39329. * Unreachable object, free

39330. OK

39331. done so that duk_mark_heaphdr() works correctly

39332. must also check refzero_list

39333. * Mark objects on finalize_list. *

39334. DUK_USE_REFERENCE_COUNTING

39335. XXX: remove this feature entirely? it would only matter for * emergency GC. Disable for lowest memory builds.

39336. free inner references (these exist e.g. when external * strings are enabled)

39337. ignored

39338. Non-zero refcounts should not happen because we refcount * finalize all unreachable objects which should cancel out * refcounts (even for cycles).

39339. * Mark-and-sweep garbage collection.

39340. * Mark refzero_list objects. ** Objects on the refzero_list have no inbound references. They might have * outbound references to objects that we might free, which would invalidate * any references held by the refzero objects. A refzero object might also * be rescued by refcount finalization. Refzero objects are treated as * reachability roots to ensure they (or anything they point to) are not * freed in mark-and-sweep.

39341. * Mark the heap.

39342. **comment:** * Object compaction (emergency only). ** Object compaction is a separate step after sweeping, as there is * more free memory for it to work with. Also, currently compaction * may insert new objects into the heap allocated list and the string * table which we don't want to do during a sweep (the reachability flags of such objects would be incorrect). The objects inserted * are currently: ** - a temporary duk_hbuffer for a new properties allocation * - if array part is abandoned, string keys are interned * * The object insertions go to the front of the list, so they do not * cause an infinite loop (they are not compacted).

label: code-design

39343. mark finalizer work list as reachability roots

39344. **comment:** Require a lot of stack to force a value stack grow/shrink. * Recursive mark-and-sweep is prevented by allocation macros * so this won't trigger another mark-and-sweep.

label: code-design

39345. * Mark unreachable, finalizable objects. ** Such objects will be moved aside and their finalizers run later. They have * to be treated as reachability roots for their properties etc to remain * allocated. This marking is only done for unreachable values which would * be swept later (refzero_list is thus excluded). ** Objects are first marked FINALIZABLE and only then marked as reachability * roots; otherwise circular references might be handled inconsistently.

39346. temproots

39347. refzero_list treated as reachability roots

39348. nothing now

39349. * Finalize refcounts for heap elements just about to be freed. * This must be done for all objects before freeing to avoid any * stale pointer dereferences. ** Note that this must deduce the set of objects to be freed * identically to duk_sweep_heap().

39350. flags have been already cleared

39351. * Reset trigger counter

39352. **comment:** XXX: duk_small_uint_t would be enough for this loop

label: code-design

39353. **comment:** Run fake finalizer. Avoid creating unnecessary garbage.

label: code-design

39354. * Unreachable object about to be swept. Finalize target refcounts * (objects which the unreachable object points to) without doing * refzero processing. Recursive decrefs are also prevented when * refzero processing is disabled. ** Value cannot be a finalizable object, as they have been made * temporarily reachable for this round.

39355. Caller will finish the marking process if we hit a recursion limit.

39356. no mark-and-sweep gc

39357. may have FINALIZED

39358. log this with a normal debug level because this should be relatively rare

39359. * Marking functions for heap types: mark children recursively

39360. **comment:** * Finalize objects in the finalization work list. Finalized * objects are queued back to heap_allocated with FINALIZED set. ** Since finalizers may cause arbitrary side effects, they are * prevented during string table and object property allocation * resizing using the DUK_MS_FLAG_NO_FINALIZERS flag in * heap->mark_and_sweep_base_flags. In this case the objects * remain in the finalization work list after mark-and-sweep * exits and they may be finalized on the next pass. ** Finalization currently happens inside "MARKANDSWEEP_RUNNING" * protection (no mark-and-sweep may be triggered by the * finalizers). As a side effect: ** 1) an out-of-memory error inside a finalizer will not * cause a mark-and-sweep and may cause the finalizer * to fail unnecessarily ** 2) any temporary objects whose refcount decreases to zero * during finalization will not be put into refzero_list; * they can only be collected by another mark-and-sweep ** This is not optimal, but since the sweep for this phase has * already happened, this is probably good enough for now.

label: code-design

39361. hash part is a 'weak reference' and does not contribute

39362. **comment:** Checking this here rather than in memory alloc primitives * reduces checking code there but means a failed allocation * will go through a few retries before giving up. That's * fine because this only happens during debugging.

label: code-design

39363. DUK_HEAPHDR_HAS_FINALIZED may be set if we're doing a * refzero finalization and mark-and-sweep gets triggered * during the finalizer.

39364. A finalizer is looked up from the object and up its prototype chain * (which allows inherited finalizers). A prototype loop must not cause * an error to be thrown here; duk_hobject_hasprop_raw() will ignore a * prototype loop silently and indicate that the property doesn't exist.

39365. nothing to process

39366. * Clear (reachable) flags of refzero work list.

39367. Keep heap->finalize_list up-to-date during the list walk. * This has no functional impact, but does matter e.g. for * duk_push_heapptr() asserts when assertions are enabled.

39368. * Begin

39369. * Mark roots, hoping that recursion limit is not normally hit. * If recursion limit is hit, run additional reachability rounds * starting from "temproots" until marking is complete. ** Marking happens in two phases: first we mark actual reachability * roots (and run "temproots" to complete the process). Then we * check which objects are unreachable and are finalizable; such * objects are marked as FINALIZABLE and marked as reachability * (and "temproots" is run again to complete the process). ** The heap finalize_list must also be marked as a reachability root. * There may be objects on the list from a previous round if the * previous run had finalizer skip flag.

39370. Run the finalizer, duk_hobject_run_finalizer() sets FINALIZED. * Next mark-and-sweep will collect the object unless it has * become reachable (i.e. rescued). FINALIZED prevents the * finalizer from being executed again before that.

39371. nop

39372. DUK_USE_STRTAB_PROBE

39373. * Reachable object, keep

39374. May happen in some out-of-memory corner cases.

39375. DUK_HEAPHDR_HAS_FINALIZED may or may not be set.

39376. * Sweep stringtable

39377. An object may be in heap_allocated list with a zero * refcount also if it is a temporary object created by * a finalizer; because finalization now runs inside * mark-and-sweep, such objects will not be queued to * refzero_list and will thus appear here with refcount * zero.

39378. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed.

39379. **comment:** Select a thread for mark-and-sweep use. ** XXX: This needs to change later.

label: code-design

39380. An object may be in heap_allocated list with a zero * refcount if it has just been finalized and is waiting * to be collected by the next cycle.

39381. * Sweep heap

39382. **comment:** XXX: could clear FINALIZED already here; now cleared in * next mark-and-sweep.

label: code-design

39383. DUK_USE_STRTAB_CHAIN

39384. finalize_list will always be processed completely

39385. approximate

39386. **comment:** XXX: thread selection for mark-and-sweep is currently a hack. * If we don't have a thread, the entire mark-and-sweep is now * skipped (although we could just skip finalizations).

label: code-design

39387. **comment:** XXX: which lists should participate? to be finalized?

label: code-design

39388. nargs

39389. mark finalizable as reachability roots

39390. * Clear (reachable) flags of finalize_list ** We could mostly do in the sweep phase when we move objects from the * heap into the finalize_list. However, if a finalizer run is skipped * during a mark-and-sweep, the objects on the finalize_list will be marked * reachable during the next mark-and-sweep. Since they're already on the * finalize_list, no-one will be clearing their REACHABLE flag so we do it * here. (This now overlaps with the sweep handling in a harmless way.)

39391. Used during heap destruction: don't actually run finalizers * because we're heading into forced finalization. Instead, * queue finalizable objects back to the heap_allocated list.

39392. No finalizers for ROM objects

39393. * Misc

39394. * Memory allocation handling.

39395. Note: key issue here is to re-lookup the base pointer on every attempt. * The pointer being reallocated may change after every mark-and-sweep.

39396. for zero size allocations NULL is allowed

39397. **comment:** * Compared to a direct macro expansion this wrapper saves a few * instructions because no heap dereferencing is required.

label: code-design

39398. Note: must behave like a no-op with NULL and any pointer * returned from malloc/realloc with zero size.

39399. simulate alloc failure on every realloc (except when mark-and-sweep is running)

39400. * Helpers ** The fast path checks are done within a macro to ensure "inlining" * while the slow path actions use a helper (which won't typically be * inlined in size optimized builds).

