to-use * string. * * XXX: Currently the debug client formats all values for UI use. A better * solution would be to pass values in typed form and let the UI format them, * so that styling etc. could take typing into account.
 label: code-design
27226. An eval call quite possibly changes the local variables so always re-read locals afterwards. We don't need to wait for Eval to complete here; the requests will pipeline automatically and be executed in order.
27227. Commands initiated by the debug client (= us)
27228. res.status(200).json(val);
27229. raw identification string
2730. Create debugger and web UI singletons, tie them together and start them.
27231. * Debug protocol parser * * The debug protocol parser is an EventEmitter which parses debug messages * from an input stream and emits 'debug-message' events for completed * messages ending in an EOM. The parser also provides debug dumping, stream * logging functionality, and statistics gathering functionality. * * This parser is used to parse both incoming and outgoing messages. For * outgoing messages the only function is to validate and debug dump the * messages we're about to send. The downside of dumping at this low level * is that we can't match request and reply/error messages here. * * <http://www.sitepoint.com/nodejs-events-and-eventemitter/>
27232. Pretty print a dvalue string (bytes represented as U+0000...U+00FF) * for UI usage without quotes.
27233. Loose matching is tempting but counterproductive: filenames must match 1:1 between the debug client and the debug target for e.g. breakpoints to work as expected. Note that a breakpoint may be assigned by selecting a file from a dropdown populated by scanning the filesystem for available sources and there's no way of knowing if the debug target uses the exact same name.
27234. web UI singleton transport connection to target dummy passthrough for message dumping parser for incoming debug messages parser for outgoing debug messages (stats, dumping)
27235. **comment:** XXX: make the client do this?
 label: code-design

27236. // This fails with "RangeError: Maximum call stack size exceeded" for some // reason, so use a much slower variant. for (i = 0, n = buf.length; i < n; i++) { cp[i] = buff[i]; } return String.fromCharCode.apply(String, cp);
27237. We require a destroy() method from the actual target stream
27238. Debug protocol integer
27239. shift forces unsigned
27240. Send a status request to trigger a status notify, result is ignored: target sends a status notify instead of a meaningful reply
27241. See doc/debugger.rst for format description.
27242. Pretty print a dvalue string (bytes represented as U+0000...U+00FF) * for UI usage. Try UTF-8 decoding to get a nice Unicode string (JSON * encoded) but if that fails, ensure that bytes are encoded transparently. * The result is a quoted string with a special quote marker for a "raw" * string when UTF-8 decoding fails. Very long strings are optionally * clipped.
27243. console.dir(argv);
27244. Intentional invalid command
27245. When we fall back to representing bytes, indicate that the string is "raw" with a 'r"' prefix (a somewhat arbitrary convention). U+0022 = ", U+0027 = '
27246. number (IEEE double), big endian
27247. We want the fileMap to contain the filename relative to the search dir root.
27248. Initial debugger connection
27249. Represented signed 32-bit integers as plain integers. Debugger code expects this for all fields that are not duk_tval representations (e.g. command numbers and such).
27250. Right now bytecode is a string containing a direct dump of the bytecode in target endianness. Decode here so that the web UI doesn't need to.
27251. **comment:** The value key should not be used programmatically, it is just there to make the dumps more readable.
 label: code-design
27252. msg.varname and msg.varvalue are proper Unicode strings here, they need to be converted into protocol strings (U+0000...U+00FF).
27253. Note: typeof null === 'object', so null special case explicitly
27254. Parse complete dvalues (quite inefficient now) by trial parsing. Consume a value only when it's fully present in 'buf'. See doc/debugger.rst for format description.
27255. 0x80...0xbf: integers 0-63
27256. pointer
27257. * Source file manager * * Scan the list of search directories for Ecmascript source files and * build an index of them. Provides a mechanism to find a source file * based on a raw 'fileName' property provided by the debug target, and * to provide a file list for the web UI. * * NOTE: it's tempting to do loose matching for filenames, but this does * not work in practice. Filenames must match 1:1 with the debug target * so that e.g. breakpoints assigned based on filenames found from the * search paths will match 1:1 on the debug target. If this is not the * case, breakpoints won't work as expected.
27258. not cached, send (cache already updated)
27259. CUSTOMTRANSPORT: to use a custom transport, change this.targetStream to use your custom transport.
27260. Resend all debugger state for new client clear client state cache
27261. Parse arguments.
27262. not negative zero
27263. stats and dumping
27264. map from (merged) command name to number
27265. stats for current debug connection
27266. "request" can be a string or "true"
27267. Use a PassThrough stream to debug dump and get stats for output messages. Simply write outgoing data to both the targetStream and this.passsthrough separately.
27268. object
27269. * Debugger output formatting
27270. Read final, effective breakpoints from the target
27271. cached
27272. null
27273. **comment:** XXX: unprintable characters etc? In some UI cases we'd want to e.g. escape newlines and in others not.
 label: code-design
27274. 4-byte string
27275. String map for commands (debug dumping). A single map works (instead of separate maps for each direction) because command numbers don't currently overlap. So merge the YAML metadata.

27576. duk_heap, with heap ptr compression, ROM strings+objects
27577. ...
27578. Scan ROM pointer range for faster detection of "is 'p' a ROM pointer" * later on.
27579. heapSz
27580. **comment:** not needed
 label: requirement
27581. numPools
27582. **comment:** * Simplified example of an external strings strategy where incoming strings * are written sequentially into a fixed, memory mapped flash area. ** The example first scans if the string is already in the flash (which may * happen if the same string is interned multiple times), then adds it to * flash if there is space. ** This example is too slow to be used in a real world application: there * should be e.g. a hash table to quickly check for strings that are already * present in the string data (similarly to how string interning works in * Duktape itself).
 label: code-design
27583. * Not present yet, check if we have space. Again, be careful to * ensure there is space for a NUL following the input data.
27584. Linear scan. An actual implementation would need some acceleration * structure, e.g. select a sublist based on first character. ** NOTE: input string (behind 'ptr' with 'len' bytes) DOES NOT have a * trailing NUL character. Any strings returned from this function * MUST have a trailing NUL character.
27585. * 'ajduk' specific functionality, examples for low memory techniques
27586. Pointer compression with ROM strings/objects: ** For now, use DUK_USE_ROM_OBJECTS to signal the need for compressed ROM * pointers. DUK_USE_ROM_PTRCOMP_FIRST is provided for the ROM pointer * compression range minimum to avoid duplication in user code.
27587. to avoid empty source file
27588. Ensure that we always get the heap_udata given in heap creation. * (Useful for Duktape development, not needed for user programs.)
27589. AjsHeap.dump(), allows Ecmascript code to dump heap status at suitable * points.
27590. heapNum
27591. protected call not yet running
27592. **comment:** The if-condition should be the fastest possible check * for "is 'p' in ROM?". If pointer is in ROM, we'd like * to compress it quickly. Here we just scan a ~1K array * which is very bad for performance and for illustration * only.
 label: code-design
27593. Ensure that we always get the heap_udata given in heap creation.
27594. heap
27595. * These strings are from util/duk_meta_to_strarray.py
27596. **comment:** * Check if we already have the string. Be careful to compare for * NUL terminator too, it is NOT present in 'ptr'. This algorithm * is too simplistic and way too slow for actual use.
 label: code-design
27597. duk_heap, with heap ptr compression, RAM strings+objects
27598. This is a blind lookup, could check index validity. * Duktape should never decompress a pointer which would * be out-of-bounds here.
27599. **comment:** * External strings strategy intended for valgrind testing: external strings * are allocated using malloc()/free() so that valgrind can be used to ensure * that strings are e.g. freed exactly once.
 label: code-design
27600. * These strings are manually added, and would be gathered in some * application specific manner.
27601. **comment:** It's not worth it to make very small strings external, as * they would take the same space anyway. Also avoids zero * length degenerate case.
 label: code-design
27602. **comment:** Somewhat portable way of losing a const without warnings. * Another approach is to cast through intptr_t, but that * type is not always available.
 label: code-design
27603. * Example pointer compression functions. ** 'base' is chosen so that no non-NULL pointer results in a zero result * which is reserved for NULL pointers.
27604. * There is space, add the string to our collection, being careful * to append the NUL.
27605. DUK_CMDLINE_AJSHEAP
27606. **comment:** * Wrapped ajs_heap.c alloc functions ** Used to write an alloc log.
 label: code-design
27607. until_nul
27608. We should really never be here: Duktape should only be * compressing pointers which are in the ROM compressed * pointers list, which are known at 'make dist' time. * We go on, causing a pointer compression error.
27609. * Simplified example of an external strings strategy where a set of strings * is gathered during application compile time and baked into the application * binary. ** Duktape built-in strings are available from duk_build_meta.json, see * util/duk_meta_to_strarray.py. There may also be a lot of application * specific strings, e.g. those used by application specific APIs. These * must be gathered through some other means, see e.g. util/scan_strings.py.
27610. * Execution timeout example
27611. See userdata discussion in ajsheap_enc16().
27612. duk_hthread, with heap ptr compression, ROM strings+objects
27613. **comment:** potentially unused
 label: code-design
27614. **comment:** Userdata is not needed in this case but would be useful if heap * pointer compression were used for multiple heaps. The userdata * allows the callback to distinguish between heaps and their base * pointers. ** If not needed, the userdata can be left out during compilation * by simply ignoring the userdata argument of the pointer encode * and decode macros. It is kept here so that any bugs in actually * providing the value inside Duktape are revealed during compilation.
 label: code-design
27615. numHeaps
27616. * Helpers
27617. seconds
27618. * Convert an 8-bit input string (e.g. ISO-8859-1) into CESU-8. * Calling code supplies the "code page" as a 256-entry array of * codepoints for the conversion. ** This is useful when input data is in non-UTF-8 format and must * be converted at runtime, e.g. when compiling non-UTF-8 source * code. Another alternative is to use e.g. iconv.
27619. Temporary buffer length wraps.
27620. max expansion is 1 input byte -> 3 output bytes
27621. Decode an 8-bit string using 'codepage' into Unicode codepoints and * re-encode into CESU-8. Codepage argument must point to a 256-entry * table. Only supports BMP (codepoints U+0000 to U+FFFF).
27622. [... tmp res]
27623. In CESU-8 all codepoints in [0x0000,0xFFFF] are * allowed, including surrogates.
27624. DUK_CODEPAGE_CONV_H_INCLUDED
27625. <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP1252.TXT>
27626. Example: compile and run test source encoded in Windows codepage 1252.
27627. undefined
27628. Exercise all 3 byte lengths: any ASCII character is 1 byte, 0xFC maps to * U+00FC which is 2 bytes, and 0x80 maps to U+20AC which is 3 bytes.
27629. * Same as above, but if the exception inherits from std::exception, it's * "what()" will be included in the error message.
27630. * If you let your own C++ exceptions propagate out of a Duktape/C function * it will be caught by Duktape and considered a programming error. Duktape * will catch the exception and convert it to a Duktape error. ** This may be allowed in a later version once all the implications have been * worked out.
27631. ERROR: exception propagated to Duktape
27632. * Example class with a destructor
27633. suppress warning

27634. * Example of how to use DUK_USE_CPP_EXCEPTIONS to support automatic * variables (e.g. destructor calls) in Duktape/C functions. ** Compile with -DDUK_OPT_CPP_EXCEPTIONS: ** \$ g++ -otest -DDUK_OPT_CPP_EXCEPTIONS -I<duktape_dist>/src/ \ * <duktape_dist>/src/duktape.cpp_exceptions.cpp -lm * or ensure duk_config.h has DUK_USE_CPP_EXCEPTIONS enabled using * genconfig. When executed you should see something like: ** \$./test * my_class instance created * my_class instance destroyed <= destructor gets called * --> rc=1 (SyntaxError: parse error (line 1)) * [...] ** Duktape uses a custom exception class (duk_internal_exception) which * doesn't inherit from any base class, so that catching any base classes * in user code won't accidentally catch exceptions thrown by Duktape.

27635. * You can use C++ exceptions inside Duktape/C functions for your own * purposes but you should catch them before they propagate to Duktape.

27636. * SyntaxError caused by eval exits Duktape/C function but destructors * are executed.

27637. * Same as above, but if the exception inherits from std::exception with * a NULL what(). Duktape will describe the error as 'unknown' if so.

27638. Handshake line is available for caller for the * duration of the callback, and must not be freed * by the caller.

27639. Too small, resize.

27640. just in case, if dvalues changed something

27641. mixed endian (arm)

27642. Define to enable error prints to stderr.

27643. 0x80 ... 0xbf

27644. **comment:** IEEE double byte order, detect at run time (could also use * preprocessor defines but that's verbose to make portable). ** >>> struct.unpack('>d', '1122334455667788'.decode('hex')) * (3.841412024471731e-226,) * >>> struct.unpack('>d', '8877665544332211'.decode('hex')) * (-7.086876636573014e-268,) * >>> struct.unpack('>d', '4433221188776655'.decode('hex')) * (3.529430307187744e+20,)
label: code-design

27646. Too big, resize so that we reclaim memory if we have just * received a large string/buffer value.

27647. little endian

27648. 0x00 ... 0x1f

27649. **comment:** * Example debug transport with a local debug message encoder/decoder. ** Provides a "received dvalue" callback for a fully parsed dvalue (user * code frees dvalue) and a "cooperate" callback for e.g. UI integration. * There are a few other callbacks. See test.c for usage examples. ** This transport implementation is not multithreaded which means that: ** - Callbacks to "received dvalue" callback come from the Duktape thread, * either during normal execution or from duk_debugger_cooperate(). ** - Calls into duk_trans_dvalue_send() must be made from the callbacks * provided (e.g. "received dvalue" or "cooperate") which use the active * Duktape thread. ** - The only exception to this is when Duktape is idle: you can then call * duk_trans_dvalue_send() from any thread (only one thread at a time). * When you next call into Duktape or call duk_debugger_cooperate(), the * queued data will be read and processed by Duktape. ** There are functions for creating and freeing values; internally they use * malloc() and free() for memory management. Duktape heap alloc functions * are not used to minimize disturbances to the Duktape heap under debugging. ** Doesn't depend on C99 types; assumes "int" is at least 32 bits, and makes * a few assumptions about format specifiers.
label: code-design

27650. never here

27651. 0x60 ... 0x7f

27652. Caller must provide a buffer at least DUK_DVALUE_TOSTRING_BUflen in size.

27653. Harmless warning on some platforms (re: range)

27654. Alloc size is len + 1 so that a NUL terminator is always * guaranteed which is convenient, e.g. you can printf() the * value safely.

27655. big endian

27656. Integers are network endian, read back into host format.

27657. Portable IEEE double byteswap. Relies on runtime detection of * host endianness.

27658. Integers are written in network endian format.

27659. IEEE doubles are network endian, read back into host format.

27660. 32 hex encoded or \xXX escaped bytes, possible "...", NUL

27661. * Dvalue transport handling

27662. Integers are network endian, read back into host format in * a portable manner.

27663. 0xc0 ... 0xff

27664. * Dvalue handling

27665. **comment:** Define to enable debug prints to stderr.
label: code-design

27666. end switch

27667. * Duktape callbacks

27668. Portable sign handling, doesn't assume 'int' is exactly 32 bits * like a direct cast would.

27669. Trial parse handshake line or dvalue(s).

27670. IEEE doubles are written in network endian format.

27671. Must cooperate until user callback provides data. From * Duktape's perspective we MUST block until data is received.

27672. mixed endian

27673. 0x20 ... 0x5f

27674. **comment:** some extra to reduce resizes
label: code-design

27675. Append data.

27676. When read_offset is large enough, "rebase" buffer by deleting already * read data and updating offsets.

27677. big endian: ok as is

27678. Convert argument dvalue into Duktape debug protocol format. * Literal constants are used here for the debug protocol, * e.g. initial byte 0x02 is REP, see doc/debugger.rst.

27679. tolerates NULL

27680. d: ieee double

27681. sending towards Duktape (duktape read callback)

27682. Buffer size needed by duk_dvalue_to_string().

27683. buf: buffer data, len: buffer length

27684. DUK_TRANS_DVALUE_H_INCLUDED

27685. struct duk_dvalue 'tag' values, note that these have nothing to do with * Duktape debug protocol initial byte. Struct fields used with the type * are noted next to the define.

27686. i: class number, buf: pointer data, len: pointer length

27687. i: 32-bit signed integer

27688. buf: pointer data, len: pointer length

27689. Sending dvalues towards Duktape.

27690. Duktape debug callbacks provided by the transport.

27691. receiving from Duktape (duktape write callback)

27692. buf: string data, len: string length

27693. Could use a union for the value but the gain would be relatively small.

27694. no fields

27695. **comment:** 0=little endian, 1=big endian, 2=mixed endian
label: code-design

27696. Initializing and freeing the transport context.

27697. Dvalue handling.

27698. i: lightfunc flags, buf: pointer data, len: pointer length

27699. Attach debugger; this will fail with a fatal error here unless * debugger support is compiled in. To fail more gracefully, call * this under a duk_safe_call() to catch the error.

27700. DumpHeap

27701. fake ptr len

27702. The Duktape handshake line is given in 'line' (without LF). * The 'line' argument can be accessed for the duration of the * callback (read only). Don't free 'line' here, the transport * handles that.

27703. medium, >= 32 chars

27704. Evaluate simple test code, callbacks will "step over" until end. ** The test code here is just for exercising the debug transport. * The 'evalMe' variable is evaluated (using debugger command Eval) * before every step to force different dvalues to be carried over * the transport.

27705. duk_trans_dvalue_send_req_cmd() sends a REQ dvalue followed by * an integer dvalue (command) for convenience.

27706. classnum

27707. Detached call forwarded as is.

27708. 0x14 = StepOver

27709. * Example program using the dvalue debug transport.

27710. long buffer, >= 65536 chars

27711. TriggerStatus

27712. suppress warning

27713. Here a normal debug client would wait for dvalues until an EOM * dvalue was received (which completes a debug message). The * debug message would then be handled, possibly causing UI changes * and/or causing debug commands to be sent to Duktape. ** The callback is responsible for eventually freeing the dvalue. * Here we free it immediately, but an actual client would probably * gather dvalues into an array or linked list to handle when the * debug message was complete.

27714. Duktape is not blocked; you can cooperate with e.g. a user * interface here and send dvalues to Duktape, but don't block.

27715. Also send a dummy TriggerStatus request with trailing dvalues * ignored by Duktape; Duktape will parse the dvalues to be able to * skip them, so that the dvalue encoding is exercised.

27716. 0x1e = Eval

27717. **comment:** First time Duktape becomes blocked, send DumpHeap which * exercises a lot of parsing code. ** NOTE: Valgrind may complain about reading uninitialized * bytes. This is caused by the DumpHeap command writing out * verbatim duk_tval values which are intentionally not * always fully initialized for performance reasons.

label: code-design

27718. short, <= 31 chars

27719. Duktape is blocked on a read and won't continue until debug * command(s) are sent. ** Normally you'd enter your own event loop here, and process * events until something needs to be sent to Duktape. For * example, the user might press a "Step over" button in the * UI which would cause dvalues to be sent. You can then * return from this callback. ** The code below sends some example messages for testing the * dvalue handling of the transport. ** If you create dvalues manually and send them using * duk_trans_dvalue_send(), you must free the dvalues after * the send call returns using duk_dvalue_free().

27720. lf_flags

27721. DUK_TRANS_SOCKET_H_INCLUDED

27766. ignore errors for now -> [... stash eventTimers]

27767. not found, append to list

27768. Initialize global stash 'eventTimers'.

27769. Update timer_count.

27770. Misc

27771. -> [...]

27772. -> [... stash eventTimers retval]

27773. One-shot timer (always removed) or removed by user callback.

27774. Finally, register the callback to the global stash 'eventTimers' object.

27775. * Determine poll() timeout (as close to poll() as possible as * the wait is relative).

27776. Interval timer, not removed by user callback. Queue back to * timer list and bubble to its final sorted position.

27777. deleted, perhaps by previous callback

27778. Timer is now at the last position; use swaps to "bubble" it to its * correct sorted position.

27779. * If exit has been requested, exit without running further * callbacks.

27780. **comment:** mark to-be-deleted, cleaned up by next poll
label: code-design

27781. last timer at timer_count - 1

27782. Zero last element for clarity.

27783. Socket poll state.

27784. [... stash eventTimers]

27785. error

27786. * Compact poll list by removing pollfds with fd == 0.

27787. Set global 'EventLoop'.

27788. eventTimers[timer_id] = callback

27789. **comment:** zeroize unused entries for sanity
label: code-design

27790. Last timer expires first (list is always kept sorted).

27791. -> [... stash eventTimers func]

27792. delay/interval

27793. oneshot=1 (setTimeout), repeated=0 (setInterval)

27794. The callback associated with the timer is held in the "global stash", * in <stash>.eventTimers[String(id)]. The references must be deleted * when a timer struct is deleted.

27795. Get Javascript compatible 'now' timestamp (millisecs since 1970).

27796. events == 0 means stop listening to the FD

27797. -> [timer_id stash eventTimers]

27798. * Expire timers.

27799. Shift elements downwards to keep the timer list dense * (no need if last element).

27800. * If exit requested, bail out as fast as possible.

27801. 't' expires later than 't-1', so swap them and repeat.

27802. Timer to bubble is at index i, timer to compare to is * at i-1 (both guaranteed to exist).

27803. Return timer id.

27804. Bubble last timer on timer list backwards until it has been moved to * its proper sorted position (based on 'target' time).

27805. next target time

27806. i = input index * j = output index (initially same as i)

27807. The C state is now up-to-date, but we still need to delete * the timer callback state from the global 'stash'.

27808. 'rc' fds active

27809. clamping ensures that fits

27810. * Expired timer(s) still exist?

27811. timeout

27812. * Move the timer to 'expiring' for the duration of the callback. * Mark a one-shot timer deleted, compute a new target for an interval.

27813. * Call timer callback. The callback can operate on the timer list: * add new timers, remove timers. The callback can even remove the * expired timer whose callback we're calling. However, because the * timer being expired has been moved to 'timer_expiring', we don't * need to worry about the timer's offset changing on the timer list.

27814. **comment:** this is quite excessive for embedded use, but good for testing
label: code-design

27815. if timeout, no need to check pollfd

27816. The Ecmascript poll handler is passed through EventLoop.fdPollHandler * which c_eventloop.js sets before we come here.

27817. indexes: * 0 = function (callback) * 1 = delay * 2 = boolean: oneshot

27818. -> [func delay oneshot stash eventTimers]

27819. **comment:** * Unlike insertion, deletion needs a full scan of the timer list * and an expensive remove. If no match is found, nothing is deleted. * Caller gets a boolean return code indicating match. * * When a timer is being expired and its user callback is running, * the timer has been moved to 'timer_expiring' and its deletion * needs special handling: just mark it to-be-deleted and let the * expiry code remove it.
label: code-design

27820. nargs

27821. * Poll for activity or timeout.

27822. copy only if indices have diverged

27823. timer has been requested for removal

27824. -> [global EventLoop fdPollHandler]

27825. Because a user callback can mutate the timer list (by adding or deleting * a timer), we expire one timer and then rescan from the end again. There * is a sanity limit on how many times we do this per expiry round.

27826. keep output index the same
27827. **comment:** * Check socket activity, handle all sockets. Handling is offloaded to * Ecmascript code (fd + revents). ** If FDs are removed from the poll list while we're processing callbacks, * the entries are simply marked unused (fd set to 0) without actually * removing them from the poll list. This ensures indices are not * disturbed. The poll list is compacted before next poll().
label: code-design
27828. numeric ID (returned from e.g. setTimeout); zero if unused
27829. Should never happen, so return whatever.
27830. delete eventTimers[timer_id]
27831. 't' expires earlier than (or same time as) 't-1', so we're done.
27832. indexes: * 0 = timer id
27833. **comment:** * C eventloop example. ** Timer management is similar to eventloop.js but implemented in C. * In particular, timer insertion is an O(n) operation; in a real world * eventloop based on a heap insertion would be O(log N).
label: code-design
27834. print('unexpected revents, close fd');
27835. no size control now print('READ', Duktape.enc('jx', data));
27836. * C eventloop example (c_eventloop.c). ** Ecmascript code to initialize the exposed API (setTimeout() etc) when * using the C eventloop. ** <https://developer.mozilla.org/en-US/docs/Web/JavaScript/Timers>
27837. This simple example doesn't have support for write blocking / draining
27838. Connected
27839. print('ACCEPT:', Duktape.enc('jx', acc_res));
27840. Special case: callback arguments are provided. [arg1, arg2, ...] [global(this), arg1, arg2, ...]
27841. print('activity on fd', fd, 'revents', revents);
27842. * Timer API
27843. **comment:** * Socket handling ** Ideally this would be implemented more in C than here for more speed * and smaller footprint: C code would directly maintain the callback state * and such. ** Also for more optimal I/O, the buffer churn caused by allocating and * freeing a lot of buffer values could be eliminated by reusing buffers. * Socket reads would then go into a pre-allocated buffer, for instance.
label: code-design
27844. retval ignored
27845. print('UNKNOWN');
27846. Legacy case: callback is a string.
27847. oneshot
27848. Normal case: callback given as a function without arguments.
27849. Math.exp(0)...Math.exp(8) is an uneven distribution between 1...~2980.
27850. Here the inserts take a lot of time because the underlying timer manager * data structure has O(n) insertion performance.
27851. * Test using timers and intervals with curses.
27852. * Pure Ecmascript eventloop example. ** Timer state handling is inefficient in this trivial example. Timers are * kept in an array sorted by their expiry time which works well for expiring * timers, but has O(n) insertion performance. A better implementation would * use a heap or some other efficient structure for managing timers so that * all operations (insert, remove, get nearest timer) have good performance. ** <https://developer.mozilla.org/en-US/docs/Web/JavaScript/Timers>
27853. **comment:** If exit requested, don't call any more callbacks. This allows a callback to do cleanups and request exit, and can be sure that no more callbacks are processed.
label: code-design
27854. Remove the timer from the active list and process it. The user callback may add new timers which is not a problem. The callback may also delete timers which is not a problem unless the timer being deleted is the timer whose callback we're running; this is why the timer is recorded in this.expiring so that clearTimeout() and clearInterval() can detect this situation.
27855. sockets fd -> callback fd -> callback fd -> callback
27856. If the timer was one-shot, it's marked 'removed'. If the user callback requested deletion for the timer, it's also marked 'removed'. If the timer is an interval (and is not marked removed), insert it back into the timer list.
27857. this.dumpState();
27858. Timer has expired and we're processing its callback. User callback has requested timer deletion. Mark removed, so that the timer is not reinserted back into the active list. This is actually a common case because an interval may very well cancel itself.
27859. Special case: callback arguments are provided. [arg1, arg2, ...] [global(this), arg1, arg2, ...]
27860. This simple example doesn't have support for write blocking / draining
27861. no such ID, ignore
27862. print('zero read for fd ' + fd + ', closing forcibly'); ignore result
27863. print('UNKNOWN');
27864. Legacy case: callback is a string.
27865. timers active timers, sorted (nearest expiry last) set to timer being expired (needs special handling in clearTimeout/clearInterval)
27866. no size control now print('READ', Duktape.enc('jx', data));
27867. print('revents ' + t.revents + ' for fd ' + fd + ', closing forcibly'); ignore result
27868. misc
27869. print('ACCEPT:', Duktape.enc('jx', acc_res));
27870. * Create poll socket list. This is a very naive approach. * On Linux, one could use e.g. epoll() and manage socket lists * incrementally.
27871. start
27872. deleteCount
27873. * Find 'i' such that we want to insert *after* timers[i] at index i+1. * If no such timer, for-loop terminates with i-1, and we insert at -1+1=0.
27874. print('exit requested, exit');
27875. Remove timer/interval with a timer ID. The timer/interval can reside either on the active list or it may be an expired timer (this.expiring) whose user callback we're running when this function gets called.
27876. Get timer with lowest expiry time. Since the active timers list is sorted, it's always the last timer.
27877. * Wait timeout for timer closest to expiry. Since the poll * timeout is relative, get this as close to poll() as possible.
27878. print(new Date(), 'poll_set OUT:', Duktape.enc('jx', poll_set));
27879. * Do the actual poll.
27880. * Timer API ** These interface with the singleton EventLoop.
27881. print('UNKNOWN POLLOUT');
27882. Timers to expire?
27883. * Exit check (may be requested by a user callback)
27884. **comment:** Timer on active list: mark removed (not really necessary, but nice for dumping), and remove from active list.
label: code-design
27885. insert after 't', to index i+1
27886. * Event loop ** Timers are sorted by 'target' property which indicates expiry time of * the timer. The timer expiring next is last in the array, so that * removals happen at the end, and inserts for timers expiring in the * near future displace as few elements in the array as possible.
27887. print(new Date(), 'poll_set IN:', Duktape.enc('jx', poll_set));
27888. * Here we must be careful with mutations: user callback may add and * delete an arbitrary number of timers. ** Current solution is simple: check whether the timer at the end of * the list has expired. If not, we're done. If it has expired, * remove it from the active list, record it in this.expiring, and call * the user callback. If user code deletes the this.expiring timer, * there is special handling which just marks the timer deleted so * it won't get inserted back into the active list. ** This process is repeated at most maxExpiry times to ensure we don't * get stuck forever; user code could in principle add more and more * already expired timers.
27889. custom call
27890. * Process expired timers.

27891. * Process all sockets so that nothing is left unhandled for the * next round.
27892. flag for removal
27893. Timer has not expired, and no other timer could have expired either because the list is sorted.
27894. Reinsert interval timer to correct sorted position. The timer must be an interval timer because one-shot timers are marked 'removed' above.
27895. Eat errors silently. When resizing curses window an EINTR happens now.
27896. Normal case: callback given as a function without arguments.
27897. Set global 'FileIo'.

28079. POSIX
28080. If not provided, use safe default for alignment.
28081. * Date provider selection * * User may define DUK_USE_DATE_GET_NOW() etc directly, in which case we'll * rely on an external provider. If this is not done, revert to previous * behavior and use Unix/Windows built-in provider.
28082. Cannot determine byte order.
28083. --- Cygwin ---
28084. !defined(DUK_USE_BYTERORDER) && defined(__BYTE_ORDER__)
28085. More or less standard endianness predefines provided by header files. * The ARM hybrid case is detected by assuming that __FLOAT_WORD_ORDER * will be big endian, see: <http://lists.mysql.com/internals/443>. * On some platforms some defines may be present with an empty value which * causes comparisons to fail: <https://github.com/svaarala/duktape/issues/453>.
28086. !defined(DUK_USE_BYTERORDER)
28087. **comment:** For custom platforms allow user to define byteorder explicitly. * Since endianness headers are not standardized, this is a useful * workaround for custom platforms for which endianness detection * is not directly supported. Perhaps custom hardware is used and * user cannot submit upstream patches.
 label: code-design
28088. **comment:** Don't know how to declare unreachable point, so don't do it; this * may cause some spurious compilation warnings (e.g. "variable used * uninitialized").
 label: code-design
28089. Good default is a bit arbitrary because alignment requirements * depend on target. See <https://github.com/svaarala/duktape/issues/102>.
28090. --- Windows ---
28091. User provided InitJS.
28092. These have been tested from VS2008 onwards; may work in older VS versions * too but not enabled by default.
28093. Error codes are represented with platform int. High bits are used * for flags and such, so 32 bits are needed.
28094. Intermediate define for 'have inttypes.h'
28095. build is not C99 or C++11, play it safe
28096. GCC: test not very accurate; enable only in relatively recent builds * because of bugs in gcc-4.4 (<http://lists.debian.org/debian-gcc/2010/04/msg00000.html>)
28097. Intel x86 (32-bit), x64 (64-bit) or x32 (64-bit but 32-bit pointers), * define only one of DUK_F_X86, DUK_F_X64, DUK_F_X32. *
 <https://sites.google.com/site/x32abi/>
28098. Enabled with debug/assertions just so that any issues can be caught.
28099. C99 or compatible
28100. --- Mac OSX, iPhone, Darwin ---
28101. C99 or above
28102. MinGW. Also GCC flags (DUK_F_GCC) are enabled now.
28103. This detection is not very reliable.
28104. Support for 48-bit signed integer duk_tval with transparent semantics.
28105. GCC and Clang provide endianness defines as built-in predefines, with * leading and trailing double underscores (e.g. __BYTE_ORDER__). See * output of "make gcprefs" and "make clangprefs". Clang doesn't * seem to provide __FLOAT_WORD_ORDER__; assume not mixed endian for clang. *
 <http://gcc.gnu.org/onlinedocs/cpp/Common-Predefined-Macros.html>

28106. 64-bit type detection is a bit tricky. ** `ULLONG_MAX` is a standard define. `__LONG_LONG_MAX__` and `__ULONG_LONG_MAX__` * are used by at least GCC (even if system headers don't provide `ULLONG_MAX`). * Some GCC variants may provide `__LONG_LONG_MAX__` but not `__ULONG_LONG_MAX__`. ** `ULL / LL` constants are rejected / warned about by some compilers, even if * the compiler has a 64-bit type and the compiler/system headers provide an * unsupported constant (`ULL/LL`)! Try to avoid using `ULL / LL` constants. * As a side effect we can only check that e.g. `ULONG_MAX` is larger than 32 * bits but can't be sure it is exactly 64 bits. Self tests will catch such * cases.

28107. Convert any input pointer into a "void *", losing a const qualifier. * This is not fully portable because casting through `duk_uintptr_t` may * not work on all architectures (e.g. those with long, segmented pointers).

28108. Small integers (16 bits or more) can fall back to the 'int' type, but * have a typedef so they are marked "small" explicitly.

28109. **comment:** Most portable, potentially wastes space
label: code-design

28110. PowerPC

28111. --- Solaris ---

28112. **comment:** Technically C99 (C++11) but found in many systems. On some systems * `__STDC_LIMIT_MACROS` and `__STDC_CONSTANT_MACROS` must be defined before * including `stdint.h` (see above).
label: code-design

28113. Missing some obvious constants.

28114. No provider for `DUK_USE_DATE_PARSE_STRING()`, fall back to ISO 8601 only.

28115. no `endian.h` or `stdint.h`

28116. --- Atari ST TOS ---

28117. GCC: assume we have `_va_copy()` in non-C99 mode.

28118. User forced alignment to 4 or 8.

28119. C99 / C++11 and above: rely on `va_copy()` which is required.

28120. <http://bellard.org/tcc/tcc-doc.html#SEC9>

28121. Check that architecture is two's complement, standard C allows e.g. * `INT_MIN` to be $-2^{31}+1$ (instead of -2^{31}).

28122. Based on 'make checkalign' there are no alignment requirements on * Linux MIPS except for doubles, which need align by 4. Alignment * requirements vary based on target though.

28123. AmigaOS on M68k

28124. not configured for DLL build

28125. * You may add overriding `#define/#undef` directives below for * customization. You of course cannot un-`#include` or un-`typedef` * anything; these require direct changes above.

28126. **comment:** cannot detect 64-bit type, not always needed so don't error
label: code-design

28131. --- Generic fallback ---

28132. **comment:** --- Generic POSIX ---
label: code-design

28133. no parsing (not an error)

28134. **comment:** ANSI C (various versions) and some implementations require that the * pointer arguments to `memset()`, `memcpy()`, and `memmove()` be valid values * even when byte size is 0 (even a NULL pointer is considered invalid in * this context). Zero-size operations as such are allowed, as long as their * pointer arguments point to a valid memory area. The `DUK_MEMSET()`, * `DUK_MEMCPY()`, and `DUK_MEMMOVE()` macros require this same behavior, i.e.: * (1) pointers must be valid and non-NULL, (2) zero size must otherwise be * allowed. If these are not fulfilled, a macro wrapper is needed. * * <http://stackoverflow.com/questions/5243012/is-it-guaranteed-to-be-safe-to-perform-memcpy0-0-0> * <http://lists.cs.uiuc.edu/pipermail/llvmdev/2007-October/011065.html> * * Not sure what's the required behavior when a pointer points just past the * end of a buffer, which often happens in practice (e.g. zero size memmoves). * For example, if allocation size is 3, the following pointer would not * technically point to a valid memory byte: * * <-- alloc --> * | 0 | 1 | 2 | * ^ - p=3, points after last valid byte (2)
label: code-design

28135. C++11 or above

28136. SPARC byte order varies so rely on autodetection.

28137. `DUK_F_PACKED_TVAL_PROVIDED`

28138. <http://www.monkey.org/openbsd/archive/ports/0401/msg00089.html>

28139. VBCC

28140. `sigsetjmp()` alternative

28141. GCC. Clang also defines `__GNUC__` so don't detect GCC if using Clang.

28142. --- SuperH ---

28143. Pre-C99: `va_list` type is implementation dependent. This replacement * assumes it is a plain value so that a simple assignment will work. * This is not the case on all platforms (it may be a single-array element, * for instance).

28144. **comment:** The best type for an "all around int" in Duktape internals is "at least * 32 bit signed integer" which is most convenient. Same for unsigned type. * Prefer 'int' when large enough, as it is almost always a convenient type.
label: code-design

28145. uclibc

28146. Explicit marker needed; may be 'defined', 'undefined', 'or 'not provided'.

28147. No provider for `DUK_USE_DATE_FORMAT_STRING()`, fall back to ISO 8601 only.

28148. **comment:** Many platforms are missing `fpclassify()` and friends, so use replacements * if necessary. The replacement constants (FP_NAN etc) can be anything but * match Linux constants now.
label: code-design

28149. * Checks for config option consistency (`DUK_USE_xxx`)

28150. autodetect compiler

28151. Rely on C89 headers only; `time.h` must be here.

28152. These functions don't currently need replacement but are wrapped for * completeness. Because these are used as function pointers, they need * to be defined as concrete C functions (not macros).

28153. --- TI-Nspire ---

28154. **comment:** We need `va_copy()` which is defined in C99 / C++11, so an awkward * replacement is needed for pre-C99 / pre-C++11 environments. This * will quite likely need portability hacks for some non-C99 * environments.
label: code-design

28155. AmigaOS on M68K or PPC is always big endian.

28156. Feature option forcing.

28157. --- ARM 64-bit ---

28158. * Feature option handling

28159. **comment:** * Wrapper typedefs and constants for integer types, also sanity check types. * * C99 typedefs are quite good but not always available, and we want to avoid * forcibly redefining the C99 typedefs. So, there are Duktape wrappers for * all C99 typedefs and Duktape code should only use these typedefs. Type * detection when C99 is not supported is best effort and may end up detecting * some types incorrectly. * * Pointer sizes are a portability problem: pointers to different types may * have a different size and function pointers are very difficult to manage * portably. * * http://en.wikipedia.org/wiki/C_data_types#Fixed-width_integer_types * * Note: there's an interesting corner case when trying to define minimum * signed integer value constants which leads to the current workaround of * defining e.g. `-0x80000000` as `(-0x7fffffffL - 1L)`. See doc/code-issues.txt * for a longer discussion. * * Note: avoid typecasts and computations in

macro integer constants as they * can then no longer be used in macro relational expressions (such as * #if DUK_SIZE_MAX < 0xffffffffUL). There is internal code which relies on * being able to compare DUK_SIZE_MAX against a limit.

label: code-design

28160. Not standard but common enough

28161. --- QNX ---

28162. **comment:** Object property allocation layout has implications for memory and code * footprint and generated code size/speed. The best layout also depends * on whether the platform has alignment requirements or benefits from * having mostly aligned accesses.

label: code-design

28180. C++11 apparently ratified stdint.h

28181. QNX gcc cross compiler seems to define e.g. __LITTLEENDIAN__ or __BIGENDIAN__: * \$ /opt/qnx650/host/linux/x86/usr/bin/i486-pc-nto-qnx6.5.0-gcc -dM -E -</dev/null | grep -ni endian * 67:#define __LITTLEENDIAN__ 1 * \$ /opt/qnx650/host/linux/x86/usr/bin/mips-unknown-nto-qnx6.5.0-gcc -dM -E -</dev/null | grep -ni endian * 70:#define __BIGENDIAN__ 1 * \$ /opt/qnx650/host/linux/x86/usr/bin/arm-unknown-nto-qnx6.5.0-gcc -dM -E -</dev/null | grep -ni endian *

70:#define __LITTLEENDIAN__ 1

28182. At least some uclibc versions have broken floating point math. For * example, `fpclassify()` can incorrectly classify certain NaN formats. * To be safe, use replacements.

28183. Placeholder fix for (detection is wider than necessary): * http://llvm.org/bugs/show_bug.cgi?id=17788

28184. `snprintf()` is technically not part of C89 but usually available.

28185. --- x32 ---

28186. Basic integer typedefs and limits, preferably from inttypes.h, otherwise * through automatic detection.

28187. **comment:** Only include when compiling Duktape to avoid polluting application build * with a lot of unnecessary defines.

label: code-design

28188. --- VBCC ---

28189. On some systems SIZE_MAX can be smaller than max unsigned 32-bit value * which seems incorrect if size_t is (at least) an unsigned 32-bit type. * However, it doesn't seem useful to error out compilation if this is the * case.

28190. **comment:** On other platforms use layout 2, which requires some padding but * is a bit more natural than layout 3 in ordering the entries. Layout * 3 is currently not used.

label: code-design

28191. VS2005+ should have variadic macros even when they're not C99.

28192. illumos / Solaris

28193. DUK_COMPILING_DUKTAPE

28194. DUK_OPT_FORCE_BYTEORDER

28195. QNX

28196. since gcc-4.5

28197. **comment:** Windows 32-bit and 64-bit are currently the same.

label: code-design

28198. This is optionally used by panic handling to cause the program to segfault * (instead of e.g. `abort()`) on panic. Valgrind will then indicate the C * call stack leading to the panic.

28199. IEEE float/double typedef.

28200. --- ARM 32-bit ---

28201. **comment:** XXX: This is technically not guaranteed because it's possible to configure * an x86 to require aligned accesses with Alignment Check (AC) flag.

label: code-design

28202. TinyC

28203. **comment:** Note: the funny looking computations for signed minimum 16-bit, 32-bit, and * 64-bit values are intentional as the obvious forms (e.g. -0x80000000L) are * -not- portable. See code-issues.txt for a detailed discussion.

label: code-design

28204. These are necessary wild guesses.

28205. Already provided above

28206. Atari ST TOS. __TOS__ defined by PureC. No platform define in VBCC * apparently, so to use with VBCC user must define __TOS__ manually.

28207. Byte order is big endian but cannot determine IEEE double word order.

28208. --- Flashplayer (Crossbridge) ---

28209. MIPS byte order varies so rely on autodetection.

28210. stdint.h not available

28211. **comment:** The most portable way to figure out local time offset is `gmtime()`, * but it's not thread safe so use with caution.

label: requirement

28212. Codepoint type. Must be 32 bits or more because it is used also for * internal codepoints. The type is signed because negative codepoints * are used as internal markers (e.g. to mark EOF or missing argument). * (X)UTF-8/CESU-8 encode/decode take and return an unsigned variant to * ensure duk_uint32_t casts back and forth nicely. Almost everything * else uses the signed one.

28213. DUK_USE_VARIADIC_MACROS: required from compilers, so no fill-in.

28214. TOS on M68K is always big endian.

28215. don't use `strftime()` for now

28216. **comment:** not sure, not needed with C99 anyway

label: requirement

28217. C++ doesn't have standard designated union initializers ({ .foo = 1 }).

28218. --- Emscripten ---

28219. nop

28220. DLL build detection

28221. **comment:** Avoid custom date parsing and formatting for portability.

label: code-design28222. Workaround for older C++ compilers before including <inttypes.h>, * see e.g.: https://sourceware.org/bugzilla/show_bug.cgi?id=15366

28223. * Compiler autodetection

28224. --- SPARC 32-bit ---

28225. --- Clang ---

28226. On some platforms int is 16-bit but long is 32-bit (e.g. PureC)

28227. **comment:** * Byte order and double memory layout detection * * Endianness detection is a major portability hassle because the macros * and headers are not standardized. There's even variance across UNIX * platforms. Even with "standard" headers, details like underscore count * varies between platforms, e.g. both __BYTE_ORDER and _BYTE_ORDER are used * (Crossbridge has a single underscore, for instance). * * The checks below are structured with this in mind: several approaches are * used, and at the end we check if any of them worked. This allows generic * approaches to be tried first, and platform/compiler specific hacks tried * last. As a last resort, the user can force a specific endianness, as it's * not likely that automatic detection will work on the most exotic platforms. * * Duktape supports little and big endian machines. There's also support * for a hybrid used by some ARM machines where integers are little endian * but IEEE double values use a mixed order (12345678 -> 43218765). This * byte order for doubles is referred to as "mixed endian".

label: code-design28228. **comment:** Check whether we should use 64-bit integers or not. * * Quite incomplete now. Use 64-bit types if detected (C99 or other detection) * unless they are known to be unreliable. For instance, 64-bit types are * available on VBCC but seem to misbehave.**label:** code-design28229. VS2013+ supports union initializers but there's a bug involving union-inside-struct: * <https://connect.microsoft.com/VisualStudio/feedback/details/805981> * The bug was fixed (at least) in VS2015 so check for VS2015 for now: * <https://blogs.msdn.microsoft.com/vcblog/2015/07/01/c-compiler-front-end-fixes-in-vs2015/> * Manually tested using VS2013, CL reports 18.00.31101, so enable for VS2013 too.

28230. no user declarations

28231. DUK_CONFIG_H_INCLUDED

28232. BCC (Bruce's C compiler): this is a "torture target" for compilation

28233. Generic Unix (includes Cygwin)

28234. There was a curious bug where test-bi-date-canceling.js would fail e.g. * on 64-bit Ubuntu, gcc-4.8.1, -m32, and no -std=c99. Some date computations * using doubles would be optimized which then broke some corner case tests. * The problem goes away by adding 'volatile' to the datetime computations. * Not sure what the actual triggering conditions are, but using this on * non-C99 systems solves the known issues and has relatively little cost * on other platforms.

28235. C99 / C++11 and above: rely on va_copy() which is required. * Omit parenthesis on macro right side on purpose to minimize differences * to direct use.

28236. C99 types

28237. DUK_SIZE_MAX (= SIZE_MAX) is often reliable

28238. --- PowerPC 64-bit ---

28239. See: /opt/qnx650/target/qnx6/usr/include/sys/platform.h

28240. --- SPARC 64-bit ---

28241. On platforms without any alignment issues, layout 1 is preferable * because it compiles to slightly less code and provides direct access * to property keys.

28242. Strict C99 case: DUK_UINTPTR_MAX (= UINTPTR_MAX) should be very reliable

28243. autodetect platform

28244. **comment:** NetBSD 6.0 x86 (at least) has a few problems with pow() semantics, * see test-bug-netbsd-math-pow.js. Use NetBSD specific workaround. * (This might be a wider problem; if so, generalize the define name.)**label:** code-design

28245. autodetect architecture

28246. In VBCC (0.0 / 0.0) results in a warning and 0.0 instead of NaN. * In MSVC (VS2010 Express) (0.0 / 0.0) results in a compile error. * Use a computed NaN (initialized when a heap is created at the * latest).

28247. Clang: assume we have __va_copy() in non-C99 mode.

28248. --- Bruce's C compiler ---

28249. Same as 'duk_int_t' but guaranteed to be a 'fast' variant if this * distinction matters for the CPU. These types are used mainly in the * executor where it might really matter.

28250. vbcc + AmigaOS may be missing these

28251. C99 or C++11, no known issues

28252. **comment:** XXX: DUK_LIKELY, DUK_UNLIKELY for msvc?**label:** code-design

28253. Initial fix: disable secure CRT related warnings when compiling Duktape * itself (must be defined before including Windows headers). Don't define * for user code including duktape.h.

28254. varargs

28255. * Fill-ins for platform, architecture, and compiler

28256. e.g. strftime

28257. **comment:** Note: PRS and FMT are intentionally left undefined for now. This means * there is no platform specific date parsing/formatting but there is still * the ISO 8601 standard format.**label:** code-design

28258. vsnprintf() is technically not part of C89 but usually available.

28259. Rely on autodetection for byte order, alignment, and packed tval.

28260. AmigaOS + M68K seems to have math issues even when using GCC cross * compilation. Use replacements for all AmigaOS versions on M68K * regardless of compiler.

28261. Byte order is little endian but cannot determine IEEE double word order.

28262. C++

28263. MIPS. Related defines: __MIPSEB__, __MIPSEL__, __mips_isa_rev, __LP64__

28264. VBCC is missing the built-ins even in C99 mode (perhaps a header issue).

28265. __MSC_VER

28266. **comment:** Macro for suppressing warnings for potentially unreferenced variables. * The variables can be actually unreferenced or unreferenced in some * specific cases only; for instance, if a variable is only debug printed, * it is unreferenced when debug printing is disabled.**label:** code-design

28267. Byte order varies, rely on autodetection.

28268. Use __setjmp() on Apple by default, see GH-55.

28269. TI-Nspire (using Ndless)

28270. --- PowerPC 32-bit ---

28271. Some math functions are C99 only. This is also an issue with some * embedded environments using uclibc where uclibc has been configured * not to provide some functions. For now, use replacements whenever * using uclibc.

28272. Most portable

28273. Boolean values are represented with the platform 'int'.

28274. Shared includes: stdint.h is C99

28275. BSD variant

28276. Old uclibcs have a broken memcpy so use memmove instead (this is overly wide * now on purpose): <http://lists.uclibc.org/pipermail/uclibc-cvs/2008-October/025511.html>

28277. date.h is omitted, and included per platform

28278. * Architecture autodetection

28279. The most portable current time provider is time(), but it only has a * one second resolution.

28280. Convenience, e.g. gcc 4.5.1 == 40501; <http://stackoverflow.com/questions/6031819/emulating-gccs-built-in-unreachable>

28281. defined(DUK_USE_BYTEORDER)

28282. In VBCC (1.0 / 0.0) results in a warning and 0.0 instead of infinity. * Use a computed infinity (initialized when a heap is created at the * latest).

28283. For now, hash part is dropped if and only if 16-bit object fields are used.

28284. MSVC dllexport/dllimport: appropriate `__declspec` depends on whether we're * compiling Duktape or the application.

28285. **comment:** On Windows, assume we're little endian. Even Itanium which has a * configurable endianness runs little endian in Windows.
label: code-design

28286. **comment:** Compiler specific hackery needed to force struct size to match alignment, * see e.g. `duk_hbuffer.h`. * * <http://stackoverflow.com/questions/11130109/c-struct-size-alignment> * http://stackoverflow.com/questions/10951039/specifying-64-bit-alignment
label: code-design

28287. Index values must have at least 32-bit signed range.

28288. **comment:** Workaround for GH-323: avoid inlining control when compiling from * multiple sources, as it causes compiler portability trouble.
label: code-design

28289. byte order

28290. Linux

28291. Based on 'make checkalign' there are no alignment requirements on * Linux SH4, but align by 4 is probably a good basic default.

28292. MSVC preprocessor defines: <http://msdn.microsoft.com/en-us/library/b0084kay.aspx> * `_MSC_FULL_VER` includes the build number, but it has at least two formats, see e.g. * `BOOST_MSVC_FULL_VER` in http://www.boost.org/doc/libs/1_52_0/boost/config/compiler/visualc.hpp

28293. ARM

28294. Fast variants of small integers, again for really fast paths like the * executor.

28295. **comment:** When C99 types are not available, we use heuristic detection to get * the basic 8, 16, 32, and (possibly) 64 bit types. The fast/least * types are then assumed to be exactly the same for now: these could * be improved per platform but C99 types are very often now available. * 64-bit types are not available on all platforms; this is OK at least * on 32-bit platforms. * * This detection code is necessarily a bit hacky and can provide `typedefs` * and defines that won't work correctly on some exotic platform.
label: code-design

28296. **comment:** * Cleanups (all statement parsing flows through here). * * Pop label site and reset labels. Reset 'next temp' to value at * entry to reuse temps.
label: code-design

28297. **comment:** * Reference counting helper macros. The macros take a thread argument * and must thus always be executed in a specific thread context. The * thread argument is needed for features like finalization. Currently * it is not required for INCREF, but it is included just in case. * * Note that 'raw' macros such as `DUK_HEAPHDR_GET_REFCOUNT()` are not * defined without `DUK_USE_REFERENCE_COUNTING`, so caller must `#ifdef` * around them.
label: code-design

28298. alloc external with size zero

28299. 'i' is the first entry we'll keep

28300. If blen <= 0xffffUL, clen is also guaranteed to be <= 0xffffUL.

28301. Set catcher regs: `idx_base+0 = value, idx_base+1 = lj_type`.

28302. resend state next time executor is about to run

28303. **comment:** XXX: avoid this check somehow
label: code-design

28304. Should match `Function.prototype.toString()`

28305. * Main struct

28306. '/'

28307. * Unwind debugger state. If we unwind while stepping * (either step over or step into), pause execution.

28308. `Duktape.modLoaded[]` module cache

28309. [obj handler trap]

28310. Not safe to use 'reg_varbind' as assignment expression * value, so go through a temp.

28311. **comment:** size for formatting buffers
label: code-design

28312. default case exists: go there if no case matches

28313. registers are mutable, non-deletable

28314. '{'

28315. If the debugger is active we need to force an interrupt so that * debugger breakpoints are rechecked. This is important for function * calls caused by side effects (e.g. when doing a `DUK_OP_GETPROP`), see * GH-303. Only needed for success path, error path always causes a * breakpoint recheck in the executor. It would be enough to set this * only when returning to an Ecmascript activation, but setting the flag * on every return should have no ill effect.

28316. get or set a range of flags; m=first bit number, n=number of bits

28317. [level obj func pc line]

28318. * Ecmascript compliant [[GetProperty]](P), for internal use only. * * If property is found: * - Fills descriptor fields to 'out_desc' * - If `DUK_GETDESC_FLAG_PUSH_VALUE` is set, pushes a value related to the * property onto the stack ('undefined' for accessor properties). * - Returns non-zero * * If property is not found: * - 'out_desc' is left in untouched state (possibly garbage) * - Nothing is pushed onto the stack (not even with `DUK_GETDESC_FLAG_PUSH_VALUE` * set) * - Returns zero * * May cause arbitrary side effects and invalidate (most) `duk_tval` * pointers.

28319. [arg1 ... argN this]

28320. * Matching order: * * Punctuator first chars, also covers comments, regexps * LineTerminator * Identifier or reserved word, also covers null/true/false literals * NumericLiteral * StringLiteral * EOF * * The order does not matter as long as the longest match is * always correctly identified. There are order dependencies * in the clauses, so it's not trivial to convert to a switch.

28321. Allocator functions.

28322. next does not exist or next is not a letter

28323. * Create and push an error object onto the top of stack. * If a "double error" occurs, use a fixed error instance * to avoid further trouble.

28324. 'enum'

28325. `SameValue(NaN, NaN) = true`, regardless of NaN sign or extra bits

28326. just making sure

28327. needed for inf: causes mantissa to become zero, * and rounding to be skipped.

28328. String table assert check omitted from 1.x branch * backport.

28329. **comment:** XXX: string not shared because it is conditional
label: code-design

28330. carry

28331. Initial bytes for markers.

28332. queue back to heap_allocated

28333. XXX: We can't resize the value stack to a size smaller than the * current top, so the order of the resize and adjusting the stack * top depends on the current vs. final size of the value stack. * The operations could be combined to avoid this, but the proper * fix is to only grow the value stack on a function call, and only * shrink it (without throwing if the shrink fails) on function * return.

28334. print provider

28335. form: { DecimalDigits }, val1 = min count

28336. * Figure out the final, non-bound constructor, to get "prototype" * property.

28337. **comment:** * Note: * * - `duk_match_regexp()` is required not to `longjmp()` in ordinary "non-match" * conditions; a `longjmp()` will terminate the entire matching process. * * - Clearing `saved[]` is not necessary because backtracking does it * * - Backtracking also rewinds `ctx.recursion` back to zero, unless an * internal/limit error occurs (which causes a `longjmp()`) * * - If we supported anchored matches, we would break out here * unconditionally; however, Ecmascript regexps don't have anchored * matches. It might make sense to implement a fast bail-out if * the regexp begins with '^' and `sp` is not 0: currently we'll just * run through the entire input string, trivially failing the match * at every non-zero offset.
label: code-design

28338. `DUK_TOK_LPAREN`

28339. caller ensures; rom objects are never bufferobjects now

28340. Would be nice to bulk clear the allocation, but the context * is 1-2 kilobytes and nothing should rely on it being zeroed.

28341. 1 -> needs a PUTVAR
28342. * Post-increment/decrement will return the original value as its * result value. However, even that value will be coerced using * ToNumber() which is quite awkward. Specific bytecode opcodes * are used to handle these semantics. ** Note that post increment/decrement has a "no LineTerminator here" * restriction. This is handled by duk__expr_lbp(), which forcibly terminates * the previous expression if a LineTerminator occurs before '++'/'--'.

28405. **comment:** XXX: compression (as an option)

label: code-design

28406. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. ** This handling is now identical for C and Ecmascript functions. * C functions always have the 'NEWENV' flag set, so their * environment record initialization is delayed (which is good). ** Delayed creation (on demand) is handled in duk_js_var.c.

28407. **comment:** Declaration binding instantiation conceptually happens when calling a * function; for us it essentially means that function prologue. The * conceptual process is described in E5 Section 10.5. ** We need to keep track of all encountered identifiers to (1) create an * identifier-to-register map ("varmap"); and (2) detect duplicate * declarations. Identifiers which are not bound to registers still need * to be tracked for detecting duplicates. Currently such identifiers * are put into the varmap with a 'null' value, which is later cleaned up. ** To support functions with a large number of variable and function * declarations, registers are not allocated beyond a certain limit; * after that limit, variables and functions need slow path access. * Arguments are currently always register bound, which imposes a hard * (and relatively small) argument count limit. ** Some bindings in E5 are not configurable (=deletable) and almost all * are mutable (writable). Exceptions are: ** - The 'arguments' binding, established only if no shadowing argument * or function declaration exists. We handle 'arguments' creation * and binding through an explicit slow path environment record. ** - The "name" binding for a named function expression. This is also * handled through an explicit slow path environment record.

28541. **comment:** * Array built-ins * * Note that most Array built-ins are intentionally generic and work even * when the 'this' binding is not an Array instance. To ensure this, * Array algorithms do not assume "magical" Array behavior for the "length" * property, for instance. * * XXX: the "Throw" flag should be set for (almost?) all [[Put]] and * [[Delete]] operations, but it's currently false throughout. Go through * all put/delete cases and check throw flag use. Need a new API primitive * which allows throws flag to be specified. * * XXX: array lengths above 2G won't work reliably. There are many places * where one needs a full signed 32-bit range ([-0xffffffff, 0xffffffff], * i.e. -33- bits). Although array 'length' cannot be written to be outside * the unsigned 32-bit range (E5.1 Section 15.4.5.1 throws a RangeError if so) * some intermediate values may be above 0xffffffff and this may not be always * correctly handled now (duk_uint32_t is not enough for all algorithms). * * For instance, push() can legitimately write entries beyond length 0xffffffff * and cause a RangeError only at the end. To do this properly, the current * push() implementation tracks the array index using a 'double' instead of a * duk_uint32_t (which is somewhat awkward). See test-bi-array-push-maxlen.js. * * On using "put" vs. "def" prop * ===== * * Code below must be careful to use the appropriate primitive as it matters * for compliance. When using "put" there may be inherited properties in * Array.prototype which cause side effects when values are written. When * using "define" there are no such side effects, and many test262 test cases * check for this (for real world code, such side effects are very rare). * Both "put" and "define" are used in the E5.1 specification; as a rule, * "put" is used when modifying an existing array (or a non-array 'this' * binding) and "define" for setting values into a fresh result array. * * Also note that Array instance 'length' should be writable, but not * enumerable and definitely not configurable: even Duktape code internally * assumes that an Array instance will always have a 'length' property. * Preventing deletion of the property is critical.

28847. record previous atom info in case next token is a quantifier
28848. ..."
28849. * Ecmascript compliant [[GetOwnProperty]](P), for internal use only. * * If property is found: * - Fills descriptor fields to 'out_desc' * - If DUK_GETDESC_FLAG_PUSH_VALUE is set, pushes a value related to the * property onto the stack ('undefined' for accessor properties). * - Returns non-zero *

* If property is not found: * - 'out_desc' is left in untouched state (possibly garbage)
* - Nothing is pushed onto the stack (not even with DUK_GETDESC_FLAG_PUSH_VALUE set)
* - Returns zero
** Notes:
* - Getting a property descriptor may cause an allocation (and hence GC) to take place, hence reachability and refcount of all related values matter. Reallocation of value stack, properties, etc may invalidate many duk_tval pointers (concretely, those which reside in memory areas subject to reallocation). However, heap object pointers are never affected (heap objects have stable pointers).
* - The value of a plain property is always reachable and has a non-zero reference count.
* - The value of a virtual property is not necessarily reachable from elsewhere and may have a refcount of zero. Hence we push it onto the valstack for the caller, which ensures it remains reachable while it is needed.
* - There are no virtual accessor properties. Hence, all getters and setters are always related to concretely stored properties, which ensures that the get/set functions in the resulting descriptor are reachable and have non-zero refcounts. Should there be virtual accessor properties later, this would need to change.

28850. not enumerable

The '\ character of an escape sequence is not matched here, see discussion in duk_unicode_is_identifier_start(). ** To match non-ASCII characters (codepoints >= 0x80), a very slow linear range-by-range scan is used. The codepoint is first compared to the IdentifierStart ranges, and if it doesn't match, then to a set consisting of code points in

IdentifierPart but not in * IdentifierStart. This is done to keep the unicode range data small, * at the expense of speed. * * The ASCII fast path consists of: * * 0x0030 ... 0x0039 ['0' ... '9', UnicodeDigit] * 0x0041 ... 0x005a ['A' ... 'Z', IdentifierStart] * 0x0061 ... 0x007a ['a' ... 'z', IdentifierStart] * 0x0024 ['\$', IdentifierStart] * 0x005f['_', IdentifierStart and * UnicodeConnectorPunctuation] * * UnicodeCombiningMark has no code points <= 0x7f. * * The matching code reuses the "identifier start" tables, and then * consults a separate range set for characters in "identifier part" * but not in "identifier start". These can be extracted with the * "src/extract_chars.py" script. * * UnicodeCombiningMark -> categories Mn, Mc * UnicodeDigit -> categories Nd * UnicodeConnectorPunctuation -> categories Pc

label: code-design

28955. x <- y * z

28956. * Note: assuming new_a_size == 0, and that entry part contains * no conflicting keys, refcounts do not need to be adjusted for * the values, as they remain exactly the same. * * The keys, however, need to be interned, incref'd, and be * reachable for GC. Any intern attempt may trigger a GC and * claim any non-reachable strings, so every key must be reachable * at all times. * * A longjmp must not occur here, as the new_p allocation would * be freed without these keys being decref'd, hence the messy * decref handling if intern fails.

28957. **comment:** * 'props' contains {key,value,flags} entries, optional array entries, and * an optional hash lookup table for non-array entries in a single 'sliced' * allocation. There are several layout options, which differ slightly in * generated code size/speed and alignment/padding; duk_features.h selects * the layout used. * * Layout 1 (DUK_USE_HOBJECT_LAYOUT_1): * * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xffffffffUL = deleted

** Layout 2 (DUK_USE_HOBJECT_LAYOUT_2): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_uint8_t) + pad bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted ** Layout 3 (DUK_USE_HOBJECT_LAYOUT_3): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) ** In layout 1, the 'e_next' count is rounded to 4 or 8 on platforms * requiring 4 or 8 byte alignment. This ensures proper alignment * for the entries, at the cost of memory footprint. However, it's * probably preferable to use another layout on such platforms instead. ** In layout 2, the key and value parts are swapped to avoid padding * the key array on platforms requiring alignment by 8. The flags part * is padded to get alignment for array entries. The 'e_next' count does * not need to be rounded as in layout 1. ** In layout 3, entry values and array values are always aligned properly, * and assuming pointers are at most 8 bytes, so are the entry keys. Hash * indices will be properly aligned (assuming pointers are at least 4 bytes). * Finally, flags don't need additional alignment. This layout provides * compact allocations without padding (even on platforms with alignment * requirements) at the cost of a bit slower lookups. ** Objects with few keys don't have a hash index; keys are looked up linearly, * which is cache efficient because the keys are consecutive. Larger objects * have a hash index part which contains integer indexes to the entries part. ** A single allocation reduces memory allocation overhead but requires more * work when any part needs to be resized. A sliced allocation for entries * makes linear key matching faster on most platforms (more locality) and * skimps on flags size (which would be followed by 3 bytes of padding in * most architectures if entries were placed in a struct). ** 'props' also contains internal properties distinguished with a non-BMP * prefix. Often used properties should be placed early in 'props' whenever * possible to make accessing them as fast as possible.

29114. **comment:** Throwing an error this deep makes the error rather vague, but * saves hundreds of bytes of code.
label: code-design
29115. This is not strictly necessary, but avoids compiler warnings; e.g. * gcc won't reliably detect that no uninitialized data is read below.
29116. Trigger at zero or below
29117. Custom coercion for API
29118. **comment:** Note: cannot read more than 24 bits without possibly shifting top bits out. * Fixable, but adds complexity.
label: code-design
29119. Almost all global level Function objects are constructable * but not all: Function.prototype is a non-constructable, * callable Function.
29120. source ends before dest starts
29121. * Statement terminator check, including automatic semicolon * handling. After this step, 'curr_tok' should be the first * token after a possible statement terminator.
29122. * Exposed string-to-number API * * Input: [string] * Output: [number] * * If number parsing fails, a NaN is pushed as the result. If number parsing * fails due to an internal error, an InternalError is thrown.
29123. 64-bit OK because always ≥ 0
29124. reg/const for switch value
29125. **comment:** When formatting an argument to a string, errors may happen from multiple * causes. In general we want to catch obvious errors like a toLogString() * throwing an error, but we don't currently try to catch every possible * error. In particular, internal errors (like out of memory or stack) are * not caught. Also, we expect Error.toString() to not throw an error.
label: code-design
29126. Each round of finalizer execution may spawn new finalizable objects * which is normal behavior for some applications. Allow multiple * rounds of finalization, but use a shrinking limit based on the * first round to detect the case where a runaway finalizer creates * an unbounded amount of new finalizable objects. Finalizer rescue * is not supported: the semantics are unclear because most of the * objects being finalized here are already reachable. The finalizer * is given a boolean to indicate that rescue is not possible. * * See discussion in: <https://github.com/svaarala/duktape/pull/473>
29127. no prototype, updated below
29128. unwind to 'resume' caller
29129. 0x0f-0xff
29130. **comment:** XXX: missing trap result validation for non-configurable target keys * (must be present), for non-extensible target all target keys must be * present and no extra keys can be present. * <http://www.ecma-international.org/ecma-262/6.0/#sec-proxy-object-internal-methods-and-internal-slots-ownpropertykeys>
label: code-design
29131. **comment:** NOTE: lightfuncs are coerced to full functions because * lightfuncs don't fit into a property value slot. This * has some side effects, see test-dev-lightfunc-accessor.js.
label: code-design
29132. IdentityEscape, with dollar added as a valid additional * non-standard escape (see test-regexp-identity-escape-dollar.js). * Careful not to match end-of-buffer (<0) here.
29133. 1st related value (type specific)
29134. The caller is responsible for being sure that bytecode being loaded * is valid and trusted. Invalid bytecode can cause memory unsafe * behavior directly during loading or later during bytecode execution * (instruction validation would be quite complex to implement). * * This signature check is the only sanity check for detecting * accidental invalid inputs. The initial 0xFF byte ensures no * ordinary string will be accepted by accident.
29135. Shared object part
29136. always throw ReferenceError for unresolvable

29137. * Mark roots, hoping that recursion limit is not normally hit. * If recursion limit is hit, run additional reachability rounds * starting from "temproots" until marking is complete. ** Marking happens in two phases: first we mark actual reachability * roots (and run "temproots" to complete the process). Then we * check which objects are unreachable and are finalizable; such * objects are marked as FINALIZABLE and marked as reachability * (and "temproots" is run again to complete the process). ** The heap finalize_list must also be marked as a reachability root. * There may be objects on the list from a previous round if the * previous run had finalizer skip flag.

29138. Shift to sign extend.

29139. '^'

29140. required_desc_flags

29141. **comment:** Stack indices for better readability
label: code-design

29142. * Try registers

29143. no prototype or class yet

29144. shadowed; update value

29145. E5 Section 8.6.2 + custom classes

29146. **comment:** Lookup current thread; use the stable 'entry_thread' for this to * avoid clobber warnings. Any valid, reachable 'thr' value would be * fine for this, so using 'entry_thread' is just to silence warnings.
label: code-design

29147. RELATIONAL EXPRESSION

29148. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property existence check right now.

29149. These are just convenience "wiping" of state. Side effects should * not be an issue here: thr->heap and thr->heap->lj have a stable * pointer. Finalizer runs etc capture even out-of-memory errors so * nothing should throw here.

29150. Zero escape (also allowed in non-strict mode)

29151. roughly 64 bytes

29152. XXX: this doesn't actually work properly for tail calls, so * tail calls are disabled when DUK_USE_NONSTD_FUNC_CALLER_PROPERTY * is in use.

29153. * Dragon4 slow path (binary) digit generation. * An extra digit is generated for rounding.

29154. this is a bit approximate (errors out before max is reached); this is OK

29155. **comment:** * Parse a function-body-like expression (FunctionBody or Program * in E5 grammar) using a two-pass parse. The productions appear * in the following contexts: * * - function expression * - function statement * - function declaration * - getter in object literal * - setter in object literal * - global code * - eval code * - Function constructor body ** This function only parses the statement list of the body; the argument * list and possible function name must be initialized by the caller. * For instance, for Function constructor, the argument names are originally * on the value stack. The parsing of statements ends either at an EOF or * a closing brace; this is controlled by an input flag. ** Note that there are many differences affecting parsing and even code * generation: * * - Global and eval code have an implicit return value generated * by the last statement; function code does not * * - Global code, eval code, and Function constructor body end in * an EOF, other bodies in a closing brace ('}') * * Upon entry, 'curr_tok' is ignored and the function will pull in the * first token on its own. Upon exit, 'curr_tok' is the terminating * token (EOF or closing brace).
label: code-design

29156. When torture not enabled, can just use the same helper because * 'reg' won't get spilled.

29157. Note: actual update happens once write has been completed * without error below. The write should always succeed * from a specification viewpoint, but we may e.g. run out * of memory. It's safer in this order.

29158. Convert buffer to result string.

29159. default prototype (Note: 'thr' must be reachable)

29160. we know these because enum objects are internally created

29161. **comment:** XXX: error message is a bit misleading: we reached a recursion * limit which is also essentially the same as a C callstack limit * (except perhaps with some relaxed threading assumptions).
label: code-design

29162. **comment:** Direct eval requires that there's a current * activation and it is an Ecmascript function. * When Eval is executed from e.g. cooperate API * call we'll need to do an indirect eval instead.
label: code-design

29163. 1 = num actual 'return values'

29164. should never happen

29165. '-' verbatim

29166. Regexp tokens

29167. avoid attempt to compact the current object

29168. DUK_TOK_TRUE

29169. idx_bottom and idx_retval are only used for book-keeping of * Ecmascript-initiated calls, to allow returning to an Ecmascript * function properly. They are duk_size_t to match the convention * that value stack sizes are duk_size_t and local frame indices * are duk_idx_t.

29170. **comment:** This loop is optimized for size. For speed, there should be * two separate loops, and we should ensure that memcmp() can be * used without an extra "will searchstring fit" check. Doing * the preconditioning for 'p' and 'p_end' is easy but cpos * must be updated if 'p' is wound back (backward scanning).
label: code-design

29171. min(incl)

29172. may be equal

29173. traceback depth ensures fits into 16 bits

29174. * Get the values onto the stack first. It would be possible to cover * some normal cases without resorting to the value stack. ** The right hand side could be a light function (as they generally * behave like objects). Light functions never have a 'prototype' * property so E5.1 Section 15.3.5.3 step 3 always throws a TypeError. * Using duk_require_hobject() is thus correct (except for error msg).

29175. DUK_TOK_GET

29176. * Various

29177. Module has now evaluated to a wrapped module function. Force its * .name to match module.name (defaults to last component of resolved * ID) so that it is shown in stack traces too. Note that we must not * introduce an actual name binding into the function scope (which is * usually the case with a named function) because it would affect the * scope seen by the module and shadow accesses to globals of the same name. * This is now done by compiling the function as anonymous and then forcing * its .name without setting a "has name binding" flag.

29178. Characters outside BMP cannot be escape()'d. We could * encode them as surrogate pairs (for codepoints inside * valid UTF-8 range, but not extended UTF-8). Because * escape() and unescape() are legacy functions, we don't.

29179. trailer

29180. * Check whether we need to abandon an array part (if it exists)

29181. [... env callee]

29182. **comment:** These is not 100% because format would need to be non-portable "long long". * Also print out as doubles to catch cases where the "long" type is not wide * enough; the limits will then not be printed accurately but the magnitude * will be correct.
label: code-design

29183. an Ecmascript function

29184. **comment:** avoid pressure to add/remove strings, invalidation of call data argument, etc.
label: code-design

29185. end of bytecode

29186. key is 'length', cannot match argument exotic behavior

29187. * First check whether property exists; if not, simple case. This covers * steps 1-4.

29188. * Do-while statement is mostly trivial, but there is special * handling for automatic semicolon handling (triggered by the * DUK_ALLOW_AUTO_SEMI_ALWAYS) flag related to a bug filed at: * * https://bugs.ecmascript.org/show_bug.cgi?id=8 * * See doc/compiler.rst for details.

29189. must be found: was found earlier, and cannot be inherited

29190. Input value should be on stack top and will be coerced and * popped. Refuse to update an Array's 'length' to a value * outside the 32-bit range. Negative zero is accepted as zero.

29191. shift in zeroes

29192. free object and all auxiliary (non-heap) allocs

29193. Useful for internal call sites where we either expect an object (function) * or a lightfunc. Returns NULL for a lightfunc.

29194. bytes in dest

29195. stack[0] = regexp * stack[1] = string

29196. flags

29197. Check for maximum buffer length.

29198. 'Thread'

29199. **comment:** Pointer to bytecode executor's 'curr_pc' variable. Used to copy * the current PC back into the topmost activation when activation * state is about to change (or "syncing" is otherwise needed). This * is rather awkward but important for performance, see execution.rst.
label: code-design

29200. The Quote(value) operation: quote a string. * * Stack policy: [] -> [].

29201. Output #2: last component name

29202. tc1 = false, tc2 = false

29203. 0

29204. Exponent without a sign or with a +/- sign is accepted * by all call sites (even JSON.parse()).

29205. 0x90-0x9f

29206. **comment:** XXX: Shuffling support could be implemented here so that LDINT+LDINTX * would only shuffle once (instead of twice). The current code works * though, and has a smaller compiler footprint.
label: code-design

29207. * Write to entry part

29208. To use the shared helper need the virtual index.

29209. * Slow delete, but we don't care as we're already in a very slow path. * The delete always succeeds: key has no exotic behavior, property * is configurable, and no resize occurs.

29210. LAYOUT 1

29211. For len == 0, i is initialized to len - 1 which underflows. * The condition (i < len) will then exit the for-loop on the * first round which is correct. Similarly, loop termination * happens by i underflowing.

29212. Raw internal valstack access macros: access is unsafe so call site * must have a guarantee that the index is valid. When that is the case, * using these macro results in faster and smaller code than duk_get_tval(). * Both 'ctx' and 'idx' are evaluated multiple times, but only for asserts.

29213. * Node.js Buffer.isEncoding()

29214. array entries are all plain values

29215. **comment:** Buffer values are encoded in (lowercase) hex to make the * binary data readable. Base64 or similar would be more * compact but less readable, and the point of JX/JC * variants is to be as useful to a programmer as possible.
label: code-design

29216. **comment:** XXX: the helper currently assumes stack top contains new * 'length' value and the whole calling convention is not very * compatible with what we need.
label: code-design

29217. Coerce to number before validating pointers etc so that the * number coercions in duk_hbufferobject_validated_write() are * guaranteed to be side effect free and not invalidate the * pointer checks we do here.

29218. Mark-and-sweep interval is relative to combined count of objects and * strings kept in the heap during the latest mark-and-sweep pass. * Fixed point .8 multiplier and .0 adder. Trigger count (interval) is * decreased by each (re)allocation attempt (regardless of size), and each * refzero processed object. ** 'SKIP' indicates how many (re)allocations to wait until a retry if * GC is skipped because there is no thread do it with yet (happens * only during init phases).

29219. XXX: assert 'c' is an enumerator

29220. two special escapes: '\n' and "", other printables as is

29221. for indexOf, ToInteger(undefined) would be 0, i.e. correct, but * handle both indexOf and lastIndexOf specially here.

29222. DUK_USE_AUGMENT_ERROR_THROW

29223. * Exponent notation for non-base-10 numbers isn't specified in ECMAScript * specification, as it never explicitly turns up: non-decimal numbers can * only be formatted with Number.prototype.toString([radix]) and for that, * behavior is not explicitly specified. ** Logical choices include formatting the exponent as decimal (e.g. binary * 100000 as 1e+5) or in current radix (e.g. binary 100000 as 1e+101). * The Dragon4 algorithm (in the original paper) prints the exponent value * in the target radix B. However, for radix values 15 and above, the * exponent separator 'e' is no longer easily parseable. Consider, for * instance, the number "1.faecee+1c".

29224. Template functions are not strictly constructable (they don't * have a "prototype" property for instance), so leave the * DUK_HOBJECT_FLAG_CONSTRUCTABLE flag cleared here.

29225. **comment:** Most practical strings will go here.
label: code-design

29226. non-strict eval: env is caller's env or global env (direct vs. indirect call) * global code: env is is global env

29227. **comment:** XXX: use the exactly same arithmetic function here as in executor
label: code-design

29228. -> [... lval new_rval]

29229. sep (even before first one)

29230. **comment:** XXX: use advancing pointers instead of index macros -> faster and smaller?
label: code-design

29231. 0x7F is special

29232. IEEE requires that zeros compare the same regardless * of their signed, so if both x and y are zeroes, they * are caught above.

29233. Signed integers always map to 4 bytes now.

29234. Resolve Proxy targets until Proxy chain ends. No explicit check for * a Proxy loop: user code cannot create such a loop without tweaking * internal properties directly.

29235. estimate is valid

29236. Note: it's nice if size is 2^N (not 4x4 = 16 bytes on 32 bit)

29237. always true, arg is unsigned

29238. ArrayBuffer: unlike any other argument variant, create * a view into the existing buffer.

29239. DUK_TOK_DO

29240. * Slow path: potentially requires function calls for coercion

29241. 'ArrayBuffer'

29242. Initialize index so that we skip internal control keys.

29243. flags have been already cleared

29244. * ArrayBuffer, DataView, and TypedArray constructors

29245. **comment:** * XXX: for now, indicate that an expensive catch binding * declarative environment is always needed. If we don't * need it, we don't need the const_varname either.
label: code-design

29246. -> [... this timeval_new timeval_new]

29247. DUK_TOK_CONST

29248. **comment:** XXX: unnecessary copying of values? Just set 'top' to * b + c, and let the return handling fix up the stack frame?
label: code-design

29249. Slot C

29250. **comment:** Array is dense and contains only strings, but ASIZE may * be larger than used part and there are UNUSED entries.

label: code-design

29251. At least: ... [err]
29252. wrapped
29253. whole or fraction digit
29254. * Constructor calls
29255. only 'length'
29256. DUK_USE_DEBUGGER_DUMPHEAP
29257. 'toISOString'
29258. 'res' contains expression value
29259. No other escape beginning with a digit in strict mode
29260. **comment:** Use Murmurhash2 directly for short strings, and use "block skipping" * for long strings: hash an initial part and then sample the rest of * the string with reasonably sized chunks. An initial offset for the * sampling is computed based on a hash of the initial part of the string; * this is done to (usually) avoid the case where all long strings have * certain offset ranges which are never sampled. * * Skip should depend on length and bound the total time to roughly * logarithmic. With current values: * * 1M string => 256 * 241 = 61696 bytes (0.06M) of hashing * 1G string => 256 * 16321 = 4178176 bytes (3.98M) of hashing * * XXX: It would be better to compute the skip offset more "smoothly" * instead of having a few boundary values.

29349. Terminating conditions. For fixed width output, we just ignore the * terminating conditions (and pretend that tc1 == tc2 == false). The * the current shortcut for fixed-format output is to generate a few * extra digits and use rounding (with carry) to finish the output.
29350. Return value when returning to this activation (points to caller * reg, not callee reg); index is absolute (only set if activation is * not topmost). * * Note: idx_bottom is always set, while idx_retval is only applicable * for activations below the topmost one. Currently idx_retval for * the topmost activation is considered garbage (and it not initialized * on entry or cleared on return; may contain previous or garbage * values).
29351. Unlike non-obsolete String calls, substr() algorithm in E5.1 * specification will happily coerce undefined and null to strings * ("undefined" and "null").
29352. DecimalEscape, only \0 is allowed, no leading zeroes are allowed
29353. parse new token
29354. 1e9
29355. Negative value checked so that a "time jump" works * reasonably. * * Same interval is now used for status sending and * peeking.
29356. * Misc shared helpers.
29357. don't set 'n' at all, inherited value is used as name
29358. ;'
29359. switch cmd
29360. **comment:** XXX: could add a fast path to process chunks of input codepoints, * but relative benefit would be quite small.
 label: code-design
29361. Copy interrupt counter/init value state to new thread (if any). * It's OK for new_thr to be the same as curr_thr.
29362. User totalLength overrides a computed length, but we'll check * every copy in the copy loop. Note that duk_to_uint() can * technically have arbitrary side effects so we need to recheck * the buffers in the copy loop.
29363. **comment:** XXX: some overlapping code; cleanup
 label: code-design
29364. stack[0] = searchElement * stack[1] = fromIndex * stack[2] = object * stack[3] = length (not needed, but not popped above)
29365. from curr pc
29366. * Maximum size check
29367. isError flag for yield
29368. * callstack_top - 1 --> this function * callstack_top - 2 --> caller (may not exist) * * If called directly from C, callstack_top might be 1. If calling * activation doesn't exist, call must be indirect.
29369. no need to unwind callstack
29370. * Array part
29371. **comment:** * Number should already be in NaN-normalized form, * but let's normalize anyway.
 label: code-design
29372. [array totalLength bufres buf]
29373. When src_size == 0, src_data may be NULL (if source * buffer is dynamic), and dst_data may be NULL (if * target buffer is dynamic). Avoid zero-size memcpy() * with an invalid pointer.
29374. [r1,r2] is the range
29375. * NormalizePropertyDescriptor() related helper. * * Internal helper which validates and normalizes a property descriptor * represented as an EcmaScript object (e.g. argument to defineProperty()). * The output of this conversion is a set of defprop_flags and possibly * some values pushed on the value stack; some subset of: property value, * getter, setter. Caller must manage stack top carefully because the * number of values pushed depends on the input property descriptor. * * The original descriptor object must not be altered in the process.
29376. duk_handle_call / duk_handle_safe_call recursion depth limiting
29377. DUK_HOBJECT_FLAG_NEWENV: handled below
29378. A leading digit is not required in some cases, e.g. accept ".123". * In other cases (JSON.parse()) a leading digit is required. This * is checked for after the loop.
29379. common case, already closed, so skip
29380. ignore millisecond fractions after 3
29381. * unshift()
29382. E5 Section 10.4.3

29383. No built-in functions are constructable except the top * level ones (Number, etc).

29384. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed, * and we're in an infinite loop.

29385. Raw helper for getting a value from the stack, checking its tag. * The tag cannot be a number because numbers don't have an internal * tag in the packed representation.

29386. Bernstein hash init value is normally 5381

29387. * DECLVAR * * See E5 Sections: * 10.4.3 Entering Function Code * 10.5 Declaration Binding Instantiation * 12.2 Variable Statement * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * * Variable declaration behavior is mainly discussed in Section 10.5, * and is not discussed in the execution semantics (Sections 11-13). * * Conceptually declarations happen when code (global, eval, function) * is entered, before any user code is executed. In practice, register- * bound identifiers are 'declared' automatically (by virtue of being * allocated to registers with the initial value 'undefined'). Other * identifiers are declared in the function prologue with this primitive. * * Since non-register bindings eventually back to an internal object's * properties, the 'prop_flags' argument is used to specify binding type: * * - Immutable binding: set DUK_PROPDESC_FLAG_WRITABLE to false * - Non-deletable binding: set DUK_PROPDESC_FLAG_CONFIGURABLE to false * - The flag DUK_PROPDESC_FLAG_ENUMERABLE should be set, although it * doesn't really matter for internal objects * * All bindings are non-deletable mutable bindings except: * * - Declarations in eval code (mutable, deletable) * - 'arguments' binding in strict function code (immutable) * - Function name binding of a function expression (immutable) * * Declarations may go to declarative environment records (always * so for functions), but may also go to object environment records * (e.g. global code). The global object environment has special * behavior when re-declaring a function (but not a variable); see * E5.1 specification, Section 10.5, step 5.e. * * Declarations always go to the 'top-most' environment record, i.e. * we never check the record chain. It's not an error even if a * property (even an immutable or non-deletable one) of the same name * already exists. * * If a declared variable already exists, its value needs to be updated * (if possible). Returns 1 if a PUTVAR needs to be done by the caller; * otherwise returns 0.

29388. **comment:** duk_handle_call_xxx: call ignores C recursion limit (for errhandler calls)

label: code-design

29389. expt 0xffff is infinite/nan

29390. Augment the error if called as a normal function. __FILE__ and __LINE__ * are not desirable in this case.

29391. %s

29392. e.g. "x" < "xx"

 label: code-design
29549. at least one opcode emitted
29550. Slice offsets are element (not byte) offsets, which only matters * for TypedArray views, Node.js Buffer and ArrayBuffer have shift * zero so byte and element offsets are the same. Negative indices * are counted from end of slice, crossed indices are allowed (and * result in zero length result), and final values are clamped * against the current slice. There's intentionally no check * against the underlying buffer here.
29551. side effects, in theory (referenced by global env)
29552. * Object.seal() and Object.freeze() (E5 Sections 15.2.3.8 and 15.2.3.9) * * Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. ** Note: virtual (non-concrete) properties which are non-configurable but * writable would pose some problems, but such properties do not currently * exist (all virtual properties are non-configurable and non-writable). * If they did exist, the non-configurability does NOT prevent them from * becoming non-writable. However, this change should be recorded somehow * so that it would turn up (e.g. when getting the property descriptor), * requiring some additional flags in the object.
29553. additional flags which are passed in the same flags argument as property * flags but are not stored in object properties.
29554. **comment:** XXX: Is this INCREF necessary? 'func' is always a borrowed * reference reachable through the value stack? If changed, stack * unwind code also needs to be fixed to match.
 label: code-design
29555. **comment:** XXX: shared decoding of 'b' and 'c'?
 label: code-design
29556. **comment:** The fast path for array property put is not fully compliant: * If one places conflicting number-indexed properties into * Array.prototype (for example, a non-writable Array.prototype[7]) * the fast path will incorrectly ignore them. ** This fast path could be made compliant by falling through * to the slow path if the previous value was UNUSED. This would * also remove the need to check for extensibility. Right now a * non-extensible array is slower than an extensible one as far * as writes are concerned. ** The fast path behavior is documented in more detail here: * tests/ecmascript/test-misc-array-fast-write.js
 label: code-design
29557. **comment:** XXX: because we unwind stacks above, thr->heap->curr_thread is at * risk of pointing to an already freed thread. This was indeed the * case in test-bug-multithread-valgrind.c, until duk_handle_call() * was fixed to restore thr->heap->curr_thread before rethrowing an * uncaught error.
 label: code-design

29558. Allow naked fraction (e.g. ".123")
29559. * Rate limit check for sending status update or peeking into * the debug transport. Both can be expensive operations that * we don't want to do on every opcode. *
* Making sure the interval remains reasonable on a wide variety * of targets and bytecode is difficult without a timestamp, so * we use a Date-provided timestamp
for the rate limit check. * But since it's also expensive to get a timestamp, a bytecode * counter is used to rate limit getting timestamps.
29560. >>> struct.unpack('>d', '4000112233445566'.decode('hex')) * (2.008366013071895.)
29561. Other longjmp types are handled by executor before propagating * the error here.
29562. * E5 Section 11.8.6 describes the main algorithm, which uses * [[HasInstance]]. [[HasInstance]] is defined for only * function objects: * * - Normal functions:
E5 Section 15.3.5.3 * - Functions established with Function.prototype.bind(): * E5 Section 15.3.4.5.3 ** For other objects, a TypeError is thrown. * * Limited
Proxy support: don't support 'getPrototypeOf' trap but * continue lookup in Proxy target if the value is a Proxy.
29563. * Ecmascript/native function call or lightfunc call
29564. Halt execution and enter a debugger message loop until execution is resumed * by the client. PC for the current activation may be temporarily decremented * so
that the "current" instruction will be shown by the client. This helper * is callable from anywhere, also outside bytecode executor.
29565. computed live
29566. **comment:** Load a function from bytecode. The function object returned here must * match what is created by duk_js_push_closure() with respect to its flags, *
properties, etc. * * NOTE: there are intentionally no input buffer length / bound checks. * Adding them would be easy but wouldn't ensure memory safety as
untrusted * or broken bytecode is unsafe during execution unless the opcodes themselves * are validated (which is quite complex, especially for indirect opcodes).
label: code-design
29567. * For an external string, the NUL-terminated string data is stored * externally. The user must guarantee that data behind this pointer * doesn't change while it's
used.
29568. Note: masking of 'x' is not necessary because of * range check and shifting -> no bits overlapping * the marker should be set.
29569. **comment:** * Object.defineProperty() related helper (E5 Section 15.2.3.6) * * Inlines all [[DefineOwnProperty]] exotic behaviors. * * Note: Ecmascript compliant
[[DefineOwnProperty]](P, Desc, Throw) is not * implemented directly, but Object.defineProperty() serves its purpose. * We don't need the [[DefineOwnProperty]]
internally and we don't have a * property descriptor with 'missing values' so it's easier to avoid it * entirely. * * Note: this is only called for actual objects, not
primitive values. * This must support virtual properties for full objects (e.g. Strings) * but not for plain values (e.g. strings). Lightfuncs, even though * primitive in
a sense, are treated like objects and accepted as target * values.

29589. * Helper for valstack space * * Caller of DUK_ASSERT_VALSTACK_SPACE() estimates the number of free stack entries * required for its own use, and any
child calls which are not (a) Duktape API calls * or (b) Duktape calls which involve extending the valstack (e.g. getter call).
29590. 'modLoaded'
29591. * Assertions before
29592. **comment:** * Buffer writer (dynamic buffer only) * * Helper for writing to a dynamic buffer with a concept of a "spare" area * to reduce resizes. You can ensure
there is enough space beforehand and * then write for a while without further checks, relying on a stable data * pointer. Spare handling is automatic so call sites
only indicate how * much data they need right now. * * There are several ways to write using bufwriter. The best approach * depends mainly on how much
performance matters over code footprint. * The key issues are (1) ensuring there is space and (2) keeping the * pointers consistent. Fast code should ensure space
for multiple writes * with one ensure call. Fastest inner loop code can temporarily borrow * the 'p' pointer but must write it back eventually. * * Be careful to
ensure all macro arguments (other than static pointers like * 'thr' and 'bw_ctx') are evaluated exactly once, using temporaries if * necessary (if that's not possible,
there should be a note near the macro). * Buffer write arguments often contain arithmetic etc so this is * particularly important here.
label: code-design
29593. Ordering should not matter (E5 Section 11.8.5, step 3.a) but * preserve it just in case.
29594. for zero size, don't push anything on valstack
29595. Here we'd have the option of decoding unpadded base64 * (e.g. "xxxxyy" instead of "xxxxyy==". Currently not * accepted.
29596. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway
29597. * Conceptually, we look for the identifier binding by starting from * 'env' and following to chain of environment records (represented * by the prototype chain). * *
If 'env' is NULL, the current activation does not yet have an * allocated declarative environment record; this should be treated * exactly as if the environment
record existed but had no bindings * other than register bindings. * * Note: we assume that with the DUK_HOBJECT_FLAG_NEWENV cleared * the
environment will always be initialized immediately; hence * a NULL 'env' should only happen with the flag set. This is the * case for: (1) function calls, and (2)
strict, direct eval calls.
29598. heap level "stash" object (e.g., various reachability roots)
29599. * For global or eval code this is straightforward. For functions * created with the Function constructor we only get the source for * the body and must manufacture
the "function ..." part. * * For instance, for constructed functions (v8): * * > a = new Function("foo", "bar", "print(foo)"); * [Function] * > a.toString() * function
anonymous(foo,bar) {\nprint(foo)\n} ** Similarly for e.g. getters (v8): * * > x = { get a(foo,bar) { print(foo); } } * { a: [Getter] } * >
Object.getOwnPropertyDescriptor(x, 'a').get.toString() * 'function a(foo,bar) { print(foo); }'

29662. '\xffBytecode'
29663. Catch a double-to-int64 cast issue encountered in practice.
29664. * DumpHeap command
29665. **comment:** * Lexer for source files, ToNumber() string conversions, RegExp expressions, * and JSON. ** Provides a stream of Ecmascript tokens from an UTF-8/CESU-8 buffer. The * caller can also rewind the token stream into a certain position which is * needed by the compiler part for multi-pass scanning. Tokens are * represented as duk_token structures, and contain line number information. * Token types are identified with DUK_TOK_* defines. ** Characters are decoded into a fixed size lookup window consisting of * decoded Unicode code points, with window positions past the end of the * input filled with an invalid codepoint (-1). The tokenizer can thus * perform multiple character lookups efficiently and with few sanity * checks (such as access outside the end of the input), which keeps the * tokenization code small at the cost of performance. ** Character data in tokens, such as identifier names and string literals, * is encoded into CESU-8 format on-the-fly while parsing the token in * question. The string data is made reachable to garbage collection by * placing the token-related values in value stack entries allocated for * this purpose by the caller. The characters exist in Unicode code point * form only in the fixed size lookup window, which keeps character data * expansion (of especially ASCII data) low. ** Token parsing supports the full range of Unicode characters as described * in the E5 specification. Parsing has been optimized for ASCII characters * because ordinary Ecmascript code consists almost entirely of ASCII * characters. Matching of complex Unicode codepoint sets (such as in the * IdentifierStart and IdentifierPart productions) is optimized for size, * and is done using a linear scan of a bit-packed list of ranges. This is * very slow, but should never be entered unless the source code actually * contains Unicode characters. ** Ecmascript tokenization is partially context sensitive. First, * additional future reserved words are recognized in strict mode (see E5 * Section 7.6.1.2). Second, a forward slash character ('/') can be * recognized either as starting a RegExp literal or as a division operator, * depending on context. The caller must provide necessary context flags * when requesting a new token. ** Future work: * * * Make line number tracking optional, as it consumes space. * * * Add a feature flag for disabling UTF-8 decoding of input, as most * source code is ASCII. Because of Unicode escapes written in ASCII, * this does not allow Unicode support to be removed from e.g. * duk_unicode_is_identifier_start() nor does it allow removal of CESU-8 * encoding of e.g. string literals. * * * Add a feature flag for disabling Unicode compliance of e.g. identifier * names. This allows for a build more than a kilobyte smaller, because * Unicode ranges needed by duk_unicode_is_identifier_start() and * duk_unicode_is_identifier_part() can be dropped. String literals * should still be allowed to contain escaped Unicode, so this still does * not allow removal of CESU-8 encoding of e.g. string literals. * * * Character lookup tables for codepoints above BMP could be stripped. * * * Strictly speaking, E5 specification requires that source code consists * of 16-bit code units, and if not, must be conceptually converted to * that format first. The current lexer processes Unicode code points * and allows characters outside the BMP. These should be converted to * surrogate pairs while reading the source characters into the window, * not after tokens have been formed (as is done now).

However, the fix * is not trivial because two characters are decoded from one codepoint. *** Optimize for speed as well as size. Large if-else ladders are (at * least potentially) slow.

29666. [... buf loop]

29667. **comment:** * Heap object representation. ** Heap objects are used for Ecmascript objects, arrays, and functions, * but also for internal control like declarative and object environment * records. Compiled functions, native functions, and threads are also * objects but with an extended C struct. ** Objects provide the required Ecmascript semantics and exotic behaviors * especially for property access. ** Properties are stored in three conceptual parts: * 1. A linear 'entry part' contains ordered key-value-attributes triples * and is the main method of string properties. * 2. An optional linear 'array part' is used for array objects to store a * (dense) range of [0,N[array indexed entries with default attributes * (writable, enumerable, configurable). If the array part would become * sparse or non-default attributes are required, the array part is * abandoned and moved to the 'entry part'. * 3. An optional 'hash part' is used to optimize lookups of the entry * part; it is used only for objects with sufficiently many properties * and can be abandoned without loss of information. ** These three conceptual parts are stored in a single memory allocated area. * This minimizes memory allocation overhead but also means that all three * parts are resized together, and makes property access a bit complicated.

30015. **comment:** XXX: this could be more compact by accessing the internal properties * directly as own properties (they cannot be inherited, and are not * externally visible).

label: code-design

30016. Get/set the current user visible size, without accounting for a dynamic * buffer's "spare" (= usable size).

30017. looping should never happen

30018. Validate byte read/write for virtual 'offset', i.e. check that the * offset, taking into account h->offset, is within the underlying * buffer size. This is a safety check which is needed to ensure * that even a misconfigured duk_hbufferobject never causes memory * unsafe behavior (e.g. if an underlying dynamic buffer changes * after being setup). Caller must ensure 'buf' != NULL.

30019. Careful with wrapping: arr_idx upshift may easily wrap, whereas * length downshift won't.

30020. digit position is absolute, not relative

30021. c

30022. **comment:** Same test with volatiles

label: test

30023. There's overlap: the desired end result is that * conceptually a copy is made to avoid "trampling" * of source data by destination writes. We make * an actual temporary copy to handle this case.

30024. **comment:** XXX: just use toString() for now; permitted although not recommended. * nargs==1, so radix is passed to toString().

label: code-design

30025. %d; only 16 bits are guaranteed

30026. 'this' value: * E5 Section 6.b.i ** The only (standard) case where the 'this' binding is non-null is when * (1) the variable is found in an object environment record, and * (2) that object environment record is a 'with' block. *

30027. This is important to ensure dynamic buffer data pointer is not * NULL (which is possible if buffer size is zero), which in turn * causes portability issues with e.g. memmove() and memcpy().

30028. Since we already started writing the reply, just emit nothing.

30029. * For top-level objects, 'length' property has the following * default attributes: non-writable, non-enumerable, non-configurable * (E5 Section 15). ** However, 'length' property for Array.prototype has attributes * expected of an Array instance which are different: writable, * non-enumerable, non-configurable (E5 Section 15.4.5.2). ** This is currently determined implicitly based on class; there are * no attribute flags in the init data.

30030. -> [... errhandler undefined(= this) errval]

30031. Reconfigure value stack for return to an Ecmascript function at 'act_idx'.

30032. * First pass. ** Gather variable/function declarations needed for second pass. * Code generated is dummy and discarded.

30033. valid pc range is [0, length[

30034. Current tracedata contains 2 entries per callstack entry.

30035. [... errval]

30036. **comment:** XXX: there is a small risk here: because the ISO 8601 parser is * very loose, it may end up parsing some datetime values which * would be better parsed with a platform specific parser.
label: code-design

30037. * Return (t - LocalTime(t)) in minutes: ** t - LocalTime(t) = t - (t + LocalTZA + DaylightSavingTA(t)) * = -(LocalTZA + DaylightSavingTA(t)) ** where DaylightSavingTA() is checked for time 't'. ** Note that the sign of the result is opposite to common usage, * e.g. for EE(S)T which normally is +2h or +3h from UTC, this * function returns -120 or -180. *

30038. **comment:** XXX: no need for indirect call
label: code-design

30039. XXX: the implementation now assumes "chained" bound functions, * whereas "collapsed" bound functions (where there is ever only * one bound function which directly points to a non-bound, final * function) would require a "collapsing" implementation which * merges argument lists etc here.