39401. * Avoid a GC if GC is already running. This can happen at a late * stage in a GC when we try to e.g. resize the stringtable * or compact objects.

39402. * Reallocate memory with garbage collection, using a callback to provide * the current allocated pointer. This variant is used when a mark-and-sweep * (e.g. finalizers) might change the original pointer.

39403. no voluntary gc

39404. * First attempt

39405. simulate alloc failure on every alloc (except when mark-and-sweep is running)

39406. DUK_USE_MARK_AND_SWEEP

39407. assume memset with zero size is OK

39408. * Allocate memory with garbage collection

39409. pt before mark-and-sweep

39410. Must behave like a no-op with NULL and any pointer returned from * malloc/realloc with zero size.

39411. saves a few instructions to have this wrapper (see comment on duk_heap_mem_alloc)

39412. Count free operations toward triggering a GC but never actually trigger * a GC from a free. Otherwise code which frees internal structures would * need to put in NULLs at every turn to ensure the object is always in * consistent state for a mark-and-sweep.

39413. useful for debugging

39414. ptr may be NULL

39415. * Relocate memory with garbage collection

39416. * Retry with several GC attempts. Initial attempts are made without * emergency mode; later attempts use emergency mode which minimizes * memory allocations forcibly.

39417. * Free memory

39418. * Voluntary periodic GC (if enabled)

39419. DUK_USE_MARK_AND_SWEEP && DUK_USE_VOLUNTARY_GC

39420. * Avoid a GC if GC is already running. See duk_heap_mem_alloc().

39421. For initial entry use default value; zero forces an * interrupt before executing the first instruction.

39422. DUK_USE_INTERRUPT_COUNTER

39423. * Support functions for duk_heap.

39424. may be NULL

39425. arbitrary remove only works with double linked heap, and is only required by * reference counting so far.

39426. **comment:** The prev/next pointers of the removed duk_heaphdr are left as garbage. * It's up to the caller to ensure they're written before inserting the * object back.
label: code-design

39427. Copy interrupt counter/init value state to new thread (if any). * It's OK for new_thr to be the same as curr_thr.

39428. yes -> move back to heap allocated

39429. Require a lot of stack to force a value stack grow/shrink.

39430. * Refcount memory freeing loop. ** Frees objects in the refzero_pending list until the list becomes * empty. When an object is freed, its references get decref'd and * may cause further objects to be queued for freeing. ** This could be expanded to allow incremental freeing: just bail out * early and resume at a future alloc/decref/refzero.

39431. 'count' is more or less comparable to normal trigger counter update * which happens in memory block (re)allocation.

39432. * Buffers have no internal references. However, a dynamic * buffer has a separate allocation for the buffer. This is * freed by duk_heap_free_heapdr_raw().

39433. DUK_USE_REFERENCE_COUNTING

39434. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed, * and we're in an infinite loop.

39435. DUK_USE_REFZERO_FINALIZER_TORTURE

39436. no -> decref members, then free

39437. Run fake finalizer. Avoid creating new refzero queue entries * so that we are not forced into a forever loop.

39438. ignored

39439. no refcounting

39440. **comment:** Avoid fake finalization for the duk_refcount_fake_finalizer function * itself, otherwise we're in infinite recursion.
label: code-design

39441. * Finalizer check. ** Note: running a finalizer may have arbitrary side effects, e.g. * queue more objects on refzero_list (tail), or even trigger a * mark-and-sweep.
** Note: quick reject check should match vast majority of * objects and must be safe (not throw any errors, ever).

39442. An object may have FINALIZED here if it was finalized by mark-and-sweep * on a previous run and refcount then decreased to zero. We won't run the * finalizer again here.

39443. refcount is unsigned, so always true

39444. currently, always the case

39445. not emergency

39446. A finalizer is looked up from the object and up its prototype chain * (which allows inherited finalizers).

39447. must never longjmp

39448. Torture option to shake out finalizer side effect issues: * make a bogus function call for every finalizable object, * essentially simulating the case where everything has a * finalizer.

39449. * Rescue or free.

39450. May happen in some out-of-memory corner cases.

39451. * Once the whole refzero cascade has been freed, check for * a voluntary mark-and-sweep.

39452. tail insert: don't disturb head in case refzero is running

39453. * Detect recursive invocation

39454. nothing to finalize

39455. **comment:** unused
label: code-design

39456. nothing now

39457. Refzero head is still the same. This is the case even if finalizer * inserted more refzero objects; they are inserted to the tail.

39458. not strictly necessary

39459. * Strings have no internal references but do have "weak" * references in the string cache. Also note that strings * are not on the heap_allocated list like other heap * elements.

39460. duk_hobject_run_finalizer() sets

39461. * Inref and decref functions. * Decref may trigger immediate refzero handling, which may free and finalize * an arbitrary number of objects. *

39462. * Heap object refcount finalization. ** When an object is about to be freed, all other objects it refers to must * be decref'd. Refcount finalization does NOT free the object or its inner * allocations (mark-and-sweep shares these helpers), it just manipulates * the refcounts. ** Note that any of the decref's may cause a refcount to drop to zero, BUT * it will not be processed inline; instead, because refzero is already * running, the objects will just be queued to refzero list and processed * later. This eliminates C recursion.

39463. **comment:** XXX: do something to force a callstack grow/shrink, perhaps * just a manual forced resize?
label: code-design

39464. bump refcount to prevent refzero during finalizer processing

39465. * Objects have internal references. Must finalize through * the "refzero" work list.

39466. * Pick an object from the head (don't remove yet).

39467. **comment:** XXX: ideally this would be just one flag (maybe a derived one) so * that a single bit test is sufficient to check the condition.
label: test

39468. approximate

39469. * Remove the object from the refzero list. This cannot be done * before a possible finalizer has been executed; the finalizer * may trigger a mark-and-sweep, and mark-and-sweep must be able * to traverse a complete refzero_list.

39470. **comment:** XXX: better to get base and walk forwards?
label: code-design

39471. nargs

39472. * Churn refzero_list until empty

39473. remove artificial bump

39474. cannot happen: strings are not put into refzero list (they don't even have the next/prev pointers)

39475. hash part is a 'weak reference' and does not contribute

39476. DUK_USE_MARK_AND_SWEEP && DUK_USE_VOLUNTARY_GC

39477. * Reference counting implementation.

39478. **comment:** * Refzero handling is skipped entirely if (1) mark-and-sweep is * running or (2) execution is paused in the debugger. The objects * are left in the heap, and will be freed by mark-and-sweep or * eventual heap destruction. ** This is necessary during mark-and-sweep because refcounts are also * updated during the sweep phase (otherwise objects referenced by a * swept object would have incorrect refcounts) which then calls here. * This could be avoided by using separate decref macros in * mark-and-sweep; however, mark-and-sweep also calls finalizers which * would use the ordinary decref macros anyway and still call this *

function. ** This check must be enabled also when mark-and-sweep support has been * disabled: the flag is also used in heap destruction when running * finalizers for remaining objects, and the flag prevents objects from * being moved around in heap linked lists.

label: code-design

39479. * Misc

39480. **comment:** * Delete references to given hstring from the heap string cache. ** String cache references are 'weak': they are not counted towards * reference counts, nor serve as roots for mark-and-sweep. When an * object is about to be freed, such references need to be removed.

label: code-design

39481. update entry, allocating if necessary

39482. may be equal

39483. * String scanning helpers ** All bytes other than UTF-8 continuation bytes ([0x80,0xbff]) are * considered to contribute a character. This must match how string * character length is computed.

39484. take last entry

39485. * Scan from shortest distance: * - start of string * - end of string * - cache entry (if exists)

39486. LRU: move our entry to first

39487. **comment:** * Convert char offset to byte offset ** Avoid using the string cache if possible: for ASCII strings byte and * char offsets are equal and for short strings direct scanning may be * better than using the string cache (which may evict a more important * entry). ** Typing now assumes 32-bit string byte/char offsets (duk_uint_fast32_t). * Better typing might be to use duk_size_t.

label: code-design

39488. no sce, or sce scan not best

39489. * Update cache entry (allocating if necessary), and move the * cache entry to the first place (in an "LRU" policy).

39490. clen == blen -> pure ascii

39491. **comment:** * For non-ASCII strings, we need to scan forwards or backwards * from some starting point. The starting point may be the start * or end of the string, or some cached midpoint in the string * cache. ** For "short" strings we simply scan without checking or updating * the cache. For longer strings we check and update the cache as * necessary, inserting a new cache entry if none exists.

label: code-design

39492. **comment:** 'sce' points to the wrong entry here, but is no longer used

label: code-design

39493. Scan error: this shouldn't normally happen; it could happen if * string is not valid UTF-8 data, and clen/blen are not consistent * with the scanning algorithm.

39494. **comment:** XXX: the string shouldn't appear twice, but we now loop to the * end anyway; if fixed, add a looping assertion to ensure there * is no duplicate.

label: code-design

39495. * For ASCII strings, the answer is simple.

39496. * String cache. ** Provides a cache to optimize indexed string lookups. The cache keeps * track of (byte offset, char offset) states for a fixed number of strings. * Otherwise we'd need to scan from either end of the string, as we store * strings in (extended) UTF-8.

39497. initialize for debug prints, needed if sce==NULL

39498. * A C * B A * C <- sce ==> B * D D

39499. may be less, since DELETED entries are NULled by rehash

39500. **comment:** load factor too low or high, count actually used entries and resize

label: code-design

39501. Count actually used (non-NULL, non-DELETED) entries.

39502. OK

39503. avoid array abandoning which interns strings

39504. unsigned intentionally

39505. dummy

39506. checking for DUK__DELETED_MARKER is not necessary here, but helper does it now

39507. may be NULL

39508. NUL terminate for convenient C access

39509. Undefine local defines

39510. If blen <= 0xffffUL, clen is also guaranteed to be <= 0xffffUL.

39511. Overflow, relevant mainly when listlen is 16 bits.

39512. find and remove string from stringtable; caller must free the string itself

39513. **comment:** * String table algorithm: fixed size string table with array chaining ** The top level string table has a fixed size, with each slot holding * either NULL, string pointer, or pointer to a separately allocated * string pointer list. ** This is good for low memory environments using a pool allocator: the * top level allocation has a fixed size and the pointer lists have quite * small allocation size, which further matches the typical pool sizes * needed by objects, strings, property tables, etc.

label: code-design

39514. char: use int cast

39515. guaranteed to succeed

39516. * Create a hstring and insert into the heap. The created object * is directly garbage collectable with reference count zero. ** The caller must place the interned string into the stringtable * immediately (without chance of a longjmp); otherwise the string * is lost.

39517. fail

39518. new_used / size <= 1 / DIV <=> new_used <= size / DIV

39519. DUK_USE_STRTAB_PROBE

39520. DUK_USE_DEBUG

39521. caller is responsible for ensuring this

39522. strings may have inner refs (extdata) in some cases

39523. grow by at most one

39524. Note: hstring is in heap but has refcount zero and is not strongly reachable. * Caller should increase refcount and make the hstring reachable before any * operations which require allocation (and possible gc).

39525. looping should never happen

39526. not strictly necessary

39527. Using an explicit 'ASCII' flag has larger footprint (one call site * only) but is quite useful for the case when there's no explicit * 'clen' in duk_hstring.

39528. **comment:** avoid pressure to add/remove strings, invalidation of call data argument, etc.

label: code-design

39529. rehash even if old and new sizes are the same to get rid of * DELETED entries.

39530. DUK_USE_ROM_STRINGS

39531. * Heap stringtable handling, string interning.

39532. Force a resize so that DELETED entries are eliminated. * Another option would be duk__recheck_strtab_size_probe(); * but since that happens on every intern anyway, this whole * check can now be disabled.

39533. **comment:** unused with some debug level combinations

label: code-design

39534. * The attempt to allocate may cause a GC. Such a GC must not attempt to resize * the stringtable (though it can be swept); finalizer execution and object * compaction must also be postponed to avoid the pressure to add strings to the * string table. Call site must prevent these.

39535. Because new_size > duk_count_used_probe(heap), guaranteed to work

39536. DUK_USE_HEAPPTR16

39537. failed

39538. avoid recursive string table call

39539. formatted result limited

39540. Free strings in the stringtable and any allocations needed * by the stringtable itself.

39541. * String table algorithm: closed hashing with a probe sequence ** This is the default algorithm and works fine for environments with * minimal memory constraints.
39542. DUK_USE_STRTAB_CHAIN
39543. Now two entries in the same slot, alloc list
39544. **comment:** XXX: could check for e16 == 0 because NULL is guaranteed to * encode to zero.
 label: code-design
39545. required for rehash to succeed, equality not that useful
39546. * Exposed calls
39547. **comment:** XXX: This is VERY inefficient now, and should be e.g. a * binary search or perfect hash, to be fixed.
 label: code-design
39548. All strings beginning with 0xff are treated as "internal", * even strings interned by the user. This allows user code to * create internal properties too, and makes behavior consistent * in case user code happens to use a string also used by Duktape * (such as string has already been interned and has the 'internal' * flag set).
39549. st_used remains the same, DELETED is counted as used
39550. **comment:** Prevent any side effects on the string table and the caller provided * str/blen arguments while interning is in progress. For example, if * the caller provided str/blen from a dynamic buffer, a finalizer might * resize that dynamic buffer, invalidating the call arguments.
 label: code-design
39551. For manual testing only.
39552. **comment:** unused
 label: code-design
39553. Relies on NULL encoding to zero.
39554. FAIL
39555. * Raw intern and lookup
39556. new_free / size <= 1 / DIV <=> new_free <= size / DIV
39557. Without ROM objects "needs refcount update" == is heap allocated.
39558. **comment:** * Reference counting helper macros. The macros take a thread argument * and must thus always be executed in a specific thread context. The * thread argument is needed for features like finalization. Currently * it is not required for INCREF, but it is included just in case. ** Note that 'raw' macros such as DUK_HEAPHDR_GET_REFCOUNT() are not * defined without DUK_USE_REFERENCE_COUNTING, so caller must #ifdef * around them.
 label: code-design
39559. **comment:** Slow variants, call to a helper to reduce code size. * Can be used explicitly when size is always more important than speed.
 label: code-design
39560. DUK_USE_REFERENCE_COUNTING
39561. refcount macros not defined without refcounting, caller must #ifdef now
39562. round out to 8 bytes
39563. currently nop
39564. result: updated refcount
39565. * Note: type is treated as a field separate from flags, so some masking is * involved in the macros below.
39566. refcounting requires direct heap frees, which in turn requires a dual linked heap
39567. 5 heap flags
39568. mark-and-sweep: finalized (on previous pass)
39569. Original idiom used, minimal code size.

39572. Optimized for size.
39573. DUK_USE_ROM_OBJECTS
39574. nop
39575. Optimized for speed.
39576. **comment:** XXX: double evaluation for 'tv' argument.
 label: code-design
39577. **comment:** * Common heap header ** All heap objects share the same flags and refcount fields. Objects other * than strings also need to have a single or double linked list pointers * for insertion into the "heap allocated" list. Strings are held in the * heap-wide string table so they don't need link pointers. ** Technically, 'h_refcount' must be wide enough to guarantee that it cannot * wrap (otherwise objects might be freed incorrectly after wrapping). This * means essentially that the refcount field must be as wide as data pointers. * On 64-bit platforms this means that the refcount needs to be 64 bits even * if an 'int' is 32 bits. This is a bit unfortunate, and compromising on * this might be reasonable in the future. ** Heap header size on 32-bit platforms: 8 bytes without reference counting, * 16 bytes with reference counting.
 label: code-design
39578. init pointer fields to null
39579. Check that prev/next links are consistent: if e.g. h->prev is != NULL, * h->prev->next should point back to h.
39580. DUK_USE_FASTINT
39581. **comment:** XXX: fast-int-to-double
 label: code-design
39582. read-only object, in code section
39583. 2 bits for heap type
39584. side effects
39585. mark-and-sweep: children not processed
39586. mark-and-sweep: finalizable (on current pass)
39587. Casting convenience.
39588. **comment:** Convenience for some situations; the above macros don't allow NULLs * for performance reasons.
 label: code-design
39589. **comment:** 16 bits would be enough for shared heaphdr flags and duk_hstring * flags. The initial parts of duk_heaphdr_string and duk_heaphdr * must match so changing the flags field size here would be quite * awkward. However, to minimize struct size, we can pack at least * 16 bits of duk_hstring data into the flags field.
 label: code-design
39590. * Heap header definition and assorted macros, including ref counting. * Access all fields through the accessor macros.
39591. Default variants. Selection depends on speed/size preference. * Concretely: with gcc 4.8.1 -Os x64 the difference in final binary * is about +1kB for _FAST variants.
39592. get or set a range of flags; m=first bit number, n=number of bits
39593. **comment:** * Macros to set a duk_tval and update refcount of the target (decref the * old value and incref the new value if necessary). This is both performance * and footprint critical; any changes made should be measured for size/speed.
 label: code-design
39594. **comment:** When DUK_USE_HEAPPTR16 (and DUK_USE_REFCOUNT16) is in use, the * struct won't align nicely to 4 bytes. This 16-bit extra field * is added to make the alignment clean; the field can be used by * heap objects when 16-bit packing is used. This field is now * conditional to DUK_USE_HEAPPTR16 only, but it is intended to be * used with DUK_USE_REFCOUNT16 and DUK_USE_DOUBLE_LINKED_HEAP; * this only matter to low memory environments anyway.
 label: code-design
39595. **comment:** Fast variants, inline refcount operations except for refzero handling. * Can be used explicitly when speed is always more important than size. * For a good compiler and a single file build, these are basically the * same as a forced inline.
 label: code-design