30040. The current implementation of localeCompare() is simply a codepoint * by codepoint comparison, implemented with a simple string compare * because UTF-8 should preserve codepoint ordering (assuming valid * shortest UTF-8 encoding). ** The specification requires that the return value must be related * to the sort order: e.g. negative means that 'this' comes before * 'that' in sort order. We assume an ascending sort order.

30041. valstack

30042. not protected, respect reclimit, not constructor

30059. Limits

30060. Encoded as surrogate pair, each encoding to 3 bytes for * 6 bytes total. Codepoints above U+10FFFF encode as 6 bytes * too, see duk_unicode_encode_cesu8().

30061. * Setup value stack: clamp to 'nargs', fill up to 'nregs' * Value stack may either grow or shrink, depending on the * number of func registers and the number of actual arguments. * If nregs >= 0, func wants args clamped to 'nargs'; else it * wants all args (= 'num_stack_args').

30062. [sep ToObject(this) len sep result]

30063. * Variant 2 or 4

30064. Lightfunc, always success.

30065. step 11.c is relevant only if non-strict (checked in 11.c.ii)

30066. XX==

30067. **comment:** A plain buffer coerces to a Duktape.Buffer because it's the * object counterpart of the plain buffer value. But it might * still make more sense to produce an ArrayBuffer here?
label: code-design

30068. Force exponential format. Used for toExponential().

30069. Cannot wrap: each object is at least 8 bytes so count is * at most 1/8 of that.

30070. wipe the capture range made by the atom (if any)

30071. Anything else is not constructable.

30072. attrs in E5 Section 15.3.5.1

30073. * Use the index in the header to find the right starting point

30074. Tolerate act_caller->func == NULL which happens in * some finalization cases; treat like unknown caller.

30075. **comment:** XXX: remove DUK_CALL_FLAG_IGNORE_RECLIMIT flag: there's now the * reclimit bump?
label: code-design

30076. maximum length of standard format tag that we support

30077. buffer size is >= 1

30078. ignore encoding for now

30079. enable manually for dumping

30080. (?=

30081. require to be safe

30082. Parser part count.

30083. for side effects, result ignored

30084. Now we can check offset validity.

30085. Milliseconds between status notify and transport peeks.

30086. Matching separator index is used in the control table

30087. rehash even if old and new sizes are the same to get rid of * DELETED entries.

30088. * Two pass approach to processing the property descriptors. * On first pass validate and normalize all descriptors before * any changes are made to the target object. On second pass * make the actual modifications to the target object. ** Right now we'll just use the same normalize/validate helper * on both passes, ignoring its outputs on the first pass.

30089. * Stringify implementation.

30090. ToNumber() for a double is a no-op.

30091. default: char escape (two chars)

30092. * Hobject allocation. ** Provides primitive allocation functions for all object types (plain object, * compiled function, native function, thread). The object return is not yet * in "heap allocated" list and has a refcount of zero, so caller must careful.

30093. Check actual underlying buffers for validity and that they * cover the copy. No side effects are allowed after the check * so that the validity status doesn't change.
30094. * Special parser for character classes; calls callback for every * range parsed and returns the number of ranges present.
30095. negate result
30096. * Lightfunc
30097. **comment:** * Refzero handling is skipped entirely if (1) mark-and-sweep is * running or (2) execution is paused in the debugger. The objects * are left in the heap, and will be freed by mark-and-sweep or * eventual heap destruction. * * This is necessary during mark-and-sweep because refcounts are also * updated during the sweep phase (otherwise objects referenced by a * swept object would have incorrect refcounts) which then calls here. * This could be avoided by using separate decref macros in * mark-and-sweep; however, mark-and-sweep also calls finalizers which * would use the ordinary decref macros anyway and still call this * function. * * This check must be enabled also when mark-and-sweep support has been * disabled: the flag is also used in heap destruction when running * finalizers for remaining objects, and the flag prevents objects from * being moved around in heap linked lists.
label: code-design
30098. XXX: len >= 0x80000000 won't work below because a signed type * is needed by qsort.
30099. Special handling for year sign.
30100. [arg1 ... argN obj length new_length]
30101. The algorithm in E5.1 Section 15.9.1.12 normalizes month, but * does not normalize the day-of-month (nor check whether or not * it is finite) because it's not necessary for finding the day * number which matches the (year,month) pair. * * We assume that duk__day_from_year() is exact here. * * Without an explicit infinity / NaN check in the beginning, * day_num would be a bogus integer here. * * It's possible for 'year' to be out of integer range here. * If so, we need to return NaN without integer overflow. * This fixes test-bug-setyear-overflow.js
30102. * Node.js Buffer.prototype.slice([start], [end]) * ArrayBuffer.prototype.slice(begin, [end]) * TypedArray.prototype.slice(begin, [end]) * * The API calls are almost identical; negative indices are counted from end * of buffer, and final indices are clamped (allowing crossed indices). Main * differences: * * - Copy/view behavior; Node.js .slice() and TypedArray .subarray() create * views, ArrayBuffer .slice() creates a copy * * - Resulting object has a different class and prototype depending on the * call (or 'this' argument) * * - TypedArray .subarray() arguments are element indices, not byte offsets
30103. **comment:** When alloc_size == 0 the second allocation may not * actually exist.

30350. preincrement and predecrement
30351. Value would normally be omitted, replace with 'null'.
30352. e.g. require('/foo'), empty terms not allowed
30353. string is internal
30354. * Parse regexp Disjunction. Most of regexp compilation happens here. ** Handles Disjunction, Alternative, and Term productions directly without * recursion. The only constructs requiring recursion are positive/negative * lookaheads, capturing parentheses, and non-capturing parentheses. ** The function determines whether the entire disjunction is a 'simple atom' * (see doc/regexp.rst discussion on 'simple quantifiers') and if so, * returns the atom character length which is needed by the caller to keep * track of its own atom character length. A disjunction with more than one * alternative is never considered a simple atom (although in some cases * that might be the case). ** Return value: simple atom character length or < 0 if not a simple atom. * Appends the bytecode for the disjunction matcher to the end of the temp * buffer. ** Regexp top level structure is: ** Disjunction = Term* * | Term* | Disjunction * * Term = Assertion * | Atom * | Atom Quantifier * * An empty Term sequence is a valid disjunction alternative (e.g. //|c||/). ** Notes: ** Tracking of the 'simple-ness' of the current atom vs. the entire * disjunction are separate matters. For instance, the disjunction * may be complex, but individual atoms may be simple. Furthermore, * simple quantifiers are used whenever possible, even if the * disjunction as a whole is complex. ** The estimate of whether an atom is simple is conservative now, * and it would be possible to expand it. For instance, captures * cause the disjunction to be marked complex, even though captures * -can- be handled by simple quantifiers with some minor modifications. ** Disjunction 'tainting' as 'complex' is handled at the end of the * main for loop collectively for atoms. Assertions, quantifiers, * and '| tokens need to taint the result manually if necessary. * Assertions cannot add to result char length, only atoms (and * quantifiers) can; currently quantifiers will taint the result * as complex though.
30355. Get a pointer to the current buffer contents (matching current allocation * size). May be NULL for zero size dynamic/external buffer.
30356. success: leave varname in stack
30357. safe
30358. [... closure template len_value]
30359. Note: negative pc values are ignored when patching jumps, so no explicit checks needed

30447. mark finalizer work list as reachability roots

30448. Initial '{' has been checked and eaten by caller.

30449. '\xffMap'

30450. The directive prologue flag is cleared by default so that it is * unset for any recursive statement parsing. It is only "revived" * if a directive is detected. (We could also make directives only * allowed if 'allow_source_elem' was true.)

30451. 'NaN'

30452. unsigned 31-bit range

30453. DUK_USE_EXPLICIT_NULL_INIT

30454. valgrind whine without this

30455. **comment:** * Helper for calling a user error handler. * * 'thr' must be the currently active thread; the error handler is called * in its context. The valstack of 'thr' must have the error value on * top, and will be replaced by another error value based on the return * value of the error handler. * * The helper calls duk_handle_call() recursively in protected mode. * Before that call happens, no longjmps should happen; as a consequence, * we must assume that the valstack contains enough temporary space for * arguments and such. * * While the error handler runs, any errors thrown will not trigger a * recursive error handler call (this is implemented using a heap level * flag which will "follow" through any coroutines resumed inside the * error handler). If the error handler is not callable or throws an * error, the resulting error replaces the original error (for Duktape * internal errors, duk_error_throw.c further substitutes this error with * a DoubleError which is not ideal). This would be easy to change and * even signal to the caller. * * The user error handler is stored in 'Duktape.errCreate' or * 'Duktape.errThrow' depending on whether we're augmenting the error at * creation or throw time. There are several alternatives to this approach, * see doc/error-objects.rst for discussion. * * Note: since further longjmp(s) may occur while calling the error handler * (for many reasons, e.g. a labeled 'break' inside the handler), the * caller can make no assumptions on the thr->heap->lj state after the * call (this affects especially duk_error_throw.c). This is not an issue * as long as the caller writes to the lj state only after the error handler * finishes.

label: code-design

30456. * Exposed calls

30457. key encountered as a setter

30458. Don't need to sync curr_pc here; duk_new() will do that * when it augments the created error.

30459. one i_step over

30460. Shared prefix for all buffer types.

30461. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. * * Delayed creation (on demand) is handled in duk_js_var.c.

30462. Reject a proxy object as the target because it would need * special handler in property lookups. (ES6 has no such restriction)

30463. must restore reliably before returning
30464. * Basic context initialization. * * Some init values are read from the bytecode header * whose format is (UTF-8 codepoints): * * uint flags * uint nsaved (even, 2n+2 where n = num captures)
30465. return 'res_arr' or 'null'
30466. **comment:** This would be nice, but parsing is faster without resetting the * value slots. The only side effect is that references to temporary * string values may linger until lexing is finished; they're then * freed normally.

30747. string is ASCII, clen == blen

30748. DUK_USE_HOBJECT_HASH_PART || DUK_USE_STRTAB_PROBE

30749. * Since character data is only generated by decoding the source or by * the compiler itself, we rely on the input codepoints being correct * and avoid a check here. * * Character data can also come here through decoding of Unicode * escapes ("udead\ubeef") so all 16-bit unsigned values can be * present, even when the source file itself is strict UTF-8.

30750. **comment:** XXX: more emergency behavior, e.g. find smaller hash sizes etc

label: code-design

30751. * Copy array elements to new array part.

30752. For strings, special form for short lengths.

30753. Setup function properties.

30754. **comment:** * In a fast check we assume old_size equals old_used (i.e., existing * array is fully dense). * * Slow check if: * * (new_size - old_size) / old_size > limit * new_size - old_size > limit * old_size * new_size > (1 + limit) * old_size || limit' is 3 bits fixed point * new_size > (1 + (limit' / 8)) * old_size || * 8 * 8 * new_size > (8 + limit') * old_size || : 8 * new_size > (8 + limit') * (old_size / 8) * new_size > limit' * (old_size / 8) || limit' = 9 -> max 25% increase * arr_idx + 1 > limit' * (old_size / 8) * * This check doesn't work well for small values, so old_size is rounded * up for the check (and the '+ 1' of arr_idx can be ignored in practice): * * arr_idx > limit' * ((old_size + 7) / 8)

label: code-design

30755. **comment:** * A few notes on the algorithm: * * - Terms are not allowed to begin with a period unless the term * is either '.' or '..'. This simplifies implementation (and * is within CommonJS modules specification). * * - There are few output bound checks here. This is on purpose: * the resolution input is length checked and the output is never * longer than the input. The resolved output is written directly * over the input because it's never longer than the input at any * point in the algorithm. * * - Non-ASCII characters are processed as individual bytes and * need no special treatment. However, U+0000 terminates the * algorithm; this is not an issue because U+0000 is not a * desirable term character anyway.

label: code-design

30756. * Utilities

30757. * Helpers * * The fast path checks are done within a macro to ensure "inlining" * while the slow path actions use a helper (which won't typically be * inlined in size optimized builds).

30758. **comment:** If the platform doesn't support the entire Ecmascript range, we need * to return 0 so that the caller can fall back to the default formatter. * * For now, assume that if time_t is 8 bytes or more, the whole Ecmascript * range is supported. For smaller time_t values (4 bytes in practice), * assumes that the signed 32-bit range is supported. * * XXX: detect this more correctly per platform. The size of time_t is * probably not an accurate guarantee of strftime() supporting or not * supporting a large time range (the full Ecmascript range).

label: code-design

30759. **comment:** XXX: now that pc2line is used by the debugger quite heavily in * checked execution, this should be optimized to avoid value stack * and perhaps also implement some form of pc2line caching (see * future work in debugger.rst).

label: code-design

30760. * Case clause. * * Note: cannot use reg_case as a temp register (for SEQ target) * because it may be a constant.

30761. **comment:** XXX: not sure what the correct semantic details are here, * e.g. handling of missing values (gaps), handling of non-array * trap results, etc. * * For keys, we simply skip non-string keys which seems to be * consistent with how e.g. Object.keys() will process proxy trap * results (ES6, Section 19.1.2.14).

label: code-design

30984. **comment:** Registers 'bc' and 'bc + 1' are written in longjmp handling * and if their previous values (which are temporaries) become * unreachable -and- have a finalizer, there'll be a function * call during error handling which is not supported now (GH-287). * Ensure that both 'bc' and 'bc + 1' have primitive values to * guarantee no finalizer calls in error handling. Scrubbing also * ensures finalizers for the previous values run here rather than * later. Error handling related values are also written to 'bc' * and 'bc + 1' but those values never become unreachable during * error handling, so there's no side effect problem even if the * error value has a finalizer.
 label: code-design

30985. no_block

30986. The original value needs to be preserved for filter(), hence * this funny order. We can't re-get the value because of side * effects.

31531. * Comparison
31532. DUK_JSON_H_INCLUDED
31533. may have side effects
31534. increases key refcount
31535. on first round, skip
31536. **comment:** * Ecmascript specification algorithm and conversion helpers. * * These helpers encapsulate the primitive Ecmascript operation * semantics, and are used by the bytecode executor and the API * (among other places). Note that some primitives are only * implemented as part of the API and have no "internal" helper. * (This is the case when an internal helper would not really be * useful; e.g. the operation is rare, uses value stack heavily, * etc.) * * The operation arguments depend on what is required to implement * the operation: * * - If an operation is simple and stateless, and has no side * effects, it won't take an duk_hthread argument and its * arguments may be duk_tval pointers (which are safe as long * as no side effects take place). * * - If complex coercions are required (e.g. a "ToNumber" coercion) * or errors may be thrown, the operation takes an duk_hthread * argument. This also implies that the operation may have * arbitrary side effects, invalidating any duk_tval pointers. * * - For operations with potential side effects, arguments can be * taken in several ways: * * a) as duk_tval pointers, which makes sense if the "common case" * can be resolved without side effects (e.g. coercion); the * arguments are pushed to the valstack for coercion if * necessary * * b) as duk_tval values * * c) implicitly on value stack top * * d) as indices to the value stack * * Future work: * * - Argument styles may not be the most sensible in every case now. * * - In-place coercions might be useful for several operations, if * in-place coercion is OK for the bytecode executor and the API.
label: code-design
31537. Note: may be triggered even if minimal new_size would not reach the limit, * plan limit accordingly (taking DUK_VALSTACK_GROW_STEP into account).
31538. **comment:** A little tricky string approach to provide the flags string. * This depends on the specific flag values in duk_regexp.h, * which needs to be asserted for. In practice this doesn't * produce more compact code than the easier approach in use.
label: code-design
31539. Note: intentionally use approximations to shave a few instructions: * a_used = old_used (accurate: old_used + 1) * a_size = arr_idx (accurate: arr_idx + 1)
31540. Slot C is used in a non-standard fashion (range of regs), * emitter code has special handling for it (must not set the * "no shuffle" flag).
31541. Note: if atom were to contain e.g. captures, we would need to * re-match the atom to get correct captures. Simply quantifiers * do not allow captures in their atom now, so this is not an issue.
31542. * Criteria for augmenting: * * - augmentation enabled in build (naturally) * - error value internal prototype chain contains the built-in * Error prototype object (i.e. 'val instanceof Error') * * Additional criteria for built-in augmenting: * * - error value is an extensible object

31543. **comment:** XXX: solve into closed form (smaller code)

label: code-design

31544. * Check the function type, handle bound function chains, and prepare * parameters for the rest of the call handling. Also figure out the * effective 'this' binding, which replaces the current value at * idx_func + 1. * * If the target function is a 'bound' one, follow the chain of 'bound' * functions until a non-bound function is found. During this process, * bound arguments are 'prepended' to existing ones, and the "this" * binding is overridden. See E5 Section 15.3.4.5.1. * * If the final target function cannot be handled by an ecma-to-ecma * call, return to the caller with a return value indicating this case. * The bound chain is resolved and the caller can resume with a plain * function call.

31545. must be signed for loop structure

31546. is_extra

31547. **comment:** * Memory calls: relative to heap, GC interaction, but no error throwing. * * XXX: Currently a mark-and-sweep triggered by memory allocation will run * using the heap->heap_thread. This thread is also used for running * mark-and-sweep finalization; this is not ideal because it breaks the * isolation between multiple global environments. * * Notes: * * - DUK_FREE() is required to ignore NULL and any other possible return * value of a zero-sized alloc/realloc (same as ANSI C free()). * * - There is no DUK_REALLOC_ZEROED because we don't assume to know the * old size. Caller must zero the reallocated memory. * * - DUK_REALLOC_INDIRECT() must be used when a mark-and-sweep triggered * by an allocation failure might invalidate the original 'ptr', thus * causing a realloc retry to use an invalid pointer. Example: we're * reallocating the value stack and a finalizer resizes the same value * stack during mark-and-sweep. The indirect variant requests for the * current location of the pointer being reallocated using a callback * right before every realloc attempt; this circuitous approach is used * to avoid strict aliasing issues in a more straightforward indirect * pointer (void **) approach. Note: the pointer in the storage * location is read but is NOT updated; the caller must do that.

31566. replace in stack

31567. (maybe) truncated

31568. nothing to process

31569. Encode string in small chunks, estimating the maximum expansion so that * there's no need to ensure space while processing the chunk.

31570. * Object.getOwnPropertyDescriptor() (E5 Sections 15.2.3.3, 8.10.4) * * This is an actual function call.

31571. knock back "next temp" to this whenever possible

31572. * Detected a directive

31573. 'for'

31574. complete the millisecond field

31575. 'It is true'

31576. Pre/post inc/dec for register variables, important for loops.

31577. **comment:** Lightfunc name, includes Duktape/C native function pointer, which * can often be used to locate the function from a symbol table. * The name also includes the 16-bit duk_tval flags field because it * includes the magic value. Because a single native function often * provides different functionality depending on the magic value, it * seems reasonably to include it in the name. * * On the other hand, a complicated name increases string table * pressure in low memory environments (but only when function name * is accessed).

label: code-design

31578. **comment:** XXX: if duk_hobject_define_property_internal() was updated * to handle a pre-existing accessor property, this would be * a simple call (like for the ancestor case).

label: code-design

31579. Iteration solution

31580. **comment:** 16 bits would be enough for shared heaphdr flags and duk_hstring * flags. The initial parts of duk_heaphdr_string and duk_heaphdr * must match so changing the flags field size here would be quite * awkward. However, to minimize struct size, we can pack at least * 16 bits of duk_hstring data into the flags field.

label: code-design

31581. * Helper tables

31582. 'this'

31583. **comment:** XXX: could check for e16 == 0 because NULL is guaranteed to * encode to zero.

label: code-design

31584. approximate

31585. Avoid NaN-to-integer coercion as it is compiler specific.

31586. Reset to zero size, keep current limit.

31587. if len_x == len_y == 0, buf_x and/or buf_y may * be NULL, but that's OK.

31588. callback for indirect reallocs, request for current pointer

31589. [... this]

31590. * Portable 12-byte representation

31591. avoid multiple computations of flags address; bypasses macros

31592. **comment:** Reg/const access macros: these are very footprint and performance sensitive * so modify with care.

label: code-design

31593. must not truncate

31594. prefix matches, lengths matter now

31595. Careful with reachability here: don't pop 'obj' before pushing * proxy target.

31596. * Replace valstack top with case converted version.

31597. Shuffle decision not changed.

31598. * Stack index validation/normalization and getting a stack duk_tval ptr. ** These are called by many API entrypoints so the implementations must be * fast and "inlined". ** There's some repetition because of this; keep the functions in sync.

31599. numeric value of token

31600. [...] constructor arg1 ... argN] -> [retval]

31601. * Rebuild the hash part always from scratch (guaranteed to finish). ** Any resize of hash part requires rehashing. In addition, by rehashing * get rid of any elements marked deleted (DUK__HASH_DELETED) which is critical * to ensuring the hash part never fills up.

31602. temps

31603. 'Object'

31604. not strictly necessary

31605. IsDataDescriptor(desc) == true

31606. POSTFIX EXPRESSION

31607. If argument count is 1 and first argument is a buffer, write the buffer * as raw data into the file without a newline; this allows exact control * over stdout/stderr without an additional entrypoint (useful for now). ** Otherwise current print/alert semantics are to ToString() coerce * arguments, join them with a single space, and append a newline.

31608. * Exposed regexp compilation primitive. ** Sets up a regexp compilation context, and calls duk_parse_disjunction() to do the * actual parsing. Handles generation of the compiled regexp header and the * "boilerplate" capture of the matching substring (save 0 and 1). Also does some * global level regexp checks after recursive compilation has finished. ** An escaped version of the regexp source, suitable for use as a RegExp instance * 'source' property (see E5 Section 15.10.3), is also left on the stack. ** Input stack: [pattern flags] * Output stack: [bytecode escaped_source] (both as strings)

31609. 'Error'

31610. * Flags for __FILE__ / __LINE__ registered into tracedata

31611. Count actually used entry part entries (non-NULL keys).

31612. DUK_TOK_ARSHIFT

31613. **comment:** XXX: possibly incorrect handling of empty expression
label: code-design

31614. used entries + approx 100% -> reset load to 50%

31615. '\x0ffRegbase'

31616. is_decl

31617. but don't allow leading plus

31618. **comment:** * String cache should ideally be at duk_hthread level, but that would * cause string finalization to slow down relative to the number of * threads; string finalization must check the string cache for "weak" * references to the string being finalized to avoid dead pointers. ** Thus, string caches are now at the heap level now.
label: code-design

31619. For manual debugging: instruction count based on executor and * interrupt counter book-keeping. Inspect debug logs to see how * they match up.

31620. [...] holder name val enum obj_key val obj_key]

31621. lj.value1 is already set

31622. number of arguments allocated to regs

31623. Optimized for size.

31624. * Default fatal error handler

31625. named "arithmetic" because result is signed

31626. Default implicit return value.

31627. lookup name from current activation record's functions' registers

31628. custom; implies DUK_HOBJECT_IS_BUFFEROBJECT

31629. max # of key-value pairs initialized in one MPUTOBJ set

31630. unicode code points, window[0] is always next

31631. Sync so that augmentation sees up-to-date activations, NULL * thr->ptr_curr_pc so that it's not used if side effects occur * in augmentation or longjmp handling.

31632. thread not currently running

31633. Refzero head is still the same. This is the case even if finalizer * inserted more refzero objects; they are inserted to the tail.

31634. [...] key arg1 ... argN]

31635. * GETIDREF: a GetIdentifierReference-like helper. ** Provides a parent traversing lookup and a single level lookup * (for HasBinding). ** Instead of returning the value, returns a bunch of values allowing * the caller to read, write, or delete the binding. Value pointers * are duk_tval pointers which can be mutated directly as long as * refcounts are properly updated. Note that any operation which may * reallocate valstacks or compact objects may invalidate the returned * duk_tval (but not object) pointers, so caller must be very careful. ** If starting environment record 'env' is given, 'act' is ignored. * However, if 'env' is NULL, the caller may identify, in 'act', an * activation which hasn't had its declarative environment initialized * yet. The activation registers are then looked up, and its parent * traversed normally. ** The 'out' structure values are only valid if the function returns * success (non-zero).

31636. Ignore the normalize/validate helper outputs on the value stack, * they're popped automatically.

31637. **comment:** A union is used here as a portable struct size / alignment trick: * by adding a 32-bit or a 64-bit (unused) union member, the size of * the struct is effectively forced to be a multiple of 4 or 8 bytes * (respectively) without increasing the size of the struct unless * necessary.

31821. String and buffer enumeration behavior is identical now, * so use shared handler.

31822. 37x32 = 1184 bits

31823. heap->dbg_detached_cb: keep

31824. This check used to be for (t < 0) but on some platforms * time_t is unsigned and apparently the proper way to detect * an mktime() error return is the cast above. See e.g.: * <http://pubs.opengroup.org/onlinepubs/009695299/functions/mktime.html>

31825. **comment:** Fast variants, inline refcount operations except for refzero handling. * Can be used explicitly when speed is always more important than size. * For a good compiler and a single file build, these are basically the * same as a forced inline.

label: code-design

31826. [... key] -> [...]

31827. * Use current token to decide whether a RegExp can follow. * * We can use either 't' or 't_nores'; the latter would not * recognize keywords. Some keywords can be followed by a * RegExp (e.g. "return"), so using 't' is better. This is * not trivial, see doc/compiler.rst.

31828. Khronos/ES6 requires zeroing even when DUK_USE_ZERO_BUFFER_DATA * is not set.

31829. * Refcount memory freeing loop. * * Frees objects in the refzero_pending list until the list becomes * empty. When an object is freed, its references get decref'd and * may cause further objects to be queued for freeing. * * This could be expanded to allow incremental freeing: just bail out * early and resume at a future alloc/decref/refzero.

31830. Note: 'fast' breaks will jump to pc_label_site + 1, which will * then jump here. The double jump will be eliminated by a * peephole pass, resulting in an optimal jump here. The label * site jumps will remain in bytecode and will waste code size.

31831. **comment:** * Prototype walking starting from 'env'. * * ('act' is not needed anywhere here.)

label: code-design

31832. mark range 'direct', bypass canonicalization (see Wiki)

31833. Do debugger forwarding before raw() because the raw() function * doesn't get the log level right now.

31834. estimate year upwards (towards positive infinity), then back down; * two iterations should be enough

31835. return module.exports

31836. * Parsing an expression starting with 'new' is tricky because * there are multiple possible productions deriving from * LeftHandSideExpression which begin with 'new'. * * We currently resort to one-token lookahead to distinguish the * cases. Hopefully this is correct. The binding power must be * such that parsing ends at an LPAREN (CallExpression) but not at * a PERIOD or LBRACKET (MemberExpression). * * See doc/compiler.rst for discussion on the parsing approach, * and testcases/test-dev-new.js for a bunch of documented tests.

31837. exrptop is the top level variant which resets nud/led counts

31838. control props

31839. push value to stack

31840. * shift()

31841. k+argCount-1; note that may be above 32-bit range

31842. * Assert macro: failure causes panic.

31843. **comment:** Similar workaround for INFINITY.

label: code-design

31844. * Fallback marking handler if recursion limit is reached. * * Iterates 'temproots' until recursion limit is no longer hit. Note * that temproots may reside either in heap allocated list or the * refzero work list. This is a slow scan, but guarantees that we * finish with a bounded C stack. * * Note that nodes may have been marked as temproots before this * scan begun, OR they may have been marked during the scan (as * we process nodes recursively also during the scan). This is * intended behavior.

31845. **comment:** If number would need zero padding (for whole number part), use * exponential format instead. E.g. if input number is 12300, 3 * digits are generated ("123"), output "1.23e+4" instead of "12300". * Used for toPrecision().

label: code-design

31846. number

31847. Must be element size multiple from * start offset to end of buffer.

31848. empty ("") is allowed in some formats (e.g. Number()), as zero

31849. slow path is shared

31850. * If matching with a regexp: * - non-global RegExp: lastIndex not touched on a match, zeroed * on a non-match * - global RegExp: on match, lastIndex will be updated by regexp * executor to point to next char after the matching part (so that * characters in the matching part are not matched again) * * If matching with a string: * - always non-global match, find first occurrence * * We need: * - The character offset of start-of-match for the replacer function * - The byte offsets for start-of-match and end-of-match to implement * the replacement values \$\$, \$`, and \$', and to copy non-matching * input string portions (including header and

trailer) verbatim. ** NOTE: the E5.1 specification is a bit vague how the RegExp should * behave in the replacement process; e.g. is matching done first for * all matches (in the global RegExp case) before any replacer calls * are made? See: test-bi-string-proto-replace.js for discussion.

31851. -> [... func]

31852. * Various defines and file specific helper macros

31854. **comment:** integer, but may be +/- Infinite, +/- zero (not NaN, though)

label: code-design

31855. 11 bits

31856. **comment:** Lookup active label information. Break/continue distinction is necessary to handle switch * statement related labels correctly: a switch will only catch a 'break', not a 'continue'. ** An explicit label cannot appear multiple times in the active set, but empty labels (unlabelled * iteration and switch statements) can. A break will match the closest unlabelled or labelled * statement. A continue will match the closest unlabelled or labelled iteration statement. It is * a syntax error if a continue matches a labelled switch statement; because an explicit label cannot * be duplicated, the continue cannot match any valid label outside the switch. ** A side effect of these rules is that a LABEL statement related to a switch should never actually * catch a continue abrupt completion at run-time. Hence an INVALID opcode can be placed in the * continue slot of the switch's LABEL statement.

31971. **comment:** code emission temporary
label: code-design
31972. * TypedArray.prototype.set() * * TypedArray set() is pretty interesting to implement because: * * - The source argument may be a plain array or a typedarray. If the * source is a TypedArray, values are decoded and re-encoded into the * target (not as a plain byte copy). This may happen even when the * element byte size is the same, e.g. integer values may be re-encoded * into floats. * * - Source and target may refer to the same underlying buffer, so that * the set() operation may overlap. The specification requires that this * must work as if a copy was made before the operation. Note that this * is NOT a simple memmove() situation because the source and target * byte sizes may be different -- e.g. a 4-byte source (Int8Array) may * expand to a 16-byte target (Uint32Array) so that the target overlaps * the source both from beginning and the end (unlike in typical memmove). * * - Even if 'buf' pointers of the source and target differ, there's no * guarantee that their memory areas don't overlap. This may be the * case with external buffers. * * Even so, it is nice to optimize for the common case: * * - Source and target separate buffers or non-overlapping. * * - Source and target have a compatible type so that a plain byte copy * is possible. Note that while e.g. uint8 and int8 are compatible * (coercion one way or another doesn't change the byte representation), * e.g. int8 and uint8clamped are NOT compatible when writing int8 * values into uint8clamped typedarray (-1 would clamp to 0 for instance). * * See test-bi-typedarray-proto-set.js.

31973. (quotient-remainder (* r B) s) using a dummy subtraction loop

32093. lj value2: thread
32094. Note: use 'curr' as a temp propdesc
32095. Setter APIs detect special year numbers (0...99) and apply a +1900 * only in certain cases. The legacy `getYear()` getter applies -1900 * unconditionally.
32096. * `substring()`, `substr()`, `slice()`
32097. 30: setHours
32098. Expression, ']' terminates
32099. * Number checkers
32100. E5 Section 11.2.3, step 6.a.i
32101. -> [hobject props]
32102. XXX: shared handling for 'duk_expr_lhs'?
32103. Fix for <https://github.com/svaarala/duktape/issues/155>: * If 'default' is first clause (detected by `pc_prevcase < 0`) * we need to ensure we stay in the matching chain.
32104. eat 'in'
32105. This may trigger mark-and-sweep with arbitrary side effects, * including an attempted resize of the object we're resizing, * executing a finalizer which may add or remove properties of * the object we're resizing etc.
32106. Call with count == `DUK_LEXER_WINDOW_SIZE` to fill buffer initially.
32107. zero-based month
32108. * Must be very careful here, every DECREF may cause reallocation * of our valstack.
32109. expect_token
32110. periods
32111. idx of first argument on stack
32112. Add trailer if: * a) non-empty input * b) empty input and no (zero size) match found (step 11)
32113. check stack first
32114. mod_id may be NULL

32115. http://en.wikipedia.org/wiki/ANSI_escape_code
32116. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway
32117. DUK_TOK_SET
32118. * Lookup variable and update in-place if found.
32119. 'Int8Array'
32120. Last component name in resolved path
32121. Must match src/extract_chars.py, generate_match_table3().
32122. Resize target buffer for requested size. Called by the macro only when the * fast path test (= there is space) fails.
32123. Ready to make the copy. We must proceed element by element * and must avoid any side effects that might cause the buffer * validity check above to become invalid. * * Although we work through the value stack here, only plain * numbers are handled which should be side effect safe.
32124. **comment:** * Compared to a direct macro expansion this wrapper saves a few * instructions because no heap dereferencing is required.
label: code-design
32125. Force pause if we were doing "step into" in another activation.
32126. allow fmt==NULL
32127. **comment:** * Relocate property allocation, moving properties to the new allocation. * * Includes key compaction, rehashing, and can also optionally abandoning * the array part, 'migrating' array entries into the beginning of the * new entry part. Arguments are not validated here, so e.g. new_h_size * MUST be a valid prime. * * There is no support for in-place reallocation or just compacting keys * without resizing the property allocation. This is intentional to keep * code size minimal. * * The implementation is relatively straightforward, except for the array * abandonment process. Array abandonment requires that new string keys * are interned, which may trigger GC. All keys interned so far must be * reachable for GC at all times; valstack is used for that now. * * Also, a GC triggered during this reallocation process must not interfere * with the object being resized. This is currently controlled by using * heap->mark_and_sweep_base_flags to indicate that no finalizers will be * executed (as they can affect ANY object) and no objects are compacted * (it would suffice to protect this particular object only, though). * * Note: a non-checked variant would be nice but is a bit tricky to * implement for the array abandonment process. It's easy for * everything else. * * Note: because we need to potentially resize the valstack (as part * of abandoning the array part), any tval pointers to the valstack * will become invalid after this call.

32195. * Variant 1 or 3

32196. 'enumerable'

32197. **comment:** * There are two [[Construct]] operations in the specification: * * - E5 Section 13.2.2: for Function objects * - E5 Section 15.3.4.5.2: for "bound" Function objects * * The chain of bound functions is resolved in Section 15.3.4.5.2, * with arguments "piling up" until the [[Construct]] internal * method is called on the final, actual Function object. Note * that the "prototype" property is looked up *only* from the * final object, *before* calling the constructor. * * Currently we follow the bound function chain here to get the * "prototype" property value from the final, non-bound function. * However, we let duk_handle_call() handle the argument "piling" * when the constructor is called. The bound function chain is * thus now processed twice. * * When constructing new Array instances, an unnecessary object is * created and discarded now: the standard [[Construct]] creates an * object, and calls the Array constructor. The Array constructor * returns an Array instance, which is used as the result value for * the "new" operation; the object created before the Array constructor * call is discarded. * * This would be easy to fix, e.g. by knowing that the Array constructor * will always create a replacement object and skip creating the fallback * object in that case. * * Note: functions called via "new" need to know they are called as a * constructor. For instance, built-in constructors behave differently * depending on how they are called.

Note that we can't do this when an activation * is created, because breakpoint status (and stepping status) may change * later, so we must recheck every time we're executing an activation. * This primitive should be side effect free to avoid changes during check.
32301. at most sizeof(buf) - 1
32302. val
32303. Old solution: don't iterate, incorrect
32304. * API calls related to general value stack manipulation: resizing the value * stack, pushing and popping values, type checking and reading values, * coercing values, etc. * * Also contains internal functions (such as duk_get_tval()), defined * in duk_api_internal.h, with semantics similar to the public API.
32305. No BC shuffling now.
32306. syntactically left-associative but parsed as right-associative
32307. * Local result type for duk_get_identifier_reference() lookup.
32308. **comment:** XXX: would be nice to enumerate an object at specified index
label: code-design
32309. ''
32310. * Heap stringtable handling, string interning.
32311. By default the global object is read-only which is often much * more of an issue than having read-only built-in objects (like * RegExp, Date, etc). Use a RAM-based copy of the global object * and the global environment object for convenience.
32312. Creation time error augmentation
32313. The casts through duk_intr_pt is to avoid the following GCC warning: * * warning: cast from pointer to integer of different size [-Wpointer-to-int-cast] * * This still generates a /Wp64 warning on VS2010 when compiling for x86.
32314. **comment:** * Note: currently register bindings must be fixed for the entire * function. So, even though the catch variable is in a register * we know, we must use an explicit environment record and slow path * accesses to read/write the catch binding to make closures created * within the catch clause work correctly. This restriction should * be fixable (at least in common cases) later. * * See: test-bug-catch-binding-2.js. * * XXX: improve to get fast path access to most catch clauses.
label: code-design
32315. check that byte has the form 10xx xxxx
32316. * Memory constants
32317. return 'res' (of right part) as our result
32318. -> [func funcname env]
32319. this variant is used when an assert would generate a compile warning by * being always true (e.g. >= 0 comparison for an unsigned value
32320. Stringcache is used for speeding up char-offset-to-byte-offset * translations for non-ASCII strings.
32321. **comment:** Note: strictness is *not* inherited from the current Duktape/C. * This would be confusing because the current strictness state * depends on whether we're running inside a Duktape/C activation * (= strict mode) or outside of any activation (= non-strict mode). * See tests/api/test-eval-strictness.c for more discussion.
label: code-design
32322. * Finalizer check. * * Note: running a finalizer may have arbitrary side effects, e.g. * queue more objects on refzero_list (tail), or even trigger a * mark-and-sweep. * * Note: quick reject check should match vast majority of * objects and must be safe (not throw any errors, ever).
32323. Get Proxy target object. If the argument is not a Proxy, return it as is. * If a Proxy is revoked, an error is thrown.
32324. * Assertion helpers.
32325. is_setget
32326. * Compute new alloc size and alloc new area. * * The new area is allocated as a dynamic buffer and placed into the * valstack for reachability. The actual buffer is then detached at * the end. * * Note: heap_mark_and_sweep_base_flags are altered here to ensure * no-one touches this object while we're resizing and rehashing it. * The flags must be reset on every exit path after it. Finalizers * and compaction is prevented currently for all objects while it * would be enough to restrict it only for the current object.
32327. replacer function
32328. [...]
32329. **comment:** remove the string (mark DELETED), could also call * duk_heap_string_remove() but that would be slow and * pointless because we already know the slot.

32558. equals and strict equals

32559. * Loose equality, strict equality, and SameValue (E5 Sections 11.9.1, 11.9.4, * 9.12). These have much in common so they can share some helpers. * * Future work notes: * - Current implementation (and spec definition) has recursion; this should * be fixed if possible. * * - String-to-number coercion should be possible without going through the * value stack (and be more compact) if a shared helper is invoked.

32560. The debugger protocol doesn't support a plain integer encoding for * the full 32-bit unsigned range (only 32-bit signed). For now, * unsigned 32-bit values simply written as signed ones. This is not * a concrete issue except for 32-bit heapdfr fields. Proper solutions * would be to (a) write such integers as IEEE doubles or (b) add an * unsigned 32-bit dvalue.

32561. **comment:** * XXX: attempt to get the call result to "next temp" whenever * possible to avoid unnecessary register shuffles. * * XXX: CSPROP (and CSREG) can overwrite the call target register, and save one temp, * if the call target is a temporary register and at the top of the temp reg "stack".
label: code-design

32562. tv points to element just below prev top

32563. * Duktape/C function magic

32564. * Identifier handling

32565. error gets its 'name' from the prototype

32566. Use a new environment but there's no 'arguments' object; * delayed environment initialization. This is the most * common case.

32567. E5 Sections 11.9.1, 11.9.3

32568. Capital sigma occurred at "end of word", lowercase to * U+03C2 = GREEK SMALL LETTER FINAL SIGMA. Otherwise * fall through and let the normal rules lowercase it to * U+03C3 = GREEK SMALL LETTER SIGMA.

32569. current digit

32570. * Extern

32571. * Mark objects on finalize_list. *

32572. **comment:** XXX: repetition of stack pre-checks -> helper or macro or inline
label: code-design

32573. **comment:** * Data follows the struct header. The struct size is padded by the * compiler based on the struct members. This guarantees that the * buffer data will be aligned-by-4 but not necessarily aligned-by-8. * * On platforms where alignment does not matter, the struct padding * could be removed (if there is any). On platforms where alignment * by 8 is required, the struct size must be forced to be a multiple * of 8 by some means. Without it, some user code may break, and also * Duktape itself breaks (e.g. the compiler stores duk_tvals in a * dynamic buffer).
label: code-design

32574. 'valueOf'

32575. XXX: potential issue with signed pointers, p_end < p.

32576. * Helpers to resize properties allocation on specific needs.

32577. **comment:** The line number tracking is a bit inconsistent right now, which * affects debugger accuracy. Mostly call sites emit opcodes when * they have parsed a token (say a terminating semicolon) and called * duk_advance(). In this case the line number of the previous * token is the most accurate one (except in prologue where * prev_token.start_line is 0). This is probably not 100% correct * right now.
label: code-design

32578. shared object part

32579. "Have" flags must not be conflicting so that they would * apply to both a plain property and an accessor at the same * time.

32580. [... re_obj input]

32581. Backpointers.

32582. string access cache (codepoint offset -> byte offset) for fast string * character looping; 'weak' reference which needs special handling in GC.

32583. bottom of new func

32584. re_ctx->captures at the start of the atom parsed in this loop

32585. * Scan from shortest distance: * - start of string * - end of string * - cache entry (if exists)

32586. refzero_list treated as reachability roots

32587. * Memory calls.

32588. +0.5 is handled by floor, this is on purpose

32589. Duplicate (shadowing) labels are not allowed, except for the empty * labels (which are used as default labels for switch and iteration * statements). * * We could also allow shadowing of non-empty pending labels without any * other issues than breaking the required label shadowing requirements * of the E5 specification, see Section 12.12.

32590. internal temporary value, used for char classes

32591. **comment:** format is too large, abort
label: code-design

32979. LOGICAL EXPRESSIONS
32980. %lf, %ld etc
32981. * Switch is pretty complicated because of several conflicting concerns: * * - Want to generate code without an intermediate representation, * i.e., in one go * * - Case selectors are expressions, not values, and may thus e.g. throw * exceptions (which causes evaluation order concerns) * * - Evaluation semantics of case selectors and default clause need to be * carefully implemented to provide correct behavior even with case value * side effects * * - Fall through case and default clauses; avoiding dead JUMPs if case * ends with an unconditional jump (a break or a continue) * * - The same case value may occur multiple times, but evaluation rules * only process the first match before switching to a "propagation" mode * where case values are no longer evaluated * * See E5 Section 12.11. Also see doc/compiler.rst for compilation * discussion.
32982. 8: getFullYear
32983. * Debug connection peek and flush primitives
32984. 'do'
32985. duk_xdef_prop() will define an own property without any array * special behaviors. We'll need to set the array length explicitly * in the end. For arrays with elisions, the compiler will emit an * explicit SETALEN which will update the length.
32986. exponential notation forced
32987. NB: 'val' may be invalidated here because put_value may realloc valstack, * caller beware.
32988. Here we'd have the option to normalize -0 to +0.
32989. **comment:** XXX: share helper from lexer; duk_lexer.c / hexval().
label: code-design
32990. **comment:** * Create an internal enumerator object E, which has its keys ordered * to match desired enumeration ordering. Also initialize internal control * properties for enumeration. * * Note: if an array was used to hold enumeration keys instead, an array * scan would be needed to eliminate duplicates found in the prototype chain.
label: code-design

32991. **comment:** This is essentially the 'scale' algorithm, with recursion removed. * Note that 'k' is either correct immediately, or will move in one * direction in the loop. There's no need to do the low/high checks * on every round (like the Scheme algorithm does). ** The scheme algorithm finds 'k' and updates 's' simultaneously, * while the logical algorithm finds 'k' with 's' having its initial * value, after which 's' is updated separately (see the Burger-Dybvig * paper, Section 3.1, steps 2 and 3). ** The case where $m+ == m-$ (almost always) is optimized for, because * it reduces the bigint operations considerably and almost always * applies. The scale loop only needs to work with $m+$, so this works.

label: code-design

32992. A -> flags * BC -> regCatch; base register for two registers used both during * trycatch setup and when catch is triggered ** If DUK_BC_TRYCATCH_FLAG_CATCH_BINDING set: * regCatch + 0: catch binding variable name (string). * Automatic declarative environment is established for * the duration of the 'catch' clause. ** If DUK_BC_TRYCATCH_FLAG_WITH_BINDING set: * regCatch + 0: with 'target value', which is coerced to * an object and then used as a bindind object for an * environment record. The binding is initialized here, for * the 'try' clause. ** Note that a TRYCATCH generated for a 'with' statement has no * catch or finally parts.

32993. default: false

32994. **comment:** fill new_h with u32 0xff = UNUSED

label: code-design

32995. A non-extensible object cannot gain any more properties, * so this is a good time to compact.

32996. if direct eval, calling activation must exist

32997. **comment:** XXX: because of the final check below (that the literal is not * followed by a digit), this could maybe be simplified, if we bail * out early from a leading zero (and if there are no periods etc). * Maybe too complex.

label: code-design

32998. * Create escaped RegExp source (E5 Section 15.10.3). ** The current approach is to special case the empty RegExp * (" -> '(?:')") and otherwise replace unescaped '/' characters * with '\' regardless of where they occur in the regexp. ** Note that normalization does not seem to be necessary for * RegExp literals (e.g. '/foo/') because to be acceptable as * a RegExp literal, the text between forward slashes must * already match the escaping requirements (e.g. must not contain * unescaped forward slashes or be empty). Escaping IS needed * for expressions like 'new RegExp("...","")' however. * Currently, we re-escape in either case. ** Also note that we process the source here in UTF-8 encoded * form. This is correct, because any non-ASCII characters are * passed through without change.

32999. Value stack is used to ensure reachability of constants and * inner functions being loaded. Require enough space to handle * large functions correctly.

33000. **comment:** Automatic defaulting of logger name from caller. This would * work poorly with tail calls, but constructor calls are currently * never tail calls, so tail calls are not an issue now.

label: code-design

33001. Fast check for extending array: check whether or not a slow density check is required.

33002. **comment:** XXX: using duk_put_prop_index() would cause obscure error cases when Array.prototype * has write-protected array index named properties. This was seen as DoubleErrors * in e.g. some test262 test cases. Using duk_xdef_prop_index() is better but heavier. * The best fix is to fill in the tracedata directly into the array part. There are * no side effect concerns if the array part is allocated directly and only INCREFS * happen after that.

label: code-design

33047. patched later
33048. [... regexp_object]
33049. **comment:** * Note: the description in E5 Section 15.10.2.6 has a typo, it * contains 'A' twice and lacks 'a'; the intent is [0-9a-zA-Z_].
 label: documentation
33050. This was the last term, and q_last was * updated to match this term at loop top.
33051. x <- b^y; use t1 and t2 as temps
33052. prev_token.start_offset points to the closing brace here; when skipping * we're going to reparse the closing brace to ensure semicolon insertion * etc work as expected.
33053. more initializers
33054. ref.holder is global object, holder is the object with the * conflicting property.
33055. essentially tracks digit position of lowest 'f' digit
33056. **comment:** Prevent any side effects on the string table and the caller provided * str/blen arguments while interning is in progress. For example, if * the caller provided str/blen from a dynamic buffer, a finalizer might * resize that dynamic buffer, invalidating the call arguments.
 label: code-design
33057. binding power "levels" (see doc/compiler.rst)
33058. Enter message processing loop for sending Status notifys and * to finish a pending detach.
33059. result reg
33060. strings are only tracked by stringtable
33061. to avoid relookups
33062. abandoning requires a props allocation resize and * 'rechecks' the valstack, invalidating any existing * valstack value pointers!
33063. If object has a . toJSON() property, we can't be certain * that it wouldn't mutate any value arbitrarily, so bail * out of the fast path. * * If an object is a Proxy we also can't avoid side effects * so abandon.
33064. Reviving an object using a heap pointer is a dangerous API * operation: if the application doesn't guarantee that the * pointer target is always reachable, difficult-to-diagnose * problems may ensue. Try to validate the 'ptr' argument to * the extent possible.
33065. ':'
33066. **comment:** Unlike in duk_hex_encode() 'dst' is not necessarily aligned by 2. * For platforms where unaligned accesses are not allowed, shift 'dst' * ahead by 1 byte to get alignment and then DUK_MEMMOVE() the result * in place. The faster encoding loop makes up the difference. * There's always space for one extra byte because a terminator always * follows the hex data and that's been accounted for by the caller.
 label: code-design
33067. E5 Section 7.3, treat the following as newlines: * LF * CR [not followed by LF] * LS * PS * * For CR LF, CR is ignored if it is followed by LF, and the LF will bump * the line number.
33068. **comment:** * 'nregs' registers are allocated on function entry, at most 'nargs' * are initialized to arguments, and the rest to undefined. Arguments * above 'nregs' are not mapped to registers. All registers in the * active stack range must be initialized because they are GC reachable. * 'nargs' is needed so that if the function is given more than 'nargs' * arguments, the additional arguments do not 'clobber' registers * beyond 'nregs' which must be consistently initialized to undefined. * * Usually there is no need to know which registers are mapped to * local variables. Registers may be allocated to variable in any * way (even including gaps). However, a register-variable mapping * must be the same for the duration of the function execution and * the register cannot be used for anything else. * * When looking up variables by name, the '_Varmap' map is used. * When an activation closes, registers mapped to arguments are * copied into the environment record based on the same map. The * reverse map (from register to variable) is not currently needed * at run time, except for debugging, so it is not maintained.
 label: code-design
33069. Slice starting point is beyond current length.
33070. ... target is extensible
33071. duk_unicode_support.c
33072. **comment:** XXX: easier check with less code?
 label: code-design
33073. Used when precision is undefined; also used for NaN (-> "NaN"), * and +/- infinity (-> "Infinity", "-Infinity").
33074. x <- x * y, use t as temp
33075. [... v1 v2 str] -> [... str v2]
33076. Zero 'count' is also allowed to make call sites easier.
33077. **comment:** XXX: size optimize
 label: code-design
33078. l= 0 => post-update for array 'length' (used when key is an array index)
33079. **comment:** has inner functions which may slow access (XXX: this can be optimized by looking at the inner functions)
 label: code-design
33080. **comment:** XXX: need to determine LHS type, and check that it is LHS compatible
 label: code-design
33081. false
33082. * Built-in strings
33083. * Clear (reachable) flags of finalize_list * * We could mostly do in the sweep phase when we move objects from the * heap into the finalize_list. However, if a finalizer run is skipped * during a mark-and-sweep, the objects on the finalize_list will be marked * reachable during the next mark-and-sweep. Since they're already on the * finalize_list, no-one will be clearing their REACHABLE flag so we do it * here. (This now overlaps with the sweep handling in a harmless way.)
33084. * Variant 3
33085. * On second pass, skip the function.
33086. OK for NULL.
33087. Note: key issue here is to re-lookup the base pointer on every attempt. * The pointer being reallocated may change after every mark-and-sweep.
33088. -> [... key val toJSON val]
33089. **comment:** XXX: It would be nice to build the string directly but ToUint16() * coercion is needed so a generic helper would not be very * helpful (perhaps coerce the value stack first here and then * build a string from a duk_tval number sequence in one go?).
 label: code-design
33090. Note: getprop may invoke any getter and invalidate any * duk_tval pointers, so this must be done first.
33091. [obj trap_result res_arr propname]
33092. split1: prefer direct execution (no jump)
33093. in resumer's context
33094. Conceptually we'd extract the plain underlying buffer * or its slice and then do a type mask check below to * see if we should reject it. Do the mask check here * instead to avoid making a copy of the buffer slice.
33095. 'try'
33096. -> [in_val]
33097. **comment:** Currently all built-in native functions are strict. * This doesn't matter for many functions, but e.g. * String.prototype.charAt (and other string functions) * rely on being strict so that their 'this' binding is * not automatically coerced.
 label: code-design
33098. **comment:** * Helper for handling an Ecmascript-to-Ecmascript call or an Ecmascript * function (initial) Duktape.Thread.resume(). * * Compared to normal calls handled by duk_handle_call(), there are a * bunch of differences: * * - the call is never protected * - there is no C recursion depth increase (hence an "ignore recursion * limit" flag is not applicable) * - instead of making the call, this helper just performs the thread * setup and returns; the bytecode executor then restarts execution * internally * - ecmascript functions are never 'vararg' functions (they access * varargs through the 'arguments' object) * * The callstack of the target contains an earlier Ecmascript call in case * of an Ecmascript-to-Ecmascript call (whose idx_retval is updated), or * is empty in case of an initial

Duktape.Thread.resume(). * * The first thing to do here is to figure out whether an ecma-to-ecma * call is actually possible. It's not always the case if the target is * a bound function; the final function may be native. In that case, * return an error so caller can fall back to a normal call path.

label: code-design

33099. Note: 0xff != DUK_BC_B_MAX

33100. * Unions and structs for self tests

33101. Note: masking is done for 'i' to deal with negative numbers correctly

33102. * For property layout 1, tweak e_size to ensure that the whole entry * part (key + val + flags) is a suitable multiple for alignment * (platform specific). * * Property layout 2 does not require this tweaking and is preferred * on low RAM platforms requiring alignment.