39596. 25 user flags
39597. DUK_HEAPHDR_H_INCLUDED
39598. With ROM objects "needs refcount update" is true when the value is * heap allocated and is not a ROM object.
39599. **comment:** XXX: no optimized variants yet
 label: requirement
39600. **comment:** Faster alternative: avoid making a temporary copy of tvptr_dst and use * fast incref/decref macros.
 label: code-design
39601. **comment:** DUK_TVAL_SET_TVAL_UPDREF() is used a lot in executor, property lookups, * etc, so it's very important for performance. Measure when changing. ** NOTE: the source and destination duk_tval pointers may be the same, and * the macros MUST deal with that correctly.
 label: code-design
39602. mark-and-sweep: reachable
39603. * Heap native function representation.
39604. **comment:** The 'magic' field allows an opaque 16-bit field to be accessed by the * Duktape/C function. This allows, for instance, the same native function * to be used for a set of very similar functions, with the 'magic' field * providing the necessary non-argument flags / values to guide the behavior * of the native function. The value is signed on purpose: it is easier to * convert a signed value to unsigned (simply AND with 0xffff) than vice * versa. ** Note: cannot place nargs/magic into the heapdr flags, because * duk_hobject takes almost all flags already (and needs the spare).

 label: code-design
39624. **comment:** * 'props' contains {key,value,flags} entries, optional array entries, and * an optional hash lookup table for non-array entries in a single 'sliced' * allocation. There are several layout options, which differ slightly in * generated code size/speed and alignment/padding; duk_features.h selects * the layout used. *
 * Layout 1 (DUK_USE_HOBJECT_LAYOUT_1): ** e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_propvalue)
 bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted
 * * Layout 2 (DUK_USE_HOBJECT_LAYOUT_2): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_hstring)
 * bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_uint8_t) + pad bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused,
 0xfffffffffeUL = deleted * * Layout 3 (DUK_USE_HOBJECT_LAYOUT_3): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) *
 a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) *
 h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * e_size * sizeof(duk_uint8_t) bytes
 of entry flags (e_next gc reachable) * * In layout 1, the 'e_next' count is rounded to 4 or 8 on platforms * requiring 4 or 8 byte alignment. This ensures proper
 alignment * for the entries, at the cost of memory footprint. However, it's * probably preferable to use another layout on such platforms instead. * * In layout 2, the
 key and value parts are swapped to avoid padding * the key array on platforms requiring alignment by 8. The flags part * is padded to get alignment for array
 entries. The 'e_next' count does * not need to be rounded as in layout 1. * * In layout 3, entry values and array values are always aligned properly, * and assuming
 pointers are at most 8 bytes, so are the entry keys. Hash * indices will be properly aligned (assuming pointers are at least 4 bytes). * Finally, flags don't need
 additional alignment. This layout provides * compact allocations without padding (even on platforms with alignment * requirements) at the cost of a bit slower
 lookups. ** Objects with few keys don't have a hash index; keys are looked up linearly, * which is cache efficient because the keys are consecutive. Larger objects
 * have a hash index part which contains integer indexes to the entries part. ** A single allocation reduces memory allocation overhead but requires more * work
 when any part needs to be resized. A sliced allocation for entries * makes linear key matching faster on most platforms (more locality) and * skimps on flags size
 (which would be followed by 3 bytes of padding in * most architectures if entries were placed in a struct). ** 'props' also contains internal properties distinguished
 with a non-BMP * prefix. Often used properties should be placed early in 'props' whenever * possible to make accessing them as fast as possible.

39675. internal properties

39676. custom

39677. higher value conserves memory; also note that linear scan is cache friendly

39678. read-only values 'lifted' for ease of use

39679. Maximum prototype traversal depth. Sanity limit which handles e.g. * prototype loops (even complex ones like 1->2->3->4->2->3->4->2->3->4).

39680. envrec: (declarative) record is closed

39681. hash size relative to entries size: for value X, approx. hash_prime(e_size + e_size / X)

39682. LAYOUT 3

39683. internal align target for props allocation, must be 2^n for some n

39684. Sanity limit on max number of properties (allocated, not necessarily used). * This is somewhat arbitrary, but if we're close to 2^{32} properties some * algorithms will fail (e.g. hash size selection, next prime selection). * Also, we use negative array/entry table indices to indicate 'not found', * so anything above 0x80000000 will cause trouble now.

39685. object is constructable

39686. prototype: the only internal property lifted outside 'e' as it is so central

39687. controls for minimum array part growth

39688. * Macros for property handling

39689. pc2line

39690. ES6 proxy

39691. $2^{31} \approx 2G$ properties

39692. function: create an arguments object on function call

39693. accessor

39694. controls for minimum entry part growth

39695. range check not necessary because all 4-bit values are mapped

39696. XXX: duk_uarridx_t?

39697. object has any exotic behavior(s)

39698. E5 Section 8.6.2 + custom classes

39699. prop index in 'hash part', < 0 if not there

39700. don't throw for prototype loop

39701. low-level property functions

39702. object established using Function.prototype.bind()

39703. * Ecmascript [[Class]]

39704. 112.5%, i.e. new size less than 12.5% higher \rightarrow fast resize

39705. helpers for defineProperty() and defineProperties()

39706. object is a native function (duk_hnativefunction)

39707. if new_size < L * old_size, resize without abandon check; L = 3-bit fixed point, e.g. 9 $\rightarrow 9/8 = 112.5\%$

39708. function: function object is strict

39709. enumeration

39710. array part size (entirely gc reachable)

39711. 'String' object, array index exotic behavior

39712. alloc and init

39713. * Misc

39714. * Allocate an duk_hobject. * * The allocated object has no allocation for properties; the caller may * want to force a resize if a desired size is known. * * The allocated object has zero reference count and is not reachable. * The caller MUST make the object reachable and increase its reference * count before invoking any operation that might require memory allocation.

39715. * Allocate a new thread. * * Leaves the built-ins array uninitialized. The caller must either * initialize a new global context or share existing built-ins from * another thread.

39716. **comment:** * obj->props is intentionally left as NULL, and duk_hobject_props.c must deal * with this properly. This is intentional: empty objects consume a minimum * amount of memory. Further, an initial allocation might fail and cause * 'obj' to "leak" (require a mark-and-sweep) since it is not reachable yet.
label: code-design

39717. also goes into flags

39718. different memory layout, alloc size, and init

39719. **comment:** XXX: macro? sets both heaphdr and object flags
label: code-design

39720. * Hobject allocation. ** Provides primitive allocation functions for all object types (plain object, * compiled function, native function, thread). The object return is not yet * in "heap allocated" list and has a refcount of zero, so caller must careful.

39721. Zero encoded pointer is required to match NULL

39722. **comment:** unused now
label: code-design

39723. when nothing is running, API calls are in non-strict mode

39724. NULL pointer is required to encode to zero, so memset is enough.

39725. **comment:** UNUSED, intentionally empty
label: code-design

39726. Note: assumes that these string indexes are 8-bit, genstrings.py must ensure that

39727. * Hobject Ecmascript [[Class]].

39728. recheck that the property still exists

39729. * Virtual properties. ** String and buffer indices are virtual and always enumerable, * 'length' is virtual and non-enumerable. Array and arguments * object props have special behavior but are concrete.

39730. 'length' and other virtual properties are not * enumerable, but are included if non-enumerable * properties are requested.

39731. **comment:** XXX: identify enumeration target with an object index (not top of stack)
label: code-design

39732. * Entries part

39733. [... enum]

39734. * Returns non-zero if a key and/or value was enumerated, and: ** [enum] -> [key] (get_value == 0) * [enum] -> [key value] (get_value == 1) ** Returns zero without pushing anything on the stack otherwise.

39735. still reachable

39736. compact; no need to seal because object is internal

39737. [... res]

39738. -> [... enum key enum_target val]

39739. * Get enumerated keys in an Ecmascript array. Matches Object.keys() behavior * described in E5 Section 15.2.3.14.

39740. return 1 to allow callers to tail call

39741. used for array, stack, and entry indices

39742. [enum_target res]

39743. enumerator must have no keys deleted

39744. [... enum_target res trap_result val true]

39745. * Some E5/E5.1 algorithms require that array indices are iterated * in a strictly ascending order. This is the case for e.g. * Array.prototype.forEach() and JSON.stringify() PropertyList * handling. ** To ensure this property for arrays with an array part (and * arbitrary objects too, since e.g. forEach() can be applied * to an array), the caller can request that we sort the keys * here.

39746. string objects must not created without internal value

39747. control props

39748. **comment:** XXX: not sure what the correct semantic details are here, * e.g. handling of missing values (gaps), handling of non-array * trap results, etc. ** For keys, we simply skip non-string keys which seems to be * consistent with how e.g. Object.keys() will process proxy trap * results (ES6, Section 19.1.2.14).
label: code-design

39749. Enumeration keys are checked against the enumeration target (to see * that they still exist). In the proxy enumeration case _Target will * be the proxy, and checking key existence against the proxy is not * required (or sensible, as the keys may be fully virtual).

39750. -> [... enum_target res]

39751. * Array part * * Note: ordering between array and entry part must match 'abandon array' * behavior in duk_hobject_props.c: key order after an array is abandoned * must be the same.

39752. The internal _Target property is kept pointing to the original * enumeration target (the proxy object), so that the enumerator * 'next' operation can read property values if so requested. The * fact that the _Target is a proxy disables key existence check * during enumeration.

39753. **comment:** * Create an internal enumerator object E, which has its keys ordered * to match desired enumeration ordering. Also initialize internal control * properties for enumeration. ** Note: if an array was used to hold enumeration keys instead, an array * scan would be needed to eliminate duplicates found in the prototype chain.
label: code-design

39754. [enum_target res key true]

39755. -> [... enum key val]

39756. There's intentionally no check for * current underlying buffer length.

39757. -- p_insert -- p_curr * v v * | ... | insert | ... | curr

39758. [... enum_target res trap_result]

39759. must match exactly the number of internal properties inserted to enumerator

39760. **comment:** XXX: avoid this at least when enum_target is an Array, it has an * array part, and no ancestor properties were included? Not worth * it for JSON, but maybe worth it for forEach().
label: code-design

39761. Initialize index so that we skip internal control keys.

39762. -> [... enum key enum_target key]

39763. -> [...]

39764. * Proxy object handling

39765. **comment:** Create a temporary enumerator to get the (non-duplicated) key list; * the enumerator state is initialized without being needed, but that * has little impact.
label: code-design

39766. **comment:** * Helper to sort array index keys. The keys are in the enumeration object * entry part, starting from DUK__ENUM_START_INDEX, and the entry part is dense. ** We use insertion sort because it is simple (leading to compact code,) * works nicely in-place, and minimizes operations if data is already sorted * or nearly sorted (which is a very common case here). It also minimizes * the use of element comparisons in general. This is nice because element * comparisons here involve re-parsing the string keys into numbers each * time, which is naturally very expensive. ** Note that the entry part values are all "true", e.g. * * "1" -> true, "3" -> true, "2" -> true * * so it suffices to only work in the key part without exchanging any keys, * simplifying the sort. **
http://en.wikipedia.org/wiki/Insertion_sort * * (Compiles to about 160 bytes now as a stand-alone function.)
label: code-design

39767. [enum_target enum res]

39768. **comment:** * Hobject enumeration support. ** Creates an internal enumeration state object to be used e.g. with for-in * enumeration. The state object contains a snapshot of target object keys * and internal control state for enumeration. Enumerator flags allow caller * to e.g. request internal/non-enumerable properties, and to enumerate only * "own" properties. ** Also creates the result value for e.g. Object.keys() based on the same * internal structure. ** This snapshot-based enumeration approach is used to simplify enumeration: * non-snapshot-based approaches are difficult to reconcile with mutating * the enumeration target, running multiple long-lived enumerators at the * same time, garbage collection details, etc. The downside is that the * enumerator object is memory inefficient especially for iterating arrays.
label: code-design

39769. No need to replace the 'enum_target' value in stack, only the * enum_target reference. This also ensures that the original * enum target is reachable, which keeps the proxy and the proxy * target reachable. We do need to replace the internal _Target.

39770. **comment:** XXX: may need a 'length' filter for forEach()
label: code-design

39771. **comment:** XXX use get tval ptr, more efficient

label: code-design

39772. Needs to be inserted; scan backwards, since we optimize * for the case where elements are nearly in order.
39773. -> [... key val]
39774. Neutered buffer, zero length seems * like good behavior here.
39775. String and buffer enumeration behavior is identical now, * so use shared handler.
39776. [res]
39777. Target must be stored so that we can recheck whether or not * keys still exist when we enumerate. This is not done if the * enumeration result comes from a proxy trap as there is no * real object to check against.
39778. -> [... key]
39779. nargs
39780. [... enum_target res trap_result val]

39830. 1 1 1 <32 bits> * Encode in two parts to avoid bitencode 24-bit limitation
39831. valid pc range is [0, length[
39832. Although there are writable virtual properties (e.g. plain buffer * and buffer object number indices), they are handled before we come * here.
39833. should never happen
39834. [key getter this] -> [key retval]
39835. Note: no key on stack
39836. avoid attempt to compact the current object
39837. key is now reachable in the valstack
39838. NULL obj->p is OK
39839. **comment:** XXX: top of stack must contain value, which helper doesn't touch, * rework to use tv_val directly?
label: code-design