33103. don't run finalizers; queue finalizable objects back to heap_allocated

33104. val1 = count

33105. * Function declaration, function expression, or (non-standard) * function statement. * * The E5 specification only allows function declarations at * the top level (in "source elements"). An ExpressionStatement * is explicitly not allowed to begin with a "function" keyword * (E5 Section 12.4). Hence any non-error semantics for such * non-top-level statements are non-standard. Duktape semantics * for function statements are modelled after V8, see * test-dev-func-decl-outside-top.js.

33106. Get minimum array part growth for a certain size.

33107. **comment:** XXX: very slow - better to bulk allocate a gap, and copy * from args_array directly (we know it has a compact array * part, etc).

label: code-design

33108. enumerate'

33109. DUK_TOK_RSHIFT

33110. roughly 256 bytes

33111. **comment:** For now, just use duk_safe_call() to wrap duk_new(). We can't * simply use a protected duk_handle_call() because there's post * processing which might throw. It should be possible to ensure * the post processing never throws (except in internal errors and * out of memory etc which are always allowed) and then remove this * wrapper.

label: code-design

33112. object is now reachable

33113. flags: "im"

33114. Copy trap result keys into the enumerator object.

33115. * Mark-and-sweep flags * * These are separate from heap level flags now but could be merged. * The heap structure only contains a 'base mark-and-sweep flags' * field and the GC caller can impose further flags.

33116. Success path.

33117. * If entering a 'catch' block which requires an automatic * catch variable binding, create the lexical environment. * * The binding is mutable (= writable) but not deletable. * Step 4 for the catch production in E5 Section 12.14; * no value is given for CreateMutableBinding 'D' argument, * which implies the binding is not deletable.

33118. t1 <- (* r B)

33119. DUK_BUFOBJ_UINT8ARRAY

33120. Accept any duk_hbufferobject, though we're only normally * called for Duktape.Buffer values.

33121. Lenient: allow function declarations outside top level in * non-strict mode but reject them in strict mode.

33122. assertions: env must be closed in the same thread as where it runs

33123. EOF (-1) will be cast to an unsigned value first * and then re-cast for the switch. In any case, it * will match the default case (syntax error).

33124. refzero not running -> must be empty

33125. **comment:** XXX: differentiate null pointer from empty string?

label: code-design

33126. Normal object which doesn't get automatically coerced to a * primitive value. Functions are checked for specially. The * primitive value coercions for Number, String, Pointer, and * Boolean can't result in functions so suffices to check here.

33127. DUK_USE_MARK_AND_SWEEP

33128. * Coercion and fast path processing

33129. y == +Infinity

33130. caller required to know

33131. * Function name (if any) * * We don't check for prohibited names here, because we don't * yet know whether the function will be strict. Function body * parsing handles this retroactively. * * For function expressions and declarations function name must * be an Identifier (excludes reserved words). For setter/getter * it is a PropertyName which allows reserved words and also * strings and numbers (e.g. "{ get 1) { ... } }").

33132. **comment:** XXX: There are no format strings in duk_config.h yet, could add * one for formatting duk_int64_t. For now, assumes "%lld" and that * "long long" type exists. Could also rely on C99 directly but that * won't work for older MSVC.

label: code-design

33133. toLocaleString'

33134. * Manipulate value stack so that exactly 'num_stack_rets' return * values are at 'idx_rebase' in every case, assuming there are * 'rc' return values on top of stack. * * This is a bit tricky, because the called C function operates in * the same activation record and may have e.g. popped the stack * empty (below idx_rebase).

33135. Exotic behaviors are only enabled for arguments objects * which have a parameter map (see E5 Section 10.6 main * algorithm, step 12). * * In particular, a non-strict arguments object with no * mapped formals does *NOT* get exotic behavior, even * for e.g. "caller" property. This seems counterintuitive * but seems to be the case.

33136. buffer is automatically zeroed

33137. num_args

33138. DUK_OP_EXTRA, sub-operation in A

33139. insert the required matches (qmin) by copying the atom

33140. DUK_USE_INTEGER_BE

33141. out_clamped

33142. adv = 2 default OK

33143. There is no need to decref anything else than 'env': if 'env' * becomes unreachable, refzero will handle decref'ing its prototype.

33144. '-0'

33145. module table remains registered to modLoaded, minimize its size

33146. * Detach handling

33147. write back

33148. [... filename (temps) func]

33149. **comment:** It's not strictly necessary to track the current size, but * it is useful for writing robust native code.

label: code-design

33150. * Second pass parsing.

33151. **comment:** Note: cannot portably debug print a function pointer, hence 'func' not printed!

label: code-design

33152. * Arbitrary byteswap for potentially unaligned values * * Used to byteswap pointers e.g. in debugger code.

33153. **comment:** XXX: There's some overlap with duk_js_closure() here, but * seems difficult to share code. Ensure that the final function * looks the same as created by duk_js_closure().

label: code-design

33154. **comment:** It is important not to call this if the last byte read was an EOM. * Reading ahead in this scenario would cause unnecessary blocking if * another message is not available.

33279. activation is a direct eval call
33280. current lex_env of the activation (created for catcher)
33281. **comment:** Figure out all active breakpoints. A breakpoint is * considered active if the current function's fileName * matches the breakpoint's fileName, AND there is no * inner function that has matching line numbers * (otherwise a breakpoint would be triggered both * inside and outside of the inner function which would * be confusing). Example: ** function foo() { * print('foo'); * function bar() { <-.. breakpoints in these * print('bar'); | lines should not affect * } <-' foo() execution * bar(); * } ** We need a few things that are only available when * debugger support is enabled: (1) a line range for * each function, and (2) access to the function * template to access the inner functions (and their * line ranges). ** It's important to have a narrow match for active * breakpoints so that we don't enter checked execution * when that's not necessary. For instance, if we're * running inside a certain function and there's * breakpoint outside in (after the call site), we * don't want to slow down execution of the function.
label: code-design
33282. start byte offset of token in lexer input
33283. * Note: lj.value1 is 'value', lj.value2 is 'resume'. * This differs from YIELD.
33284. curr_token = get/set name

33285. Initial '[' has been checked and eaten by caller.

33305. E5 Section 9.3.1
33306. * GETVAR * * See E5 Sections: * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * 11.13.1 Simple Assignment [example of where the Reference is GetValue'd] * 8.7.1 GetValue (V) * 8.12.1 [[GetOwnProperty]] (P) * 8.12.2 [[GetProperty]] (P) * 8.12.3 [[Get]] (P) * * If 'throw' is true, always leaves two values on top of stack: [val this]. * * If 'throw' is false, returns 0 if identifier cannot be resolved, and the * stack will be unaffected in this case. If identifier is resolved, returns * 1 and leaves [val this] on top of stack. * * Note: the 'strict' flag of a reference returned by GetIdentifierReference * is ignored by GetValue. Hence we don't take a 'strict' parameter. * * The 'throw' flag is needed for implementing 'typeof' for an unreferenced * identifier. An unreferenced identifier in other contexts generates a * ReferenceError.
33307. **comment:** XXX: top of stack must contain value, which helper doesn't touch, * rework to use tv_val directly?
 label: code-design
33308. * Executor interrupt handling * * The handler is called whenever the interrupt countdown reaches zero * (or below). The handler must perform whatever checks are activated, * e.g. check for cumulative step count to impose an execution step * limit or check for breakpoints or other debugger interaction. * * When the actions are done, the handler must reinits the interrupt * init and counter values. The 'init' value must indicate how many * bytecode instructions are executed before the next interrupt. The * counter must interface with the bytecode executor loop. Concretely, * the new init value is normally one higher than the new counter value. * For instance, to execute exactly one bytecode instruction the init * value is set to 1 and the counter to 0. If an error is thrown by the * interrupt handler, the counters are set to the same value (e.g. both * to 0 to cause an interrupt when the next bytecode instruction is about * to be executed after error handling). * * Maintaining the init/counter value properly is important for accurate * behavior. For instance, executor step limit needs a cumulative step * count which is simply computed as a sum of 'init' values. This must * work accurately even when single stepping.

33372. DUK_HOBJECT_H_INCLUDED

33373. always at least the header

33374. A -> target register * B -> bytecode (also contains flags) * C -> escaped source

33375. Fast path, decode as is.

33376. * "/" followed by something in regexp mode. See E5 Section 7.8.5. * * RegExp parsing is a bit complex. First, the regexp body is delimited * by forward slashes, but the body may also contain forward slashes as * part of an escape sequence or inside a character class (delimited by * square brackets). A mini state machine is used to implement these. * * Further, an early (parse time) error must be thrown if the regexp * would cause a run-time error when used in the expression new RegExp(...). * Parsing here simply extracts the (candidate) regexp, and also accepts * invalid regular expressions (which are delimited properly). The caller * (compiler) must perform final validation and regexp compilation. * * RegExp first char may not be '/' (single line comment) or '*' (multi- * line comment). These have already been checked above, so there is no * need below for special handling of the first regexp character as in * the E5 productions. * * About unicode escapes within regexp literals: * * E5 Section 7.8.5 grammar does NOT accept \uHHHH escapes. * However, Section 6 states that regexps accept the escapes, * see paragraph starting with "In string literals...". * The regexp grammar, which sees the decoded regexp literal * (after lexical parsing) DOES have a \uHHHH unicode escape. * So, for instance: * * \u1234/* * should first be parsed by the lexical grammar as: * * \'u' RegularExpressionBackslashSequence * '1' RegularExpressionNonTerminator * '2' RegularExpressionNonTerminator * '3' RegularExpressionNonTerminator * '4' RegularExpressionNonTerminator * * and the escape itself is then parsed by the regexp engine. * This is the current implementation. * * Minor spec inconsistency: * * E5 Section 7.8.5 RegularExpressionBackslashSequence is: * * \ RegularExpressionNonTerminator * * while Section A.1 RegularExpressionBackslashSequence is: * * \ NonTerminator * * The latter is not normative and a typo. *

33377. 'break'

33378. in yielder's context

33379. * E5 Section 15.4.5.1, steps 3.k - 3.n. The order at the end combines * the error case 3.l.iii and the success case 3.m-3.n. * * Note: 'length' is always in entries part, so no array abandon issues for * 'writable' update.

33380. * Avoid a GC if GC is already running. This can happen at a late * stage in a GC when we try to e.g. resize the stringtable * or compact objects.

33381. Reject attempt to change virtual properties: not part of the * standard algorithm, applies currently to e.g. virtual index * properties of buffer objects (which are virtual but writable). * (Cannot "force" modification of a virtual property.)

33382. MakeDay

33383. Push 'this' binding, check that it is a Date object; then push the * internal time value. At the end, stack is: [... this timeval]. * Returns the time value. Local time adjustment is done if requested.

33384. Cannot use duk_to_string() on the buffer because it is usually * larger than 'len'. Also, 'buf' is usually a stack buffer.

33385. non-leap year: sunday, monday, ...

33391. XXX: optimize value stack operation

33392. * Proxy object handling

33393. * Then decode the builtins init data (see genbuiltins.py) to * init objects

33394. mark as complex (capture handling)

33395. string is a reserved word (non-strict)

33396. s <- b^(1-e) * 2

33397. * Object inspection commands: GetHeapObjInfo, GetObjPropDesc, * GetObjPropDescRange

33398. * Unreachable object about to be swept. Finalize target refcounts * (objects which the unreachable object points to) without doing * refzero processing. Recursive decrefs are also prevented when * refzero processing is disabled. * * Value cannot be a finalizable object, as they have been made * temporarily reachable for this round.

33399. Map DUK_FLX_xxx to byte size.

33400. Note that we currently parse -bytes-, not codepoints. * All non-ASCII extended UTF-8 will encode to bytes >= 0x80, * so they'll simply pass through (valid UTF-8 or not).

33401. * Get/require

33402. key, getter and setter, now reachable through object

33403. **comment:** * Finalize objects in the finalization work list. Finalized * objects are queued back to heap_allocated with FINALIZED set. * * Since finalizers may cause arbitrary side effects, they are * prevented during string table and object property allocation * resizing using the DUK_MS_FLAG_NO_FINALIZERS flag in * heap->mark_and_sweep_base_flags. In this case the objects * remain in the finalization work list after mark-and-sweep * exits and they may be finalized on the next pass. * * Finalization currently happens inside "MARKANDSWEET_RUNNING" * protection (no mark-and-sweep may be triggered by the * finalizers). As a side effect: * * 1) an out-of-memory error inside a finalizer will not * cause a mark-and-sweep and may cause the finalizer * to fail unnecessarily * * 2) any temporary objects whose refcount decreases to zero * during finalization will not be put into refzero_list; * they can only be collected by another mark-and-sweep * * This is not optimal, but since the sweep for this phase has * already happened, this is probably good enough for now. **label:** code-design

33404. * A Dragon4 number-to-string variant, based on: * * Guy L. Steele Jr., Jon L. White: "How to Print Floating-Point Numbers * Accurately" * * Robert G. Burger, R. Kent Dybvig: "Printing Floating-Point Numbers * Quickly and Accurately" * * The current algorithm is based on Figure 1 of the Burger-Dybvig paper, * i.e.

the base implementation without logarithm estimation speedups * (these would increase code footprint considerably). Fixed-format output * does not follow the suggestions in the paper; instead, we generate an * extra digit and round-with-carry. ** The same algorithm is used for number parsing (with b=10 and B=2) * by generating one extra digit and doing rounding manually. ** See doc/number-conversion.rst for limitations.

33405. holder will be set to the target object, not the actual object * where the property was found (see duk_get_identifier_reference()).

33406. 'Array'

33407. * INITSET/INITGET are only used to initialize object literal keys. * The compiler ensures that there cannot be a previous data property * of the same name. It also ensures that setter and getter can only * be initialized once (or not at all).

33408. extended utf-8 not allowed for URIs

33409. * E5 Section 15.7.2.1 requires that the constructed object * must have the original Number.prototype as its internal * prototype. However, since Number.prototype is non-writable * and non-configurable, this doesn't have to be enforced here: * The default object (bound to 'this') is OK, though we have * to change its class. * * Internal value set to ToNumber(arg) or +0; if no arg given, * ToNumber(undefined) = NaN, so special treatment is needed * (above). String internal value is immutable.

33410. bytecode limits

33411. guaranteed to find an empty slot

33412. Because 'day since epoch' can be negative and is used to compute weekday * using a modulo operation, add this multiple of 7 to avoid negative values * when year is below 1970 epoch. Ecmascript time values are restricted to * +/- 100 million days from epoch, so this adder fits nicely into 32 bits. * Round to a multiple of 7 (= floor(100000000 / 7) * 7) and add margin.

33413. Allow trailing garbage (e.g. treat "123foo" as "123")

33414. **comment:** XXX: Are steps 6 and 7 in E5 Section 15.11.4.4 duplicated by * accident or are they actually needed? The first ToString() * could conceivably return 'undefined'.

label: code-design

33415. **comment:** Size sanity check. Should not be necessary because caller is * required to check this, but we don't want to cause a segfault * if the size wraps either in duk_size_t computation or when * storing the size in a 16-bit field.

label: code-design

33416. steps 3.h and 3.i

33417. Note: toJSON() is a generic function which works even if 'this' * is not a Date. The sole argument is ignored.

33418. module (argument)

33419. valstack space that suffices for all local calls, including recursion * of other than Duktape calls (getters etc)

33420. current paren level allows 'in' token

33421. **comment:** XXX: fast-int-to-double

label: code-design

33500. **comment:** Compact but lots of churn.

label: code-design

33501. Output shuffling: only one output register is realistically possible. ** (Zero would normally be an OK marker value: if the target register * was zero, it would never be shuffled. But with DUK_USE_SHUFFLE_TORTURE * this is no longer true, so use -1 as a marker instead.)

33502. **comment:** actually used

label: code-design

33503. rule match

33504. * Helper structs

33505. terminating conditions

33506. see below

33507. allow automatic semicolon even without lineterm (compatibility)

33508. Outside any activation -> put to global.

33509. +0 = break, +1 = continue

33510. try locale specific formatter; if it refuses to format the * string, fall back to an ISO 8601 formatted value in local * time.

33511. -> [val arr]

33512. * Byte matching for back-references would be OK in case- * sensitive matching. In case-insensitive matching we need * to canonicalize characters, so back-reference matching needs * to be done with codepoints instead. So, we just decode * everything normally here, too. ** Note: back-reference index which is 0 or higher than * NCapturingParens (= number of capturing parens in the * -entire- regexp) is a compile time error. However, a * backreference referring to a valid capture which has * not matched anything always succeeds! See E5 Section * 15.10.2.9, step 5, sub-step 3.

33513. this is needed for regexp mode

33514. jump to next case clause

33515. pop plain buffer, now reachable through h_bufres

33516. * PUTPROP: Ecmascript property write. ** Unlike Ecmascript primitive which returns nothing, returns 1 to indicate * success and 0 to indicate failure (assuming throw is not set). ** This is an extremely tricky function. Some examples: * * * Currently a decref may trigger a GC, which may compact an object's * property allocation. Consequently, any entry indices (e_idx) will * be potentially invalidated by a decref. * * * Exotic behaviors (strings, arrays, arguments object) require, * among other things: * * - Preprocessing before and postprocessing after an actual property * write. For example, array index write requires pre-checking the * array 'length' property for access control, and may require an * array 'length' update after the actual write has succeeded (but * not if it fails). * * - Deletion of multiple entries, as a result of array 'length' write. * * * Input values are taken as pointers which may point to the valstack. * If valstack is resized because of the put (this may happen at least * when the array part is abandoned), the pointers can be invalidated. * (We currently make a copy of all of the input values to avoid issues.)

33517. add AD*2^16

33518. Proxy handler

33519. **comment:** * Tailcall handling ** Although the callstack entry is reused, we need to explicitly unwind * the current activation (or simulate an unwind). In particular, the * current activation must be closed, otherwise something like * test-bug-reduce-judofy.js results. Also catchstack needs be unwound * because there may be non-error-catching label entries in valid tail calls.

label: code-design

33520. **comment:** Should not be required because the code below always sets both high * and low parts, but at least gcc-4.4.5 fails to deduce this correctly * (perhaps because the low part is set (seemingly) conditionally in a * loop), so this is here to avoid the bogus warning.
label: code-design

33521. Impose a maximum string length for now. Restricted artificially to * ensure adding a heap header length won't overflow size_t. The limit * should be synchronized with DUK_HBUFFER_MAX_BYTELEN. ** E5.1 makes provisions to support strings longer than 4G characters. * This limit should be eliminated on 64-bit platforms (and increased * closer to maximum support on 32-bit platforms).

33522. relookup exports from module.exports in case it was changed by modSearch

33523. * Indexed read/write helpers (also used from outside this file)

33524. adv = 2 - 1 default OK

33525. **comment:** XXX: the key in 'key in obj' is string coerced before we're called * (which is the required behavior in E5/E5.1/E6) so the key is a string * here already.
label: code-design

33526. **comment:** XXX: side effect handling is quite awkward here
label: code-design

33527. act->func

33528. **comment:** Set stack top within currently allocated range, but don't reallocate. * This is performance critical especially for call handling, so whenever * changing, profile and look at generated code.
label: code-design

33529. **comment:** Neutered checks not necessary here: neutered buffers have * zero 'length' so we'll effectively skip them.
label: code-design

33530. Call setup checks callability.

33531. **comment:** Flags for intermediate value coercions. A flag for using a forced reg * is not needed, the forced_reg argument suffices and generates better * code (it is checked as it is used).
label: code-design

33532. **comment:** Non-ASCII slow path (range-by-range linear comparison), very slow
label: code-design

33533. Contract, either: * - Push value on stack and return 1 * - Don't push anything on stack and return 0

33534. 0: not IdentifierStart or IdentifierPart * 1: IdentifierStart and IdentifierPart * -1: IdentifierPart only

33535. DUK_BUFOBJ_UINT32ARRAY

33536. * Restore 'caller' property for non-strict callee functions.

33537. ($\geq e 0$) AND (not ($= f (\text{expt } b (- p 1))$)) * * be < ($\text{expt } b e$) == $b^e * r \leftarrow (* f \text{ be } 2) == 2 * f * b^e$ [if $b==2 \rightarrow f * b^{(e+1)}$] * s <- 2 * m+ <- be == $b^e * m - <- be == b^e * k <- 0 * B <- B * \text{low_ok} <- \text{round} * \text{high_ok} <- \text{round}$

33538. A -> unused (reserved for flags, for consistency with DUK_OP_CALL) * B -> target register and start reg: constructor, arg1, ..., argN * (for DUK_OP_NEWI, 'b' is indirect) * C -> num args (N)

33539. 0x60...0x6f

33540. ≥ 0

33541. mimic semantics for strings

33542. Parse a single statement. ** Creates a label site (with an empty label) automatically for iteration * statements. Also "peels off" any label statements for explicit labels.

33543. DUK_FLD_8BIT

33544. [key]

33545. normal key/value

33546. mm <- b^e

33547. steps 4.a and 4.b are tricky

33548. The external string struct is defined even when the feature is inactive.

33549. fixed arg count

33550. A -> flags * B -> return value reg/const * C -> currently unused

33551. **comment:** Because there are quite many call sites, pack error code (require at most * 8-bit) into a single argument.
label: code-design

33552. Raw helper to extract internal information / statistics about a value. * The return values are version specific and must not expose anything * that would lead to security issues (e.g. exposing compiled function * 'data' buffer might be an issue). Currently only counts and sizes and * such are given so there should not be a security impact.

33553. -> [...] copy template newobj]

33554. XXX: This causes recursion up to inner function depth * which is normally not an issue, e.g. mark-and-sweep uses * a recursion limiter to avoid C stack issues. Avoiding * this would mean some sort of a work list or just refusing * to serialize deep functions.

33555. * Size-optimized pc->line mapping.

33556. return as is

33557. value1 -> resume value, value2 -> resume thread, iserror -> error/normal

33558. function: create binding for func name (function templates only, used for named function expressions)

33559. The low 8 bits map directly to duk_hobject.h DUK_PROPDESC_FLAG_xxx. * The remaining flags are specific to the debugger.

33560. **comment:** XXX: copy from caller?
label: code-design

33561. always for register bindings

33562. **comment:** XXX: optimize: allocate an array part to the necessary size (upwards * estimate) and fill in the values directly into the array part; finally * update 'length'.
label: code-design

33563. heap->dbg_udata: keep

33564. If input_offset were assigned a negative value, it would * result in a large positive value. Most likely it would be * larger than input_length and be caught here. In any case * no memory unsafe behavior would happen.

33565. IdentifierStart production with Letter, ASCII, and non-BMP excluded

33566. **comment:** * Custom formatter for debug printing, allowing Duktape specific data * structures (such as tagged values and heap objects) to be printed with * a nice format string. Because debug printing should not affect execution * state, formatting here must be independent of execution (see implications * below) and must not allocate memory. ** Custom format tags begin with a '%!' to safely distinguish them from * standard format tags. The following conversions are supported: * * %!T tagged value (duk_tval *) * %!O heap object (duk_heapobj *) * %!I decoded bytecode instruction * %!C bytecode instruction opcode name (arg is long) * * Everything is serialized in a JSON-like manner. The default depth is one * level, internal prototype is not followed, and internal properties are not * serialized. The following modifiers change this behavior: * * @ print pointers * # print binary representations (where applicable) * d deep traversal of own properties (not prototype) * p follow prototype chain (useless without 'd') * i include internal properties (other than prototype) * x hexdump buffers * h heavy formatting * * For instance, the following serializes objects recursively, but does not * follow the prototype chain nor print internal properties: "%!do". ** Notes: * * Standard sprintf return value semantics seem to vary. This * implementation returns the number of bytes it actually wrote * (excluding the null terminator). If retval == buffer size, * output was truncated (except for corner cases). ** Output format is intentionally different from Ecmascript * formatting requirements, as formatting here serves debugging * of internals. ** Depth checking (and updating) is done in each type printer * separately, to allow them to call each other freely. ** Some pathological structures might take ages to print (e.g. * self recursion with 100 properties pointing to the object * itself). To guard against these, each printer also checks * whether the output buffer is full; if so, early exit. ** Reference loops are detected using a loop stack.
label: code-design

33567. dummy value used as marker

33568. never here, but fall through

33569. **comment:** * duk_handle_safe_call(): make a "C protected call" within the * current activation. ** The allowed thread states for making a call are the same as for * duk_handle_call_xxx(). * * Error handling is similar to duk_handle_call_xxx(); errors may be thrown * (and result in a fatal error) for insane arguments.
label: code-design

33570. must never longjmp
33571. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside object 'a_size'.
33572. Must set 'length' explicitly when using duk_xdef_prop_xxx() to * set the values.
33573. heapdr size and additional allocation size, followed by * type specific stuff (with varying value count)
33574. stack top contains 'true'
33575. callbacks and udata; dbg_read_cb != NULL is used to indicate attached state
33576. '\xffHandler'
33577. Note: string is a terminal heap object, so no depth check here
33578. 0x80-0x8f
33579. * Internal helper for defining an accessor property, ignoring * normal semantics such as extensibility, write protection etc. * Overwrites any existing value and attributes. This is called * very rarely, so the implementation first sets a value to undefined * and then changes the entry to an accessor (this is to save code space).
33580. Debug print which visualizes the qsort partitioning process.
33581. XXX: this placeholder is not always correct, but use for now. * It will fail in corner cases; see test-dev-func-cons-args.js.
33582. r <- (2 * f) * b^e
33583. unreferenced with some options
33584. always terminates led()
33585. (reference is valid as long activation exists)
33586. don't report __FILE__ / __LINE__ as fileName/lineNumber
33587. **comment:** Note: don't bail out early, we must read all the ranges from * bytecode. Another option is to skip them efficiently after * breaking out of here. Prefer smallest code.
label: code-design
33588. Pause for all step types: step into, step over, step out. * This is the only place explicitly handling a step out.
33589. awkward; we assume there is space for this
33590. Peek ahead in the stream one byte.
33591. * Breakpoint management
33592. * Compact an object
33593. slot B is both a target and a source (used by extraops like DUK_EXTRAOP_INSTOF)
33594. alias for above
33595. handle comma and closing brace
33596. shrink case; leave some spare
33597. strictness is not inherited, intentional
33598. only Array.prototype matches
33599. Parse a function-like expression, assuming that 'comp_ctx->curr_func' is * correctly set up. Assumes that curr_token is just after 'function' (or * 'set'/'get' etc).
33600. function: always register bound
33601. **comment:** XXX: fast primitive to set a bunch of values to UNDEFINED
label: code-design
33602. Buffer size needed for duk_bi_date_format_timeval(). * Accurate value is 32 + 1 for NUL termination: * >>> len('+123456-01-23T12:34:56.123+12:34') * 32 *
Include additional space to be safe.
33603. We want to compare the slice/view areas of the arguments. * If either slice/view is invalid (underlying buffer is shorter) * ensure equals() is false, but otherwise the only thing that * matters is to be memory safe.
33604. This seems reasonable overall.
33605. Loop prevention
33606. 'throw'
33607. we're running inside the caller's activation, so no change in call/catch stack or valstack bottom
33608. Assume that the native representation never contains a closing * parenthesis.
33609. varargs marker
33610. entry level reached
33611. Current strictness flag: affects API calls.
33612. Because value stack init policy is 'undefined above top', * we don't need to write, just assert.
33613. '*'
33614. call is from executor, so we know we have a jmpbuf
33615. Yield/resume book-keeping.
33616. finally part will catch
33617. Quite lenient, e.g. allow empty as zero, but don't allow trailing * garbage.
33618. IEEE requires that NaNs compare false
33619. Load inner functions to value stack, but don't yet copy to buffer.
33620. [start end]
33621. **comment:** Try to make do with a stack buffer to avoid allocating a temporary buffer. * This works 99% of the time which is quite nice.
label: code-design
33622. This testcase fails when Emscripten-generated code runs on Firefox. * It's not an issue because the failure should only affect packed * duk_tval representation, which is not used with Emscripten.
33623. **comment:** XXX: keys is an internal object with all keys to be processed * in its (gapless) array part. Because nobody can touch the keys * object, we could iterate its array part directly (keeping in mind * that it can be reallocated).
label: code-design
33624. Return value is like write(), number of bytes written. * The return value matters because of code like: * "off += buf.copy(...)".
33625. Exponent without digits (e.g. "1e" or "1e+"). If trailing garbage is * allowed, ignore exponent part as garbage (= parse as "1", i.e. exp 0).
33626. DUK_TOK_THROW
33627. **comment:** Note: not a typo, "object" is returned for a null value
label: documentation
33628. atom_char_length, atom_start_offset, atom_start_offset reflect the * atom matched on the previous loop. If a quantifier is encountered * on this loop, these are needed to handle the quantifier correctly. * new_atom_char_length etc are for the atom parsed on this round; * they're written to atom_char_length etc at the end of the round.
33629. Original idiom used, minimal code size.
33630. **comment:** 'fun' is quite rarely used, so no local for it
label: code-design
33631. **comment:** XXX: fastint
label: code-design
33632. Note: in integer arithmetic, (x / 4) is same as floor(x / 4) for non-negative * values, but is incorrect for negative ones.
33633. normal
33634. Careful with wrapping (left shifting idx would be unsafe).
33635. **comment:** XXX: for negative input offsets, 'offset' will be a large * positive value so the result here is confusing.
label: code-design
33636. no overflow
33637. "+11:22:0"
33638. borrowed: function being executed; for bound function calls, this is the final, real function, NULL for lightfuncs
33639. **comment:** * Augment error (throw time), unless alloc/double error
label: code-design

33640. -> [... ToObject(this) ToUInt32(length) arg[i]]
33641. The specification has quite awkward order of coercion and * checks for toPrecision(). The operations below are a bit * reordered, within constraints of observable side effects.
33642. caller
33643. match followed by capture(s)
33644. return input buffer, converted to a Duktape.Buffer object * if called as a constructor (no change if called as a * function).
33645. We could use a switch-case for the class number but it turns out * a small if-else ladder on class masks is better. The if-ladder * should be in order of relevancy.
33646. * New length is smaller than old length, need to delete properties above * the new length. * * If array part exists, this is straightforward: array entries cannot * be non-configurable so this is guaranteed to work. * * If array part does not exist, array-indexed values are scattered * in the entry part, and some may not be configurable (preventing length * from becoming lower than their index + 1). To handle the algorithm * in E5 Section 15.4.5.1, step 1 correctly, we scan the entire property * set twice.
33647. 'ptr' is evaluated both as LHS and RHS.
33648. * Ecmascript [[Class]]
33649. **comment:** Quick reject of too large or too small exponents. This check * would be incorrect for zero (e.g. "0e1000" is zero, not Infinity) * so zero check must be above.
label: code-design
33650. finalize_list will always be processed completely
33651. **comment:** XXX: exposed duk_debug_read_pointer
label: code-design
33652. -> [... key val replacer holder]
33653. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside bufferobject length.
33654. open scope information, for compiled functions only
33655. Handle empty separator case: it will always match, and always * triggers the check in step 13.c.iii initially. Note that we * must skip to either end of string or start of first codepoint, * skipping over any continuation bytes! * * Don't allow an empty string to match at the end of the input.
33656. temp reg handling
33657. * Parse function body
33658. x <- y - z
33659. 'Pointer'
33660. relookup if changed
33661. **comment:** * Augment an error at creation time with _Tracedata/fileName/lineNumber * and allow a user error handler (if defined) to process/replace the error. * The error to be augmented is at the stack top. * * thr: thread containing the error value * thr_callstack: thread which should be used for generating callstack etc. * c_filename: C __FILE__ related to the error * c_line: C __LINE__ related to the error * noblame_fileline: if true, don't fileName/line as error source, otherwise use traceback * (needed because user code filename/line are reported but internal ones * are not) * * XXX: rename noblame_fileline to flags field; combine it to some existing * field (there are only a few call sites so this may not be worth it).
label: code-design
33662. throw_flag
33663. * Else, must be one of: * - ExpressionStatement, possibly a directive (String) * - LabelledStatement (Identifier followed by ':') * * Expressions beginning with 'function' keyword are covered by a case * above (such expressions are not allowed in standard E5 anyway). * Also expressions starting with '{' are interpreted as block * statements. See E5 Section 12.4. * * Directive detection is tricky; see E5 Section 14.1 on directive * prologue. A directive is an expression statement with a single * string literal and an explicit or automatic semicolon. Escape * characters are significant and no parens etc are allowed: * * 'use strict'; // valid 'use strict' directive * 'use\u0020strict'; // valid directive, not a 'use strict' directive * ('use strict'); // not a valid directive * * The expression is determined to consist of a single string literal * based on duk__expr_nud() and duk__expr_led() call counts. The string literal * of a 'use strict' directive is determined to lack any escapes based * num_escapes count from the lexer. Note that other directives may be * allowed to contain escapes, so a directive with escapes does not * terminate a directive prologue. * * We rely on the fact that the expression parser will not emit any * code for a single token expression. However, it will generate an * intermediate value which we will then successfully ignore. * * A similar approach is used for labels.
33664. The act->prev_caller should only be set if the entry for 'caller' * exists (as it is only set in that case, and the property is not * configurable), but handle all the cases anyway.
33665. break/continue without label
33666. **comment:** XXX: the best typing needs to be validated by perf measurement: * e.g. using a small type which is the cast to a larger duk_idx_t * may be slower than declaring the variable as a duk_idx_t in the * first place.
label: code-design
33667. **comment:** XXX: conversion errors should not propagate outwards. * Perhaps values need to be coerced individually?
label: code-design
33668. XXX: here we need to know if 'left' is left-hand-side compatible. * That information is no longer available from current expr parsing * state; it would need to be carried into the 'left' ivalue or by * some other means.
33669. non-global regexp: lastIndex never updated on match
33670. Note: undefined from Section 11.8.5 always results in false * return (see e.g. Section 11.8.3) - hence special treatment here.
33671. If there's no catch block, rc_varname will be 0 and duk__patch_trycatch() * will replace the LDCONST with a NOP. For any actual constant (including * constant 0) the DUK__CONST_MARKER flag will be set in rc_varname.
33672. exposed because lexer needs these too
33673. empty match (may happen with empty separator) -> bump and continue
33674. As with all inspection code, we rely on the debug client providing * a valid, non-stale pointer: there's no portable way to safely * validate the pointer here.
33675. Set up curr_pc for opcode dispatch.
33676. [... pattern flags escaped_source]
33677. **comment:** The 'magic' field allows an opaque 16-bit field to be accessed by the * Duktape/C function. This allows, for instance, the same native function * to be used for a set of very similar functions, with the 'magic' field * providing the necessary non-argument flags / values to guide the behavior * of the native function. The value is signed on purpose: it is easier to * convert a signed value to unsigned (simply AND with 0xffff) than vice * versa. * * Note: cannot place nargs/magic into the heapdr flags, because * duk_hobject takes almost all flags already (and needs the spare).
label: code-design

33784. * ISO 8601 subset parser.
33785. Internal keys are prefixed with 0xFF in the stringtable * (which makes them invalid UTF-8 on purpose).
33786. without explicit non-BMP support, assume non-BMP characters * are always accepted as identifier characters.
33787. [res]
33788. dash is already 0
33789. Object flag. There are currently 26 flag bits available. Make sure * this stays in sync with debugger object inspection code.
33790. This may only happen if built-ins are being "torn down". * This behavior is out of specification scope.
33791. Not possible because array object 'length' is present * from its creation and cannot be deleted, and is thus * caught as an existing property above.
33792. Note: strictness is not inherited from the current Duktape/C * context. Otherwise it would not be possible to compile * non-strict code inside a Duktape/C activation (which is * always strict now). See tests/api/test-eval-strictness.c * for discussion.
33793. A -> flags * B -> base register for call (base -> func, base+1 -> this, base+2 -> arg1 ... base+2+N-1 -> argN) * (for DUK_OP_CALLI, 'b' is indirect) * C -> nargs
33794. * Wrapper for jmp_buf. * * This is used because jmp_buf is an array type for backward compatibility. * Wrapping jmp_buf in a struct makes pointer references, sizeof, etc, * behave more intuitively. * * http://en.wikipedia.org/wiki/Setjmp.h#Member_types
33795. * This is a bit tricky to implement portably. The result depends * on the timestamp (specifically, DST depends on the timestamp). * If e.g. UNIX APIs are used, they'll have portability issues with * very small and very large years. * * Current approach: * * - Stay within portable UNIX limits by using equivalent year mapping. * Avoid year 1970 and 2038 as some conversions start to fail, at * least on some platforms. Avoiding 1970 means that there are * currently DST discrepancies for 1970. * * - Create a UTC and local time breakdowns from 't'. Then create * a time_t using gmtime() and localtime() and compute the time * difference between the two. * * Equivalent year mapping (E5 Section 15.9.1.8): * * If the host environment provides functionality for determining * daylight saving time, the implementation of ECMAScript is free * to map the year in question to an equivalent year (same * leap-year-ness and same starting week day for the year) for which * the host environment provides daylight saving time information. * The only restriction is that all equivalent years should produce * the same result. * * This approach is quite reasonable but not entirely correct, e.g. * the specification also states (E5 Section 15.9.1.8): * * The implementation of ECMAScript should not try to determine * whether the exact time was subject to daylight saving time, but * just whether daylight saving time would have been in effect if * the _current daylight saving time algorithm_ had been used at the * time. This avoids complications such as taking into account the * years that the locale observed daylight saving time year round. * * Since we rely on the platform APIs for conversions between local * time and UTC, we can't guarantee the above. Rather, if the platform * has historical DST rules they will be applied. This seems to be the * general preferred direction in Ecmascript standardization (or at least * implementations) anyway, and even the equivalent year mapping should * be disabled if the platform is known to handle DST properly for the * full Ecmascript range. * * The following has useful discussion and links: * * https://bugzilla.mozilla.org/show_bug.cgi?id=351066

33910. Stage 1: find highest preventing non-configurable entry (if any). * When forcing, ignore non-configurability.

33911. **comment:** XXX: keep property attributes or tweak them here? * Properties will now be non-configurable even when they're * normally configurable for the global object.
label: code-design

33912. address

33913. * Property already exists. Steps 5-6 detect whether any changes need * to be made.

33914. may be NULL

33915. * Parse Ecmascript source InputElementDiv or InputElementRegExp * (E5 Section 7), skipping whitespace, comments, and line terminators. * * Possible results are: * (1) a token * (2) a line terminator (skipped) * (3) a comment (skipped) * (4) EOF * * White space is automatically skipped from the current position (but * not after the input element). If input has already ended, returns * DUK_TOK_EOF indefinitely. If a parse error occurs, uses an DUK_ERROR() * macro call (and hence a longjmp through current heap longjmp context). * Comments and line terminator tokens are automatically skipped. * * The input element being matched is determined by regexp_mode; if set, * parses a InputElementRegExp, otherwise a InputElementDiv. The * difference between these are handling of productions starting with a * forward slash. * * If strict_mode is set, recognizes additional future reserved words * specific to strict mode, and refuses to parse octal literals. * * The matching strategy below is to (currently) use a six character * lookup window to quickly determine which production is the -longest- * matching one, and then parse that. The top-level if-else clauses * match the first character, and the code blocks for each clause * handle -all- alternatives for that first character. Ecmascript * specification uses the "longest match wins" semantics, so the order * of the if-clauses matters. * * Misc notes: * * * Ecmascript numeric literals do not accept a sign character. * Consequently e.g. "-1.0" is parsed as two tokens: a negative * sign and a positive numeric literal. The compiler performs * the negation during compilation, so this has no adverse impact. * * * There is no token for "undefined": it is just a value available * from the global object (or simply established by doing a reference * to an undefined value). * * * Some contexts want Identifier tokens, which are IdentifierNames * excluding reserved words, while some contexts want IdentifierNames * directly. In the latter case e.g. "while" is interpreted as an * identifier name, not a DUK_TOK WHILE token. The solution here is * to provide both token types: DUK_TOK WHILE goes to 't' while * DUK_TOK_IDENTIFIER goes to 't_nores', and 'slot1' always contains * the identifier / keyword name. * * * Directive prologue needs to identify string literals such as * "use strict" and 'use strict', which are sensitive to line * continuations and escape sequences. For instance, "use\0020strict" * is a valid directive but is distinct from "use strict". The solution * here is to decode escapes while tokenizing, but to keep track of the * number of escapes. Directive detection can then check that the * number of escapes is zero. * * * Multi-line comments with one or more internal LineTerminator are * treated like a line terminator to comply with automatic semicolon * insertion.

33916. IEEE double is approximately 16 decimal digits; print a couple extra

33917. * Resizing and hash behavior

33918. String sanitizer which escapes ASCII control characters and a few other * ASCII characters, passes Unicode as is, and replaces invalid UTF-8 with * question marks. No errors are thrown for any input string, except in out * of memory situations.

33919. **comment:** Try to optimize X <op>= Y for reg-bound * variables. Detect side-effect free RHS * narrowly by seeing whether it emits code. * If not, rewind the code emitter and overwrite * the unnecessary temp reg load.

33948. object is a compiled function (duk_hcompiledfunction)
33949. Push a new closure on the stack. ** Note: if fun_temp has NEWENV, i.e. a new lexical and variable declaration * is created when the function is called, only outer_lex_env matters * (outer_var_env is ignored and may or may not be same as outer_lex_env).
33950. Need a short reg/const, does not have to be a mutable temp.
33951. delete Duktape.modLoaded[resolved_id]
33952. keep current valstack_top
33953. Disabled until fixed, see above.
33954. 'message'
33955. Just transfer the refcount from act->prev_caller to tv_caller, * so no need for a refcount update. This is the expected case.
33956. Suggested step-by-step method from documentation of RtTimeToSecondsSince1970: * [http://msdn.microsoft.com/en-us/library/windows/desktop/ms724928\(v=vs.85\).aspx](http://msdn.microsoft.com/en-us/library/windows/desktop/ms724928(v=vs.85).aspx)
33957. * Migrate array to start of entries if requested. ** Note: from an enumeration perspective the order of entry keys matters. * Array keys should appear wherever they appeared before the array abandon * operation.
33958. 0x70...0x7f
33959. Maximum iteration count for computing UTC-to-local time offset when * creating an Ecmascript time value from local parts.
33960. **comment:** XXX: depend on available temps?
 label: code-design
33961. default case
33962. %u; only 16 bits are guaranteed
33963. MultiplicativeExpression
33964. Trim white space (= allow leading and trailing whitespace)
33965. * Call user provided module search function and build the wrapped * module source code (if necessary). The module search function * can be used to implement pure Ecmascript, pure C, and mixed * Ecmascript/C modules. ** The module search function can operate on the exports table directly * (e.g. DLL code can register values to it). It can also return a * string which is interpreted as module source code (if a non-string * is returned the module is assumed to be a pure C one). If a module * cannot be found, an error must be thrown by the user callback. ** Because Duktape.modLoaded[] already contains the module being * loaded, circular references for C modules should also work * (although expected to be quite rare).
33966. One particular problem case is where an object has been * queued for finalization but the finalizer hasn't yet been * executed. ** Corner case: we're running in a finalizer for object X, and * user code calls duk_push_heapptr() for X itself. In this * case X will be in finalize_list, and we can detect the case * by seeing that X's FINALIZED flag is set (which is done before * the finalizer starts executing).
33967. does not modify tv_x
33968. 26: setSeconds

34143. **comment:** XXX: this duplicates functionality in duk_regex.c where a similar loop is * required anyway. We could use that BUT we need to update the regexp compiler * 'nranges' too. Work this out a bit more cleanly to save space.
label: code-design
34144. helper to insert a (non-string) heap object into heap allocated list
34145. * Internal API calls which have (stack and other) semantics similar * to the public API.
34146. retval is directly usable
34147. **comment:** * Error throwing helpers ** The goal is to provide verbose and configurable error messages. Call * sites should be clean in source code and compile to a small footprint. * Small footprint is also useful for performance because small cold paths * reduce code cache pressure. Adding macros here only makes sense if there * are enough call sites to get concrete benefits.
label: code-design
34148. digit count
34149. * Hobject property set/get functionality. ** This is very central functionality for size, performance, and compliance. * It is also rather intricate; see hobject-algorithms.rst for discussion on * the algorithms and memory-management.rst for discussion on refcounts and * side effect issues. ** Notes: ** - It might be tempting to assert "refcount nonzero" for objects * being operated on, but that's not always correct: objects with * a zero refcount may be operated on by the refcount implementation * (finalization) for instance. Hence, no refcount assertions are made. ** - Many operations (memory allocation, identifier operations, etc) * may cause arbitrary side effects (e.g. through GC and finalization). * These side effects may invalidate duk_tval pointers which point to * areas subject to reallocation (like value stack). Heap objects * themselves have stable pointers. Holding heap object pointers or * duk_tval copies is not problematic with respect to side effects; * care must be taken when holding and using argument duk_tval pointers. ** - If a finalizer is executed, it may operate on the same object * we're currently dealing with. For instance, the finalizer might * delete a certain property which has already been looked up and * confirmed to exist. Ideally finalizers would be disabled if GC * happens during property access. At the moment property table realloc * disables finalizers, and all DECREFs may cause arbitrary changes so * handle DECREF carefully. ** - The order of operations for a DECREF matters. When DECREF is executed, * the entire object graph must be consistent; note that a refzero may * lead to a mark-and-sweep through a refcount finalizer.
34150. **comment:** * Compact the closure, in most cases no properties will be added later. * Also, without this the closures end up having unused property slots * (e.g. in Duktape 0.9.0, 8 slots would be allocated and only 7 used). * A better future solution would be to allocate the closure directly * to correct size (and setup the properties directly without going * through the API).
label: code-design
34151. 2/3 -> 1/8 = 12.5% min growth
34152. * Reference count updates ** Note: careful manipulation of refcounts. The top is * not updated yet, so all the activations are reachable * for mark-and-sweep (which may be triggered by decref). * However, the pointers are NULL so this is not an issue.