39840. all virtual properties are non-configurable and non-writable

39841. not found
39842. resume lookup from target
39843. **comment:** Note: reuse 'curr'
 label: code-design
39844. * Get old and new length
39845. * Note: although arguments object variable mappings are only established * for non-strict functions (and a call to a non-strict function created * the arguments object in question), an inner strict function may be doing * the actual property write. Hence the throw_flag applied here comes from * the property write call.
39846. **comment:** XXX: consolidated algorithm step 15.f -> redundant?
 label: code-design
39847. **comment:** XXX: very basic optimization -> duk_get_prop_stridx_top
 label: code-design
39848. * Check whether we need to abandon an array part (if it exists)
39849. no need to decref, as previous value is 'undefined'
39850. **comment:** * The 'in' operator requires an object as its right hand side, * throwing a TypeError unconditionally if this is not the case. * * However, lightfuncs need to behave like fully fledged objects * here to be maximally transparent, so we need to handle them * here.
 label: code-design
39851. USE_PROP_HASH_PART
39852. Get default hash part size for a certain entry part size.
39853. Must coerce key: if key is an object, it may coerce to e.g. 'length'.
39854. key is 'length', cannot match argument exotic behavior
39855. * First check whether property exists; if not, simple case. This covers * steps 1-4.
39856. String is an own (virtual) property of a lightfunc.
39857. Input value should be on stack top and will be coerced and * popped. Refuse to update an Array's 'length' to a value * outside the 32-bit range. Negative zero is accepted as zero.
39858. If neutered must return 0; offset is zeroed during * neutering.
39859. * Ecmascript compliant [[GetProperty]](P), for internal use only. * * If property is found: * - Fills descriptor fields to 'out_desc' * - If DUK_GETDESC_FLAG_PUSH_VALUE is set, pushes a value related to the * property onto the stack ('undefined' for accessor properties). * - Returns non-zero * * If property is not found: * - 'out_desc' is left in untouched state (possibly garbage) * - Nothing is pushed onto the stack (not even with DUK_GETDESC_FLAG_PUSH_VALUE * set) * - Returns zero * * May cause arbitrary side effects and invalidate (most) duk_tval * pointers.
39860. **comment:** XXX: inject test
 label: code-design
39861. setter and/or getter may be NULL
39862. Not possible because array object 'length' is present * from its creation and cannot be deleted, and is thus * caught as an existing property above.
39863. replaces top of stack with new value if necessary
39864. **comment:** prev value must be unused, no decref
 label: code-design
39865. * Update an existing property of the base object.
39866. late lookup, avoid side effects
39867. * Debug logging after adjustment.
39868. Notes: * - only numbered indices are relevant, so arr_idx fast reject is good * (this is valid unless there are more than 4**32-1 arguments). * - since variable lookup has no side effects, this can be skipped if * DUK_GETDESC_FLAG_PUSH_VALUE is not set.
39869. **comment:** XXX: option to pretend property doesn't exist if sanity limit is * hit might be useful.
 label: code-design
39870. update length (curr points to length, and we assume it's still valid)
39871. * Post resize assertions.
39872. flags
39873. Abandon array part, moving array entries into entries part. * This requires a props resize, which is a heavy operation. * We also compact the entries part while we're at it, although * this is not strictly required.
39874. IsGenericDescriptor(desc) == true; this means in practice that 'desc' * only has [[Enumerable]] or [[Configurable]] flag updates, which are * allowed at this point.
39875. No resize has occurred so temp_desc->e_idx is still OK
39876. Lookup 'key' from arguments internal 'map', perform a variable write if mapped. * Used in E5 Section 10.6 algorithm for [[DefineOwnProperty]] (used by [[Put]]). * Assumes stack top contains 'put' value (which is NOT popped).
39877. **comment:** XXX: this is a major target for size optimization
 label: code-design
39878. implicit attributes
39879. [in_val in_val]
39880. leave result on stack top
39881. if fails, e_size will be zero = not an issue, except performance-wise
39882. Note: no recursion issue, we can trust 'map' to behave
39883. non-object base, no offending virtual property
39884. caller ensures; rom objects are never bufferobjects now
39885. * Some change(s) need to be made. Steps 7-11.
39886. For internal use: get non-accessor entry value and attributes
39887. * Write to entry part
39888. * All done, switch properties ('p') allocation to new one.
39889. * Slow delete, but we don't care as we're already in a very slow path. * The delete always succeeds: key has no exotic behavior, property * is configurable, and no resize occurs.
39890. hash probe sequence
39891. must have been, since in array part
39892. array entries are all plain values
39893. **comment:** XXX: the helper currently assumes stack top contains new * 'length' value and the whole calling convention is not very * compatible with what we need.
 label: code-design
39894. Coerce to number before validating pointers etc so that the * number coercions in duk_hbufferobject_validated_write() are * guaranteed to be side effect free and not invalidate the * pointer checks we do here.
39895. Buffer writes are often integers.
39896. XXX: duk_to_int() ensures we'll get 8 lowest bits as * as input is within duk_int_t range (capped outside it).
39897. [obj key value desc]
39898. resume delete to target
39899. stage 2: delete configurable entries above target length
39900. Lightfunc virtual properties are non-configurable, so * reject if match any of them.
39901. success
39902. [] -> [res]
39903. keep key reachable for GC etc; guaranteed not to fail
39904. Special behavior for 'caller' property of (non-bound) function objects * and non-strict Arguments objects: if 'caller' -value- (!) is a strict * mode function, throw a TypeError (E5 Sections 15.3.5.4, 10.6). * Quite interestingly, a non-strict function with no formal arguments * will get an arguments object -without- special 'caller' behavior! * * The E5.1 spec is a bit ambiguous if this special behavior applies when * a bound function is the base value (not the 'caller' value): Section * 15.3.4.5 (describing bind()) states that [[Get]] for bound functions * matches that of Section 15.3.5.4 ([[Get]] for Function instances). * However, Section 13.3.5.4

has "NOTE: Function objects created using * Function.prototype.bind use the default [[Get]] internal method." * The current implementation assumes this means that bound functions * should not have the special [[Get]] behavior. * * The E5.1 spec is also a bit unclear if the TypeError throwing is * applied if the 'caller' value is a strict bound function. The * current implementation will throw even for both strict non-bound * and strict bound functions. * * See test-dev-strict-func-as-caller-prop-value.js for quite extensive * tests. * * This exotic behavior is disabled when the non-standard 'caller' property * is enabled, as it conflicts with the free use of 'caller'.

39905. !DUK_USE_NONSTD_FUNC_CALLER_PROPERTY

39906. assume array part is comprehensive (contains all array indexed elements * or none of them); hence no need to check the entries part here.

39907. index is above internal buffer length -> property is fully normal

39908. write_to_array_part:

39909. E5 Section 15.5.5.1

39910. ignore retval -> [key]

39911. Resolve Proxy targets until Proxy chain ends. No explicit check for * a Proxy loop: user code cannot create such a loop without tweaking * internal properties directly.

39912. * Because buffer values are often looped over, a number fast path * is important.

39913. * E5 Section 15.4.5.1, steps 3.k - 3.n. The order at the end combines * the error case 3.l.iii and the success case 3.m-3.n. * * Note: 'length' is always in entries part, so no array abandon issues for * 'writable' update.

39914. don't push value

39915. Convert a duk_tval number (caller checks) to a 32-bit index. Returns * DUK__NO_ARRAY_INDEX if the number is not whole or not a valid array * index.

39916. * Intern key via the valstack to ensure reachability behaves * properly. We must avoid longjmp's here so use non-checked * primitives. * * Note: duk_check_stack() potentially reallocs the valstack, * invalidating any duk_tval pointers to valstack. Callers * must be careful.

39917. **comment:** never shrinks; auto-adds DUK_VALSTACK_INTERNAL_EXTRA, which is generous

label: code-design

39918. increases key refcount

39919. Reject attempt to change virtual properties: not part of the * standard algorithm, applies currently to e.g. virtual index * properties of buffer objects (which are virtual but writable). * (Cannot "force" modification of a virtual property.)

39920. avoid attempts to add/remove object keys

39921. curr is accessor, desc is data

39922. Set up pointers to the new property area: this is hidden behind a macro * because it is memory layout specific.

39923. * Local defines

39924. E5 Section 15.4.5.1, step 4

39925. Lookup 'key' from arguments internal 'map', perform a variable lookup * if mapped, and leave the result on top of stack (and return non-zero). * Used in E5 Section 10.6 algorithms [[Get]] and [[GetOwnProperty]].

39926. Note: intentionally use approximations to shave a few instructions: * a_used = old_used (accurate: old_used + 1) * a_size = arr_idx (accurate: arr_idx + 1)

39927. [... old_result] -> [... result]

39928. Must avoid duk_pop() in exit path

39929. DUK_USE_FASTINT

39930. no decref needed for a number

39931. Leave 'getter' on stack

39932. [key] -> [undefined] (default value)

39933. **comment:** XXX: There is currently no support for writing buffer object * indexed elements here. Attempt to do so will succeed and * write a concrete property into the buffer object. This should * be fixed at some point but because buffers are a custom feature * anyway, this is relatively unimportant.

label: code-design

39934. **comment:** array part must not contain any non-unused properties, as they would * be configurable and writable.

label: code-design

39935. force_flag

39936. If not found, resume existence check from Function.prototype. * We can just substitute the value in this case; nothing will * need the original base value (as would be the case with e.g. * setters/getters).

39937. * Object internal value * * Returned value is guaranteed to be reachable / incref'd, caller does not need * to incref OR decref. No proxies or accessors are invoked, no prototype walk.

39938. curr value

39939. [key] (coerced)

39940. Note: no allocation pressure, no need to check refcounts etc

39941. This function is only called for objects with array exotic behavior. * The [[DefineOwnProperty]] algorithm for arrays requires that * 'length' can never have a value outside the unsigned 32-bit range, * attempt to write such a value is a RangeError. Here we can thus * assert for this. When Duktape internals go around the official * property write interface (doesn't happen often) this assumption is * easy to accidentally break, so such code must be written carefully. * See test-bi-array-push-maxlen.js.

39942. [key setter this val key] -> [key retval]

39943. * Found existing accessor property (own or inherited). * Call setter with 'this' set to orig, and value as the only argument. * Setter calls are OK even for ROM objects. * * Note: no exotic arguments object behavior, because [[Put]] never * calls [[DefineOwnProperty]] (E5 Section 8.12.5, step 5.b).

39944. guaranteed to find an empty slot

39945. Lookup 'key' from arguments internal 'map', and leave replacement value * on stack top if mapped (and return non-zero). * Used in E5 Section 10.6 algorithm for [[GetOwnProperty]] (used by [[Get]]).