34209. Use a new environment and there's an 'arguments' object. * We need to initialize it right now.
34210. The timevalue must be in valid Ecmascript range, but since a local * time offset can be applied, we need to allow a +/- 24h leeway to * the value. In other words, although the UTC time is within the * Ecmascript range, the local part values can be just outside of it.
34211. Note: can be safely scanned as bytes (undecoded)
34212. =====
34213. No activation matches, use undefined for both .fileName and * .lineNumber (matches what we do with a _Tracedata based * no-match lookup).
34214. also goes into flags
34215. UnaryExpression
34216. **comment:** XXX: return something more useful, so that caller can throw?
 label: code-design
34217. Tailcalls are handled by back-patching the TAILCALL flag to the * already emitted instruction later (in return statement parser). * Since A and C have a special meaning here, they cannot be "shuffled".
34218. all virtual properties are non-configurable and non-writable
34219. [obj trap_result res_arr]
34220. **comment:** * The string conversion here incorporates all the necessary Ecmascript * semantics without attempting to be generic. nc_ctx->digits contains * nc_ctx->count digits (>= 1), with the topmost digit's 'position' * indicated by nc_ctx->k as follows: * * digits="123" count=3 k=0 --> 0.123 * digits="123" count=3 k=1 --> 1.23 * digits="123" count=3 k=5 --> 12300 * digits="123" count=3 k=-1 --> 0.0123 * * Note that the identifier names used for format selection are different * in Burger-Dybvig paper and Ecmascript specification (quite confusingly * so, because e.g. 'k' has a totally different meaning in each). See * documentation for discussion. * * Ecmascript doesn't specify any specific behavior for format selection * (e.g. when to use exponent notation) for non-base-10 numbers. * * The bigint space in the context is reused for string output, as there * is more than enough space for that (>1kB at the moment), and we avoid * allocating even more stack.
 label: code-design
34221. depth check is done when printing an actual type
34222. Preinc/predec for object properties.
34223. * duk_re_range_callback for generating character class ranges. * * When ignoreCase is false, the range is simply emitted as is. * We don't, for instance, eliminate duplicates or overlapping * ranges in a character class. * * When ignoreCase is true, the range needs to be normalized through * canonicalization. Unfortunately a canonicalized version of a * continuous range is not necessarily continuous (e.g. [x-{}] is * continuous but [X-{}] is not). The current algorithm creates the * canonicalized range(s) space efficiently at the cost of compile * time execution time (see doc/regexp.rst for discussion). * * Note that the ctx->nranges is a context-wide temporary value * (this is OK because there cannot be multiple character classes * being parsed simultaneously).
34224. init function state: init valstack allocations
34225. **comment:** Currently about 7*152 = 1064 bytes. The space for these * duk_bignums is used also as a temporary buffer for generating * the final string. This is a bit awkward; a union would be * more correct.
 label: code-design
34226. Check statement type based on the first token type. * * Note: expression parsing helpers expect 'curr_tok' to * contain the first token of the expression upon entry.
34227. **comment:** * The 'in' operator requires an object as its right hand side, * throwing a TypeError unconditionally if this is not the case. * * However, lightfuncs need to behave like fully fledged objects * here to be maximally transparent, so we need to handle them * here.
 label: code-design
34228. * Number-to-string conversion. The semantics of these is very tightly * bound with the Ecmascript semantics required for call sites.
34229. **comment:** XXX: inject test
 label: code-design
34230. **comment:** SCANBUILD: with suitable dmin/dmax limits 'd' is unused
 label: code-design
34231. 0xff => 255 - 256 = -1; 0x80 => 128 - 256 = -128
34232. DUK_USE_PARANOI_ERROR
34233. Does not assume that jump_pc contains a DUK_OP_JUMP previously; this is intentional * to allow e.g. an INVALID opcode be overwritten with a JUMP (label management uses this).
34234. A 32-bit unsigned integer formats to at most 32 digits (the * worst case happens with radix == 2). Output the digits backwards, * and use a memmove() to get them in the right place.
34235. Without ROM objects "needs refcount update" == is heap allocated.
34236. **comment:** Note: 'act' is dangerous here because it may get invalidated at many * points, so we re-lookup it multiple times.
 label: code-design
34237. **comment:** XXX: Add a flag to reject an attempt to re-attach? Otherwise * the detached callback may immediately reattach.
 label: code-design
34238. side effects -> don't use tv_x, tv_y after
34239. [... enum]
34240. if gap is empty, behave as if not given at all
34241. When JX/JC not in use, the type mask above will avoid this case if needed.
34242. DUK_TOK_LT
34243. no value
34244. * HASVAR: check identifier binding from a given environment record * without traversing its parents. * * This primitive is not exposed to user code as such, but is used * internally for e.g. declaration binding instantiation. * * See E5 Sections: * 10.2.1.1 HasBinding(N) * 10.2.1.2 HasBinding(N) * * Note: strictness has no bearing on this check. Hence we don't take * a 'strict' parameter.
34245. hash probe sequence
34246. * Make the C call
34247. DUK_USE_NONSTD_FUNC_STMT
34248. has access to 'this' binding
34249. **comment:** Create a temporary enumerator to get the (non-duplicated) key list; * the enumerator state is initialized without being needed, but that * has little impact.
 label: code-design
34250. **comment:** XXX: optimize for string inputs: no need to coerce to a buffer * which makes a copy of the input.
 label: code-design

34251. initial size guess
34252. Buffer writes are often integers.
34253. env[funcname] = closure
34254. Safe to call multiple times.
34255. Default variants. Selection depends on speed/size preference. * Concretely: with gcc 4.8.1 -Os x64 the difference in final binary * is about +1kB for _FAST variants.
34256. formatted result limited
34257. [] -> [res]
34258. may be NaN
34259. 'undefined', artifact of lookup
34260. assume array part is comprehensive (contains all array indexed elements * or none of them); hence no need to check the entries part here.
34261. lJ value1: value
34262. pushes function template
34263. Identifier, i.e. don't allow reserved words
34264. **comment:** Parse an inner function, adding the function template to the current function's * function table. Return a function number to be used by the outer function. * * Avoiding O(depth^2) inner function parsing is handled here. On the first pass, * compile and register the function normally into the 'funcs' array, also recording * a lexer point (offset/line) to the closing brace of the function. On the second * pass, skip the function and return the same 'fnum' as on the first pass by using * a running counter. * * An unfortunate side effect of this is that when parsing the inner function, almost * nothing is known of the outer function, i.e. the inner function's scope. We don't * need that information at the moment, but it would allow some optimizations if it * were used.
label: code-design
34265. [arg toLogString]
34266. out_token->lineterm set by caller
34267. note: any entries above the catchstack top are garbage and not zeroed
34268. Error code also packs a tracedata related flag.
34269. enumerator must have no keys deleted
34270. Stack size increases or stays the same.
34271. known to be number; in fact an integer
34272. avail_bytes += need_bytes
34273. **comment:** XXX: this illustrates that a C catchpoint implemented using duk_safe_call() * is a bit heavy at the moment. The wrapper compiles to ~180 bytes on x64. * Alternatives would be nice.
label: code-design
34274. temp variable to pass constants and flags to shared code
34275. char length of the atom parsed in this loop
34276. -> [... fn x y]
34277. **comment:** ToBoolean() does not require any operations with side effects so * we can do it efficiently. For footprint it would be better to use * duk_js_tobool()and then push+replace to the result slot.
label: code-design
34278. -> [...]
34279. topmost activation idx_retval is considered garbage, no need to init
34280. * Delayed activation environment record initialization (for functions * with NEWENV). * * The non-delayed initialization is handled by duk_handle_call().
34281. ref.value, ref.this.binding invalidated here by getprop call
34282. * Field accessor macros
34283. [... buf]
34284. idx_base and idx_base+1 get completion value and type
34285. integer number in range
34286. **comment:** XXX: duk_xdef_prop_index_wec() would be more appropriate * here but it currently makes some assumptions that might * not hold (e.g. that previous property is not an accessor). * * Using duk_put_prop() works incorrectly with '__proto__' * if the own property with that name has been deleted. This * does not happen normally, but a clever reviver can trigger * that, see complex reviver case in: test-bug-json-parse-__proto__.js.
label: code-design
34287. Force interrupt right away if we're paused or in "checked mode". * Step out is handled by callstack unwind.
34288. check stack before interning (avoid hanging temp)
34289. The extra (+4) is tight.
34290. Send version identification and flush right afterwards. Note that * we must write raw, unframed bytes here.
34291. DUK_TOK_STATIC
34292. No pointer compression because pointer is potentially outside of * Duktape heap.
34293. 'null'
34294. pc2line
34295. always normalized
34296. JUMP L1 omitted
34297. **comment:** writable, not configurable
label: code-design
34298. * Init/assert flags, copying them where appropriate. Some flags * (like NEWENV) are processed separately below.
34299. big endian
34300. entry_top + 3
34301. must match bytecode defines now; build autogenerate?
34302. Although NAMEBINDING is not directly needed for using * function instances, it's needed by bytecode dump/load * so copy it too.
34303. ''
34304. * Automatically generated by genbuiltins.py, do not edit!
34305. * Debug connection read primitives
34306. Note: when parsing a formal list in non-strict context, e.g. * "implements" is parsed as an identifier. When the function is * later detected to be strict, the argument list must be rechecked * against a larger set of reserved words (that of strict mode). * This is handled by duk_parse_func_body(). Here we recognize * whatever tokens are considered reserved in current strictness * (which is not always enough).
34307. **comment:** XXX: optimize with more direct internal access
label: code-design
34308. __proto__ setter returns 'undefined' on success unlike the * setPrototypeOf() call which returns the target object.
34309. 0x00-0x0f
34310. * String comparison (E5 Section 11.8.5, step 4), which * needs to compare codepoint by codepoint. * * However, UTF-8 allows us to use strcmp directly: the shared * prefix will be encoded identically (UTF-8 has unique encoding) * and the first differing character can be compared with a simple * unsigned byte comparison (which strcmp does). * * This will not work properly for non-xutf-8 strings, but this * is not an issue for compliance.
34311. DUK_TOK_BOR_EQ
34312. Argument must be a string, e.g. a buffer is not allowed.
34313. Note: val is a stable duk_tval pointer. The caller makes * a value copy into its stack frame, so 'tv_val' is not subject * to side effects here.
34314. number of formal arguments
34315. register, constant, or value
34316. Note: intentionally allow leading zeroes here, as the * actual parser will check for them.
34317. Impose a maximum buffer length for now. Restricted artificially to * ensure resize computations or adding a heap header length won't * overflow size_t and that a signed duk_int_t can hold a buffer * length. The limit should be synchronized with DUK_HSTRING_MAX_BYTELEN.
34318. h_code: held in bw_code

34319. * Forward declarations.
34320. heap pointer comparison suffices
34321. Note: 'count' is currently not adjusted by rounding (i.e. the * digits are not "chopped off". That shouldn't matter because * the digit position (absolute or relative) is passed on to the * convert-and-push function.
34322. **comment:** The variable environment for magic variable bindings needs to be * given by the caller and recorded in the arguments object. * * See E5 Section 10.6, the creation of setters/getters. * * The variable environment also provides access to the callee, so * an explicit (internal) callee property is not needed.
label: code-design
34323. All components default to 0 except day-of-month which defaults * to 1. However, because our internal day-of-month is zero-based, * it also defaults to zero here.
34324. Backtrack.
34325. **comment:** XXX: code duplication
label: code-design
34326. arg count
34327. **comment:** Switch to caller's setjmp() catcher so that if an error occurs * during error handling, it is always propagated outwards instead * of causing an infinite loop in our own handler.
label: code-design
34328. [... number] -> [... string]
34329. 'data' (and everything in it) is reachable through h_res now
34330. Fast path.
34331. called as a normal function: return new Date().toString()
34332. -----XX
34333. must be computed after realloc
34334. 'join'
34335. Get the value represented by an duk_ispec to a register or constant. * The caller can control the result by indicating whether or not: * * (1) a constant is allowed (sometimes the caller needs the result to * be in a register) * * (2) a temporary register is required (usually when caller requires * the register to be safely mutable; normally either a bound * register or a temporary register are both OK) * * (3) a forced register target needs to be used * * Bytecode may be emitted to generate the necessary value. The return * value is either a register or a constant.
34336. **comment:** XXX: FP_ZERO check can be removed, the else clause handles it * correctly (preserving sign).
label: code-design
34337. **comment:** XXX: the string shouldn't appear twice, but we now loop to the * end anyway; if fixed, add a looping assertion to ensure there * is no duplicate.
label: code-design
34338. re-lookup first char on first loop
34339. [... buf loop (proplist)]
34340. DUK_BUFOBJ_INT16ARRAY
34341. No net refcount changes.
34342. DUK_USE_DATE_FMT_STRFTIME
34343. eat the right paren
34344. **comment:** A straightforward 64-byte lookup would be faster * and cleaner, but this is shorter.
label: code-design
34345. For this to work, DATEMSK must be set, so this is not very * convenient for an embeddable interpreter.
34346. Fixed buffer; data follows struct, with proper alignment guaranteed by * struct size.
34347. **comment:** * Call handling. * * Main functions are: * * - duk_handle_call_unprotected(): unprotected call to Ecmascript or * Duktape/C function * - duk_handle_call_protected(): protected call to Ecmascript or * Duktape/C function * - duk_handle_safe_call(): make a protected C call within current * activation * - duk_handle_ecma_call_setup(): Ecmascript-to-Ecmascript calls * (not always possible), including tail calls and coroutine resume * * See 'execution.rst'. * * Note: setjmp() and local variables have a nasty interaction, * see execution.rst; non-volatile locals modified after setjmp() * call are not guaranteed to keep their value.
label: code-design
34348. -1 if disjunction is complex, char length if simple
34349. noblame_fileline
34350. Backtrack to previous slash or start of buffer.
34351. func limits
34352. This is a rare property helper; it sets the global thrower (E5 Section 13.2.3) * setter/getter into an object property. This is needed by the 'arguments' * object creation code, function instance creation code, and Function.prototype.bind().
34353. **comment:** Workaround for some exotic platforms where NAN is missing * and the expression (0.0 / 0.0) does NOT result in a NaN. * Such platforms use the global 'duk_computed_nan' which must * be initialized at runtime. Use 'volatile' to ensure that * the compiler will actually do the computation and not try * to do constant folding which might result in the original * problem.
label: code-design
34354. A -> target register (A, A+1) for call setup * (for DUK_OP_CSREGI, 'a' is indirect) * B -> register containing target function (not type checked here)
34355. Return the Buffer to allow chaining: b.fill(0x11).fill(0x22, 3, 5).toString()
34356. **comment:** code_idx: not needed
label: requirement
34357. keep func->h_funcs; inner functions are not reparsed to avoid O(depth^2) parsing
34358. load factor min 25%
34359. 1111 0xxx 10xx xxxx 10xx xxxx 10xx xxxx
34360. Note: peek cannot currently trigger a detach * so the dbg_detaching == 0 assert outside the * loop is correct.
34361. Assume interrupt init/counter are properly initialized here.
34362. * Parse a case or default clause.
34363. **comment:** XXX: when this error is caused by a nonexistent * file given to duk_peval_file() or similar, the * error message is not the best possible.
label: code-design
34364. impose a reasonable exponent limit, so that exp * doesn't need to get tracked using a bigint.
34365. marker value; in E5 2^32-1 is not a valid array index (2^32-2 is highest valid)
34366. maxval
34367. valstack space allocated especially for proxy lookup which does a * recursive property lookup
34368. Accept ASCII strings which conform to identifier requirements * as being emitted without key quotes. Since we only accept ASCII * there's no need for actual decoding: 'p' is intentionally signed * so that bytes >= 0x80 extend to negative values and are rejected * as invalid identifier codepoints.
34369. Careful overflow handling. When multiplying by 10: * - 0x19999998 x 10 = 0xfffffff0: no overflow, and adding * 0..9 is safe. * - 0x19999999 x 10 = 0xffffffff: no overflow, adding * 0..5 is safe, 6...9 overflows. * - 0x1999999a x 10 = 0x10000004: always overflow.
34370. The Str(key, holder) operation. * * Stack policy: [... key] -> [...]
34371. * Bitstream encoder
34372. -> [sep ToObject(this) len str sep]
34373. Decrement PC if that was requested, this requires a PC sync.
34374. Array properties have exotic behavior but they are concrete, * so no special handling here. * * Arguments exotic behavior (E5 Section 10.6, [[GetOwnProperty]]) * is only relevant as a post-check implemented below; hence no * check here.
34375. XXX: request a "last statement is terminal" from duk_parse_stmt() and duk_parse_stmts(); * we could avoid the last RETURN if we could ensure there is no way to get here * (directly or via a jump)

34520. string objects must not created without internal value
34521. eat backslash on entry
34522. * Cached module check. * * If module has been loaded or its loading has already begun without * finishing, return the same cached value ('exports'). The value is * registered when module load starts so that circular references can * be supported to some extent.
34523. * Setup a preliminary activation and figure out nargs/nregs. * * Don't touch valstack_bottom or valstack_top yet so that Duktape API * calls work normally.
34524. **comment:** XXX: Rework to use an always-inline function?
label: code-design
34525. **comment:** * Common heap header * * All heap objects share the same flags and refcount fields. Objects other * than strings also need to have a single or double linked list pointers * for insertion into the "heap allocated" list. Strings are held in the * heap-wide string table so they don't need link pointers. * * Technically, 'h_refcount' must be wide enough to guarantee that it cannot * wrap (otherwise objects might be freed incorrectly after wrapping). This * means essentially that the refcount field must be as wide as data pointers. * On 64-bit platforms this means that the refcount needs to be 64 bits even * if an 'int' is 32 bits. This is a bit unfortunate, and compromising on * this might be reasonable in the future. * * Heap header size on 32-bit platforms: 8 bytes without reference counting, * 16 bytes with reference counting.
label: code-design
34526. We're a varargs function because we need to detect whether * initialValue was given or not.
34527. cannot be strict (never mapped variables)
34528. Avoid recursive re-enter; enter when we're attached or * detaching (to finish off the pending detach).
34529. DUK_DEBUGGER_H_INCLUDED
34530. Maximum length of CommonJS module identifier to resolve. Length includes * both current module ID, requested (possibly relative) module ID, and a * slash in between.
34531. **comment:** * Property count check. This is the only point where we ensure that * we don't get more (allocated) property space that we can handle. * There aren't hard limits as such, but some algorithms fail (e.g. * finding next higher prime, selecting hash part size) if we get too * close to the 4G property limit. * * Since this works based on allocation size (not actually used size), * the limit is a bit approximate but good enough in practice.
label: code-design
34532. This loop intentionally does not ensure characters are valid * ([0-9a-fA-F]) because the hex decode call below will do that.
34533. 0 if no used entries
34534. * Basic double / byte union memory layout.
34535. copy values (no overlap even if to_ctx == from_ctx; that's not * allowed now anyway)
34536. Use match charlen instead of bytelen, just in case the input and * match codepoint encodings would have different lengths.
34537. **comment:** Count actually used array part entries and array minimum size. * NOTE: 'out_min_size' can be computed much faster by starting from the * end and breaking out early when finding first used entry, but this is * not needed now.
label: code-design

34677. * Object handling: property access and other support functions.
34678. allocated from valstack (fixed buffer)
34679. Unlike most built-ins, the internal [[PrimitiveValue]] of a Date * is mutable.
34680. DUK_TVAL_H_INCLUDED
34681. * Retry with several GC attempts. Initial attempts are made without * emergency mode; later attempts use emergency mode which minimizes * memory allocations forcibly.
34682. last component

34683. lexing (tokenization) state (contains two valstack slot indices)
34684. * Update an existing property of the base object.
34685. update length (curr points to length, and we assume it's still valid)
34686. in-place setup
34687. Currently all built-in native functions are strict. * duk_push_c_function() now sets strict flag, so * assert for it.
34688. The lo/hi indices may be crossed and hi < 0 is possible at entry.
34689. * Init compilation context
34690. add E
34691. '\xffThread'
34692. Must use memmove() because copy area may overlap (source and target * buffer may be the same, or from different slices).
34693. * Special name handling
34694. If function creation fails due to out-of-memory, the data buffer * pointer may be NULL in some cases. That's actually possible for * GC code, but shouldn't be possible here because the incomplete * function will be unwound from the value stack and never instantiated.
34695. A -> register of target object * B -> first register of key/value pair list * C -> number of key/value pairs
34696. **comment:** XXX: this is a major target for size optimization
 label: code-design
34697. 'constructor' property for all built-in objects (which have it) has attributes: * [[Writable]] = true, * [[Enumerable]] = false, * [[Configurable]] = true
34698. XXX: check num_args
34699. pop 'name'
34700. Here 'p' always points to the start of a term. * * We can also unconditionally reset q_last here: if this is * the last (non-empty) term q_last will have the right value * on loop exit.
34701. * All done, switch properties ('p') allocation to new one.
34702. * Duktape.Buffer, Node.js Buffer, and Khronos/ES6 TypedArray built-ins
34703. decode '%xx' to '%xx' if decoded char in reserved set
34704. **comment:** XXX: Finalizer lookup should traverse the prototype chain (to allow * inherited finalizers) but should not invoke accessors or proxy object * behavior.
 At the moment this lookup will invoke proxy behavior, so * caller must ensure that this function is not called if the target is * a Proxy.
 label: code-design
34705. Maximum number of breakpoints. Only breakpoints that are set are * consulted so increasing this has no performance impact.
34706. any other printable -> as is
34707. Called by duk_hstring.h macros
34708. step type: none, step into, step over, step out
34709. **comment:** XXX: faster implementation
 label: code-design
34710. cleared before entering catch part
34711. Clamp an input byte length (already assumed to be within the nominal * duk_hbufferobject 'length') to the current dynamic buffer limits to * yield a byte length limit that's safe for memory accesses. This value * can be invalidated by any side effect because it may trigger a user * callback that resizes the underlying buffer.
34712. **comment:** XXX: ignored now
 label: code-design
34713. **comment:** * Tagged type definition (duk_tval) and accessor macros. * * Access all fields through the accessor macros, as the representation * is quite tricky. * * There are two packed type alternatives: an 8-byte representation * based on an IEEE double (preferred for compactness), and a 12-byte * representation (portability). The latter is needed also in e.g. * 64-bit environments (it usually pads to 16 bytes per value). * * Selecting the tagged type format involves many trade-offs (memory * use, size and performance of generated code, portability, etc), * see doc/types.rst for a detailed discussion (especially of how the * IEEE double format is used to pack tagged values). * * NB: because macro arguments are often expressions, macros should * avoid evaluating their argument more than once.
 label: code-design
34714. * Automatically generated by extract_caseconv.py, do not edit!
34715. * Support functions for duk_heap.
34716. DUK_HCOMPILEDFUNCTION_H_INCLUDED
34717. write_to_array_part:
34718. **comment:** * Parse variant 1 or 2. The first part expression (which differs * in the variants) has already been parsed and its code emitted. * * reg_temps + 0: unused * reg_temps + 1: unused
 label: code-design

34917. approximation, close enough

34918. marker for detecting internal "double faults", see duk_error_throw.c

34919. three flags

34920. No difference between raw/ensure because the buffer shrinks.

34921. * Determining which datetime components to overwrite based on * stack arguments is a bit complicated, but important to factor * out from setters themselves for compactness. * * If DUK_DATE_FLAG_TIMESETTER, maxnargs indicates setter type: * * 1 -> millisecond * 2 -> second, [millisecond] * 3 -> minute, [second], [millisecond] * 4 -> hour, [minute], [second], [millisecond] * * Else: * * 1 -> date * 2 -> month, [date] * 3 -> year, [month], [date] * * By comparing nargs and maxnargs (and flags) we know which * components to override. We rely on part index ordering.

34922. False if the object is NULL or the prototype 'p' is NULL. * In particular, false if both are NULL (don't compare equal).

34923. Start filling in the activation

34924. SCANBUILD: complains about use of uninitialized values. * The complaint is correct, but operating in undefined * values here is intentional in some cases and the caller * ignores the results.

34925. prevent duk_expr_led() by using a binding power less than anything valid

34926. borrowed reference; although 'tv1' comes from a register, * its value was loaded using LDCONST so the constant will * also exist and be reachable.

34927. [... proplist enum_obj key val]

34928. * Unix-like Date providers * * Generally useful Unix / POSIX / ANSI Date providers.

34929. Push the current 'this' binding; throw TypeError if binding is not object * coercible (CheckObjectCoercible).

34930. All strings beginning with 0xff are treated as "internal", * even strings interned by the user. This allows user code to * create internal properties too, and makes behavior consistent * in case user code happens to use a string also used by Duktape * (such as string has already been interned and has the 'internal' * flag set).

34931. 1111 110x 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx [31 bits]

34932. shrink failure is not fatal

34933. !(l < p)

34934. valstack index of loop detection object

34935. limit is quite low: one array entry is 8 bytes, one normal entry is 4+1+8+4 = 17 bytes (with hash entry)

34936. yes -> move back to heap allocated

34937. strict flag for putvar comes from our caller (currently: fixed)

34938. catchstack limits

34939. * Manually optimized number-to-double conversion

34940. [ToObject(this) ToUint32(length) lowerValue upperValue]

34941. if a tail call: * - an Ecmascript activation must be on top of the callstack * - there cannot be any active catchstack entries

34942. [... enum_target res trap_result val true]

34943. Helper for component getter calls: check 'this' binding, get the * internal time value, split it into parts (either as UTC time or * local time), push a specified component as a return value to the * value stack and return 1 (caller can then tail call us).

34944. important for callers

34945. fail

34946. [sep ToObject(this) len]

34947. DUK_TOK_PERIOD

34948. Enumeration keys are checked against the enumeration target (to see * that they still exist). In the proxy enumeration case _Target will * be the proxy, and checking key existence against the proxy is not * required (or sensible, as the keys may be fully virtual).

34949. Easiest way to implement the search required by the specification * is to do a RegExp test() with lastIndex forced to zero. To avoid * side effects on the argument, "clone" the RegExp if a RegExp was * given as input. * * The global flag of the RegExp should be ignored; setting lastIndex * to zero (which happens when "cloning" the RegExp) should have an * equivalent effect.

34950. idx_reviver

34951. **comment:** Require a lot of stack to force a value stack grow/shrink. * Recursive mark-and-sweep is prevented by allocation macros * so this won't trigger another mark-and-sweep.

 label: code-design
34986. always in entry part, no need to look up parents etc
34987. * Raw intern and lookup
34988. Copy the property table verbatim; this handles attributes etc. * For ROM objects it's not necessary (or possible) to update * refcounts so leave them as is.
34989. CONDITIONAL EXPRESSION
34990. swap elements; deal with non-existent elements correctly
34991. [... closure/error]
34992. * Create a new property in the original object. * * Exotic properties need to be reconsidered here from a write * perspective (not just property attributes perspective). * However, the property does not exist in the object already, * so this limits the kind of exotic properties that apply.
34993. Initial value for highest_idx is -1 coerced to unsigned. This * is a bit odd, but (highest_idx + 1) will then wrap to 0 below * for out_min_size as intended.
34994. ignore
34995. **comment:** XXX: combine all the integer conversions: they share everything * but the helper function for coercion.
 label: code-design
34996. vararg function, thisArg needs special handling
34997. Assert for value stack initialization policy.
34998. **comment:** * Shallow fast path checks for accessing array elements with numeric * indices. The goal is to try to avoid coercing an array index to an * (interned) string for the most common lookups, in particular, for * standard Array objects. * * Interning is avoided but only for a very narrow set of cases: * - Object has array part, index is within array allocation, and * value is not unused (= key exists) * - Object has no interfering exotic behavior (e.g. arguments or * string object exotic behaviors interfere, array exotic * behavior does not). * * Current shortcoming: if key does not exist (even if it is within * the array allocation range) a slow path lookup with interning is * always required. This can probably be fixed so that there is a * quick fast path for non-existent elements as well, at least for * standard Array objects.
 label: code-design

35113. DUK_ERROR_H_INCLUDED

35114. Number/string-or-buffer -> coerce string to number (e.g. "'1.5' == 1.5" -> true).

35115. XXX: There are several limitations in the current implementation for * strings with $\geq 0x80000000UL$ characters. In some cases one would need * to be able to represent the range [-0xffffffff,0xffffffff] and so on. * Generally character and byte length are assumed to fit into signed 32 * bits ($< 0x80000000UL$). Places with issues are not marked explicitly * below in all cases, look for signed type usage (duk_int_t etc) for * offsets/lengths.

35116. * Reset function state and perform register allocation, which creates * 'varmap' for second pass. Function prologue for variable declarations, * binding value initializations etc is emitted as a by-product. * * Strict mode restrictions for duplicate and invalid argument * names are checked here now that we know whether the function * is actually strict. See: test-dev-strict-mode-boundary.js. * * Inner functions are compiled during pass 1 and are not reset.

35117. if 1, doing a fixed format output (not free format)

35118. We want to do a straight memory copy if possible: this is * an important operation because .set() is the TypedArray * way to copy chunks of memory. However, because set() * conceptually works in terms of elements, not all views are * compatible with direct byte copying. * * If we do manage a direct copy, the "overlap issue" handled * below can just be solved using memmove() because the source * and destination element sizes are necessarily equal.

35119. borrowed; NULL if no step state (NULLed in unwind)

35120. new buffer with string contents

35121. Allow very small lenience because some compilers won't parse * exact IEEE double constants (happened in matrix testing with * Linux gcc-4.8 -m32 at least).

35122. We could fit built-in index into magic but that'd make the magic * number dependent on built-in numbering (genbuiltins.py doesn't * handle that yet). So map both class and prototype from the * element type.

35123. * Allocate a new thread. * * Leaves the built-ins array uninitialized. The caller must either * initialize a new global context or share existing built-ins from * another thread.

35124. no regexp instance should exist without a non-configurable bytecode property

35125. original input stack before nargs/nregs handling must be * intact for 'arguments' object

35126. replaces top of stack with new value if necessary

35127. 33: setUTCDate

35128. Notes: * - only numbered indices are relevant, so arr_idx fast reject is good * (this is valid unless there are more than $4^{**}32-1$ arguments). * - since variable lookup has no side effects, this can be skipped if * DUK_GETDESC_FLAG_PUSH_VALUE is not set.

35129. Automatic semicolon insertion is allowed if a token is preceded * by line terminator(s), or terminates a statement list (right curly * or EOF).

35130. eat 'for'

35131. init 'curr_token'

35132. -> [... new_global new_globalenv new_global]

35133. Index clamping is a bit tricky, we must ensure that we'll only iterate * through elements that exist and that the specific requirements from E5.1 * Sections 15.4.4.14 and 15.4.4.15 are fulfilled; especially: * * - indexOf: clamp to [-len,len], negative handling -> [0,len], * if clamped result is len, for-loop bails out immediately * * - lastIndexOf: clamp to [-len-1, len-1], negative handling -> [-1, len-1], * if clamped result is -1, for-loop bails out immediately * * If fromIndex is not given, ToInteger(undefined) = 0, which is correct * for indexOf() but incorrect for lastIndexOf(). Hence special handling, * and why lastIndexOf() needs to be a vararg function.

35134. implicit attributes

35135. allow a constant to be returned

35224. bump refcount to prevent refzero during finalizer processing
35225. * Pointers to function data area for faster access. Function * data is a buffer shared between all closures of the same * "template" function. The data buffer is always fixed (non- * dynamic, hence stable), with a layout as follows: * * constants (duk_tval) * inner functions (duk_hobject *) * bytecode (duk_instr_t) * * Note: bytecode end address can be computed from 'data' buffer * size. It is not strictly necessary functionally, assuming * bytecode never jumps outside its allocated area. However, * it's a safety/robustness feature for avoiding the chance of * executing random data as bytecode due to a compiler error. ** Note: values in the data buffer must be incref'd (they will * be decref'd on release) for every compiledfunction referring * to the 'data' element.
35226. **comment:** * Advance lookup window by N characters, filling in new characters as * necessary. After returning caller is guaranteed a character window of * at least DUK_LEXER_WINDOW_SIZE characters. ** The main function duk_advance_bytes() is called at least once per every * token so it has a major lexer/compiler performance impact. There are two * variants for the main duk_advance_bytes() algorithm: a sliding window * approach which is slightly faster at the cost of larger code footprint, * and a simple copying one. ** Decoding directly from the source string would be another lexing option. * But the lookup window based approach has the advantage of hiding the * source string and its encoding effectively which gives more flexibility * going forward to e.g. support chunked streaming of source from flash. ** Decodes UTF-8/CESU-8 leniently with support for code points from U+0000 to * U+10FFFF, causing an error if the input is unparseable. Leniency means: * * * Unicode code point validation is intentionally not performed, * except to check that the codepoint does not exceed 0x10ffff. ** In particular, surrogate pairs are allowed and not combined, which * allows source files to represent all SourceCharacters with CESU-8. * Broken surrogate pairs are allowed, as Ecmascript does not mandate * their validation. *** Allows non-shortest UTF-8 encodings. ** Leniency here causes few security concerns because all character data is * decoded into Unicode codepoints before lexer processing, and is then * re-encoded into CESU-8. The source can be parsed as strict UTF-8 with * a compiler option. However, Ecmascript source characters include -all- * 16-bit unsigned integer codepoints, so leniency seems to be appropriate. * Note that codepoints above the BMP are not strictly SourceCharacters, * but the lexer still accepts them as such. Before ending up in a string * or an identifier name, codepoints above BMP are converted into surrogate * pairs and then CESU-8 encoded, resulting in 16-bit Unicode data as * expected by Ecmascript. * An alternative approach to dealing with invalid or partial sequences * would be to skip them and replace them with e.g. the Unicode replacement * character U+FFFD. This has limited utility because a replacement character * will most likely cause a parse error, unless it occurs inside a string. * Further, Ecmascript source is typically pure ASCII. ** See: * * <http://en.wikipedia.org/wiki=UTF-8> * <http://en.wikipedia.org/wiki/CESU-8> * <http://tools.ietf.org/html/rfc3629> * http://en.wikipedia.org/wiki/UTF-8#Invalid_byte_sequences ** Future work: * * * Reject other invalid Unicode sequences (see Wikipedia entry for examples) * in strict UTF-8 mode. ** * Size optimize. An attempt to use a 16-byte lookup table for the first * byte resulted in a code increase though. ** * Is checking against maximum 0x10ffff really useful? 4-byte encoding * imposes a certain limit anyway. *** Support chunked streaming of source code. Can be implemented either * by streaming chunks of bytes or chunks of codepoints.
label: code-design
35227. duk_push_this() + CheckObjectCoercible() + duk_to_string()
35228. pointers for scanning
35229. array part size (entirely gc reachable)

label: code-design

35358. [(builtin objects) name func]

35359. We request a tail call, but in some corner cases * call handling can decide that a tail call is * actually not possible. * See: test-bug-tailcall-preventyield-assert.c.

35360. toString() conditions

35361. Write bytecode executor's curr_pc back to topmost activation (if any).

35362. [] -> [val]

35363. **comment:** XXX: Extensibility check for target uses IsExtensible(). If we * implemented the isExtensible trap and didn't reject proxies as * proxy targets, it should be respected here.
label: code-design

35364. **comment:** Technically return value is not needed because INVLHS will * unconditionally throw a ReferenceError. Coercion is necessary * for proper semantics (consider ToNumber() called for an object). * Use DUK_EXTRAOP_UNP with a dummy register to get ToNumber().
label: code-design

35365. decl type

35366. -> [sep TObject(this) len sep str]

35367. Shared lenient buffer length clamping helper. Indices are treated as * element indices (though output values are byte offsets) which only * really matters for TypedArray views as other buffer object have a zero * shift. Negative indices are counted from end of input slice; crossed * indices are clamped to zero length; and final indices are clamped * against input slice. Used for e.g. ArrayBuffer slice().

35368. XXX: perhaps refactor this to allow caller to specify some parameters, or * at least a 'compact' flag which skips any spare or round-up .. useful for * emergency gc.

35369. [... enum_target res handler trap]

35370. XXX: Decrementing and restoring act->curr_pc works now, but if the * debugger message loop gains the ability to adjust the current PC * (e.g. a forced jump) restoring the PC here will break. Another * approach would be to use a state flag for the "decrement 1 from * topmost activation's PC" and take it into account whenever dealing * with PC values.

35371. Create a fresh object environment for the global scope. This is * needed so that the global scope points to the newly created RAM-based * global object.

35372. x <- (1<<y)

35373. * HASPROP: Ecmascript property existence check ("in" operator). ** Interestingly, the 'in' operator does not do any coercion of * the target object.

35374. Any 'res' will do.

35375. If neutered must return 0; length is zeroed during * neutering.

35376. XXX: assert idx_base

35377. **comment:** XXX: refactor into internal helper, duk_clone_hobject()
label: code-design

35378. * Get starting character offset for match, and initialize 'sp' based on it. ** Note: lastIndex is non-configurable so it must be present (we check the * internal class of the object above, so we know it is). User code can set * its value to an arbitrary (garbage) value though; E5 requires that lastIndex * be coerced to a number before using. The code below works even if the * property is missing: the value will then be coerced to zero. ** Note: lastIndex may be outside Uint32 range even after ToInteger() coercion. * For instance, ToInteger(+Infinity) = +Infinity. We track the match offset * as an integer, but pre-check it to be inside the 32-bit range before the loop. * If not, the check in E5 Section 15.10.6.2, step 9.a applies.

35379. avoid side effect issues

35380. * Setup call: target and 'this' binding. Three cases: * * 1. Identifier base (e.g. "foo()") * 2. Property base (e.g. "foo.bar()") * 3. Register base (e.g. "foo()"); i.e. when a return value is a function

35381. SHIFT EXPRESSION

35382. overflow, fall through

35383. restored if ecma-to-ecma setup fails

35384. Match labels starting from latest label because there can be duplicate empty * labels in the label set.
35385. If debugger is paused, garbage collection is disabled by default.
35386. DUK_ERR_REFERENCE_ERROR: no macros needed
35387. XXX: shared helper for duk_push_hobject_or_undefined()
35388. * Strings have no internal references but do have "weak" * references in the string cache. Also note that strings * are not on the heap_allocated list like other heap * elements.
35389. unconditionally
35390. **comment:** XXX: At the moment Duktape accesses internal keys like _Finalizer using a * normal property set/get which would allow a proxy handler to interfere with * such behavior and to get access to internal key strings. This is not a problem * as such because internal key strings can be created in other ways too (e.g. * through buffers). The best fix is to change Duktape internal lookups to * skip proxy behavior. Until that, internal property accesses bypass the * proxy and are applied to the target (as if the handler did not exist). * This has some side effects, see test-bi-proxy-internal-keys.js.
label: code-design
35391. Get local time offset (in seconds) for a certain (UTC) instant 'd'.
35392. **comment:** Can be called multiple times with no harm. Mark the transport * bad (dbg_read_cb == NULL) and clear state except for the detached * callback and the udata field. The detached callback is delayed * to the message loop so that it can be called between messages; * this avoids corner cases related to immediate debugger reattach * inside the detached callback.

35487. -> [... value]

35488. Use temporaries and update lex_ctx only when finished.

35489. mark-and-sweep not running -> must be empty

35490. **comment:** * Normal error * * Normal error is thrown with a longjmp() through the current setjmp() * catchpoint record in the duk_heap. The 'curr_thread' of the duk_heap * identifies the throwing thread. * * Error formatting is usually unnecessary. The error macros provide a * zero argument version (no formatting) and separate macros for small * argument counts. Variadic macros are not used to avoid portability * issues and avoid the need for stash-based workarounds when they're not * available. Vararg calls are avoided for non-formatted error calls * because vararg call sites are larger than normal, and there are a lot * of call sites with no formatting. * * Note that special formatting provided by debug macros is NOT available. * * The _RAW variants allow the caller to specify file and line. This makes * it easier to write checked calls which want to use the call site of the * checked function, not the error macro call inside the checked function.

35541. **comment:** If no explicit message given, put error code into message field * (as a number). This is not fully in keeping with the EcmaScript * error model because messages are supposed to be strings (Error * constructors use ToString() on their argument). However, it's * probably more useful than having a separate 'code' property.
label: code-design
35542. The #ifdef clutter here needs to handle the three cases: * (1) JX+JC, (2) JX only, (3) JC only.
35543. currently running thread
35544. temproots
35545. Tail call check: if last opcode emitted was CALL(I), and * the context allows it, change the CALL(I) to a tail call. * This doesn't guarantee that a tail call will be allowed at * runtime, so the RETURN must still be emitted. (Duktape * 0.10.0 avoided this and simulated a RETURN if a tail call * couldn't be used at runtime; but this didn't work * correctly with a thread yield/resume, see * test-bug-tailcall-thread-yield-resume.js for discussion.) * * In addition to the last opcode being CALL, we also need to * be sure that 'rc_val' is the result register of the CALL(I). * For instance, for the expression 'return 0, (function () { return 1; })', 2' the last opcode emitted is CALL (no * bytecode is emitted for '2') but 'rc_val' indicates * constant '2'. Similarly if '2' is replaced by a register * bound variable, no opcodes are emitted but tail call would * be incorrect. * * This is tricky and easy to get wrong. It would be best to * track enough expression metadata to check that 'rc_val' came * from that last CALL instruction. We don't have that metadata * now, so we check that 'rc_val' is a temporary register result * (not a constant or a register bound variable). There should * be no way currently for 'rc_val' to be a temporary for an * expression following the CALL instruction without emitting * some opcodes following the CALL. This proxy check is used * below. * * See: test-bug-comma-expr-gh131.js. * * The non-standard 'caller' property disables tail calls * because they pose some special cases which haven't been * fixed yet.
35546. * Helper: handle Array object 'length' write which automatically * deletes properties, see E5 Section 15.4.5.1, step 3. This is * quite tricky to get right. * * Used by duk_hobject_putprop().

35739. InternalError

35740. Value types, used by e.g. duk_get_type()

35741. **comment:** Duktape specific error codes (must be 8 bits at most, see duk_error.h)

label: code-design

35742. no value, e.g. invalid index

35743. * Stack manipulation (other than push/pop)

35744. Byteswap an IEEE double in the duk_double_union from host to network * order. For a big endian target this is a no-op.

35745. prefer string

35746. external use

35747. Flags for duk_push_string_file_raw()

35748. Duktape debug protocol version used by this build.

35749. **comment:** DUK_COMPILE_xxx bits 0-2 are reserved for an internal 'nargs' argument * (the nargs value passed is direct stack arguments + 1 to account for an * internal extra argument).

label: code-design

35750. fixed or dynamic, garbage collected byte buffer

35751. * Thread management

35752. * Double NaN manipulation macros related to NaN normalization needed when * using the packed duk_tval representation. NaN normalization is necessary * to keep double values compatible with the duk_tval format. * * When packed duk_tval is used, the NaN space is used to store pointers * and other tagged values in addition to NaNs. Actual NaNs are normalized * to a specific quiet NaN. The macros below are used by the implementation * to check and normalize NaN values when they might be created. The macros * are essentially NOPs when the non-packed duk_tval representation is used. * * A FULL check is exact and checks all bits. A NOTFULL check is used by * the packed duk_tval and works correctly for all NaNs except those that * begin with 0x7ff0. Since the 'normalized NaN' values used with packed * duk_tval begin with 0x7ff8, the partial check is reliable when packed * duk_tval is used. The 0x7ff8 prefix means the normalized NaN will be a * quiet NaN regardless of its remaining lower bits. * * The ME variant below is specifically for ARM byte order, which has the * feature that while doubles have a mixed byte order (32107654), unsigned * long long values has a little endian byte order (76543210). When writing * a logical double value through a ULL pointer, the 32-bit words need to be * swapped; hence the #ifdefs below for ULL writes with DUK_USE_DOUBLE_ME. * This is not full ARM support but suffices for some environments.

35753. either not a NaN

35754. convert time value to local time

35755. not directly applicable, byte order differs from a double

35756. end 'extern "C"' wrapper

35757. * Object operations

35758. set writable (effective if DUK_DEFPROP_HAVE_WRITABLE set)

35759. UnsupportedError

35760. **comment:** Internal API call flags, used for various functions in this file. * Certain flags are used by only certain functions, but since the flags * don't overlap, a single flags value can be passed around to multiple * functions. * * The unused top bits of the flags field are also used to pass values * to helpers (duk_get_part_helper() and duk_set_part_helper()). * * (Must be in-sync with genbuiltins.py)

label: code-design

35761. There are currently no native functions to yield/resume, due to the internal * limitations on coroutine handling. These will be added later.

35762. Concrete macros for NaN handling used by the implementation internals. * Chosen so that they match the duk_tval representation: with a packed * duk_tval, ensure NaNs are properly normalized; with a non-packed duk_tval * these are essentially NOPs.

35763. (internal) no source string on stack

35764. * Function (method) calls

35765. plain

35766. ECMAScript string: CESU-8 / extended UTF-8 encoded

35767. internal flag: don't zero allocated buffer

35768. use strict (outer) context for global, eval, or function code

35769. in non-packed representation we don't care about which NaN is used

35770. * Union for accessing double parts, also serves as packed duk_tval

35771. include date part in string conversion result

35772. internal flag: dynamic buffer

35773. ECMAScript null

35774. enumerate non-enumerable properties in addition to enumerable

35775. **comment:** XXX: replace with RangeError?

label: code-design

35776. * Push operations * * Push functions return the absolute (relative to bottom of frame) * position of the pushed value for convenience. * * Note: duk_dup() is technically a push.

35777. string
35778. * ROM pointer compression
35779. * Union to access IEEE double memory representation, indexes for double * memory representation, and some macros for double manipulation. * * Also used by packed duk_tval. Use a union for bit manipulation to * minimize aliasing issues in practice. The C99 standard does not * guarantee that this should work, but it's a very widely supported * practice for low level manipulation. * * IEEE double format summary: * * seeeeeeee eeeeffff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H * * s sign bit * eee... exponent field * fff... fraction * * See http://en.wikipedia.org/wiki/Double_precision_floating-point_format. * * NaNs are represented as exponent 0x7ff and mantissa != 0. The NaN is a * signaling NaN when the highest bit of the mantissa is zero, and a quiet * NaN when the highest bit is set. * * At least three memory layouts are relevant here: * * A B C D E F G H Big endian (e.g. 68k) DUK_USE_DOUBLE_BE * H G F E D C B A Little endian (e.g. x86) DUK_USE_DOUBLE_LE * D C B A H G F E Mixed/cross endian (e.g. ARM) DUK_USE_DOUBLE_ME * * ARM is a special case: ARM double values are in mixed/cross endian * format while ARM duk_uint64_t values are in standard little endian * format (H G F E D C B A). When a double is read as a duk_uint64_t * from memory, the register will contain the (logical) value * E F G H A B C D. This requires some special handling below. * * Indexes of various types (8-bit, 16-bit, 32-bit) in memory relative to * the logical (big endian) order: * * byte order duk_uint8_t duk_uint16_t duk_uint32_t * BE 01234567 0123 01 * LE 76543210 3210 10 * ME (ARM) 32107654 1032 01 * * Some processors may alter NaN values in a floating point load+store. * For instance, on X86 a FLD + FSTP may convert a signaling NaN to a * quiet one. This is catastrophic when NaN space is used in packed * duk_tval values. See: misc/clang_aliasing.c.

35780. * Helper macros for reading/writing memory representation parts, used * by duk_numconv.c and duk_tval.h.
35781. string conversion: use 'T' instead of '' as a separator
35782. Ecmascript number: double
35783. TypeError
35784. Support array for ROM pointer compression. Only declared when ROM * pointer compression is active.
35785. **comment:** Although extra/top could be an unsigned type here, using a signed type * makes the API more robust to calling code calculation errors or corner * cases (where caller might occasionally come up with negative values). * Negative values are treated as zero, which is better than casting them * to a large unsigned number. (This principle is used elsewhere in the * API too.)
label: code-design
35786. * Misc conversion
35787. Ecmascript object: includes objects, arrays, functions, threads
35788. URIError
35789. all doubles are considered normalized
35790. AUTHORS.rst
35791. day within month: 0 to 30
35792. setter: call is a time setter (affects hour, min, sec, ms); otherwise date setter (affects year, month, day-in-month)
35793. (internal) no filename on stack
35794. compile eval code (instead of global code)
35795. One problem with this macro is that expressions like the following fail * to compile: "(void) duk_error(...)". But because duk_error() is noreturn, * they make little sense anyway.
35796. set setter (given on value stack)
35797. prefer number, unless input is a Date, in which * case prefer string (E5 Section 8.12.8)
35798. Part indices for internal breakdowns. Part order from DUK_DATE_IDX_YEAR * to DUK_DATE_IDX_MILLISECOND matches argument ordering of Ecmascript API * calls (like Date constructor call). Some functions in duk_bi_date.c * depend on the specific ordering, so change with care. 16 bits are not * enough for all parts (year, specifically). * * (Must be in-sync with genbuiltins.py.)
35799. E == 0x7ff, F == 8 => normalized NaN

35804. * Default allocation functions. * * Assumes behavior such as malloc allowing zero size, yielding * a NULL or a unique pointer which is a no-op for free.
35805. * Buffer
35806. maximum size check is handled by callee
35807. **comment:** Forget the previous allocation, setting size to 0 and alloc to * NULL. Caller is responsible for freeing the previous allocation. * Getting the allocation and clearing it is done in the same API * call to avoid any chance of a realloc.
label: code-design
35808. Load constants onto value stack but don't yet copy to buffer.
35809. -> [func funcname env]
35810. _Formals
35811. Setup function properties.
35812. Push function object, init flags etc. This must match * duk_js_push_closure() quite carefully.
35813. **comment:** * Bytecode dump/load * * The bytecode load primitive is more important performance-wise than the * dump primitive. * * Unlike most Duktape API calls, bytecode dump/load is not guaranteed to be * memory safe for invalid arguments - caller beware! There's little point * in trying to achieve memory safety unless bytecode instructions are also * validated which is not easy to do with indirect register references etc.
label: code-design
35814. _Varmap is dense
35815. We know _Formals is dense and all entries will be in the * array part. GC and finalizers shouldn't affect _Formals * so side effects should be fine.
35816. skip line info
35817. Bound functions don't have all properties so we'd either need to * lookup the non-bound target function or reject bound functions. * For now, bound functions are rejected.
35818. end of _Formals
35819. **comment:** XXX: There's some overlap with duk_js_closure() here, but * seems difficult to share code. Ensure that the final function * looks the same as created by duk_js_closure().
label: code-design
35820. The caller is responsible for being sure that bytecode being loaded * is valid and trusted. Invalid bytecode can cause memory unsafe * behavior directly during loading or later during bytecode execution * (instruction validation would be quite complex to implement). * * This signature check is the only sanity check for detecting * accidental invalid inputs. The initial 0xFF byte ensures no * ordinary string will be accepted by accident.
35821. buffer limits
35822. Inner functions recursively.
35823. known to be number; in fact an integer
35824. Object extra properties. * * There are some difference between function templates and functions. * For example, function templates don't have .length and nargs is * normally used to instantiate the functions.
35825. Bytecode instructions: endian conversion needed unless * platform is big endian.
35826. **comment:** Load a function from bytecode. The function object returned here must * match what is created by duk_js_push_closure() with respect to its flags, * properties, etc. * * NOTE: there are intentionally no input buffer length / bound checks. * Adding them would be easy but wouldn't ensure memory safety as untrusted * or broken bytecode is unsafe during execution unless the opcodes themselves * are validated (which is quite complex, especially for indirect opcodes).
label: code-design
35827. duk_hcompiledfunction flags; quite version specific
35828. standard prototype
35829. Load bytecode instructions.
35830. string limits
35831. no side effects

35832. We know _Varmap only has own properties so walk property * table directly. We also know _Varmap is dense and all * values are numbers; assert for these. GC and finalizers * shouldn't affect _Varmap so side effects should be fine.

35833. **comment:** known to be 32-bit
label: code-design

35834. Fixed header info.

35835. constants are strings or numbers now

35836. Create function 'data' buffer but don't attach it yet.

35837. With constants and inner functions on value stack, we can now * atomically finish the function 'data' buffer, bump refcounts, * etc. * * Here we take advantage of the value stack being just a duk_tval * array: we can just memcpy() the constants as long as we incref * them afterwards.

35838. Estimating the result size beforehand would be costly, so * start with a reasonable size and extend as needed.

35839. DUK_USE_BYTECODE_DUMP_SUPPORT

35840. ensures no overflow

35841. The function object is now reachable and refcounts are fine, * so we can pop off all the temporaries.

35842. _Varmap

35843. -> [func funcname env funcname func]

35844. XXX: This causes recursion up to inner function depth * which is normally not an issue, e.g. mark-and-sweep uses * a recursion limiter to avoid C stack issues. Avoiding * this would mean some sort of a work list or just refusing * to serialize deep functions.

35845. Constants: variable size encoding.

35846. Return with final function pushed on stack top.

35847. [...] -> [...] buf]

35848. [...] buf func] -> [...] func]

35849. Original function instance/template had NAMEBINDING. * Must create a lexical environment on loading to allow * recursive functions like 'function foo() { foo(); }'.

label: code-design

35883. not protected, respect reclimit, not constructor

35884. pop final_cons

35885. [...] fallback retval]

35886. -> [...] target]

35887. For user code this could just return 1 (strict) always * because all Duktape/C functions are considered strict, * and strict is also the default when nothing is running. * However, Duktape may call this function internally when * the current activation is an Ecmascript function, so * this cannot be replaced by a 'return 1' without fixing * the internal call sites.

35888. make absolute

35889. use fallback as 'this' value

35890. [...] fallback constructor fallback(this) arg1 ... argN]; * Note: idx_cons points to first 'fallback', not 'constructor'.

35891. **comment:** * XXX: if duk_handle_call() took values through indices, this could be * made much more sensible. However, duk_handle_call() needs to fudge * the 'this' and 'func' values to handle bound function chains, which * is now done "in-place", so this is not a trivial change.
label: code-design

35892. * Determine whether to use the constructor return value as the created * object instance or not.

35893. Lightfuncs cannot be bound.

35894. * Call the constructor function (called in "constructor mode").

35895. [...] key arg1 ... argN]

35896. Inputs: explicit arguments (nargs), +1 for key, +2 for obj_index/nargs passing. * If the value stack does not contain enough args, an error is thrown; this matches * behavior of the other protected call API functions.

35897. **comment:** * There are two [[Construct]] operations in the specification: * * - E5 Section 13.2.2: for Function objects * - E5 Section 15.3.4.5.2: for "bound" Function objects * * The chain of bound functions is resolved in Section 15.3.4.5.2, * with arguments "piling up" until the [[Construct]] internal * method is called on the final, actual Function object. Note * that the "prototype" property is looked up *only* from the * final object, *before* calling the constructor. * * Currently we follow the bound function chain here to get the * "prototype" property value from the final, non-bound function. * However, we let duk_handle_call() handle the argument "piling" * when the constructor is called. The bound function chain is * thus now processed twice. * * When constructing new Array instances, an unnecessary object is * created and discarded now: the standard [[Construct]] creates an * object, and calls the Array constructor. The Array constructor * returns

an Array instance, which is used as the result value for * the "new" operation; the object created before the Array constructor * call is discarded. ** This would be easy to fix, e.g. by knowing that the Array constructor * will always create a replacement object and skip creating the fallback * object in that case. ** Note: functions called via "new" need to know they are called as a * constructor. For instance, built-in constructors behave differently * depending on how they are called.

label: code-design

35898. [... constructor arg1 ... argN final_cons]

35899. See comments in duk_pcall().

35900. Checking callability of the immediate target * is important, same for constructability. * Checking it for functions down the bound * function chain is not strictly necessary * because .bind() should normally reject them. * But it's good to check anyway because it's * technically possible to edit the bound function * chain via internal keys.

35901. * Create "fallback" object to be used as the object instance, * unless the constructor returns a replacement value. * Its internal prototype needs to be set based on "prototype" * property of the constructor.

35902. call_flags

35903. Get the original arguments. Note that obj_index may be a relative * index so the stack must have the same top when we use it.

35904. must work for nargs <= 0

35905. * Duktape/C function magic

35906. fall through

35907. unreachable

35908. awkward; we assume there is space for this

35909. [... key arg1 ... argN func]

35910. func

35911. Note: -nargs alone would fail for nargs == 0, this is OK

35912. [... constructor arg1 ... argN]

35913. also stash it before constructor, * in case we need it (as the fallback value)

35914. nargs

35915. **comment:** For now, just use duk_safe_call() to wrap duk_new(). We can't * simply use a protected duk_handle_call() because there's post * processing which might throw. It should be possible to ensure * the post processing never throws (except in internal errors and * out of memory etc which are always allowed) and then remove this * wrapper.

label: code-design

35916. [... func arg1 ... argN]

35917. [... constructor arg1 ... argN final_cons fallback]

35918. duplicate key

35919. We can't reliably pop anything here because the stack input * shape is incorrect. So we throw an error; if the caller has * no catch point for this, a fatal error will occur. Another * alternative would be to just return an error. But then the * stack would be in an unknown state which might cause some * very hard to diagnose problems later on. Also note that even * if we did not throw an error here, the underlying call handler * might STILL throw an out-of-memory error or some other internal * fatal error.

35920. * Manipulate callstack for the call.

35921. **comment:** XXX: awkward; we assume there is space for this, overwrite * directly instead?

35958. Don't allow mixed padding and actual chars.

35959. -----XX

35960. The lookup byte is intentionally sign extended to (at least) * 32 bits and then ORed. This ensures that is at least 1 byte * is negative, the highest bit of 't' will be set at the end * and we don't need to check every byte.

35961. invalid padding

35962. We don't check the zero padding bytes here right now * (that they're actually zero). This seems to be common * behavior for base-64 decoders.

35963. aaaaabb bbbbcccc cccccccc

35964. **comment:** Here we can choose either to end parsing and ignore * whatever follows, or to continue parsing in case * multiple (possibly padded) base64 strings have been * concatenated. Currently, keep on parsing.
label: code-design

35965. **comment:** XXX: Using a string return value forces a string intern which is * not always necessary. As a rough performance measure, hex encode * time for tests/perf/test-hex-encode.js dropped from ~35s to ~15s * without string coercion. Change to returning a buffer and let the * caller coerce to string if necessary?
label: code-design

35966. upper limit, assuming no whitespace etc

35967. checked by caller

35968. shift in zeroes

35969. idx_replacer

35970. Fast path, handle units with just actual encoding characters.

35971. **comment:** XXX: convert to fixed buffer?
label: code-design

35972. Computation must not wrap; this limit works for 32-bit size_t: * >>> srclen = 3221225469 * >>> '%x' % ((srclen + 2) / 3 * 4) * 'fffffc'

35973. **comment:** There may be whitespace between the equal signs.
label: code-design

35974. XXXXX-- -----

35975. **comment:** Tested: not faster on x64
label: code-design

35976. **comment:** A straightforward 64-byte lookup would be faster * and cleaner, but this is shorter.
label: code-design

35977. Emit 3 bytes and backtrack if there was padding. There's * always space for the whole 3 bytes so no check needed.

35978. DUK_USE_BASE64_FASTPATH

35979. flags

35980. Note: for dstlen=0, dst may be NULL

35981. Note: for srclen=0, src may be NULL

35982. * Compilation and evaluation

35983. Arguments can be: [source? filename? &comp_args] so that * nargs is 1 to 3. Call site encodes the correct nargs count * directly into flags.

35984. Helper which can be called both directly and with duk_safe_call().

35985. [... source? func_template]

35986. [... source? filename?]

35987. add_auto_proto

35988. [... closure/error]

35989. **comment:** String length is computed here to avoid multiple evaluation * of a macro argument in the calling side.
label: code-design

35990. [... result/error]

35991. **comment:** Note: strictness is *not* inherited from the current Duktape/C. * This would be confusing because the current strictness state * depends on whether we're running inside a Duktape/C activation * (= strict mode) or outside of any activation (= non-strict mode). * See tests/api/test-eval-strictness.c for more discussion.
label: code-design

35992. [... source? filename?] (depends on flags)

35993. [... func_template]

35994. **comment:** XXX: when this error is caused by a nonexistent * file given to duk_peval_file() or similar, the * error message is not the best possible.
label: code-design

35995. e.g. duk_push_string_file_raw() pushed undefined

35996. should be first on 64-bit platforms

35997. Automatic filename: 'eval' or 'input'.

35998. [... source? filename? &comp_args] (depends on flags)

35999. explicit 'this' binding, see GH-164

36000. [... closure]

36001. **comment:** XXX: unnecessary translation of flags
label: code-design

36002. Note: strictness is not inherited from the current Duktape/C * context. Otherwise it would not be possible to compile * non-strict code inside a Duktape/C activation (which is * always strict now). See tests/api/test-eval-strictness.c * for discussion.

36003. Eval is just a wrapper now.

36004. args incorrect

36005. may be safe, or non-safe depending on flags

36006. -> [... closure]

36007. [... source? filename]

36008. Treat like debugger statement: nop

36009. [... arr jsonx(arr) res] -> [... res jsonx(arr)]

36057. duk_push_sprintf constants
36058. **comment:** XXX: add fastint support?
 label: requirement
36059. This would be pointless: unexpected type and lightfunc would both return NULL
36060. duk_push_(u)int() is guaranteed to support at least (un)signed 32-bit range
36061. Get a borrowed duk_tval pointer to the current 'this' binding. Caller must * make sure there's an active callstack entry. Note that the returned pointer * is unstable with regards to side effects.
36062. DUK_API_INTERNAL_H_INCLUDED
36063. Set object 'length'.
36064. duk_push_this() + CheckObjectCoercible() + duk_to_string()
36065. Push the current 'this' binding; throw TypeError if binding is not object * coercible (CheckObjectCoercible).
36066. [] -> [val]
36067. Valstack resize flags
36068. out_clamped=NULL, RangeError if outside range
36069. **comment:** unused
 label: code-design
36070. stridx_logfunc[] must be static to allow initializer with old compilers like BCC
36071. [... Logger clog logfunc clog(=this) msg]
36072. nargs
36073. [... Logger clog logfunc clog]
36074. **comment:** * Logging ** Current logging primitive is a sprintf-style log which is convenient * for most C code. Another useful primitive would be to log N arguments * from value stack (like the Ecmascript binding does).
 label: code-design
36075. [... Logger clog res]
36076. * Memory calls.
36077. NULL accepted
36078. **comment:** * Note: since this is an exposed API call, there should be * no way a mark-and-sweep could have a side effect on the * memory allocation behind 'ptr'; the pointer should never * be something that Duktape wants to change. ** Thus, no need to use DUK_REALLOC_INDIRECT (and we don't * have the storage location here anyway).
 label: code-design
36079. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property get right now.
36080. * Helpers for writing multiple properties
36081. Key and value indices are either (-2, -1) or (-1, -2). Given idx_key, * idx_val is always (idx_key ^ 0x01).
36082. remove key and value
36083. [... obj ...]
36084. This is a rare property helper; it sets the global thrower (E5 Section 13.2.3) * setter/getter into an object property. This is needed by the 'arguments' * object creation code, function instance creation code, and Function.prototype.bind().
36085. * Object finalizer
36086. proto can also be NULL here (allowed explicitly)
36087. a value is left on stack regardless of rc
36088. pop key
36089. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property put right now (putprop protects * against it internally).
36090. "Have" flags must not be conflicting so that they would * apply to both a plain property and an accessor at the same * time.
36091. Object.defineProperty() equivalent C binding.
36092. Define own property without inheritance looks and such. This differs from * [[DefineOwnProperty]] because special behaviors (like Array 'length') are * not invoked by this method. The caller must be careful to invoke any such * behaviors if necessary.
36093. **comment:** XXX: the duk_hobject_enum.c stack APIs should be reworked
 label: code-design
36094. defprop_flags
36095. * Property handling ** The API exposes only the most common property handling functions. * The caller can invoke Ecmascript built-ins for full control (e.g. * defineProperty, getOwnPropertyDescriptor).
36096. * Object related * * Note: seal() and freeze() are accessible through Ecmascript bindings, * and are not exposed through the API.
36097. XXX: shared helper for duk_push_hobject_or_undefined()
36098. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property existence check right now.

36099. * Object handling: property access and other support functions.
36100. remove key
36101. **comment:** Careful here and with other duk_put_prop_xxx() helpers: the * target object and the property value may be in the same value * stack slot (unusual, but still conceptually clear).
 label: code-design

 label: code-design
36105. [...] -> [...] global]
36106. Note: this may fail, caller should protect the call if necessary
36107. **comment:** XXX: direct implementation
 label: requirement
36108. **comment:** Clean up stack
 label: code-design
36109. [target] -> [enum]
36110. * Object prototype
36111. **comment:** XXX: these could be implemented as macros calling an internal function * directly. * XXX: same issue as with Duktape.fin: there's no way to delete the property * now (just set it to undefined).
 label: code-design
36112. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property delete right now.
36113. * Shortcut for accessing global object properties
36114. **comment:** XXX: shared api error strings, and perhaps even throw code for rare cases?
 label: code-design
36115. Maximum value check ensures 'nbytes' won't wrap below.
36116. DUK_BUFOBJ_UINT32ARRAY
36117. throw_flag
36118. only flag now
36119. DUK_USE_VARIADIC_MACROS
36120. E5 Section 9.1
36121. The underlying types for offset/length in duk_hbufferobject is * duk_uint_t; make sure argument values fit and that offset + length * does not wrap.
36122. * When resizing the valstack, a mark-and-sweep may be triggered for * the allocation of the new valstack. If the mark-and-sweep needs * to use our thread for something, it may cause *the same valstack* * to be resized recursively. This happens e.g. when mark-and-sweep * finalizers are called. This is taken into account carefully in * duk_resize_valstack(). * * 'new_size' is known to be <= valstack_max, which ensures that * size_t and pointer arithmetic won't wrap in duk_resize_valstack().
36123. **comment:** Function pointers do not always cast correctly to void * * (depends on memory and segmentation model for instance), * so they coerce to NULL.
 label: code-design
36124. This would be pointless: we'd return NULL for both lightfuncs and * unexpected types.
36125. Lightfunc coerces to a Function instance with concrete * properties. Since 'length' is virtual for Duktape/C * functions, don't need to define that. * * The result is made extensible to mimic what happens to * strings: * > Object.isExtensible(Object('foo')) * true
36126. consequence of above
36127. Never executed if new size is smaller.
36128. * An array must have a 'length' property (E5 Section 15.4.5.2). * The special array behavior flag must only be enabled once the * length property has been added. * * The internal property must be a number (and preferably a * fastint if fastint support is enabled).
36129. **comment:** * Global state for working around missing variadic macros
 label: code-design
36130. use a temp: decref only when valstack reachable values are correct
36131. Note: recursive call
36132. * Stack index validation/normalization and getting a stack duk_tval ptr. * * These are called by many API entrypoints so the implementations must be * fast and "inlined". * * There's some repetition because of this; keep the functions in sync.
36133. **comment:** XXX: There's quite a bit of overlap with buffer creation handling in * duk.bi_buffer.c. Look for overlap and refactor.
 label: code-design
36134. Should match Function.prototype.toString()
36135. **comment:** XXX: combine all the integer conversions: they share everything * but the helper function for coercion.
 label: code-design
36136. fatal_func should be noreturn, but noreturn declarations on function * pointers has a very spotty support apparently so it's not currently * done.
36137. Allowed.
36138. **comment:** XXX: .code = err_code disabled, not sure if useful
 label: code-design
36139. * Special cases like NaN and +/- Infinity are handled explicitly * because a plain C coercion from double to int handles these cases * in undesirable ways. For instance, NaN may coerce to INT_MIN * (not zero), and INT_MAX + 1 may coerce to INT_MIN (not INT_MAX). * * This double-to-int coercion differs from ToInteger() because it * has a finite range (ToInteger() allows e.g. +/- Infinity). It * also differs fromToInt32() because the INT_MIN/INT_MAX clamping * depends on the size of the int type on the platform. In particular, * on platforms with a 64-bit int type, the full range is allowed.
36140. Assert for value stack initialization policy.
36141. val is unsigned so >= 0
36142. important to do this *after* pushing, to make the thread reachable for gc
36143. !DUK_USE_PARANOIA_ERRORS
36144. initial estimate based on format string
36145. no need to incref
36146. coerce towards zero
36147. Wrap checked above.
36148. * API calls related to general value stack manipulation: resizing the value * stack, pushing and popping values, type checking and reading values, * coercing values, etc. * * Also contains internal functions (such as duk_get_tval()), defined * in duk_api_internal.h, with semantics similar to the public API.
36149. Non-critical.

36264. Because new_size != 0, if condition doesn't need to be * (new_valstack != NULL || new_size == 0).

36265. Not halfway, round to nearest.

36266. * Number is special because it doesn't have a specific * tag in the 8-byte representation.

36267. **comment:** XXX: fast primitive to set a bunch of values to UNDEFINED

label: code-design

36268. make the new thread reachable

36269. **comment:** copied so that 'ap' can be reused

label: code-design

36270. estimate is valid

36271. * Comparison

36272. DUK_USE_REFERENCE_COUNTING

36273. **comment:** XXX: repetition of stack pre-checks -> helper or macro or inline

label: code-design

36274. Value coercion (in stack): ToInteger(), E5 Section 9.4 * API return value coercion: custom

36275. [... func]

36276. nrets

36277. Error code also packs a tracedata related flag.

36278. For tv1 == tv2, both pointing to stack top, the end result * is same as duk_pop(ctx).

36279. allow fmt==NULL

36280. thr->heap->jmpbuf_ptr is checked by duk_err_longjmp() so we don't * need to check that here. If the value is NULL, a panic occurs because * we can't return.

36281. DUK_BUFOBJ_NODEJS_BUFFER

36282. Stack size increases or stays the same.

36283. Exact halfway, round to even.

36284. **comment:** If no explicit message given, put error code into message field * (as a number). This is not fully in keeping with the EcmaScript * error model because messages are supposed to be strings (Error * constructors use ToString() on their argument). However, it's * probably more useful than having a separate 'code' property.

label: code-design

36285. Note: may be triggered even if minimal new_size would not reach the limit, * plan limit accordingly (taking DUK_VALSTACK_GROW_STEP into account).

36286. We intentionally ignore the duk_safe_call() return value and only * check the output type. This way we don't also need to check that * the returned value is indeed a string in the success case.

36287. Cannot use duk_to_string() on the buffer because it is usually * larger than 'len'. Also, 'buf' is usually a stack buffer.

36288. Clamping needed if duk_int_t is 64 bits.

36289. Note: src_data may be NULL if input is a zero-size * dynamic buffer.

36290. !DUK_USE_PREFER_SIZE

36291. Error: try coercing error to string once.

36292. Note: the realloc may have triggered a mark-and-sweep which may * have resized our valstack internally. However, the mark-and-sweep * MUST NOT leave the stack bottom/top in a different state. Particular * assumptions and facts: * * - The thr->valstack pointer may be different after realloc, * and the offset between thr->valstack_end <-> thr->valstack * may have changed. * - The offset between thr->valstack_bottom <-> thr->valstack * and thr->valstack_top <-> thr->valstack MUST NOT have changed, * because mark-and-sweep must adhere to a strict stack policy. * In other words, logical bottom and top MUST NOT have changed. * - All values above the top are unreachable but are initialized * to UNDEFINED, up to the post-realloc valstack_end. * - 'old_end_offset' must be computed after realloc to be correct.

36293. **comment:** XXX: inlined DECREF macro would be nice here: no NULL check, * refzero queueing but no refzero algorithm run (= no pointer * instability), inline code.

label: code-design

36294. **comment:** XXX: other variants like uint, u32 etc

label: code-design

36295. rely on interning, must be this string

36296. DUK_USE_FASTINT

36297. Because value stack init policy is 'undefined above top', * we don't need to write, just assert.

36298. sanity limit for function pointer size

36299. Initial stack size satisfies the stack spare constraints so there * is no need to require stack here.

36300. * Error throwing
36301. can't resize below 'top'
36302. -> [... retval]
36303. Non-buffer value is first ToString() coerced, then converted * to a buffer (fixed buffer is used unless a dynamic buffer is * explicitly requested).
36304. shared flags for a subset of types
36305. round up roughly to next 'grow step'
36306. Custom coercion for API
36307. NULL with zero length represents an empty string; NULL with higher * length is also now treated like an empty string although it is * a bit dubious. This is unlike duk_push_string() which pushes a * 'null' if the input string is a NULL.
36308. tv -> value just before prev top value; must relookup
36309. Init newly allocated slots (only).
36310. default: NULL, length 0
36311. * instanceof
36312. Assume value stack sizes (in elements) fits into duk_idx_t.
36313. useful for debugging
36314. **comment:** Relookup in case duk_js_tointeger() ends up e.g. coercing an object.
 label: code-design
36315. valstack limit caller has check, prevents wrapping
36316. default: NaN
36317. Coercion may be needed, the helper handles that by pushing the * tagged values to the stack.
36318. Note: this check relies on the fact that even a zero-size string * has a non-NULL pointer.
36319. Negative indices are always within allocated stack but * must not go below zero index.
36320. covers -Infinity
36321. * Get/require
36322. **comment:** * Number should already be in NaN-normalized form, * but let's normalize anyway.
 label: code-design
36323. Note: number has no explicit tag (in 8-byte representation)
36324. Positive index can be higher than valstack top but must * not go above allocated stack (equality is OK).
36325. Same as above but for unsigned int range.
36326. Errors are augmented when they are created, not when they are * thrown or re-thrown. The current error handler, however, runs * just before an error is thrown.
36327. **comment:** XXX: Hex encoded, length limited buffer summary here?
 label: code-design
36328. When src_size == 0, src_data may be NULL (if source * buffer is dynamic), and dst_data may be NULL (if * target buffer is dynamic). Avoid zero-size memcpy() * with an invalid pointer.
36329. check stack before interning (avoid hanging temp)
36330. **comment:** Try to make do with a stack buffer to avoid allocating a temporary buffer. * This works 99% of the time which is quite nice.
 label: code-design
36331. * Stack slice primitives
36332. **comment:** unused
 label: code-design
36333. normalize NaN which may not match our canonical internal NaN
36334. * Value stack top handling
36335. check_object_coercible
36336. If not present in finalize_list or refzero_list, the pointer * must be either in heap_allocated or the string table.
36337. One particular problem case is where an object has been * queued for finalization but the finalizer hasn't yet been * executed. * * Corner case: we're running in a finalizer for object X, and * user code calls duk_push_heapptr() for X itself. In this * case X will be in finalize_list, and we can detect the case * by seeing that X's FINALIZED flag is set (which is done before * the finalizer starts executing).
36338. **comment:** Note: Boolean prototype's internal value property is not writable, * but duk_xdef_prop_stridx() disregards the write protection. Boolean * instances are immutable. * * String and buffer special behaviors are already enabled which is not * ideal, but a write to the internal value is not affected by them.
 label: code-design
36339. Note: this allows creation of internal strings.

36372. Example: d=3.5, t=0.5 -> ret = (3 + 1) & 0xfe = 4 & 0xfe = 4 * Example: d=4.5, t=0.5 -> ret = (4 + 1) & 0xfe = 5 & 0xfe = 4
36373. **comment:** XXX: optimize loops
 label: code-design
36374. Handle change in value stack top. Respect value stack * initialization policy: 'undefined' above top. Note that * DECREF may cause a side effect that reallocates valstack, * so must relookup after DECREF.
36375. nbytes * <-----> * [... | p | x | x | q] * => [... | q | p | x | x]
36376. tagged null pointers should never occur
36377. no throw
36378. Care must be taken to avoid pointer wrapping in the index * validation. For instance, on a 32-bit platform with 8-byte * duk_tval the index 0x20000000UL would wrap the memory space * once.
36379. * Conversions and coercions * * The conversion/coercions are in-place operations on the value stack. * Some operations are implemented here directly, while others call a * helper in duk_js_ops.c after validating arguments.
36380. initialize built-ins - either by copying or creating new ones
36381. may throw an error
36382. **comment:** Set stack top within currently allocated range, but don't reallocate. * This is performance critical especially for call handling, so whenever * changing, profile and look at generated code.
 label: code-design
36383. **comment:** XXX: size optimize
 label: code-design
36384. **comment:** NUL terminator handling doesn't matter here
 label: code-design
36385. Index validation is strict, which differs from duk_equals(). * The strict behavior mimics how instanceof itself works, e.g. * it is a TypeError if rval is not a - callable- object. It would * be somewhat inconsistent if rval would be allowed to be * non-existent without a TypeError.
36386. **comment:** Clamping to zero makes the API more robust to calling code * calculation errors.
 label: code-design
36387. Surround with parentheses like in JX, ensures NULL pointer * is distinguishable from null value ("null" vs "null").
36388. * Value stack resizing. * * This resizing happens above the current "top": the value stack can be * grown or shrunk, but the "top" is not affected. The value stack cannot * be resized to a size below the current "top". * * The low level reallocation primitive must carefully recompute all value * stack pointers, and must also work if ALL pointers are NULL. The resize * is quite tricky because the valstack realloc may cause a mark-and-sweep, * which may run finalizers. Running finalizers may resize the valstack * recursively (the same value stack we're working on). So, after realloc * returns, we know that the valstack "top" should still be the same (there * should not be live values above the "top"), but its underlying size and * pointer may have changed.
36389. Stack size decreases.
36390. format plus something to avoid just missing
36391. copy values (no overlap even if to_ctx == from_ctx; that's not * allowed now anyway)
36392. unreachable
36393. **comment:** XXX: this is probably a useful shared helper: for a * duk_hbufferobject, get a validated buffer pointer/length.
 label: code-design
36394. Represent a null pointer as 'null' to be consistent with * the JX format variant. Native '%p' format for a NULL * pointer may be e.g. '(nil)'.

36470. fromPresent = true
36471. XXX: len >= 0x80000000 won't work below because we need to be * able to represent -len.
36472. right exists, [[Put]] regardless whether or not left exists
36473. [ToObject(this) item1 ... itemN arr item(i) item(i)[j]]
36474. topmost element is the result array already
36475. -> [sep ToObject(this) len sep str]
36476. [ToObject(this) item1 ... itemN arr]
36477. The lo/hi indices may be crossed and hi < 0 is possible at entry.
36478. **comment:** XXX: This helper is a bit awkward because the handling for the different iteration * callers is quite different. This now compiles to a bit less than 500 bytes, so with * 5 callers the net result is about 100 bytes / caller.
 label: code-design
36479. [sep ToObject(this) len sep result]
36480. **comment:** XXX: there's no explicit recursion bound here now. For the average * qsort recursion depth O(log n) that's not really necessary: e.g. for * 2**32 recursion depth would be about 32 which is OK. However, qsort * worst case recursion depth is O(n) which may be a problem.
 label: code-design
36481. Index clamping is a bit tricky, we must ensure that we'll only iterate * through elements that exist and that the specific requirements from E5.1 * Sections 15.4.4.14 and 15.4.4.15 are fulfilled; especially: * * - indexOf: clamp to [-len,len], negative handling -> [0,len], * if clamped result is len, for-loop bails out immediately * * - lastIndexOf: clamp to [-len-1, len-1], negative handling -> [-1, len-1], * if clamped result is -1, for-loop bails out immediately * * If fromIndex is not given, ToInteger(undefined) = 0, which is correct * for indexOf() but incorrect for lastIndexOf(). Hence special handling, * and why lastIndexOf() needs to be a vararg function.
36482. **comment:** XXX: best behavior for real world compatibility?
 label: code-design
36483. Range limited to [0, 0x7fffffff] range, i.e. range that can be * represented with duk_int32_t. Use this when the method doesn't * handle the full 32-bit unsigned range correctly.
36484. **comment:** Fall back to the initial (original) Object.toString(). We don't * currently have pointers to the built-in functions, only the top * level global objects (like "Array") so this is now done in a bit * of a hacky manner. It would be cleaner to push the (original) * function and use duk_call_method().
 label: code-design
36485. -> [... toLocaleString ToObject(val)]
36486. Note that 'l' and 'r' may cross, i.e. r < l
36487. **comment:** XXX: the insert here is a bit expensive if there are a lot of items. * It could also be special cased in the outermost for loop quite easily * (as the element is dup()'d anyway).
 label: code-design
36488. In some cases it may be that lo > hi, or hi < 0; these * degenerate cases happen e.g. for empty arrays, and in * recursion leaves.
36489. -> [... ToObject(this) ToUint32(length)]
36490. trivial cases
36491. find elements to swap
36492. args start at index 2
36493. indexOf: clamp fromIndex to [-len, len] * (if fromIndex == len, for-loop terminates directly) * * lastIndexOf: clamp fromIndex to [-len - 1, len - 1] * (if clamped to -len-1 -> fromIndex becomes -1, terminates for-loop directly)
36494. [... ToObject(this) ToUint32(length) val]
36495. **comment:** XXX: an array can have length higher than 32 bits; this is not handled * correctly now.
 label: code-design
36496. **comment:** XXX: this compiles to over 500 bytes now, even without special handling * for an array part. Uses signed ints so does not handle full array range correctly.
 label: code-design
36497. For len == 0, i is initialized to len - 1 which underflows. * The condition (i < len) will then exit the for-loop on the * first round which is correct. Similarly, loop termination * happens by i underflowing.

36498. Step 16: update length; note that the final length may be above 32 bit range * (but we checked above that this isn't the case here)
36499. stack top contains 'true'
36500. stack[0] = start * stack[1] = end * stack[2] = ToObject(this) * stack[3] = ToUint32(length) * stack[4] = result array
36501. Step 9: copy elements-to-be-deleted into the result array
36502. retval is directly usable
36503. result array is already at the top of stack
36504. has access to 'this' binding
36505. stack[0...nargs-1] = unshift args (vararg) * stack[nargs] = ToObject(this) * stack[nargs+1] = ToUint32(length)
36506. The original value needs to be preserved for filter(), hence * this funny order. We can't re-get the value because of side * effects.
36507. * splice()
36508. * isArray()
36509. The E5.1 Section 15.4.4.4 algorithm doesn't set the length explicitly * in the end, but because we're operating with an internal value which * is known to be an array, this should be equivalent.
36510. Debug print which visualizes the qsort partitioning process.
36511. for indexOf, ToInteger(undefined) would be 0, i.e. correct, but * handle both indexOf and lastIndexOf specially here.
36512. -> [sep ToObject(this) len str sep]
36513. stack[0] = compareFn * stack[1] = ToObject(this) * stack[2] = ToUint32(length)
36514. * indexOf(), lastIndexOf()
36515. move pivot out of the way

36570. -> [... ToObject(this) ToUint32(length) final_len final_len]
36571. nop

36572. Technically Array.prototype.push() can create an Array with length * longer than 2^32-1, i.e. outside the 32-bit range. The final length * is *not* wrapped to 32 bits in the specification. ** This implementation tracks length with a uint32 because it's much * more practical. ** See: test-bi-array-push-maxlen.js.

36573. The specification is a bit vague what to do if the return * value is not a number. Other implementations seem to * tolerate non-numbers but e.g. V8 won't apparently do a * ToNumber().

36574. We're a varargs function because we need to detect whether * initialValue was given or not.

36575. -> [... ToObject(this) ToUInt32(length) arg[i]]

36576. [arg1 ... argN obj length]

36577. throw flag irrelevant (false in std alg)

36578. Step 15: insert itemCount elements into the hole made above

36579. For join(), nargs is 1. For toLocaleString(), nargs is 0 and * setting the top essentially pushes an undefined to the stack, * thus defaulting to a comma separator.

36580. **comment:** XXX: 'this' will be ToObject() coerced twice, which is incorrect * but should have no visible side effects.

label: code-design

36581. [A B C D E F G H] rel_index = 2, del_count 3, item count 1 * -> [A B F G H] (conceptual intermediate step) * -> [A B . F G H] (placeholder marked) * [A B C F G H] (actual result at this point, C will be replaced)

36582. If len <= 1, middle will be 0 and for-loop bails out * immediately (0 < 0 -> false).

36583. Note: unshift() may operate on indices above unsigned 32-bit range * and the final length may be >= 2**32. However, we restrict the * final result to 32-bit range for practicality.

36584. i >= 0 would always be true

36585. **comment:** Fast exit if indices are identical. This is valid for a non-existent property, * for an undefined value, and almost always for ToString() coerced comparison of * arbitrary values (corner cases where this is not the case include e.g. a an * object with varying ToString() coercion). ** The specification does not prohibit "caching" of values read from the array, so * assuming equality for comparing an index with itself falls into the category of * "caching". ** Also, compareFn may be inconsistent, so skipping a call to compareFn here may * have an effect on the final result. The specification does not require any * specific behavior for inconsistent compare functions, so again, this fast path * is OK.

label: code-design

36586. fromPresent = false

36587. -> [... x y fn]

36588. [... this func]

36589. each call this helper serves has nargs==2

36590. -> [ToObject(this) item1 ... itemN arr]

36591. [ToObject(this) item1 ... itemN arr item(i)]

36592. * join(), toLocaleString() ** Note: checking valstack is necessary, but only in the per-element loop. ** Note: the trivial approach of pushing all the elements on the value stack * and then calling duk_join() fails when the array contains a large number * of elements. This problem can't be offloaded to duk_join() because the * elements to join must be handled here and have special handling. Current * approach is to do intermediate joins with very large number of elements. * There is no fancy handling; the prefix gets re-joined multiple times.

36593. **comment:** * Array built-ins ** Note that most Array built-ins are intentionally generic and work even * when the 'this' binding is not an Array instance. To ensure this, * Array algorithms do not assume "magical" Array behavior for the "length" * property, for instance. ** XXX: the "Throw" flag should be set for (almost?) all [[Put]] and * [[Delete]] operations, but it's currently false throughout. Go through * all put/delete cases and check throw flag use. Need a new API primitive * which allows throws flag to be specified. ** XXX: array lengths above 2G won't work reliably. There are many places * where one needs a full signed 32-bit range ([-0xffffffff, 0xffffffff], * i.e. -33- bits). Although array 'length' cannot be written to be outside * the unsigned 32-bit range (E5.1 Section 15.4.5.1 throws a RangeError if so) * some intermediate values may be above 0xffffffff and this may not be always * correctly handled now (duk_uint32_t is not enough for all algorithms). ** For instance, push() can legitimately write entries beyond length 0xffffffff * and cause a RangeError only at the end. To do this properly, the current * push() implementation tracks the array index using a 'double' instead of a * duk_uint32_t (which is somewhat awkward). See test-bi-array-push-maxlen.js. ** On using "put" vs. "def" prop * ===== * Code below must be careful to use the appropriate primitive as it matters * for compliance. When using "put" there may be inherited properties in * Array.prototype which cause side effects when values are written. When * using "define" there are no such side effects, and many test262 test cases * check for this (for real world code, such side effects are very rare). * Both "put" and "define" are used in the E5.1 specification; as a rule, * "put" is used when modifying an existing array (or a non-array 'this' * binding) and "define" for setting values into a fresh result array. ** Also note that Array instance 'length' should be writable, but not * enumerable and definitely not configurable: even Duktape code internally * assumes that an Array instance will always have a 'length' property. * Preventing deletion of the property is critical.

36605. throw_flag

36606. **comment:** XXX: encoding is ignored now.

label: code-design

36607. This behavior mostly mimics Node.js now.

36608. nargs

36609. Fast path: source is a TypedArray (or any bufferobject).

36610. NOTE! Caller must ensure that any side effects from the * coercions below are safe. If that cannot be guaranteed * (which is normally the case), caller must coerce the * argument using duk_to_number() before any pointer * validations; the result of duk_to_number() always coerces * without side effects here.

36611. Don't accept relative indices now.

36612. bits 0...1: shift

36613. default is explicit index read/write copy

36614. Clamp to target's end if too long. ** NOTE: there's no overflow possibility in the comparison; * both target_ustart and copy_size are >= 0 and based on * values in duk_int_t range. Adding them as duk_uint_t * values is then guaranteed not to overflow.

36615. [offset noAssert], when ftype != DUK_FLD_VARINT

36616. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT32

36617. Select copy mode. Must take into account element * compatibility and validity of the underlying source * buffer.

36618. For the case n==1 Node.js doesn't seem to type check * the sole member but we do it before returning it. * For this case only the original buffer object is * returned (not a copy).

36619. Push the resulting view object and attach the ArrayBuffer.

36620. DUK_FLD_32BIT

36621. >= 0

36622. arg count

36623. DUK_FLD_8BIT

36624. Neutered. We could go into the switch-case safely with * buf == NULL because check_length == 0. To avoid scanbuild * warnings, fail directly instead.

36625. * TypedArray.prototype.set() ** TypedArray set() is pretty interesting to implement because: ** - The source argument may be a plain array or a typedarray. If the * source is a TypedArray, values are decoded and re-encoded into the * target (not as a plain byte copy). This may happen even when the * element byte size is the same, e.g. integer values may be re-encoded * into floats. ** - Source and target may refer to the same underlying buffer, so that * the set() operation may overlap. The specification requires that this * must work as if a copy was made before the operation. Note that this * is NOT a simple memmove() situation because the source and target * byte sizes may be different -- e.g. a 4-byte source (Int8Array) may * expand to a 16-byte target (Uint32Array) so that the target overlaps * the source both from beginning and the end (unlike in typical memmove). ** - Even if 'buf' pointers of the source and target differ, there's no * guarantee that their memory areas don't overlap. This may be the * case with external buffers. ** Even so, it is nice to optimize for the common case: ** - Source and target separate buffers or non-overlapping. ** - Source and target have a compatible type so that a plain byte copy * is possible. Note that while e.g. uint8 and int8 are compatible * (coercion one way or another doesn't change the byte representation), * e.g. int8 and uint8clamped are NOT compatible when writing int8 * values into uint8clamped typedarray (-1 would clamp to 0 for instance). ** See test-bi-typedarray-proto-set.js.

36626. Non-object argument is simply int coerced, matches * V8 behavior (except for "null", which we coerce to * 0 but V8 TypeErrors).

36627. Array or Array-like

36628. **comment:** Static call style.
label: code-design

36629. [offset fieldByteLength noAssert], when ftype == DUK_FLD_VARINT

36630. sign doesn't matter when writing

36631. Format of magic, bits: * 0...1: elem size shift (0-3) * 2...5: elem type (DUK_HBUFFEROBJECT_ELEM_XXX)

36632. **comment:** Slow gathering of value using either 64-bit arithmetic * or IEEE doubles if 64-bit types not available. Handling * of negative numbers is a bit non-obvious in both cases.
label: code-design

36633. Resolve start/end offset as element indices first; arguments * at idx_start/idx_end are element offsets. Working with element * indices first also avoids potential for wrapping.

36634. Write in little endian

36635. [targetBuffer targetStart sourceStart sourceEnd]

36636. source starts after dest ends

36637. * Misc helpers

36638. For TypedArrays 'undefined' return value is specified * by ES6 (matches V8).

36639. Check that value is a duk_hbufferobject and return a pointer to it.

36640. **comment:** Fill offset handling is more lenient than in Node.js.
label: code-design

36641. byte sizes will match

36642. return h_bufres

36643. Must be element size multiple from * start offset to end of buffer.

36644. * Node.js Buffer: toString([encoding], [start], [end])

36645. We want to do a straight memory copy if possible: this is * an important operation because .set() is the TypedArray * way to copy chunks of memory. However, because set() * conceptually works in terms of elements, not all views are * compatible with direct byte copying. ** If we do manage a direct copy, the "overlap issue" handled * below can just be solved using memmove() because the source * and destination element sizes are necessarily equal.

36646. new buffer with string contents

36647. XXX: could add fast path for u8 compatible views

36648. A validated read() is always a number, so it's write coercion * is always side effect free and won't invalidate pointers etc.

36649. Slice offsets are element (not byte) offsets, which only matters * for TypedArray views, Node.js Buffer and ArrayBuffer have shift * zero so byte and element offsets are the same. Negative indices * are counted from end of slice, crossed indices are allowed (and * result in zero length result), and final values are clamped * against the current slice. There's intentionally no check * against the underlying buffer here.

36650. We could fit built-in index into magic but that'd make the magic * number dependent on built-in numbering (genbuiltins.py doesn't * handle that yet). So map both class and prototype from the * element type.

36651. bytes in dest

36652. Use byte copy.

36653. Argument variants. When the argument is an ArrayBuffer a view to * the same buffer is created; otherwise a new ArrayBuffer is always * created.

36654. Accept plain buffer values like array initializers * (new in Duktape 1.4.0).

36655. Shared lenient buffer length clamping helper. Indices are treated as * element indices (though output values are byte offsets) which only * really matters for TypedArray views as other buffer object have a zero * shift. Negative indices are counted from end of input slice; crossed * indices are clamped to zero length; and final indices are clamped * against input slice. Used for e.g. ArrayBuffer slice().

36656. 0xff => 255 - 256 = -1; 0x80 => 128 - 256 = -128

36657. DUK_FLD_16BIT

36658. Update 'buffer_length' to be the effective, safe limit which * takes into account the underlying buffer. This value will be * potentially invalidated by any side effect.

36659. xxx -> DUK_HBUFFEROBJECT_ELEM_INT32

36660. avoid side effects!

36661. Node.js accepts only actual Arrays.

36662. **comment:** XXX: regetting the pointer may be overkill - we're writing * to a side-effect free array here.
label: code-design

36663. crossed offsets or zero size

36664. Must use memmove() because copy area may overlap (source and target * buffer may be the same, or from different slices).

36665. Gather in little endian

36666. unsigned

36667. We need 'nbytes' even for a failed offset; return value must be * (offset + nbytes) even when write fails due to invalid offset.

36668. **comment:** XXX: function flag to make this automatic?
label: requirement

36669. XXX: happens e.g. when evaluating: String(Buffer.prototype).

36670. For all duk_hbufferobjects, get the plain buffer inside * without making a copy. This is compatible with Duktape 1.2 * but means that a slice/view information is ignored and the * full underlying buffer is returned. ** If called as a constructor, a new Duktape.Buffer object * pointing to the same plain buffer is created below.

36671. DUK_FLD_VARINT; not relevant here

36672. Shared helper.

36673. **comment:** ArrayBuffer argument is handled specially above; the rest of the * argument variants are handled by shared code below.
label: code-design

36674. Copy values by index reads and writes. Let virtual * property handling take care of coercion.

36675. Accept any duk_hbufferobject, though we're only normally * called for Duktape.Buffer values.

36676. idx_end

36677. may be NULL

36678. -> [buffer]

36679. [offset value littleEndian], when DUK_FLD_TYPEDARRAY (regardless of ftype)

36680. Node.js return value for noAssert out-of-bounds reads is * usually (but not always) NaN. Return NaN consistently.

36681. Copy values through direct validated reads and writes.

36682. Return the Buffer to allow chaining: b.fill(0x11).fill(0x22, 3, 5).toString()

36683. Gather in big endian

36684. compare: similar to string comparison but for buffer data.

36685. **comment:** * Node.js Buffer.prototype.equals() * Node.js Buffer.prototype.compare() * Node.js Buffer.compare()
label: requirement

Array index is target buffer elem type, * bitfield indicates compatible source types. The types must have same byte * size and they must be coercion compatible.
36763. source out-of-bounds (but positive)
36764. Map DUK_FLX_xxx to byte size.
36765. **comment:** The DataView .buffer property is ordinarily set to the argument * which is an ArrayBuffer. We accept any duk_hbufferobject as * an argument and .buffer will be set to the argument regardless * of what it is. This may be a bit confusing if the argument * is e.g. a DataView or another TypedArray view. * * XXX: Copy .buffer property from a DataView/TypedArray argument? * Create a fresh ArrayBuffer for Duktape.Buffer and Node.js Buffer * arguments? See: test-bug-dataview-buffer-prop.js.
 label: code-design
36766. **comment:** XXX: split into separate functions for each field type?
 label: code-design
36767. [start end]
36768. [array totalLength bufres buf]
36769. Offset is coerced first to signed integer range and then to unsigned. * This ensures we can add a small byte length (1-8) to the offset in * bound checks and not wrap.
36770. one i_step over
36771. default to false
36772. Unlike for negative arguments, some call sites * want length to be clamped if it's positive.
36773. For n == 0, Node.js ignores totalLength argument and * returns a zero length buffer.
36774. Return value is like write(), number of bytes written. * The return value matters because of code like: * "off += buf.copy(...)".
36775. xxx -> DUK_HBUFFEROBJECT_ELEM_INT8
36776. xxx -> DUK_HBUFFEROBJECT_ELEM_INT16
36777. These are not needed when only Duktape.Buffer is supported.
36778. DUK_FLD_FLOAT
36779. undefined coerces to zero which is correct
36780. Copy values, the copy method depends on the arguments. * * Copy mode decision may depend on the validity of the underlying * buffer of the source argument; there must be no harmful side effects * from there to here for copy_mode to still be valid.
36781. DUK_FLD_DOUBLE
36782. Map DUK_HBUFFEROBJECT_ELEM_xxx to duk_hobject class number. * Sync with duk_hbufferobject.h and duk_hobject.h.
36783. xxx -> DUK_HBUFFEROBJECT_ELEM_FLOAT32
36784. [offset littleEndian], when DUK_FLD_TYPEDARRAY (regardless of ftype)
36785. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8
36786. even for zero-length string
36787. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT16
36788. new buffer of specified size
36789. pop plain buffer, now reachable through h_bufres
36790. Node.js return value for failed writes is offset + #bytes * that would have been written.
36791. DUK_USE_BUFFEROBJECT_SUPPORT
36792. Custom behavior: plain buffer is used as internal buffer * without making a copy (matches Duktape.Buffer).
36793. ignore_loop
36794. Shift to sign extend.
36795. No copy, leave zero bytes in the buffer. There's no * ambiguity with Float32/Float64 because zero bytes also * represent 0.0.
36796. **comment:** XXX: for negative input offsets, 'offset' will be a large * positive value so the result here is confusing.
 label: code-design
36797. no overflow
36798. **comment:** Copy the .buffer property, needed for TypedArray.prototype.subarray(). * * XXX: limit copy only for TypedArray classes specifically?
 label: code-design
36799. stack is unbalanced, but: [<something> buf]
36800. **comment:** The condition could be more narrow and check for the * copy area only, but there's no need for fine grained * behavior when the underlying buffer is misconfigured.
 label: code-design
36801. Set .buffer to the argument ArrayBuffer.
36802. **comment:** unnecessary shift for last byte
 label: code-design
36803. **comment:** Slow writing of value using either 64-bit arithmetic * or IEEE doubles if 64-bit types not available. There's * no special sign handling when writing variants.
 label: code-design
36804. * ArrayBuffer.isView()
36805. **comment:** XXX: easier check with less code?
 label: code-design
36806. **comment:** The resulting buffer object gets the same class and prototype as * the buffer in 'this', e.g. if the input is a Node.js Buffer the * result is a Node.js Buffer; if the input is a Float32Array, the * result is a Float32Array. * * For the class number this seems correct. The internal prototype * is not so clear: if 'this' is a bufferobject with a non-standard * prototype object, that value gets copied over into the result * (instead of using the standard prototype for that object type).
 label: code-design
36807. return input buffer, converted to a Duktape.Buffer object * if called as a constructor (no change if called as a * function).
36808. * Indexed read/write helpers (also used from outside this file)
36809. * Node.js Buffer: constructor
36810. Write in big endian
36811. replaced
36812. * Node.js Buffer.byteLength()
36813. non-zero: make copy
36814. There's overlap: the desired end result is that * conceptually a copy is made to avoid "trampling" * of source data by destination writes. We make * an actual temporary copy to handle this case.
36815. Note: unbalanced stack on purpose
36816. Copy slice, respecting underlying buffer limits; remainder * is left as zero.