39946. [key trap_result] -> []

39947. **comment:** XXX: investigate whether write protect can be handled above, if we * just update length here while ignoring its protected status

label: code-design

39948. **comment:** XXX: unnecessary string coercion for array indices, * intentional to keep small.

label: code-design

39949. remove value

39950. * Object.isSealed() and Object.isFrozen() (E5 Sections 15.2.3.11, 15.2.3.13) * * Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. * * Note: all virtual (non-concrete) properties are currently non-configurable * and non-writable (and there are no accessor virtual properties), so they don't * need to be considered here now.

39951. * Fast path for defining array indexed values without interning the key. * This is used by e.g. code for Array prototype and traceback creation so * must avoid interning.

39952. * Object.getOwnPropertyDescriptor() (E5 Sections 15.2.3.3, 8.10.4) * * This is an actual function call.

39953. * Not found

39954. * Proxy helpers

39955. steps 3.h and 3.i

39956. * Found; post-processing (Function and arguments objects)

39957. [key val]

39958. valstack space that suffices for all local calls, including recursion * of other than Duktape calls (getters etc)

39959. the entries [new_e_next, new_e_size_adjusted[are left uninitialized on purpose (ok, not gc reachable)

39960. cannot be arguments exotic

39961. actually used, non-NULL keys

39962. avoid double coercion

39963. Note: assume array part is comprehensive, so that either * the write goes to the array part, or we've abandoned the * array above (and will not come here).

39964. Magically bound variable cannot be an accessor. However, * there may be an accessor property (or a plain property) in * place with magic behavior removed. This happens e.g. when * a magic property is redefined with defineProperty(). * Cannot assert for "not accessor" here.

39965. * Local prototypes

39966. **comment:** XXX: post-checks (such as no duplicate keys)

label: code-design

39967. **comment:** The handler is looked up with a normal property lookup; it may be an * accessor or the handler object itself may be a proxy object. If the * handler is a proxy, we need to extend the valstack as we make a * recursive proxy check without a function call in between (in fact * there is no limit to the potential recursion here). ** (For sanity, proxy creation rejects another proxy object as either * the handler or the target at the moment so recursive proxy cases * are not realized now.)

label: code-design

39968. Check array density and indicate whether or not the array part should be abandoned.

39969. [key value] or [key undefined]

39970. descriptor type specific checks

39971. avoid multiple computations of flags address; bypasses macros

39972. * Found existing own (non-inherited) plain property. * Do an access control check and update in place.

39973. * Ecmascript compliant [[GetOwnProperty]](P), for internal use only. ** If property is found: * - Fills descriptor fields to 'out_desc' * - If DUK_GETDESC_FLAG_PUSH_VALUE is set, pushes a value related to the * property onto the stack ('undefined' for accessor properties). * - Returns non-zero * * If property is not found: * - 'out_desc' is left in untouched state (possibly garbage) * - Nothing is pushed onto the stack (not even with DUK_GETDESC_FLAG_PUSH_VALUE * set) * - Returns zero ** Notes: * * - Getting a property descriptor may cause an allocation (and hence * GC) to take place, hence reachability and refcount of all related * values matter. Reallocation of value stack, properties, etc may * invalidate many duk_tval pointers (concretely, those which reside * in memory areas subject to reallocation). However, heap object * pointers are never affected (heap objects have stable pointers). * * - The value of a plain property is always reachable and has a non-zero * reference count. * * - The value of a virtual property is not necessarily reachable from * elsewhere and may have a refcount of zero. Hence we push it onto * the valstack for the caller, which ensures it remains reachable * while it is needed. * * - There are no virtual accessor properties. Hence, all getters and * setters are always related to concretely stored properties, which * ensures that the get/set functions in the resulting descriptor are * reachable and have non-zero refcounts. Should there be virtual * accessor properties later, this would need to change.

39974. **comment:** * XXX: array indices are mostly typed as duk_uint32_t here; duk_uarridx_t * might be more appropriate.

label: code-design

39975. not enumerable

39976. * Allocate and initialize a new entry, resizing the properties allocation * if necessary. Returns entry index (e_idx) or throws an error if alloc fails. ** Sets the key of the entry (increasing the key's refcount), and updates * the hash part if it exists. Caller must set value and flags, and update * the entry value refcount. A decref for the previous value is not necessary.

39977. should not happen

39978. previous value is assumed to be garbage, so don't touch it

39979. * Abandon array failed, need to decref keys already inserted * into the beginning of new_e_k before unwinding valstack.

39980. standard behavior, step 3.f.i

39981. index is above internal string length -> property is fully normal

39982. * Rebuild the hash part always from scratch (guaranteed to finish). ** Any resize of hash part requires rehashing. In addition, by rehashing * get rid of any elements marked deleted (DUK_HASH_DELETED) which is critical * to ensuring the hash part never fills up.

39983. must not be extensible

39984. **comment:** fill new_h with u32 0xff = UNUSED

label: code-design

39985. * Misc helpers

39986. side effects

39987. NULL if tv_obj is primitive

39988. actual update happens once write has been completed without * error below.

39989. IsDataDescriptor(desc) == true

39990. Target object must be checked for a conflicting * non-configurable property.

39991. guaranteed when building arguments

39992. With this check in place fast paths won't need read-only * object checks. This is technically incorrect if there are * setters that cause no writes to ROM objects, but current * built-ins don't have such setters.

39993. * Copy array elements to new array part.

39994. property exists, either 'desc' is empty, or all values * match (SameValue)

39995. we currently assume virtual properties are not configurable (as none of them are)

39996. * Property lookup

39997. Stage 1: find highest preventing non-configurable entry (if any). * When forcing, ignore non-configurability.

39998. Count actually used entry part entries (non-NULL keys).

39999. Note: use 'curr' as a temp propdesc

40000. Fast check for extending array: check whether or not a slow density check is required.

40001. * GETPROP: Ecmascript property read.

40002. * Property not found in prototype chain.

40003. unsigned

40004. **comment:** * In a fast check we assume old_size equals old_used (i.e., existing * array is fully dense). ** Slow check if: * * (new_size - old_size) / old_size > limit * new_size - old_size > limit * old_size * new_size > (1 + limit) * old_size || limit' is 3 bits fixed point * new_size > (1 + (limit' / 8)) * old_size || * 8 * new_size > (8 + limit') * old_size || : 8 * new_size > (8 + limit') * (old_size / 8) * new_size > limit' * (old_size / 8) || limit' = 9 -> max 25% increase * arr_idx + 1 > limit' * (old_size / 8) ** This check doesn't work well for small values, so old_size is rounded * up for the check (and the '+ 1' of arr_idx can be ignored in practice): * * arr_idx > limit' * ((old_size + 7) / 8)

label: code-design

40005. * Property already exists. Steps 5-6 detect whether any changes need * to be made.

40006. Must have array part and no conflicting exotic behaviors. * Doesn't need to have array special behavior, e.g. Arguments * object has array part.

40007. Delete elements required by a smaller length, taking into account * potentially non-configurable elements. Returns non-zero if all * elements could be deleted, and zero if all or some elements could * not be deleted. Also writes final "target length" to 'out_result_len'. * This is the length value that should go into the 'length' property * (must be set by the caller). Never throws an error.

40008. * Compact an object. Minimizes allocation size for objects which are * not likely to be extended. This is useful for internal and non- * extensible objects, but can also be called for non-extensible objects. * May abandon the array part if it is computed to be too sparse. ** This call is relatively expensive, as it needs to scan both the * entries and the array part. * * The call may fail due to allocation error.

40009. XXX: fast path for arrays?

40010. force the property to 'undefined' to create a slot for it

40011. This may trigger mark-and-sweep with arbitrary side effects, * including an attempted resize of the object we're resizing, * executing a finalizer which may add or remove properties of * the object we're resizing etc.

40012. This is a pretty awkward control flow, but we need to recheck the * key coercion here.

40013. [obj key undefined]

40014. **comment:** * XXX: duk_uint_fast32_t should probably be used in many places here.

label: code-design

40015. [obj key desc value get set curr_value]

40016. valstack space allocated especially for proxy lookup which does a * recursive property lookup

40017. DUK_USE_HOBJECT_HASH_PART

40018. **comment:** XXX: pre-checks (such as no duplicate keys)

label: code-design

40019. coercion order matters

40020. XXX: The TypeError is currently not applied to bound * functions because the 'strict' flag is not copied by * bind(). This may or may not be correct, the specification * only refers to the value being a "strict mode Function * object" which is ambiguous.