36817. Nominal size check.
36818. Coerce value to a number before computing check_length, so that * the field type specific coercion below can't have side effects * that would invalidate check_length.
36819. **comment:** Neutered checks not necessary here: neutered buffers have * zero 'length' so we'll effectively skip them.
label: code-design
36820. Check that 'this' is a duk_hbufferobject and return a pointer to it.
36821. **comment:** XXX: The duk_to_number() cast followed by integer coercion * is platform specific so NaN, +/- Infinity, and out-of-bounds * values result in platform specific output now. * See: test-bi-nodejs-buffer-proto-varint-special.js
label: code-design
36822. as elements
36823. Argument must be a string, e.g. a buffer is not allowed.
36824. target out-of-bounds (but positive)
36825. unbalanced stack on purpose
36826. Compute result length and validate argument buffers.
36827. only accept lowercase 'utf8' now.
36828. Cannot overlap.
36829. Convert indices to byte offsets.
36830. no need to decref
36831. [... this]
36832. stack top: new time value, return 1 to allow tail calls
36833. Convert day from one-based to zero-based (internal). This may * cause the day part to be negative, which is OK.
36834. 3
36835. Apply timezone offset to get the main parts in UTC
36836. **comment:** XXX: there is a small risk here: because the ISO 8601 parser is * very loose, it may end up parsing some datetime values which * would be better parsed with a platform specific parser.
label: code-design
36837. 8: getFullYear
36838. now expected to fit into a 32-bit integer
36839. All components default to 0 except day-of-month which defaults * to 1. However, because our internal day-of-month is zero-based, * it also defaults to zero here.
36840. MakeDate
36841. 37: setUTCFullYear
36842. * Return (t - LocalTime(t)) in minutes: * * t - LocalTime(t) = t - (t + LocalTZA + DaylightSavingTA(t)) * = -(LocalTZA + DaylightSavingTA(t)) * * where DaylightSavingTA() is checked for time 't'. * * Note that the sign of the result is opposite to common usage, * e.g. for EE(S)T which normally is +2h or +3h from UTC, this * function returns -120 or -180. *
36843. Integer division which floors also negative values correctly.
36844. -"-"
36845. invalid value which never matches
36846. 7
36847. estimate year upwards (towards positive infinity), then back down; * two iterations should be enough
36848. Helper for string conversion calls: check 'this' binding, get the * internal time value, and format date and/or time in a few formats. * Return value allows tail calls.
36849. Here we'd have the option to normalize -0 to +0.
36850. -> [O toISOString O]
36851. -> [timeval this timeval]
36852. Optional UTC conversion.
36853. Note: %06d for positive value, %07d for negative value to include * sign and 6 digits.
36854. Internal timevalue is already NaN, so don't touch it.
36855. 5: toLocaleTimeString
36856. Old solution: don't iterate, incorrect
36857. 38: getYear
36858. 6
36859. * Other file level defines
36860. zero-based -> one-based
36861. called as a normal function: return new Date().toString()
36862. * ISO 8601 subset parser.
36863. 39: setYear
36864. Rule control flags.
36865. 1: toDateString
36866. E5.1 Section 15.9.1.6
36867. tzoffset seconds are dropped; 16 bits suffice for * time offset in minutes
36868. if-digit-else-ctrl
36869. Causes a ToNumber() coercion, but doesn't break coercion order since * year is coerced first anyway.
36870. Unlike most built-ins, the internal [[PrimitiveValue]] of a Date * is mutable.
36871. Parts are in local time, convert when setting.
36872. **comment:** * String/JSON conversions * * Human readable conversions are now basically ISO 8601 with a space * (instead of 'T') as the date/time separator. This is a good baseline * and is platform independent. * * A shared native helper to provide many conversions. Magic value contains * a set of flags. The helper provides: * * toString() * toDateString() * toTimeString() * toLocaleString() * toLocaleDateString() * toLocaleTimeString() * toUTCString() * toISOString() * * Notes: * * - Date.prototype.toGMTString() and Date.prototype.toUTCString() are * required to be the same EcmaScript function object (!), so it is * omitted from here. * * - Date.prototype.toUTCString(): E5.1 specification does not require a * specific format, but result should be human readable. The * specification suggests using ISO 8601 format with a space (instead of 'T') separator if a more human readable format is not available. * * - Date.prototype.toISOString(): unlike other conversion functions, * toISOString() requires a RangeError for invalid date values.
label: code-design
36873. -> [... this]
36874. 16: getHours
36875. Note2
36876. char loop
36877. 33: setUTCDate
36878. 25: setUTCMilliseconds
36879. Use explicit steps in computation to try to ensure that * computation happens with intermediate results coerced to * double values (instead of using something more accurate). * E.g. E5.1 Section 15.9.1.11 requires use of IEEE 754 * rules (= EcmaScript '+' and '*' operators). * * Without 'volatile' even this approach fails on some platform * and compiler combinations. For instance, gcc 4.8.1 on Ubuntu * 64-bit, with -m32 and without -std=c99, test-bi-date-canceling.js * would fail because of some optimizations when computing tmp_time * (MakeTime below). Adding 'volatile' to tmp_time solved this * particular problem (annoyingly, also adding debug prints or * running the executable under valgrind hides it).
36880. match against rule part/sep bits
36881. Coerce all finite parts with ToInteger(). ToInteger() must not * be called for NaN/Infinity because it will convert e.g. NaN to * zero. If ToInteger() has already been called, this has no side * effects and is idempotent. * * Don't read dparts[DUK_DATE_IDX_WEEKDAY]; it will cause Valgrind * issues if the value is uninitialized.
36882. NaN timevalue: we need to coerce the arguments, but * the resulting internal timestamp needs to remain NaN. * This works but is not pretty: parts and dparts will * be partially uninitialized, but we only write to them.

36883. Rule table: first matching rule is used to determine what to do next.
36884. flags
36885. fits into duk_small_int_t
36886. 'out_buf' must be at least DUK_BI_DATE_ISO8601_BUFSIZE long.
36887. formatters always get one-based month/day-of-month
36888. Setter APIs detect special year numbers (0...99) and apply a +1900 * only in certain cases. The legacy getYear() getter applies -1900 * unconditionally.
36889. 2: toTimeString
36890. **comment:** TimeClip() should never be necessary
label: code-design
36891. continue matching, set neg_tzoffset flag
36892. -> [... this timeval_new]
36893. 30: setHours
36894. TimeClip(), which also handles Infinity -> NaN conversion
36895. unsigned
36896. zero-based day
36897. 34: setMonth
36898. Note: rely on index ordering
36899. Parser part masks.
36900. 20: getSeconds
36901. Expects 'this' at top of stack on entry.
36902. 28: setMinutes
36903. t1 = milliseconds within day (fits 32 bit) * t2 = day number from epoch (fits 32 bit, may be negative)
36904. * Indirect magic value lookup for Date methods. ** Date methods don't put their control flags into the function magic value * because they wouldn't fit into a LIGHTFUNC's magic field. Instead, the * magic value is set to an index pointing to the array of control flags * below. ** This must be kept in strict sync with genbuiltins.py!
36905. Day-of-month is one-based in the API, but zero-based * internally, so fix here. Note that month is zero-based * both in the API and internally.
36906. 1
36907. * Determining which datetime components to overwrite based on * stack arguments is a bit complicated, but important to factor * out from setters themselves for compactness. ** If DUK_DATE_FLAG_TIMESETTER, maxnargs indicates setter type: ** 1 -> millisecond * 2 -> second, [millisecond] * 3 -> minute, [second], [millisecond] * 4 -> hour, [minute], [second], [millisecond] ** Else: ** 1 -> date * 2 -> month, [date] * 3 -> year, [month], [date] ** By comparing nargs and maxnargs (and flags) we know which * components to override. We rely on part index ordering.
36908. zero-based month
36909. Parser part count.
36910. 6: toUTCString
36911. no argument given -> leave components untouched
36912. msec
36913. Compute time value from (double) parts. The parts can be either UTC * or local time; if local, they need to be (conceptually) converted into * UTC time. The parts may represent valid or invalid time, and may be * wildly out of range (but may cancel each other and still come out in * the valid Date range).
36914. Matching separator index is used in the control table
36915. don't care value, year is mandatory
36916. **comment:** * Date built-ins ** Unlike most built-ins, Date has some platform dependencies for getting * UTC time, converting between UTC and local time, and parsing and * formatting time values. These are all abstracted behind DUK_USE_xxx * config options. There are built-in platform specific providers for * POSIX and Windows, but external providers can also be used. ** See doc/datetime.rst.
label: code-design
36917. SCANBUILD: complains about use of uninitialized values. * The complaint is correct, but operating in undefined * values here is intentional in some cases and the caller * ignores the results.
36918. 27: setUTCSeconds
36919. unreferenced with some options
36920. 36: setFullYear
36921. -> [this]
36922. Leaves new timevalue on stack top and returns 1, which is correct * for part setters.
36923. 4
36924. 21: getUTCSeconds
36925. seconds, doesn't fit into 16 bits
36926. Equivalent year for DST calculations outside [1970,2038[range, see * E5 Section 15.9.1.8. Equivalent year has the same leap-year-ness and * starts with the same weekday on Jan 1. * https://bugzilla.mozilla.org/show_bug.cgi?id=351066
36927. may be NaN
36928. 3: toLocaleString
36929. 17: getUTCHours
36930. 22: getMilliseconds
36931. Set datetime parts from stack arguments, defaulting any missing values. * Day-of-week is not set; it is not required when setting the time value.
36932. 12: getDate
36933. There are at most 7 args, but we use 8 here so that also * DUK_DATE_IDX_WEEKDAY gets initialized (to zero) to avoid the potential * for any Valgrind gripes later.
36934. 35: setUTCMonth
36935. Special handling for year sign.
36936. caller checks
36937. 24: setMilliseconds
36938. MakeTime
36939. 0x08583b00
36940. 5
36941. If 'day' is NaN, returns NaN.
36942. **comment:** DUK_USE_DATE_GET_LOCAL_TZOFFSET() needs to be called with a * time value computed from UTC parts. At this point we only * have 'd' which is a time value computed from local parts, so * it is off by the UTC-to-local time offset which we don't know * yet. The current solution for computing the UTC-to-local * time offset is to iterate a few times and detect a fixed * point or a two-cycle loop (or a sanity iteration limit), * see test-bi-date-local-parts.js and test-bi-date-tzoffset-basic-fi.js. ** E5.1 Section 15.9.1.9: * UTC(t) = t - LocalTZA - DaylightSavingTA(t - LocalTZA) * * For NaN/inf, DUK_USE_DATE_GET_LOCAL_TZOFFSET() returns 0.
label: code-design
36943. 9: getUTCFullYear
36944. During parsing, month and day are one-based; set defaults here.
36945. The algorithm in E5.1 Section 15.9.1.12 normalizes month, but * does not normalize the day-of-month (nor check whether or not * it is finite) because it's not necessary for finding the day * number which matches the (year,month) pair. ** We assume that duk_day_from_year() is exact here. ** Without an explicit infinity / NaN check in the beginning, * day_num would be a bogus integer here. ** It's possible for 'year' to be out of integer range here. * If so, we need to return NaN without integer overflow. * This fixes test-bug-setyear-overflow.js.
36946. MakeDay
36947. Push 'this' binding, check that it is a Date object; then push the * internal time value. At the end, stack is: [... this timeval]. * Returns the time value. Local time adjustment is done if requested.

36948. Helper for component getter calls: check 'this' binding, get the * internal time value, split it into parts (either as UTC time or * local time), push a specified component as a return value to the * value stack and return 1 (caller can then tail call us).

36949. Different calling convention than above used because the helper * is shared.

36950. non-leap year: sunday, monday, ...

36951. Note1: the specification doesn't require matching a time form with * just hours ("HH"), but we accept it here, e.g. "2012-01-02T12Z". ** Note2: the specification doesn't require matching a timezone offset * with just hours ("HH"), but accept it here, e.g. "2012-01-02T03:04:05+02"

36952. * API oriented helpers

36953. 11: getUTCMonth

36954. leap year: sunday, monday, ...

36955. **comment:** This shouldn't be necessary, but check just in case * to avoid any chance of overruns.
label: code-design

36956. Note: DST adjustment is determined using UTC time.

36957. handle negative values

36958. 32: setDate

36959. Note: DST adjustment is determined using UTC time. * If 'd' is NaN, tzoffset will be 0.

36960. **comment:** XXX: idx_val would fit into 16 bits, but using duk_small_uint_t * might not generate better code due to casting.
label: code-design

36961. 7: toISOString

36962. **comment:** * Setters. ** Setters are a bit more complicated than getters. Component setters * break down the current time value into its (normalized) component * parts, replace one or more components with -unnormalized- new values, * and the components are then converted back into a time value. As an * example of using unnormalized values: ** var d = new Date(1234567890); ** is equivalent to: ** var d = new Date(0); * d.setUTCSeconds(1234567890); ** A shared native helper to provide almost all setters. Magic value * contains a set of flags and also packs the "maxnargs" argument. The * helper provides: ** setMilliseconds() * setUTCSeconds() * setUTCMinutes() * setUTCHours() * setDate() * setUTCDate() * setMonth() * setUTCMonth() * setFullYear() * setUTCFullYear() * setYear() ** Notes: ** - Date.prototype.setYear() (Section B addition): special year check * is omitted. NaN / Infinity will just flow through and ultimately * result in a NaN internal time value. ** - Date.prototype.setYear() does not have optional arguments for * setting month and day-in-month (like setFullYear()), but we indicate * 'maxnargs' to be 3 to get the year written to the correct component * index in duk_set_part_helper(). The function has nargs == 1, so only * the year will be set regardless of actual argument count.
label: code-design

36963. 13: getUTCDate

36964. No locale specific formatter; this is OK, we fall back * to ISO 8601.

36965. 2

36966. Maximum iteration count for computing UTC-to-local time offset when * creating an Ecmascript time value from local parts.

36967. Assume that year, month, day are all coerced to whole numbers. * They may also be NaN or infinity, in which case this function * must return NaN or infinity to ensure time value becomes NaN. * If 'day' is NaN, the final return will end up returning a NaN, * so it doesn't need to be checked here.

36968. 23: getUTCSeconds

36969. -> [timeval this]

36970. We should never exit the loop above.

36971. e.g. a = -4, b = 5 --> -4 - 5 + 1 / 5 --> -8 / 5 --> -1 * a = -5, b = 5 --> -5 - 5 + 1 / 5 --> -9 / 5 --> -1 * a = -6, b = 5 --> -6 - 5 + 1 / 5 --> -10 / 5 --> -2

36972. Parser separator indices.

36973. -> [... this timeval_new timeval_new]

36974. "-1234560"

36975. rule match

36976. deal with negative values

36977. 10: getMonth

36978. * Calendar helpers ** Some helpers are used for getters and can operate on normalized values * which can be represented with 32-bit signed integers. Other helpers are * needed by setters and operate on un-normalized double values, must watch * out for non-finite numbers etc.

36979. **comment:** Debug macro to print all parts and dparts (used manually because of debug level).
label: code-design

36980. Unlike year, the other parts fit into 16 bits so %d format * is portable.

36981. * Date/time parsing helper. ** Parse a datetime string into a time value. We must first try to parse * the input according to the standard format in E5.1 Section 15.9.1.15. * If that fails, we can try to parse using custom parsing, which can * either be platform neutral (custom code) or platform specific (using * existing platform API calls). ** Note in particular that we must parse whatever toString(), toUTCString(), * and toISOString() can produce; see E5.1 Section 15.9.4.2. ** Returns 1 to allow tail calling. ** There is much room for improvement here with respect to supporting * alternative datetime formats. For instance, V8 parses '2012-01-01' as * UTC and '2012/01/01' as local time.

36982. unpack args

36983. Set timeval to 'this' from dparts, push the new time value onto the * value stack and return 1 (caller can then tail call us). Expects * the value stack to contain 'this' on the stack top.

36984. Given a day number, determine year and day-within-year.

36985. Parser separator masks.

36986. Equivalent year mapping, used to avoid DST trouble when platform * may fail to provide reasonable DST answers for dates outside the * ordinary range (e.g. 1970-2038). An equivalent year has the same * leap-year-ness as the original year and begins on the same weekday * (Jan 1). ** The year 2038 is avoided because there seem to be problems with it * on some platforms. The year 1970 is also avoided as there were * practical problems with it; an equivalent year is used for it too, * which breaks some DST computations for 1970 right now, see e.g. * test-bi-date-tzoffset-brute-fi.js.

36987. * Helper to format a time value into caller buffer, used by logging. * 'out_buf' must be at least DUK_BI_DATE_ISO8601_BUFSIZE long.

36988. * Constructor calls

36989. Helper for component setter calls: check 'this' binding, get the * internal time value, split it into parts (either as UTC time or * local time), modify one or more components as specified, recompute * the time value, set it as the internal value. Finally, push the * new time value as a return value to the value stack and return 1 * (caller can then tail call us).

36990. ignore millisecond fractions after 3

36991. try locale specific formatter; if it refuses to format the * string, fall back to an ISO 8601 formatted value in local * time.

36992. 15: getUTCDay

36993. This assert depends on the input parts representing time inside * the Ecmascript range.

36994. **comment:** XXX: getter with class check, useful in built-ins
label: code-design

36995. get as double to handle huge numbers correctly

36996. these computations are guaranteed to be exact for the valid * E5 time value range, assuming milliseconds without fractions.

36997. if no NaN handling flag, may still be NaN here, but not Inf

36998. 0: toString

36999. 26: setSeconds

37000. Split time value into parts. The time value is assumed to be an internal * one, i.e. finite, no fractions. Possible local time adjustment has already * been applied when reading the time value.

37001. Because 'day since epoch' can be negative and is used to compute weekday * using a modulo operation, add this multiple of 7 to avoid negative values * when year is below 1970 epoch. Ecmascript time values are restricted to * +/- 100 million days from epoch, so this adder fits nicely into 32 bits. * Round to a multiple of 7 (= floor(100000000 / 7) * 7) and add margin.

37002. Contract, either: * - Push string to value stack and return 1 * - Don't push anything and return 0

37003. 19: getUTCMonth

37005. **comment:** Note: this is very tricky; we must never 'overshoot' the * correction downwards.

label: code-design

37006. * Forward declarations

37007. conservative

37008. Note: in integer arithmetic, $(x / 4)$ is same as $\text{floor}(x / 4)$ for non-negative * values, but is incorrect for negative ones.

37009. Compute day number of the first day of a given year.

37010. 29: setUTCMinutes

37011. Behavior for nargs < 2 is implementation dependent: currently we'll * set a NaN time value (matching V8 behavior) in this case.

37012. "+11:22:0"

37013. Note: toJSON() is a generic function which works even if 'this' * is not a Date. The sole argument is ignored.

37014. **comment:** Two value cycle, see e.g. test-bi-date-tzoffset-basic-fi.js. * In these cases, favor a higher tzoffset to get a consistent * result which is independent of iteration count. Not sure if * this is a generically correct solution.**label:** code-design

37015. complete the millisecond field

37016. * Getters. ** Implementing getters is quite easy. The internal time value is either * NaN, or represents milliseconds (without fractions) from Jan 1, 1970. * The internal time value can be converted to integer parts, and each * part will be normalized and will fit into a 32-bit signed integer. ** A shared native helper to provide all getters. Magic value contains * a set of flags and also packs the date component index argument. The * helper provides: * * getFullYear() * getUTCFullYear() * getMonth() * getUTCMonth() * getDate() * getUTCDate() * getDay() * getUTCDay() * getHours() * getUTCHours() * getMinutes() * getUTCMinutes() * getSeconds() * getUTCSecs() * getMilliseconds() * getUTCMilliseconds() * getYear() * * Notes: * * - Date.prototype.getDate(): 'date' means day-of-month, and is * zero-based in internal calculations but public API expects it to * be one-based. * * - Date.prototype.getTime() and Date.prototype.valueOf() have identical * behavior. They have separate function objects, but share the same C * function (duk_bi_date_prototype_value_of).

37017. day number for Jan 1 since epoch

37018. -> [... this timeval]

37019. Parser part indices.

37020. no fractions in internal time

37021. no need to mask idx portion

37022. does not fit into 16 bits

37023. This is based on Rhino EquivalentYear() algorithm: *

<https://github.com/mozilla/rhino/blob/f99cc11d616f0cdda2c42bde72b3484df6182947/src/org.mozilla/javascript/NativeDate.java>

37024. 0

37025. Iteration solution

37026. accept string if next char is NUL (otherwise reject)

37027. SCANBUILD: scan-build complains here about assigned value * being garbage or undefined. This is correct but operating * on undefined values has no ill effect and is ignored by the * caller in the case where this happens.

37028. 31: setUTCHours

37029. This native function is also used for Date.prototype.getTime() * as their behavior is identical.

37030. Note1

37031. Given a (year, month, day-within-month) triple, compute day number. * The input triple is un-normalized and may contain non-finite values.

37032. accept string

37033. No platform-specific parsing, this is not an error.

37034. Apply ToNumber() to specified index; if ToInteger(val) in [0,99], add * 1900 and replace value at idx_val.

37035. 4: toLocaleDateString

37036. This is based on V8 EquivalentYear() algorithm (see src/genequivyear.py): * <http://code.google.com/p/v8/source/browse/trunk/src/date.h#146>

37037. Use double parts, they tolerate unnormalized time. ** Note: DUK_DATE_IDX_WEEKDAY is initialized with a bogus value (DUK_PI_TZHOUR) * on purpose. It won't be actually used by duk_bi_date_get_timeval_from_dparts(), * but will make the value initialized just in case, and avoid any * potential for Valgrind issues.

37038. See comments below on MakeTime why these are volatile.

37039. Contract, either: * - Push value on stack and return 1 * - Don't push anything on stack and return 0

37040. E5 Sections 15.9.3.1, B.2.4, B.2.5

37041. tzoffset

37042. The timevalue must be in valid Ecmascript range, but since a local * time offset can be applied, we need to allow a +/- 24h leeway to * the value. In other words, although the UTC time is within the * Ecmascript range, the local part values can be just outside of it.

37043. seconds

37044. 18: getMinutes

37045. Buffer sizes for some UNIX calls. Larger than strictly necessary * to avoid Valgrind errors.

37063. copy to buffer with spare to avoid Valgrind gripes from strftime

37064. valgrind whine without this

37065. This check used to be for $(t < 0)$ but on some platforms * time_t is unsigned and apparently the proper way to detect * an mktime() error return is the cast above. See e.g.: * <http://pubs.opengroup.org/onlinepubs/009695299/functions/mktime.html>

37066. * Unix-like Date providers ** Generally useful Unix / POSIX / ANSI Date providers.

37067. DUK_USE_DATE_NOW_TIME

37068. Get current Ecmascript time (= UNIX/Posix time, but in milliseconds).

37069. UTC

37070. * This is a bit tricky to implement portably. The result depends * on the timestamp (specifically, DST depends on the timestamp). * If e.g. UNIX APIs are used, they'll have portability issues with * very small and very large years. ** Current approach: * * - Stay within portable UNIX limits by using equivalent year mapping. * Avoid year 1970 and 2038 as some conversions start to fail, at * least on some platforms. Avoiding 1970 means that there are * currently DST

discrepancies for 1970. ** - Create a UTC and local time breakdowns from 't'. Then create * a time_t using gmtime() and localtime() and compute the time * difference between the two. ** Equivalent year mapping (E5 Section 15.9.1.8): ** If the host environment provides functionality for determining * daylight saving time, the implementation of ECMAScript is free * to map the year in question to an equivalent year (same * leap-year-ness and same starting week day for the year) for which * the host environment provides daylight saving time information. * The only restriction is that all equivalent years should produce * the same result. ** This approach is quite reasonable but not entirely correct, e.g. * the specification also states (E5 Section 15.9.1.8): ** The implementation of ECMAScript should not try to determine * whether the exact time was subject to daylight saving time, but * just whether daylight saving time would have been in effect if * the _current daylight saving time algorithm_ had been used at the * time. This avoids complications such as taking into account the * years that the locale observed daylight saving time year round. ** Since we rely on the platform APIs for conversions between local * time and UTC, we can't guarantee the above. Rather, if the platform * has historical DST rules they will be applied. This seems to be the * general preferred direction in Ecmascript standardization (or at least * implementations) anyway, and even the equivalent year mapping should * be disabled if the platform is known to handle DST properly for the * full Ecmascript range. ** The following has useful discussion and links: ** https://bugzilla.mozilla.org/show_bug.cgi?id=351066

37071. local

37072. DUK_USE_DATE_FMT_STRFTIME

37073. tm_isdst is both an input and an output to mktime(), use 0 to * avoid DST handling in mktime(): * - <https://github.com/svaarala/duktape/issues/406> * - <http://stackoverflow.com/questions/8558919/mktime-and-tm-isdst>

37074. flags

37075. For this to work, DATEMSK must be set, so this is not very * convenient for an embeddable interpreter.

37076. If not within Ecmascript range, some integer time calculations * won't work correctly (and some asserts will fail), so bail out * if so. This fixes test-bug-date-insane-setyear.js. There is * a +/- 24h leeway in this range check to avoid a test262 corner * case documented in test-bug-date-timeval-edges.js.

37516. -> [... key val toJSON val key]

37517. Caller ensures space for at least DUK_JSON_MAX_ESC_LEN.

37518. Zero length string is not accepted without quotes

37519. Getter might have arbitrary side effects, * so bail out.

37520. nret

37521. Negative zero needs special handling in JX/JC because * it would otherwise serialize to '0', not '-0'.

37522. -> [... voidp voidp]

37523. [... holder name val enum obj_key new_elem]

37524. Disabled until fixed, see above.

37525. Error message doesn't matter: the error is ignored anyway.

37526. -> [... key val]

37527. Value would normally be omitted, replace with 'null'.

37528. Value would yield 'undefined', so skip key altogether. * Side effects have already happened.

37529. XXX: array internal?

37530. For JX, expressing the whole unsigned 32-bit range matters.

37531. Caller must ensure 'tv' is indeed a fastint!

37532. safe

37533. will result in undefined

37534. **comment:** Execute the fast path in a protected call. If any error is thrown, * fall back to the slow path. This includes e.g. recursion limit * because the fast path has a smaller recursion limit (and simpler, * limited loop detection).

label: code-design

37535. typed for duk_unicode_decode_xutf8()

37536. **comment:** XXX: Would be nice to share the fast path loop from duk_hex_decode() * and avoid creating a temporary buffer. However, there are some * differences which prevent trivial sharing: * * - Pipe char detection * - EOF detection * - Unknown length of input and output * * The best approach here would be a bufwriter and a reasonably sized * safe inner loop (e.g. 64 output bytes at a time).

label: code-design

37537. Once recursion depth is increased, exit path must decrease * it (though it's OK to abort the fast path).
37538. If object has a .toJSON() property, we can't be certain * that it wouldn't mutate any value arbitrarily, so bail * out of the fast path. ** If an object is a Proxy we also can't avoid side effects * so abandon.
37539. **comment:** Unlike in duk_hex_encode() 'dst' is not necessarily aligned by 2. * For platforms where unaligned accesses are not allowed, shift 'dst' * ahead by 1 byte to get alignment and then DUK_MEMMOVE() the result * in place. The faster encoding loop makes up the difference. * There's always space for one extra byte because a terminator always * follows the hex data and that's been accounted for by the caller.
- label:** code-design
37540. catches EOF (NUL)
37541. The code below is incorrect if .toString() or .valueOf() have * have been overridden. The correct approach would be to look up * the method(s) and if they resolve to the built-in function we * can safely bypass it and look up the internal value directly. * Unimplemented for now, abort fast path for boxed values.
37542. accept comma, expect new value
37543. Array part may be larger than 'length'; if so, iterate * only up to array 'length'.
37544. -> [... reviver holder name val]
37545. [... holder name val]
37546. We rely on a few object flag / class number relationships here, * assert for them.
37547. Standard JSON omits functions
37548. unreachable
37549. nargs
37550. The JA(value) operation: encode array. ** Stack policy: [array] -> [array].
37551. x == 0x00 (EOF) causes syntax_error
37552. **comment:** XXX: move masks to js_ctx? they don't change during one * fast path invocation.
- label:** code-design
37553. Note: duk_dec_req_stridx() backtracks one char
37554. -> [... key val toJSON val]
37555. Here the specification requires correct array index enumeration * which is a bit tricky for sparse arrays (it is handled by the * enum setup code). We now enumerate ancestors too, although the * specification is not very clear on whether that is required.
37556. First pass parse is very lenient (e.g. allows '1.2.3') and extracts a * string for strict number parsing.
37557. -> [... key val]
37558. 0x00: slow path * other: as is
37559. value was undefined/unsupported
37560. **comment:** spaces[] must be static to allow initializer with old compilers like BCC
- label:** code-design
37561. Ordinary gap, undefined encodes to 'null' in * standard JSON (and no JX/JC support here now).
37562. Conceptually we'd extract the plain underlying buffer * or its slice and then do a type mask check below to * see if we should reject it. Do the mask check here * instead to avoid making a copy of the buffer slice.
37563. * JSON.stringify() fast path ** Otherwise supports full JSON, JX, and JC features, but bails out on any * possible side effect which might change the value being serialized. The * fast path can take advantage of the fact that the value being serialized * is unchanged so that we can walk directly through property tables etc.
37564. **comment:** XXX: helper
- label:** code-design
37565. coerce in-place
37566. Number serialization has a significant impact relative to * other fast path code, so careful fast path for fastints.
37567. [... num]
37568. * Entry points
37569. Caller has already eaten the first character ('(') which we don't need.
37570. C recursion check.

37749. [arg1 ... argN this loggerLevel loggerName 'fmt' arg]

37750. A stubbed built-in is useful for e.g. compilation torture testing with BCC.

37751. fmin() with args -0 and +0 is not guaranteed to return * -0 as Ecmascript requires.

37752. Not odd, or y == -Infinity

37753. fmax() with args -0 and +0 is not guaranteed to return * +0 as Ecmascript requires.

37754. Wrappers for calling standard math library methods. These may be required * on platforms where one or more of the math built-ins are defined as macros * or inline functions and are thus not suitable to be used as function pointers.

37755. Numbers half-way between integers must be rounded towards +Infinity, * e.g. -3.5 must be rounded to -3 (not -4). When rounded to zero, zero * sign must be set appropriately. E5.1 Section 15.8.2.15. ** Note that ANSI C round() is "round to nearest integer, away from zero", * which is incorrect for negative values. Here we make do with floor().

37756. DUK_USE_MATH_BUILTIN

37757. See test-bug-netbsd-math-pow.js: NetBSD 6.0 on x86 (at least) does not * correctly handle some cases where x=+/-0. Specific fixes to these * here.

37758. * Note: fmax() does not match the E5 semantics. E5 requires * that if -any- input to Math.max() is a NaN, the result is a * NaN. fmax() will return a NaN only if both- inputs are NaN. * Same applies to fmin(). * * Note: every input value must be coerced with ToNumber(), even * if we know the result will be a NaN anyway: ToNumber() may have * side effects for which even order of evaluation matters.

37759. * x is finite and non-zero ** -1.6 -> floor(-1.1) -> -2 * -1.5 -> floor(-1.0) -> -1 (towards +Inf) * -1.4 -> floor(-0.9) -> -1 * -0.5 -> -0.0 (special case) * -0.1 -> -0.0 (special case) * +0.1 -> +0.0 (special case) * +0.5 -> floor(+1.0) -> 1 (towards +Inf) * +1.4 -> floor(+1.9) -> 1 * +1.5 -> floor(+2.0) -> 2 (towards +Inf) * +1.6 -> floor(+2.1) -> 2

37760. order must match constants in genbuiltins.py

37761. DUK_USE_AVOID_PLATFORM_FUNCPTRS

37762. * Math built-ins

37763. +0.5 is handled by floor, this is on purpose

37764. Math.pow(-0,y) where y<0 should be: * - -Infinity if y<0 and an odd integer * - Infinity otherwise * NetBSD pow() returns -Infinity for all finite y<0. The * if- clause also catches y == -Infinity (which works even * without the fix).

37765. Note: not normalized, but duk_push_number() will normalize

37766. **comment:** XXX: what's the safest way of creating a negative zero?

label: code-design

37767. Math.pow(+0,y) should be Infinity when y<0. NetBSD pow() * returns -Infinity instead when y is <0 and finite. The * if-clause also catches y == -Infinity (which works even * without the fix).

37768. The ANSI C pow() semantics differ from Ecmascript. ** E.g. when x==1 and y is +/- infinite, the Ecmascript required * result is NaN, while at least Linux pow() returns 1.

37769. fmod() return value has same sign as input (negative) so * the result here will be in the range]-2,0], 1 indicates * odd. If x is -Infinity, NaN is returned and the odd check * always concludes "not odd" which results in desired outcome.

37770. * Use static helpers which can work with math.h functions matching * the following signatures. This is not portable if any of these math * functions is actually a macro. ** Typing here is intentionally 'double' wherever values interact with * the standard library APIs.

37771. The specification has quite awkward order of coercion and * checks for toPrecision(). The operations below are a bit * reordered, within constraints of observable side effects.

37772. * E5 Section 15.7.2.1 requires that the constructed object * must have the original Number.prototype as its internal * prototype. However, since Number.prototype is non-writable * and non-configurable, this doesn't have to be enforced here: * The default object (bound to 'this') is OK, though we have * to change its class. * * Internal value set to ToNumber(arg) or +0; if no arg given, * ToNumber(undefined) = NaN, so special treatment is needed * (above). String internal value is immutable.

37773. digits

37774. leading digit + fractions

37799. **comment:** XXX: for Object.keys() the [[OwnPropertyKeys]] result (trap result) * should be filtered so that only enumerable keys remain. Enumerability * should be checked with [[GetOwnProperty]] on the original object * (i.e., the proxy in this case). If the proxy has a getOwnPropertyDescriptor * trap, it should be triggered for every property. If the proxy doesn't have * the trap, enumerability should be checked against the target object instead. * We don't do any of this now, so Object.keys() and Object.getOwnPropertyNames() * return the same result now for proxy traps. We still do clean up the trap * result, so that Object.keys() and Object.getOwnPropertyNames() will return a * clean array of strings without gaps.

37897. flags: "i"
37898. [regexp source bytecode]
37899. result object is created and discarded; wasteful but saves code space
37900. stack[0] = separator (string or regexp) * stack[1] = limit * stack[2] = input string * stack[3] = result array
37901. * The specification uses RegExp [[Match]] to attempt match at specific * offsets. We don't have such a primitive, so we use an actual RegExp * and tweak
 lastIndex. Since the RegExp may be non-global, we use a * special variant which forces global-like behavior for matching.
37902. * Case conversion
37903. **comment:** XXX: It would be nice to build the string directly but ToUint16() * coercion is needed so a generic helper would not be very * helpful (perhaps coerce
 the value stack first here and then * build a string from a duk_tval number sequence in one go?).
 label: code-design
37904. lastIndex already set up for next match
37905. DUK_USE_REGEXP_SUPPORT
37906. Empty searchstring always matches; cpos must be clamped here. * (If q_blen were < 0 due to clamped coercion, it would also be * caught here.)
37907. [regexp string]
37908. **comment:** This loop is optimized for size. For speed, there should be * two separate loops, and we should ensure that memcmp() can be * used without an extra
 "will searchstring fit" check. Doing * the preconditioning for 'p' and 'p_end' is easy but cpos * must be updated if 'p' is wound back (backward scanning).
 label: code-design
37909. The current implementation of localeCompare() is simply a codepoint * by codepoint comparison, implemented with a simple string compare * because UTF-8
 should preserve codepoint ordering (assuming valid * shortest UTF-8 encoding). * * The specification requires that the return value must be related * to the sort
 order: e.g. negative means that 'this' comes before * 'that' in sort order. We assume an ascending sort order.
37910. prefix matches, lengths matter now
37911. min(incl)
37912. not found
37913. stack[0] = search value * stack[1] = replace value * stack[2] = input string * stack[3] = result buffer * stack[4] = regexp match OR match string
37914. For Ecmascript strings, this check can only match for * initial UTF-8 bytes (not continuation bytes). For other * strings all bets are off.
37915. match == search string, by definition
37916. res_obj
37917. ToUint16() coercion is mandatory in the E5.1 specification, but * this non-compliant behavior makes more sense because we support * non-BMP codepoints. Don't
 use CESU-8 because that'd create * surrogate pairs.
37918. match string
37919. empty match (may happen with empty separator) -> bump and continue
37920. * Various
37921. * toString(), valueOf()
37922. when going backwards, we decrement cpos 'early'; * 'p' may point to a continuation byte of the char * at offset 'cpos', but that's OK because we'll * backtrack all
 the way to the initial byte.
37923. trailer
37924. don't allow an empty match at the end of the string
37925. [... replacer match [captures] match_char_offset input]

37926. XXX: There are several limitations in the current implementation for * strings with $\geq 0x80000000UL$ characters. In some cases one would need * to be able to represent the range [-0xffffffff, 0xffffffff] and so on. * Generally character and byte length are assumed to fit into signed 32 * bits ($< 0x80000000UL$). Places with issues are not marked explicitly * below in all cases, look for signed type usage (duk_int_t etc) for * offsets/lengths.

37927. **comment:** XXX: could share code with duk_js_ops.c, duk_js_compare_helper
label: code-design

37928. * indexOf() and lastIndexOf()
37929. ch1 = (r_increment << 8) + byte
37930. * If matching with a regexp: * - non-global RegExp: lastIndex not touched on a match, zeroed * on a non-match * - global RegExp: on match, lastIndex will be updated by regexp * executor to point to next char after the matching part (so that * characters in the matching part are not matched again) * * If matching with a string: * - always non-global match, find first occurrence * * We need: * - The character offset of start-of-match for the replacer function * - The byte offsets for start-of-match and end-of-match to implement * the replacement values \$\$, \$` and \$', and to copy non-matching * input string portions (including header and trailer) verbatim. * * NOTE: the E5.1 specification is a bit vague how the RegExp should * behave in the replacement process; e.g. is matching done first for * all matches (in the global RegExp case) before any replacer calls * are made? See: test-bi-string-proto-replace.js for discussion.

37931. return as is
37932. repl_value
37933. Not found. Empty string case is handled specially above.

38315. --- AmigaOS ---

38316. BCC, assume we're on x86.
38317. Pointer size determination based on __WORDSIZE or architecture when * that's not available.
38318. Unsigned index variant.
38319. External provider already defined.
38320. Byte order varies, so rely on autodetect.
38321. DUK_USE_UNION_INITIALIZERS: required from compilers, so no fill-in.
38322. **comment:** Special naming to avoid conflict with e.g. DUK_FREE() in duk_heap.h * (which is unfortunately named). May sometimes need replacement, e.g. * some compilers don't handle zero length or NULL correctly in realloc().
label: code-design
38323. empty
38324. --- MSVC ---
38325. We're generally assuming that we're working on a platform with a 32-bit * address space. If DUK_SIZE_MAX is a typecast value (which is necessary * if SIZE_MAX is missing), the check must be avoided because the * preprocessor can't do a comparison.
38326. 64-bit constants. Since LL / ULL constants are not always available, * use computed values. These values can't be used in preprocessor * comparisons; flag them as such.
38327. --- x86 ---
38328. --- MIPS 32-bit ---
38329. XXX: add feature options to force basic types from outside?
38330. Array index values, could be exact 32 bits. * Currently no need for signed duk_arridx_t.
38331. SIZE_MAX may be missing so use an approximate value for it.
38332. DUK_F_BCC
38333. Complex condition broken into separate parts.
38334. POSIX
38335. If not provided, use safe default for alignment.
38336. * Date provider selection * * User may define DUK_USE_DATE_GET_NOW() etc directly, in which case we'll * rely on an external provider. If this is not done, revert to previous * behavior and use Unix/Windows built-in provider.
38337. Cannot determine byte order.
38338. --- Cygwin ---
38339. !defined(DUK_USE_BYTEORDER) && defined(__BYTE_ORDER__)
38340. More or less standard endianness predefines provided by header files. * The ARM hybrid case is detected by assuming that __FLOAT_WORD_ORDER * will be big endian, see: <http://lists.mysql.com/internals/443>. * On some platforms some defines may be present with an empty value which * causes comparisons to fail: <https://github.com/svaarala/duktape/issues/453>.
38341. !defined(DUK_USE_BYTEORDER)
38342. **comment:** For custom platforms allow user to define byteorder explicitly. * Since endianness headers are not standardized, this is a useful * workaround for custom platforms for which endianness detection * is not directly supported. Perhaps custom hardware is used and * user cannot submit upstream patches.
label: code-design
38343. **comment:** Don't know how to declare unreachable point, so don't do it; this * may cause some spurious compilation warnings (e.g. "variable used * uninitialized").
label: code-design
38344. Good default is a bit arbitrary because alignment requirements * depend on target. See <https://github.com/svaarala/duktape/issues/102>.
38345. --- Windows ---
38346. User provided InitJS.
38347. These have been tested from VS2008 onwards; may work in older VS versions * too but not enabled by default.
38348. Error codes are represented with platform int. High bits are used * for flags and such, so 32 bits are needed.
38349. Intermediate define for 'have inttypes.h'
38350. build is not C99 or C++11, play it safe
38351. GCC: test not very accurate; enable only in relatively recent builds * because of bugs in gcc-4.4 (<http://lists.debian.org/debian-gcc/2010/04/msg00000.html>)
38352. Intel x86 (32-bit), x64 (64-bit) or x32 (64-bit but 32-bit pointers), * define only one of DUK_F_X86, DUK_F_X64, DUK_F_X32. * <https://sites.google.com/site/x32abi/>
38353. Enabled with debug/assertions just so that any issues can be caught.
38354. C99 or compatible
38355. --- Mac OSX, iPhone, Darwin ---
38356. C99 or above
38357. MinGW. Also GCC flags (DUK_F_GCC) are enabled now.
38358. This detection is not very reliable.
38359. Support for 48-bit signed integer duk_tval with transparent semantics.
38360. GCC and Clang provide endianness defines as built-in predefines, with * leading and trailing double underscores (e.g. __BYTE_ORDER__). See * output of "make gcpredes" and "make clangpredes". Clang doesn't * seem to provide __FLOAT_WORD_ORDER__; assume not mixed endian for clang. * <http://gcc.gnu.org/onlinedocs/cpp/Common-Predefined-Macros.html>
38361. 64-bit type detection is a bit tricky. * * ULLONG_MAX is a standard define. __LONG_LONG_MAX__ and __ULONGLONG_MAX__ * are used by at least GCC (even if system headers don't provide ULLONG_MAX). * Some GCC variants may provide __LONG_LONG_MAX__ but not __ULONGLONG_MAX__. * * ULL / LL constants are rejected / warned about by some compilers, even if * the compiler has a 64-bit type and the compiler/system headers provide an * unsupported constant (ULL/LL)! Try to avoid using ULL / LL constants. * As a side effect we can only check that e.g. ULONG_MAX is larger than 32 * bits but can't be sure it is exactly 64 bits. Self tests will catch such * cases.
38362. Convert any input pointer into a "void **", losing a const qualifier. * This is not fully portable because casting through duk_uintptr_t may * not work on all architectures (e.g. those with long, segmented pointers).
38363. Small integers (16 bits or more) can fall back to the 'int' type, but * have a typedef so they are marked "small" explicitly.
38364. **comment:** Most portable, potentially wastes space
label: code-design
38365. PowerPC
38366. --- Solaris ---
38367. **comment:** Technically C99 (C++11) but found in many systems. On some systems * __STDC_LIMIT_MACROS and __STDC_CONSTANT_MACROS must be defined before * including stdint.h (see above).
label: code-design
38368. Missing some obvious constants.
38369. No provider for DUK_USE_DATE_PARSE_STRING(), fall back to ISO 8601 only.
38370. no endian.h or stdint.h
38371. --- Atari ST TOS ---
38372. GCC: assume we have __va_copy() in non-C99 mode.
38373. User forced alignment to 4 or 8.
38374. C99 / C++11 and above: rely on va_copy() which is required.
38375. <http://bellard.org/tcc/tcc-doc.html#SEC9>
38376. Check that architecture is two's complement, standard C allows e.g. * INT_MIN to be -2**31+1 (instead of -2**31).
38377. Based on 'make checkalign' there are no alignment requirements on * Linux MIPS except for doubles, which need align by 4. Alignment * requirements vary based on target though.
38378. AmigaOS on M68k
38379. not configured for DLL build
38380. * You may add overriding #define/#undef directives below for * customization. You of course cannot un-#include or un-typedef * anything; these require direct changes above.

38381. **comment:** cannot detect 64-bit type, not always needed so don't error
label: code-design
38382. --- Generic UNIX ---
38383. std::exception
38384. A few types are assumed to always exist.

38443. --- VBCC ---

38444. On some systems SIZE_MAX can be smaller than max unsigned 32-bit value * which seems incorrect if size_t is (at least) an unsigned 32-bit type. * However, it doesn't seem useful to error out compilation if this is the * case.

38445. **comment:** On other platforms use layout 2, which requires some padding but * is a bit more natural than layout 3 in ordering the entries. Layout * 3 is currently not used.
label: code-design

38446. VS2005+ should have variadic macros even when they're not C99.

38447. illumos / Solaris

38448. DUK_COMPILING_DUKTAPE

38449. DUK_OPT_FORCE_BYTEORDER

38450. QNX

38451. since gcc-4.5

38452. **comment:** Windows 32-bit and 64-bit are currently the same.
label: code-design

38453. This is optionally used by panic handling to cause the program to segfault * (instead of e.g. abort()) on panic. Valgrind will then indicate the C * call stack leading to the panic.

38454. IEEE float/double typedef.

38455. --- ARM 32-bit ---

38456. **comment:** XXX: This is technically not guaranteed because it's possible to configure * an x86 to require aligned accesses with Alignment Check (AC) flag.
label: code-design

38457. TinyC

38458. **comment:** Note: the funny looking computations for signed minimum 16-bit, 32-bit, and * 64-bit values are intentional as the obvious forms (e.g. -0x80000000L) are * -not- portable. See code-issues.txt for a detailed discussion.
label: code-design

38459. These are necessary wild guesses.

38460. Already provided above

38461. Atari ST TOS. __TOS__ defined by PureC. No platform define in VBCC * apparently, so to use with VBCC user must define __TOS__ manually.

38462. Byte order is big endian but cannot determine IEEE double word order.

38463. --- Flashplayer (Crossbridge) ---

38464. MIPS byte order varies so rely on autodetection.

38465. stdint.h not available

38466. **comment:** The most portable way to figure out local time offset is gmtime(), * but it's not thread safe so use with caution.
label: requirement

38467. Codepoint type. Must be 32 bits or more because it is used also for * internal codepoints. The type is signed because negative codepoints * are used as internal markers (e.g. to mark EOF or missing argument). * (X)UTF-8/CESU-8 encode/decode take and return an unsigned variant to * ensure duk_uint32_t casts back and forth nicely. Almost everything * else uses the signed one.

38468. DUK_USE_VARIADIC_MACROS: required from compilers, so no fill-in.

38469. TOS on M68K is always big endian.

38470. don't use strftime() for now

38471. **comment:** not sure, not needed with C99 anyway
label: requirement

38472. C++ doesn't have standard designated union initializers ({ .foo = 1 }).

38473. --- Emscripten ---

38474. nop

38475. DLL build detection

38476. **comment:** Avoid custom date parsing and formatting for portability.
label: code-design

38477. Workaround for older C++ compilers before including <inttypes.h>, * see e.g.: https://sourceware.org/bugzilla/show_bug.cgi?id=15366

38478. * Compiler autodetection

38479. --- SPARC 32-bit ---

38480. --- Clang ---

38481. On some platforms int is 16-bit but long is 32-bit (e.g. PureC)

38482. **comment:** * Byte order and double memory layout detection * * Endianness detection is a major portability hassle because the macros * and headers are not standardized. There's even variance across UNIX * platforms. Even with "standard" headers, details like underscore count * varies between platforms, e.g. both __BYTE_ORDER and _BYTE_ORDER are used * (Crossbridge has a single underscore, for instance). * * The checks below are structured with this in mind: several approaches are * used, and at the end we check if any of them worked. This allows generic * approaches to be tried first, and platform/compiler specific hacks tried * last. As a last resort, the user can force a specific endianness, as it's * not likely that automatic detection will work on the most exotic platforms. * * Duktape supports little and big endian machines. There's also support * for a hybrid used by some ARM machines where integers are little endian * but IEEE double values use a mixed order (12345678 -> 43218765). This * byte order for doubles is referred to as "mixed endian".
label: code-design

38483. **comment:** Check whether we should use 64-bit integers or not. * * Quite incomplete now. Use 64-bit types if detected (C99 or other detection) * unless they are known to be unreliable. For instance, 64-bit types are * available on VBCC but seem to misbehave.
label: code-design

38484. VS2013+ supports union initializers but there's a bug involving union-inside-struct: * <https://connect.microsoft.com/VisualStudio/feedback/details/805981> * The bug was fixed (at least) in VS2015 so check for VS2015 for now: * <https://blogs.msdn.microsoft.com/vcblog/2015/07/01/c-compiler-front-end-fixes-in-vs2015/> * Manually tested using VS2013, CL reports 18.00.31101, so enable for VS2013 too.

38485. no user declarations

38486. DUK_CONFIG_H_INCLUDED

38487. BCC (Bruce's C compiler): this is a "torture target" for compilation

38488. Generic Unix (includes Cygwin)

38489. There was a curious bug where test-bi-date-canceling.js would fail e.g. * on 64-bit Ubuntu, gcc-4.8.1, -m32, and no -std=c99. Some date computations * using doubles would be optimized which then broke some corner case tests. * The problem goes away by adding 'volatile' to the datetime computations. * Not sure what the actual triggering conditions are, but using this on * non-C99 systems solves the known issues and has relatively little cost * on other platforms.

38490. C99 / C++11 and above: rely on va_copy() which is required. * Omit parenthesis on macro right side on purpose to minimize differences * to direct use.

38491. C99 types

38492. DUK_SIZE_MAX (= SIZE_MAX) is often reliable

38493. --- PowerPC 64-bit ---
38494. See: /opt/qnx650/target/qnx6/usr/include/sys/platform.h
38495. --- SPARC 64-bit ---
38496. On platforms without any alignment issues, layout 1 is preferable * because it compiles to slightly less code and provides direct access * to property keys.
38497. Strict C99 case: DUK_UINTPTR_MAX (= UINTPTR_MAX) should be very reliable
38498. autodetect platform
38499. **comment:** NetBSD 6.0 x86 (at least) has a few problems with pow() semantics, * see test-bug-netbsd-math-pow.js. Use NetBSD specific workaround. * (This might be a wider problem; if so, generalize the define name.)
label: code-design
38500. autodetect architecture
38501. In VBCC (0.0 / 0.0) results in a warning and 0.0 instead of NaN. * In MSVC (VS2010 Express) (0.0 / 0.0) results in a compile error. * Use a computed NaN (initialized when a heap is created at the * latest).
38502. Clang: assume we have __va_copy() in non-C99 mode.
38503. --- Bruce's C compiler ---
38504. Same as 'duk_int_t' but guaranteed to be a 'fast' variant if this * distinction matters for the CPU. These types are used mainly in the * executor where it might really matter.
38505. vbcc + AmigaOS may be missing these
38506. C99 or C++11, no known issues
38507. **comment:** XXX: DUK_LIKELY, DUK_UNLIKELY for msvc?
label: code-design
38508. Initial fix: disable secure CRT related warnings when compiling Duktape * itself (must be defined before including Windows headers). Don't define * for user code including duktape.h.
38509. varargs
38510. * Fill-ins for platform, architecture, and compiler
38511. e.g. strftime
38512. **comment:** Note: PRS and FMT are intentionally left undefined for now. This means * there is no platform specific date parsing/formatting but there is still * the ISO 8601 standard format.
label: code-design
38513. vsnprintf() is technically not part of C89 but usually available.
38514. Rely on autodetection for byte order, alignment, and packed tval.
38515. AmigaOS + M68K seems to have math issues even when using GCC cross * compilation. Use replacements for all AmigaOS versions on M68K * regardless of compiler.
38516. Byte order is little endian but cannot determine IEEE double word order.
38517. C++
38518. MIPS. Related defines: __MIPSEB__, __MIPSEL__, __mips_isa_rev, __LP64__
38519. VBCC is missing the built-ins even in C99 mode (perhaps a header issue).
38520. __MSC_VER
38521. **comment:** Macro for suppressing warnings for potentially unreferenced variables. * The variables can be actually unreferenced or unreferenced in some * specific cases only; for instance, if a variable is only debug printed, * it is unreferenced when debug printing is disabled.
label: code-design
38522. Byte order varies, rely on autodetection.
38523. Use __setjmp() on Apple by default, see GH-55.
38524. TI-Nspire (using Ndless)
38525. --- PowerPC 32-bit ---
38526. Some math functions are C99 only. This is also an issue with some * embedded environments using uclibc where uclibc has been configured * not to provide some functions. For now, use replacements whenever * using uclibc.
38527. Most portable
38528. Boolean values are represented with the platform 'int'.
38529. Shared includes: stdint.h is C99
38530. BSD variant
38531. Old uclibcs have a broken memcpy so use memmove instead (this is overly wide * now on purpose): <http://lists.uclibc.org/pipermail/uclibc-cvs/2008-October/025511.html>
38532. date.h is omitted, and included per platform
38533. * Architecture autodetection
38534. The most portable current time provider is time(), but it only has a * one second resolution.
38535. Convenience, e.g. gcc 4.5.1 == 40501; <http://stackoverflow.com/questions/6031819/emulating-gccs-built-in-unreachable>
38536. defined(DUK_USE_BYTEORDER)
38537. In VBCC (1.0 / 0.0) results in a warning and 0.0 instead of infinity. * Use a computed infinity (initialized when a heap is created at the * latest).
38538. For now, hash part is dropped if and only if 16-bit object fields are used.
38539. MSVC dllexport/dllimport: appropriate __declspec depends on whether we're * compiling Duktape or the application.
38540. **comment:** On Windows, assume we're little endian. Even Itanium which has a * configurable endianness runs little endian in Windows.
label: code-design
38541. **comment:** Compiler specific hackery needed to force struct size to match alignment, * see e.g. duk_hbuffer.h. * * <http://stackoverflow.com/questions/11130109/c-struct-size-alignment> * <http://stackoverflow.com/questions/10951039/specifying-64-bit-alignment>
label: code-design
38542. Index values must have at least 32-bit signed range.
38543. **comment:** Workaround for GH-323: avoid inlining control when compiling from * multiple sources, as it causes compiler portability trouble.
label: code-design
38544. byte order
38545. Linux
38546. Based on 'make checkalign' there are no alignment requirements on * Linux SH4, but align by 4 is probably a good basic default.
38547. MSVC preprocessor defines: <http://msdn.microsoft.com/en-us/library/b0084kay.aspx> * __MSC_FULL_VER includes the build number, but it has at least two formats, see e.g. * BOOST_MSVC_FULL_VER in http://www.boost.org/doc/libs/1_52_0/boost/config/compiler/visualc.hpp
38548. ARM
38549. Fast variants of small integers, again for really fast paths like the * executor.
38550. **comment:** When C99 types are not available, we use heuristic detection to get * the basic 8, 16, 32, and (possibly) 64 bit types. The fast/least * types are then assumed to be exactly the same for now: these could * be improved per platform but C99 types are very often now available. * 64-bit types are not available on all platforms; this is OK at least * on 32-bit platforms. * * This detection code is necessarily a bit hacky and can provide typedefs * and defines that won't work correctly on some exotic platform.
label: code-design
38551. **comment:** parameter passing, not thread safe
label: requirement
38552. args go here in parens
38553. * Structs
38554. Note: combining __FILE__, __LINE__, and __func__ into fmt would be * possible compile time, but waste some space with shared function names.
38555. DUK_USE_VARIADIC_MACROS
38556. * Prototypes

38557. **comment:** * Debugging macros, DUK_DPRINT() and its variants in particular. * * DUK_DPRINT() allows formatted debug prints, and supports standard * and Duktape specific formatters. See duk_debug_vsnprintf.c for details. * * DUK_D(x), DUK_DD(x), and DUK_DDD(x) are used together with log macros * for technical reasons. They are concretely used to hide 'x' from the * compiler when the corresponding log level is disabled. This allows * clean builds on non-C99 compilers, at the cost of more verbose code. * Examples: * * DUK_D(DUK_DPRINT("foo")); * DUK_DD(DUK_DPRINT("foo")); * DUK_DDD(DUK_DDDPRINT("foo")); * * This approach is preferable to the old "double parentheses" hack because * double parentheses make the C99 solution worse: __FILE__ and __LINE__ can * no longer be added transparently without going through globals, which * works poorly with threading.
label: code-design

38558. DUK_DEBUG_H_INCLUDED

38559. omit

38560. **comment:** Without variadic macros resort to comma expression trickery to handle debug * prints. This generates a lot of harmless warnings. These hacks are not * needed normally because DUK_D() and friends will hide the entire debug log * statement from the compiler.

38589. terminal type: no depth check

38590. may be NULL

38591. XXX: use DUK_HSTRING_FLAG_INTERNAL?

38592. **comment:** * Custom formatter for debug printing, allowing Duktape specific data * structures (such as tagged values and heap objects) to be printed with * a nice format string. Because debug printing should not affect execution * state, formatting here must be independent of execution (see implications * below) and must not allocate memory. * * Custom format tags begin with a '%!' to safely distinguish them from * standard format tags. The following conversions are supported: * * %!T tagged value (duk_tval *) * %!O heap object (duk_heaphdr *) * %!I decoded bytecode instruction * %!C bytecode instruction opcode name (arg is long) * * Everything is serialized in a JSON-like manner. The default depth is one * level, internal prototype is not followed, and internal properties are not * serialized. The following modifiers change this behavior: * * @ print pointers * # print binary representations (where applicable) * d deep traversal of own properties (not prototype) * p follow prototype chain (useless without 'd') * i include internal properties (other than prototype) * x hexdump buffers * h heavy formatting * * For instance, the following serializes objects recursively, but does not * follow the prototype chain nor print internal properties: "%!do". * * Notes: * * * Standard snprintf return value semantics seem to vary. This * implementation returns the number of bytes it actually wrote * (excluding the null terminator). If retval == buffer size, * output was truncated (except for corner cases). * * * Output format is intentionally different from EcmaScript * formatting requirements, as formatting here serves debugging * of internals. * * * Depth checking (and updating) is done in each type printer * separately, to allow them to call each other freely. * * * Some pathological structures might take ages to print (e.g. * self recursion with 100 properties pointing to the object * itself). To guard against these, each printer also checks * whether the output buffer is full; if so, early exit. * * * Reference loops are detected using a loop stack.

38697. no_block
38698. * Simple commands
38699. Safe to call multiple times.
38700. **comment:** Can be called multiple times with no harm. Mark the transport * bad (dbg_read_cb == NULL) and clear state except for the detached * callback and the udata field. The detached callback is delayed * to the message loop so that it can be called between messages; * this avoids corner cases related to immediate debugger reattach * inside the detached callback.
label: code-design
38701. The debugger protocol doesn't support a plain integer encoding for * the full 32-bit unsigned range (only 32-bit signed). For now, * unsigned 32-bit values simply written as signed ones. This is not * a concrete issue except for 32-bit heaphdr fields. Proper solutions * would be to (a) write such integers as IEEE doubles or (b) add an * unsigned 32-bit dvalue.
38702. tentative, checked later
38703. Write signed 32-bit integer.
38704. Peek ahead in the stream one byte.
38705. * Breakpoint management
38706. **comment:** Numbers are normalized to big (network) endian. We can * (but are not required) to use integer dvalues when there's * no loss of precision. * * XXX: share check with other code; this check is slow but * reliable and doesn't require careful exponent/mantissa * mask tricks as in the fastint downgrade code.
label: code-design
38707. Decrement PC if that was requested, this requires a PC sync.
38708. **comment:** For short strings, use a fixed temp buffer.
label: code-design
38709. restore stack top
38710. Pretend like we got EOM
38711. always push some string
38712. * Detach handling
38713. duk_hnativefunction specific fields.
38714. [...] eval "eval" eval_input level]
38715. Process one debug message. Automatically restore value stack top to its * entry value, so that individual message handlers don't need exact value * stack handling which is convenient.
38716. For now shared handler is fine.
38717. Signed integers always map to 4 bytes now.
38718. No debugger support.
38719. * Debug connection message write helpers
38720. terminator
38721. enum_flags
38722. this cannot initiate a detach
38723. true even with reattach
38724. XXX: Current putvar implementation doesn't have a success flag, * add one and send to debug client?
38725. keep heap->dbg_detached_cb
38726. num_stack_args
38727. **comment:** It is important not to call this if the last byte read was an EOM. * Reading ahead in this scenario would cause unnecessary blocking if * another message is not available.
label: code-design
38728. We're conceptually between two opcodes; act->pc indicates the next * instruction to be executed. This is usually the correct pc/line to * indicate in Status. (For the 'debugger' statement this now reports * the pc/line after the debugger statement because the debugger opcode * has already been executed.)
38729. Return 1: got EOM
38730. heap->dbg_processing: keep on purpose to avoid debugger re-entry in detaching state
38731. NOTE: length may be zero
38732. Read fully.
38733. No activation, no variable access. Could also pretend * we're in the global program context and read stuff off * the global object.
38734. get_value
38735. * Process incoming debug requests * * Individual request handlers can push temporaries on the value stack and * rely on duk_debug_process_message() to restore the value stack top * automatically.
38736. even after a detach and possible reattach
38737. avoid calling write callback in detach1()
38738. **comment:** XXX: Not needed for now, so not implemented. Note that * function pointers may have different size/layout than * a void pointer.
label: requirement
38739. **comment:** XXX: optimize to use direct reads, i.e. avoid * value stack operations.
label: code-design
38740. pruned
38741. switch cmd
38742. For anything other than an Error instance, we calculate the * error location directly from the current activation if one * exists.
38743. NOTE: act may be NULL if an error is thrown outside of any activation, * which may happen in the case of, e.g. syntax errors.
38744. Careful here: state must be wiped before the call * so that we can cleanly handle a re-attach from * inside the callback.
38745. **comment:** Ensure there are no stale active breakpoint pointers. * Breakpoint list is currently kept - we could empty it * here but we'd need to handle refcounts correctly, and * we'd need a 'thr' reference for that. * * XXX: clear breakpoint on either attach or detach?
label: code-design

38751. XXX: Currently no inspection of threads, e.g. value stack, call * stack, catch stack, etc.

38752. * Debug connection skip primitives
38753. isAccessor
38754. * Helper structs
38755. At least: ... [err]
38756. Error instance, use augmented error data directly
38757. just in case callback is broken and won't write 'x'
38758. Accept any pointer-like value; for 'object' dvalue, read * and ignore the class number.
38759. DUK_USE_DEBUGGER_DUMPHEAP
38760. -> [... func varmap enum]
38761. duk_hobject specific fields.
38762. The index range space is conceptually the array part followed by the * entry part. Unlike normal enumeration all slots are exposed here as * is and return 'unused' if the slots are not in active use. In particular * the array part is included for the full a_size regardless of what the * array .length is.
38763. enum_index
38764. this is especially critical to avoid another write call in detach1()
38765. * Debug connection write primitives
38766. For errors a string coerced result is most informative * right now, as the debug client doesn't have the capability * to traverse the error object.
38767. As an initial implementation, write flush after every EOM (and the * version identifier). A better implementation would flush only when * Duktape is finished processing messages so that a flush only happens * after all outbound messages are finished on that occasion.
38768. Inspect a property using a virtual index into a conceptual property list * consisting of (1) all array part items from [0,a_size[(even when above * .length) and (2) all entry part items from [0,e_next[. Unused slots are * indicated using dvalue 'unused'.
38769. Use b[] to access the size of the union, which is strictly not * correct. Can't use fixed size unless there's feature detection * for pointer byte size.
38770. **comment:** XXX: this has some overlap with object inspection; remove this and make * DumpHeap return lists of heapptrs instead?
 label: code-design
38771. Detach is pending; can be triggered from outside the * debugger loop (e.g. Status notify write error) or by * previous message handling. Call detached callback * here, in a controlled state, to ensure a possible * reattach inside the detached_cb is handled correctly. * * Recheck for detach in a while loop: an immediate * reattach involves a call to duk_debugger_attach() * which writes a debugger handshake line immediately * inside the API call. If the transport write fails * for that handshake, we can immediately end up in a * "transport broken, detaching" case several times here. * Loop back until we're either cleanly attached or * fully detached. * * NOTE: Reset dbg_processing = 1 forcibly, in case we * re-attached; duk_debugger_attach() sets dbg_processing * to 0 at the moment.
38772. The eval code is executed within the lexical environment of a specified * activation. For now, use global object eval() function, with the eval * considered a 'direct call to eval'. * * Callstack level for debug commands only affects scope -- the callstack * as seen by, e.g. Duktape.act() will be the same regardless.
38773. not an error
38774. As an initial implementation, read flush after exiting the message * loop. If transport is broken, this is a no-op (with debug logs).
38775. **comment:** NOTE: This is a bit fragile. It's important to ensure that * duk_debug_process_messages() never throws an error or * act->curr_pc will never be reset.
 label: code-design
38776. thr->heap->dbg_detaching may be != 0 if a debugger write outside * the message loop caused a transport error and detach1() to run.
38777. DUK_USE_STRTAB_PROBE
38778. Process messages until we're no longer paused or we peek * and see there's nothing to read right now.
38779. may be set to 0 by duk_debugger_attach() inside callback
38780. Variant for writing duk_tvals so that any heap allocated values are * written out as tagged heap pointers.

38840. no valstack space check
38841. Assertion compatible inside a comma expression, evaluates to void. * Currently not compatible with DUK_USE_PANIC_HANDLER() which may have * a statement block.
38842. DUK_ERR_UNCAUGHT_ERROR: no macros needed
38843. assertion disabled
38844. DUK_USE_PARANOIJD_ERRORS
38845. DUK_ERR_EVAL: no macros needed
38846. **comment:** * Normal error * * Normal error is thrown with a longjmp() through the current setjmp() * catchpoint record in the duk_heap. The 'curr_thread' of the duk_heap * identifies the throwing thread. * * Error formatting is usually unnecessary. The error macros provide a * zero argument version (no formatting) and separate macros for small * argument counts. Variadic macros are not used to avoid portability * issues and avoid the need for stash-based workarounds when they're not * available. Vararg calls are avoided for non-formatted error calls * because vararg call sites are larger than normal, and there are a lot * of call sites with no formatting. * * Note that special formatting provided by debug macros is NOT available. * * The _RAW variants allow the caller to specify file and line. This makes * it easier to write checked calls which want to use the call site of the * checked function, not the error macro call inside the checked function.
label: code-design
38847. * Helper for valstack space * * Caller of DUK_ASSERT_VALSTACK_SPACE() estimates the number of free stack entries * required for its own use, and any child calls which are not (a) Duktape API calls * or (b) Duktape calls which involve extending the valstack (e.g. getter call).
38848. **comment:** * Augment an error at creation time with _Tracedata/fileName/lineNumber * and allow a user error handler (if defined) to process/replace the error. * The error to be augmented is at the stack top. * * thr: thread containing the error value * thr_callstack: thread which should be used for generating callstack etc. * c_filename: C __FILE__ related to the error * c_line: C __LINE__ related to the error * noblame_fileline: if true, don't fileName/line as error source, otherwise use traceback * (needed because user code filename/line are reported but internal ones * are not) * * XXX: rename noblame_fileline to flags field; combine it to some existing * field (there are only a few call sites so this may not be worth it).
label: code-design
38849. unsigned
38850. **comment:** * Augmenting errors at their creation site and their throw site. * * When errors are created, traceback data is added by built-in code * and a user error handler (if defined) can process or replace the * error. Similarly, when errors are thrown, a user error handler * (if defined) can process or replace the error. * * Augmentation and other processing at error creation time is nice * because an error is only created once, but it may be thrown and * rethrown multiple times. User error handler registered for processing * an error at its throw site must be careful to handle rethrowing in * a useful manner. * * Error augmentation may throw an internal error (e.g. alloc error). * * Ecmascript allows throwing any values, so all values cannot be * augmented. Currently, the built-in augmentation at error creation * only augments error values which are Error instances (= have the * built-in Error.prototype in their prototype chain) and are also * extensible. User error handlers have no limitations in this respect.

38851. [...] errval]
38852. 3 entries actually needed below
38853. no need to check now: both success and error are OK
38854. **comment:** XXX: optimize: allocate an array part to the necessary size (upwards * estimate) and fill in the values directly into the array part; finally * update 'length'.
label: code-design
38855. assume PC is at most 32 bits and non-negative
38856. No activation matches, use undefined for both .fileName and * .lineNumber (matches what we do with a _Tracedata based * no-match lookup).
38857. Append a "(line NNN)" to the "message" property of any error * thrown during compilation. Usually compilation errors are * SyntaxErrors but they can also be out-of-memory errors and * the like.
38858. DUK_USE_ERRTHROW
38859. num args
38860. If tracebacks are enabled, the '_Tracedata' property is the only * thing we need: 'fileName' and 'lineNumber' are virtual properties * which use '_Tracedata'.
38861. Lightfunc, not blamed now.
38862. * If tracebacks are disabled, 'fileName' and 'lineNumber' are added * as plain own properties. Since Error.prototype has accessors of * the same name, we need to define own properties directly (cannot * just use e.g. duk_put_prop_stridx). Existing properties are not * overwritten in case they already exist.
38863. -> [...] ... error]
38864. the argument only used for thr->heap, so specific thread doesn't matter
38865. traceback depth doesn't take into account the filename/line * special handling above (intentional)
38866. -> [...] ... errhandler errval]
38867. DUK_USE_ERRTHROW || DUK_USE_ERRCREATE
38868. * DUK_CALL_FLAG_IGNORE_RECLIMIT causes duk_handle_call() to ignore C * recursion depth limit (and won't increase it either). This is * dangerous, but useful because it allows the error handler to run * even if the original error is caused by C recursion depth limit. * * The heap level

DUK_HEAP_FLAG_ERRHANDLER_RUNNING is set for the * duration of the error handler and cleared afterwards. This flag * prevents the error handler from running recursively. The flag is * heap level so that the flag properly controls even coroutines * launched by an error handler. Since the flag is heap level, it is * critical to restore it correctly. * * We ignore errors now: a success return and an error value both * replace the original error value. (This would be easy to change.)

38869. Finally, blame the innermost callstack entry which has a * .fileName property.

38870. [... error]

38871. ignore reclimit, not constructor

38872. Native function, no relevant lineNumber.

38873. !DUK_USE_TRACEBACKS

38874. Without tracebacks the concrete .fileName and .lineNumber need * to be added directly.

38875. PC points to next instruction, find offending PC, * PC == 0 for native code.

38876. [... error func]

38877. ignore_loop

38878. callstack limits

38879. When creating built-ins, some of the built-ins may not be set * and we want to tolerate that when throwing errors.

38880. * The traceback format is pretty arcane in an attempt to keep it compact * and cheap to create. It may change arbitrarily from version to version. * It should be decoded/accessible through version specific accessors only. * * See doc/error-objects.rst

38881. [... error lineNumber fileName]

38882. * Add line number to a compiler error.

38883. DUK_USE_AUGMENT_ERROR_CREATE

38884. * Add .fileName and .lineNumber to an error on the stack top.

38885. * Criteria for augmenting: * * - augmentation enabled in build (naturally) * - error value internal prototype chain contains the built-in * Error prototype object (i.e. 'val instanceof Error') * * Additional criteria for built-in augmenting: * * - error value is an extensible object

38886. since no recursive error handler calls

38887. DUK_USE_PC2LINE

38888. **comment:** * Check whether or not we have an error handler. * * We must be careful of not triggering an error when looking up the * property. For instance, if the property is a getter, we don't want * to call it, only plain values are allowed. The value, if it exists, * is not checked. If the value is not a function, a TypeError happens * when it is called and that error replaces the original one.

label: code-design

38889. invalidated by pushes, so get out of the way

38901. -> [... errhandler undefined(= this) errval]

38902. Compiler SyntaxErrors (and other errors) come first, and are * blamed by default (not flagged "noblame").

38903. [... arr]

38904. Add function object.

38905. **comment:** * Helper for calling a user error handler. * * 'thr' must be the currently active thread; the error handler is called * in its context. The valstack of 'thr' must have the error value on * top, and will be replaced by another error value based on the return * value of the error handler. * * The helper calls duk_handle_call() recursively in protected mode. * Before that call happens, no longjmps should happen; as a consequence, * we must assume that the valstack contains enough temporary space for * arguments and such. * * While the error handler runs, any errors thrown will not trigger a * recursive error handler call (this is implemented using a heap level * flag which will "follow" through any coroutines resumed inside the * error handler). If the error handler is not callable or throws an * error, the resulting error replaces the original error (for Duktape * internal errors, duk_error_throw.c further substitutes this error with * a DoubleError which is not ideal). This would be easy to change and * even signal to the caller. * * The user error handler is stored in 'Duktape.errCreate' or * 'Duktape.errThrow' depending on whether we're augmenting the error at * creation or throw time. There are several alternatives to this approach, * see doc/error-objects.rst for discussion. * * Note: since further longjmp(s) may occur while calling the error handler * (for many reasons, e.g. a labeled 'break' inside the handler), the * caller can make no assumptions on the thr->heap->lj state after the * call (this affects especially duk_error_throw.c). This is not an issue * as long as the caller writes to the lj state only after the error handler * finishes.

label: code-design

38906. * Add ._Tracedata to an error on the stack top.

38907. XXX: specify array size, as we know it

38908. (flags<<32) + (line), flags = 0

38909. * Augment an error being created using Duktape specific properties * like ._Tracedata or .fileName/.lineNumber.

38910. * Augment an error at throw time; allow a user error handler (if defined) * to process/replace the error. The error to be augmented is at the * stack top.

38911. unreferenced w/o tracebacks

38912. Filename/line from C macros (_FILE_, _LINE_) are added as an * entry with a special format: (string, number). The number contains * the line and flags.

38913. **comment:** * Note: each API operation potentially resizes the callstack, * so be careful to re-lookup after every operation. Currently * these is no issue because we don't store a temporary 'act' * pointer at all. (This would be a non-issue if we operated * directly on the array part.)

label: code-design

38914. XXX: set with duk_object_set_length() when tracedata is filled directly

38915. unreferenced w/o asserts

38916. **comment:** XXX: using duk_put_prop_index() would cause obscure error cases when Array.prototype * has write-protected array index named properties. This was seen as DoubleErrors * in e.g. some test262 test cases. Using duk_xdef_prop_index() is better but heavier. * The best fix is to fill in the tracedata directly into the array part. There are * no side effect concerns if the array part is allocated directly and only INCREFs * happen after that.

label: code-design

38917. Add a number containing: pc, activation flags. * * PC points to next instruction, find offending PC. Note that * PC == 0 for native code.

38918. C call site gets blamed next, unless flagged not to do so. * XXX: file/line is disabled in minimal builds, so disable this * too when appropriate.

38919. **comment:** If we don't have a jmpbuf_ptr, there is little we can do * except panic. The caller's expectation is that we never * return. * * With C++ exceptions we now just propagate an uncaught error * instead of invoking the fatal error handler. Because there's * a dummy jmpbuf for C++ exceptions now, this could be changed.

38939. * Get prototype object for an integer error code.

38940. **comment:** XXX: more specific error classes?
label: code-design

38941. DUK_USE_DEBUGGER_SUPPORT

38942. side effects

38943. XXX: Allow customizing the pause and notify behavior at runtime * using debugger runtime flags. For now the behavior is fixed using * config options.

38944. all we need to know

38945. **comment:** * XXX: As noted above, a protected API call won't be counted as a * catcher. This is usually convenient, e.g. in the case of a top- * level duk_pcall(), but may not always be desirable. Perhaps add an * argument to treat them as catchers?
label: code-design

38946. * Error helpers

38947. * Exposed helper for setting up heap longjmp state.

38948. use_prev_pc

38949. DUK_USE_DEBUGGER_SUPPORT && (DUK_USE_DEBUGGER_THROW_NOTIFY || DUK_USE_DEBUGGER_PAUSE_UNCAUGHT)

38950. If something is thrown with the debugger attached and nobody will * catch it, execution is paused before the longjmp, turning over * control to the debug client. This allows local state to be examined * before the stack is unwound. Errors are not intercepted when debug * message loop is active (e.g. for Eval).

38951. **comment:** * The __FILE__ and __LINE__ information is intentionally not used in the * creation of the error object, as it isn't useful in the tracedata. The * tracedata still contains the function which returned the negative return * code, and having the file/line of this function isn't very useful.
label: code-design

38952. Sync so that augmentation sees up-to-date activations, NULL * thr->ptr_curr_pc so that it's not used if side effects occur * in augmentation or longjmp handling.

38953. **comment:** * Create and throw an error (originating from Duktape internally) * * Push an error object on top of the stack, possibly throw augmenting * the error, and finally longjmp. * * If an error occurs while we're dealing with the current error, we might * enter an infinite recursion loop. This is prevented by detecting a * "double fault" through the heap->handling_error flag; the recursion * then stops at the second level.
label: code-design

38954. * Create and throw an Ecmascript error object based on a code and a message. * * Used when we throw errors internally. Ecmascript generated error objects * are created by Ecmascript code, and the throwing is handled by the bytecode * executor.

38955. **comment:** XXX: if attempt to push beyond allocated valstack, this double fault * handling fails miserably. We should really write the double error * directly to thr->heap->lj.value1 and avoid valstack use entirely.
label: code-design

38956. * Create and push an error object onto the top of stack. * If a "double error" occurs, use a fixed error instance * to avoid further trouble.

38957. **comment:** XXX: unnecessary '%s' formatting here, but cannot use * 'msg' as a format string directly.
label: code-design

38958. reset callstack limit

38959. **comment:** XXX: this generates quite large code - perhaps select the error * class based on the code and then just use the error 'name'?
label: code-design

38960. just making sure

38961. * Finally, longjmp

38962. **comment:** Allow headroom for calls during error handling (see GH-191). * We allow space for 10 additional recursions, with one extra * for, e.g. a print() call at the deepest level.
label: code-design

38963. **comment:** * Augment error (throw time), unless alloc/double error
label: code-design

38964. **comment:** XXX: shared strings
label: code-design

38965. Error object is augmented at its creation here.

38966. * Helper for C function call negative return values.

38967. * Exception for Duktape internal throws when C++ exceptions are used * for long control transfers. * * Doesn't inherit from any exception base class to minimize the chance * that user code would accidentally catch this exception.

38968. intentionally empty

38969. DUK_EXCEPTION_H_INCLUDED

38970. duk_tval intentionally skipped

38971. * Forward declarations

38972. * Forward declarations for all Duktape structures.

38973. DUK_FORWDECL_H_INCLUDED

38974. no typedef

38975. Current size (not counting a dynamic buffer's "spare").

38976. External buffer with 'curr_alloc' managed by user code and pointing to an * arbitrary address. When heap pointer compression is not used, this struct * has the same layout as duk_hbuffer_dynamic.

38977. No pointer compression because pointer is potentially outside of * Duktape heap.

38978. **comment:** It's not strictly necessary to track the current size, but * it is useful for writing robust native code.
label: code-design

38979. Stored in duk_heaphdr h_extra16.

38980. * Flags * * Fixed buffer: 0 * Dynamic buffer: DUK_HBUFFER_FLAG_DYNAMIC * External buffer: DUK_HBUFFER_FLAG_DYNAMIC | DUK_HBUFFER_FLAG_EXTERNAL

38981. * Data following the header depends on the DUK_HBUFFER_FLAG_DYNAMIC * flag. * * If the flag is clear (the buffer is a fixed size one), the buffer * data follows the header directly, consisting of 'size' bytes. * * If the flag is set, the actual buffer is allocated separately, and * a few control fields follow the header. Specifically: * * - a "void *" pointing to the current allocation * - a duk_size_t indicating the full allocated size (always >= 'size') * * If DUK_HBUFFER_FLAG_EXTERNAL is set, the buffer has been allocated * by user code, so that Duktape won't be able to resize it and won't * free it. This allows buffers to point to e.g. an externally * allocated structure such as a frame buffer. * * Unlike strings, no terminator byte (NUL) is guaranteed after the * data. This would be convenient, but would pad aligned user buffers * unnecessarily upwards in size. For instance, if user code requested * a 64-byte dynamic buffer, 65 bytes would actually be allocated which * would then potentially round upwards to perhaps 68 or 72 bytes.

38982. **comment:** * Data follows the struct header. The struct size is padded by the * compiler based on the struct members. This guarantees that the * buffer data will be aligned-by-4 but not necessarily aligned-by-8. * * On platforms where alignment does not matter, the struct padding * could be removed (if there is any). On platforms where alignment * by 8 is required, the struct size must be forced to be a multiple * of 8 by some means. Without it, some user code may break, and also * Duktape itself breaks (e.g. the compiler stores duk_tvals in a * dynamic buffer).
label: code-design

38983. size stored in duk_heapheader unused flag bits
38984. * Misc defines
38985. indirect allocs
38986. may be NULL if alloc_size == 0
38987. * Prototypes
38988. **comment:** * Allocation size for 'curr_alloc' is alloc_size. There is no * automatic NUL terminator for buffers (see above for rationale). * * 'curr_alloc' is explicitly allocated with heap allocation * primitives and will thus always have alignment suitable for * e.g. duk_tval and an IEEE double.
label: code-design
38989. Dynamic buffer with 'curr_alloc' pointing to a dynamic area allocated using * heap allocation primitives. Also used for external buffers when low memory * options are not used.
38990. * Heap buffer representation. * * Heap allocated user data buffer which is either: * * 1. A fixed size buffer (data follows header statically) * 2. A dynamic size buffer (data pointer follows header) * * The data pointer for a variable size buffer of zero size may be NULL.
38991. Get/set the current user visible size, without accounting for a dynamic * buffer's "spare" (= usable size).
38992. Intentionally not 0x7fffffffUL; at least JSON code expects that * 2*len + 2 fits in 32 bits.
38993. buffer pointer is to an externally allocated buffer
38994. assume 0 <=> NULL
38995. dynamic buffer ops
38996. DUK_HBUFFER_H_INCLUDED
38997. **comment:** A union is used here as a portable struct size / alignment trick: * by adding a 32-bit or a 64-bit (unused) union member, the size of * the struct is effectively forced to be a multiple of 4 or 8 bytes * (respectively) without increasing the size of the struct unless * necessary.
label: code-design
38998. no extra padding
38999. * Field access
39000. Cannot be compressed as a heap pointer because may point to * an arbitrary address.
39001. Without heap pointer compression duk_hbuffer_dynamic and duk_hbuffer_external * have the same layout so checking for fixed vs. dynamic (or external) is enough.
39002. * Structs
39003. Get a pointer to the current buffer contents (matching current allocation * size). May be NULL for zero size dynamic/external buffer.
39004. Stored in duk_heapheader unused flags.
39005. Shared prefix for all buffer types.
39006. buffer is behind a pointer, dynamic or external
39007. Fixed buffer; data follows struct, with proper alignment guaranteed by * struct size.
39008. Impose a maximum buffer length for now. Restricted artificially to * ensure resize computations or adding a heap header length won't * overflow size_t and that a signed duk_int_t can hold a buffer * length. The limit should be synchronized with DUK_HSTRING_MAX_BYTelen.
39009. Because size > 0, NULL check is correct
39010. **comment:** Size sanity check. Should not be necessary because caller is * required to check this, but we don't want to cause a segfault * if the size wraps either in duk_size_t computation or when * storing the size in a 16-bit field.
label: code-design
39011. alloc external with size zero
39012. the compressed pointer is zeroed which maps to NULL, so nothing to do.
39013. For indirect allocs.
39014. no need to write 'out_bufdata'
39015. zero everything unless requested not to do so
39016. * duk_hbuffer allocation and freeing.
39017. Allocate a new duk_hbuffer of a certain type and return a pointer to it * (NULL on error). Write buffer data pointer to 'out_bufdata' (only if * allocation successful).
39018. no wrapping
39019. **comment:** * duk_hbuffer operations such as resizing and inserting/appending data to * a dynamic buffer. * * Append operations append to the end of the buffer and they are relatively * efficient: the buffer is grown with a "spare" part relative to the buffer * size to minimize reallocations. Insert operations need to move existing * data forward in the buffer with memmove() and are not very efficient. * They are used e.g. by the regexp compiler to "backpatch" regexp bytecode.
label: code-design
39020. * Resizing
39021. 'res' may be NULL if new allocation size is 0.
39022. **comment:** * Note: use indirect realloc variant just in case mark-and-sweep * (finalizers) might resize this same buffer during garbage * collection.
label: code-design
39023. * Maximum size check
39024. * The entire allocated buffer area, regardless of actual used * size, is kept zeroed in resizes for simplicity. If the buffer * is grown, zero the new part.
39025. All element accessors are host endian now (driven by TypedArray spec).
39026. Validate that the whole slice [0,length] is contained in the underlying * buffer. Caller must ensure 'buf' != NULL.
39027. DUK_HBUFFEROBJECT_H_INCLUDED
39028. byte index limit for element access, exclusive
39029. **comment:** Slice and accessor information. * * Because the underlying buffer may be dynamic, these may be * invalidated by the buffer being modified so that both offset * and length should be validated before every access. Behavior * when the underlying buffer has changed doesn't need to be clean: * virtual 'length' doesn't need to be affected, reads can return * zero/NaN, and writes can be ignored. * * Note that a data pointer cannot be precomputed because 'buf' may * be dynamic and its pointer unstable.
label: code-design
39030. Validate byte read/write for virtual 'offset', i.e. check that the * offset, taking into account h->offset, is within the underlying * buffer size. This is a safety check which is needed to ensure * that even a misconfigured duk_hbufferobject never causes memory * unsafe behavior (e.g. if an underlying dynamic buffer changes * after being setup). Caller must ensure 'buf' != NULL.
39031. Shared object part.
39032. element type
39033. Underlying buffer (refcounted), may be NULL.
39034. Get the current data pointer (caller must ensure buf != NULL) as a * duk_uint8_t ptr.
39035. True if slice is full, i.e. offset is zero and length covers the entire * buffer. This status may change independently of the duk_hbufferobject if * the underlying buffer is dynamic and changes without the hbufferobject * being changed.
39036. element size shift: * 0 = u8/i8 * 1 = u16/i16 * 2 = u32/i32/float * 3 = double
39037. No assertions for offset or length; in particular, \ * it's OK for length to be longer than underlying \ * buffer. Just ensure they don't wrap when added. \
39038. byte offset to buf
39039. * Heap Buffer object representation. Used for all Buffer variants.
39040. Clamp an input byte length (already assumed to be within the nominal * duk_hbufferobject 'length') to the current dynamic buffer limits to * yield a byte length limit that's safe for memory accesses. This value * can be invalidated by any side effect because it may trigger a user * callback that resizes the underlying buffer.
39041. Slice starting point is beyond current length.
39042. DUK_USE_BUFFEROBJECT_SUPPORT
39043. Line number range for function. Needed during debugging to * determine active breakpoints.
39044. number of arguments allocated to regs
39045. * Additional control information is placed into the object itself * as internal properties to avoid unnecessary fields for the * majority of functions. The compiler tries to omit internal * control fields when possible. * * Function templates: * * { * name: "func", // declaration, named function expressions * fileName: <debug info for creating nice errors> * _Varmap: { "arg1": 0, "arg2": 1, "varname": 2 }, * _Formals: ["arg1", "arg2"], * _Source: "function func(arg1, arg2) { ... }", * }

_Pc2line: <debug info for pc-to-line mapping>, * } ** Function instances: * * { * length: 2, * prototype: { constructor: <func> }, * caller: <thrower>, * arguments: <thrower>, * name: "func", // declaration, named function expressions * fileName: <debug info for creating nice errors> * _Varmap: { "arg1": 0, "arg2": 1, "varname": 2 }, * _Formals: ["arg1", "arg2"], * _Source: "function func(arg1, arg2) { ... }", * _Pc2line: <debug info for pc-to-line mapping>, * _Varenv: <variable environment of closure>, * _Lexenv: <lexical environment of closure (if differs from _Varenv)> * } ** More detailed description of these properties can be found * in the documentation.

39046. **comment:** XXX: casts could be improved, especially for GET/SET DATA

label: code-design

39047. * Heap compiled function (Ecmascript function) representation. * * There is a single data buffer containing the Ecmascript function's * bytecode, constants, and inner functions.

39048. shared object part

39049. **comment:** * 'nregs' registers are allocated on function entry, at most 'nargs' * are initialized to arguments, and the rest to undefined. Arguments * above 'nregs' are not mapped to registers. All registers in the * active stack range must be initialized because they are GC reachable. * 'nargs' is needed so that if the function is given more than 'nargs' * arguments, the additional arguments do not 'clobber' registers * beyond 'nregs' which must be consistently initialized to undefined. * * Usually there is no need to know which registers are mapped to * local variables. Registers may be allocated to variable in any * way (even including gaps). However, a register-variable mapping * must be the same for the duration of the function execution and * the register cannot be used for anything else. * * When looking up variables by name, the '_Varmap' map is used. * When an activation closes, registers mapped to arguments are * copied into the environment record based on the same map. The * reverse map (from register to variable) is not currently needed * at run time, except for debugging, so it is not maintained.

label: code-design

39050. * Field accessor macros

39051. DUK_HCOMPILEDFUNCTION_H_INCLUDED

39052. reg to allocate

39053. **comment:** No need for constants pointer (= same as data). * * When using 16-bit packing alignment to 4 is nice. 'funcs' will be * 4-byte aligned because 'constants' are duk_tvals. For now the * inner function pointers are not compressed, so that 'bytecode' will * also be 4-byte aligned.

label: code-design

39054. Data area, fixed allocation, stable data ptrs.

39055. Note: assumes 'data' is always a fixed buffer

39056. * Main struct

39057. * Pointers to function data area for faster access. Function * data is a buffer shared between all closures of the same * "template" function. The data buffer is always fixed (non- * dynamic, hence stable), with a layout as follows: * * constants (duk_tval) * inner functions (duk_hobject *) * bytecode (duk_instr_t) * * Note: bytecode end address can be computed from 'data' buffer * size. It is not strictly necessary functionally, assuming * bytecode never jumps outside its allocated area. However, * it's a safety/robustness feature for avoiding the chance of * executing random data as bytecode due to a compiler error. * * Note: values in the data buffer must be incref'd (they will * be decref'd on release) for every compiledfunction referring * to the 'data' element.

39058. * Accessor macros for function specific data areas

39059. **comment:** XXX: double evaluation of DUK_HCOMPILEDFUNCTION_GET_DATA()

label: code-design

39060. callback for indirect reallocs, request for current pointer

39061. Retry allocation after mark-and-sweep for this * many times. A single mark-and-sweep round is * not guaranteed to free all unreferenced memory * because of finalization (in fact, ANY number of * rounds is strictly not enough).

39062. **comment:** XXX: static alloc is OK until separate chaining stringtable * resizing is implemented.

label: code-design

39063. heap destruction ongoing, finalizer rescue no longer possible

39064. resend state next time executor is about to run

39065. No field needed when strings are in ROM.

39066. indicates a deleted string; any fixed non-NULL, non-hstring pointer works

39067. **comment:** alloc size in elements

label: code-design

39068. value1 -> label number, pseudo-type to indicate a break continuation (for ENDFIN)

39069. don't run finalizers; queue finalizable objects back to heap_allocated

39070. **comment:** unused

label: code-design

39071. DUK_USE_ROM_STRINGS

39072. don't compact objects; needed during object property allocation resize

39073. borrowed; NULL if no step state (NULLed in unwind)

39074. breakpoints: [0,breakpoint_count[gc reachable

39075. value1 -> resume value, value2 -> resume thread, iserror -> error/normal

39076. * Other heap related defines

39077. Allocator functions.

39078. don't run finalizers; leave finalizable objects in finalize_list for next round

39079. Step types

39080. used entries + approx 100% -> reset load to 50%

39081. current thread

39082. * Mark-and-sweep flags * * These are separate from heap level flags now but could be merged. * The heap structure only contains a 'base mark-and-sweep flags' * field and the GC caller can impose further flags.

39083. * Memory constants

39084. force executor restart to recheck breakpoints; used to handle function returns (see GH-303)

39085. required, NULL implies detached

39086. no value, pseudo-type to indicate a normal continuation (for ENDFIN)

39087. heap thread, used internally and for finalization

39088. * Thread switching * * To switch heap->curr_thread, use the macro below so that interrupt counters * get updated correctly. The macro allows a NULL target thread because that * happens e.g. in call handling.

39089. * Longjmp types, also double as identifying continuation type for a rethrow (in 'finally')

39090. * Longjmp state, contains the information needed to perform a longjmp. * Longjmp related values are written to value1, value2, and iserror.

39091. **comment:** * String cache should ideally be at duk_hthread level, but that would * cause string finalization to slow down relative to the number of * threads; string finalization must check the string cache for "weak" * references to the string being finalized to avoid dead pointers. * * Thus, string caches are now at the heap level now.

label: code-design

39092. Stringcache is used for speeding up char-offset-to-byte-offset * translations for non-ASCII strings.

39093. For manual debugging: instruction count based on executor and * interrupt counter book-keeping. Inspect debug logs to see how * they match up.

39094. Heap udata, used for allocator functions but also for other heap * level callbacks like pointer compression, etc.

39095. load factor min 25%

39096. helper to insert a (non-string) heap object into heap allocated list

39097. initial stringtable size, must be prime and higher than DUK_UTIL_MIN_HASH_PRIME

39098. used elements (includes DELETED)

39099. marker for detecting internal "double faults", see duk_error_throw.c

39100. callbacks and udata; dbg_read_cb != NULL is used to indicate attached state

39101. debugger state, only relevant when attached

39102. allocated heap objects

39103. 4'294'967'295

39104. longjmp type
39105. Mark-and-sweep interval is relative to combined count of objects and * strings kept in the heap during the latest mark-and-sweep pass. * Fixed point .8 multiplier and .0 adder. Trigger count (interval) is * decreased by each (re)allocation attempt (regardless of size), and each * refzero processed object. ** 'SKIP' indicates how many (re)allocations to wait until a retry if * GC is skipped because there is no thread do it with yet (happens * only during init phases).
39106. Precomputed pointers when using 16-bit heap pointer packing.
39107. Maximum number of breakpoints. Only breakpoints that are set are * consulted so increasing this has no performance impact.
39108. Milliseconds between status notify and transport peeks.
39109. value1 -> error object
39110. mark-and-sweep is currently running
39111. step type: none, step into, step over, step out
39112. refcount code is processing refzero list
39113. emergency mode: try extra hard
39114. time when status/peek was last done (Date-based rate limit)
39115. Opcode interval for a Date-based status/peek rate limit check. Only * relevant when debugger is attached. Requesting a timestamp may be a * slow operation on some platforms so this shouldn't be too low. On the * other hand a high value makes Duktape react to a pause request slowly.
39116. mark-and-sweep control
39117. if 0, 'str16' used, if > 0, 'strlist16' used
39118. * Stringtable entry for fixed size stringtable
39119. no refcounting
39120. currently processing messages or breakpoints: don't enter message processing recursively (e.g. no breakpoints when processing debugger eval)
39121. probe sequence (open addressing)
39122. * Heap structure. ** Heap contains allocated heap objects, interned strings, and built-in * strings for one or more threads.
39123. starting line number
39124. Fatal error handling, called e.g. when a longjmp() is needed but * lj.jmpbuf_ptr is NULL. fatal_func must never return; it's not * declared as "noreturn" because doing that for typedefs is a bit * challenging portability-wise.
39125. if 0, 'str' used, if > 0, 'strlist' used
39126. heap level "stash" object (e.g., various reachability roots)
39127. * Heap flags
39128. value1 -> return value, pseudo-type to indicate a return continuation (for ENDFIN)
39129. * Raw memory calls: relative to heap, but no GC interaction
39130. mark-and-sweep flags automatically active (used for critical sections)
39131. heap string indices are autogenerated in duk_strings.h
39132. * Prototypes
39133. 50x heap size
39134. string access cache (codepoint offset -> byte offset) for fast string * character looping; 'weak' reference which needs special handling in GC.
39135. currently running thread
39136. fixed top level hashtable size (separate chaining)
39137. longjmp state
39138. debugger detaching; used to avoid calling detach handler recursively
39139. required
39140. **comment:** A 16-bit listlen makes sense with 16-bit heap pointers: there * won't be space for 64k strings anyway.
 label: code-design
39141. built-in strings
39142. executor interrupt running (used to avoid nested interrupts)
39143. **comment:** * Memory calls: relative to heap, GC interaction, but no error throwing. ** XXX: Currently a mark-and-sweep triggered by memory allocation will run * using the heap->heap_thread. This thread is also used for running * mark-and-sweep finalization; this is not ideal because it breaks the * isolation between multiple global environments. ** Notes: * * - DUK_FREE() is required to ignore NULL and any other possible return * value of a zero-sized alloc/realloc (same as ANSI C free()). * * - There is no DUK_REALLOC_ZEROED because we don't assume to know the * old size. Caller must zero the reallocated memory. * * - DUK_REALLOC_INDIRECT() must be used when a mark-and-sweep triggered * by an allocation failure might invalidate the original 'ptr', thus * causing a realloc retry to use an invalid pointer. Example: we're * reallocating the value stack and a finalizer resizes the same value * stack during mark-and-sweep. The indirect variant requests for the * current location of the pointer being reallocated using a callback * right before every realloc attempt; this circuitous approach is used * to avoid strict aliasing issues in a more straightforward indirect * pointer (void **) approach. Note: the pointer in the storage * location is read but is NOT updated; the caller must do that.

39170. value1 -> yield value, isError -> error / normal
39171. work list for objects whose refcounts are zero but which have not been * "finalized"; avoids recursive C calls when refcounts go to zero in a * chain of objects.
39172. strings up to this length are not cached
39173. * Built-in strings
39174. * Debugger support

39175. 1x heap size
39176. currently paused: talk with debug client until step/resume
39177. don't resize stringtable (but may sweep it); needed during stringtable resize
39178. rnd_state for duk_util_tinyrandom.c
39179. string intern table (weak refs)
39180. load factor max 75%
39181. Currently nothing to free
39182. No str[s] pointer.
39183. explicit NULL inits
39184. some derived types
39185. **comment:** * Allocate heap struct ** Use a raw call, all macros expect the heap to be initialized
label: code-design
39186. **comment:** suppress warning, not used
label: code-design
39187. Bernstein hash init value is normally 5381; XOR it in in case pointer low bits are 0
39188. Run mark-and-sweep a few times just in case (unreachable object * finalizers run already here). The last round must rescue objects * from the previous round without running any more finalizers. This * ensures rescued objects get their FINALIZED flag cleared so that * their finalizer is called once more in forced finalization to * satisfy finalizer guarantees. However, we don't want to run any * more finalizer because that'd required one more loop, and so on.
39189. **comment:** Similar workaround for INFINITY.
label: code-design
39190. **comment:** XXX: make a common DUK_USE_ option, and allow custom fixed seed?
label: code-design
39191. Note: heap->heap_thread, heap->curr_thread, and heap->heap_object * are on the heap allocated list.
39192. * All done
39193. 'thr' is now reachable
39194. **comment:** These is not 100% because format would need to be non-portable "long long". * Also print out as doubles to catch cases where the "long" type is not wide * enough; the limits will then not be printed accurately but the magnitude * will be correct.
label: code-design
39195. **comment:** Silence a few global unused warnings here.
label: code-design
39196. Internal keys are prefixed with 0xFF in the stringtable * (which makes them invalid UTF-8 on purpose).
39197. **comment:** XXX: here again finalizer thread is the heap_thread which needs * to be coordinated with finalizer thread fixes.
label: code-design
39198. DUK_USE_ROM_STRINGS
39199. DUK_USE_HEAPPTR16
39200. assumes that allocated pointers and alloc funcs are valid * if res exists
39201. **comment:** No need to length check string: it will never exceed even * the 16-bit length maximum.
label: code-design
39202. basic platform types
39203. Currently nothing to free; 'data' is a heap object
39204. mark-and-sweep not running -> must be empty
39205. The casts through duk_intr_pt is to avoid the following GCC warning: ** warning: cast from pointer to integer of different size [-Wpointer-to-int-cast] ** This still generates a /Wp64 warning on VS2010 when compiling for x86.
39206. Only objects in heap_allocated may have finalizers. Check that * the object itself has a _Finalizer property (own or inherited) * so that we don't execute finalizers for e.g. Proxy objects.
39207. * Init the heap object
39208. **comment:** XXX: zero assumption