40021. Undefine local defines
40022. [obj key value desc value]
40023. Array properties have exotic behavior but they are concrete, * so no special handling here. ** Arguments exotic behavior (E5 Section 10.6, [[GetOwnProperty]]) * is only relevant as a post-check implemented below; hence no * check here.
40024. since duk_abandon_array_checked() causes a resize, there should be no gaps in keys
40025. If the value happens to be 0xFFFFFFFF, it's not a valid array index * but will then match DUK_NO_ARRAY_INDEX.
40026. **comment:** * Make a copy of tv_obj, tv_key, and tv_val to avoid any issues of * them being invalidated by a valstack resize. ** XXX: this is now an overkill for many fast paths. Rework this * to be faster (although switching to a valstack discipline might * be a better solution overall).
label: code-design
40027. default value
40028. write to entry part
40029. For internal use: get array part value
40030. treat like property not found
40031. [... put_value]
40032. **comment:** * Relocate property allocation, moving properties to the new allocation. ** Includes key compaction, rehashing, and can also optionally abandoning * the array part, 'migrating' array entries into the beginning of the * new entry part. Arguments are not validated here, so e.g. new_h_size * MUST be a valid prime. ** There is no support for in-place reallocation or just compacting keys * without resizing the property allocation. This is intentional to keep * code size minimal. ** The implementation is relatively straightforward, except for the array * abandonment process. Array abandonment requires that new string keys * are interned, which may trigger GC. All keys interned so far must be * reachable for GC at all times; valstack is used for that now. ** Also, a GC triggered during this reallocation process must not interfere * with the object being resized. This is currently controlled by using * heap->mark_and_sweep_base_flags to indicate that no finalizers will be * executed (as they can affect ANY object) and no objects are compacted * (it would suffice to protect this particular object only, though). ** Note: a non-checked variant would be nice but is a bit tricky to * implement for the array abandonment process. It's easy for * everything else. ** Note: because we need to potentially resize the valstack (as part * of abandoning the array part), any tval pointers to the valstack * will become invalid after this call.
label: code-design
40033. **comment:** Note: reuse 'curr' as a temp propdesc
label: code-design
40034. XXX: share final setting code for value and flags? difficult because * refcount code is different. Share entry allocation? But can't allocate * until array index checked.
40035. [key] -> []
40036. if abandon_array, new_a_size must be 0
40037. * Helpers to resize properties allocation on specific needs.
40038. for resizing of array part, use slow path
40039. -> [... trap handler]
40040. Note: proxy handling must happen before key is string coerced.
40041. guaranteed to finish, as hash is never full
40042. Push an arbitrary duk_tval to the stack, coerce it to string, and return * both a duk_hstring pointer and an array index (or DUK_NO_ARRAY_INDEX).
40043. * Migrate array to start of entries if requested. ** Note: from an enumeration perspective the order of entry keys matters. * Array keys should appear wherever they appeared before the array abandon * operation.
40044. Note: unconditional throw
40045. If a setter/getter is missing (undefined), the descriptor must * still have the property present with the value 'undefined'.
40046. Avoid side effects that might disturb curr.e_idx until * we're done editing the slot.
40047. **comment:** actually used
label: code-design
40048. **comment:** XXX: any chance of unifying this with the 'length' key handling?
label: code-design
40049. * Array part
40050. -0 is accepted here as index 0 because ToString(-0) == "0" which is * in canonical form and thus an array index.
40051. see below
40052. hash lookup
40053. **comment:** * Note: zero works as a "no update" marker because the new length * can never be zero after a new property is written. ** Note: must re-lookup because calls above (e.g. duk_alloc_entry_checked()) * may realloc and compact properties and hence change e_idx.
label: code-design
40054. * NormalizePropertyDescriptor() related helper. ** Internal helper which validates and normalizes a property descriptor * represented as an Ecmascript object (e.g. argument to defineProperty()). * The output of this conversion is a set of defprop_flags and possibly * some values pushed on the value stack; some subset of property value, * getter, setter. Caller must manage stack top carefully because the * number of values pushed depends on the input property descriptor. ** The original descriptor object must not be altered in the process.
40055. success: leave varname in stack
40056. Note: changing from writable to non-writable is OK
40057. don't touch property attributes or hash part
40058. stage 1 guarantees
40059. current assertion is quite strong: decref's and set to unused
40060. Length in elements: take into account shift, but * intentionally don't check the underlying buffer here.
40061. [key val] -> [key]
40062. * Argument exotic [[Delete]] behavior (E5 Section 10.6) is * a post-check, keeping arguments internal 'map' in sync with * any successful deletes (note that property does not need to * exist for delete to 'succeed'). ** Delete key from 'map'. Since 'map' only contains array index * keys, we can use arr_idx for a fast skip.
40063. [... key trap handler]
40064. * Get old and new length
40065. abandoning requires a props allocation resize and * 'rechecks' the valstack, invalidating any existing * valstack value pointers!
40066. * PUTPROP: Ecmascript property write. ** Unlike Ecmascript primitive which returns nothing, returns 1 to indicate * success and 0 to indicate failure (assuming throw is not set). ** This is an extremely tricky function. Some examples: * * * Currently a decref may trigger a GC, which may compact an object's * property allocation. Consequently, any entry indices (e_idx) will * be potentially invalidated by a decref. * * * Exotic behaviors (strings, arrays, arguments object) require, * among other things: * * - Preprocessing before and postprocessing after an actual property * write. For example, array index write requires pre-checking the * array 'length' property for access control, and may require an * array 'length' update after the actual write has succeeded (but * not if it fails). * * - Deletion of multiple entries, as a result of array 'length' write. * * * Input values are taken as pointers which may point to the valstack. * If valstack is resized because of the put (this may happen at least * when the array part is abandoned), the pointers can be invalidated. * (We currently make a copy of all of the input values to avoid issues.)
40067. * Found existing own or inherited plain property, but original * base is a primitive value.
40068. * Note: zero works as a "no update" marker because the new length * can never be zero after a new property is written.
40069. V
40070. ... target is extensible
40071. duk_get_min_grow_e() is always >= 1
40072. * Nice debug log.
40073. * DELPROP: Ecmascript property deletion.
40074. [... varname]
40075. * Ecmascript compliant [[Delete]](P, Throw).
40076. **comment:** XXX: for fastints, could use a variant which assumes a double duk_tval * (and doesn't need to check for fastint again).
label: code-design
40077. **comment:** XXX: the key in 'key in obj' is string coerced before we're called * (which is the required behavior in E5/E5.1/E6) so the key is a string * here already.

label: code-design

40078. note: original, uncoerced base

40079. $l = 0 \Rightarrow$ post-update for array 'length' (used when key is an array index)

40098. Read value pushed on stack.

40099. curr and desc are data

40100. accessor with defined getter

40101. key coercion (unless already coerced above)

40102. covered by comparison

40103. * Must guarantee all actually used array entries will fit into * new entry part. Add one growth step to ensure we don't run out * of space right away.

40104. [key]

40105. * Object.prototype.hasOwnProperty() and Object.prototype.propertyIsEnumerable().

40106. -> [in_val]

40107. **comment:** Note: for an accessor without getter, falling through to * check for "caller" exotic behavior is unnecessary as * "undefined" will never activate the behavior. But it does * no harm, so we'll do it anyway.**label:** code-design

40108. steps 4.a and 4.b are tricky

40109. defaults, E5 Section 8.6.1, Table 7

40110. * For property layout 1, tweak e_size to ensure that the whole entry * part (key + val + flags) is a suitable multiple for alignment * (platform specific). * * Property layout 2 does not require this tweaking and is preferred * on low RAM platforms requiring alignment.

40111. flag for later write

40112. Get minimum array part growth for a certain size.

40113. arrays MUST have a 'length' property

40114. * Note: assuming new_a_size == 0, and that entry part contains * no conflicting keys, refcounts do not need to be adjusted for * the values, as they remain exactly the same. * * The keys, however, need to be interned, incref'd, and be * reachable for GC. Any intern attempt may trigger a GC and * claim any non-reachable strings, so every key must be reachable * at all times. * * A longjmp must not occur here, as the new_p allocation would * be freed without these keys being decref'd, hence the messy * decref handling if intern fails.

40115. * Helpers for managing property storage size

40116. * Arguments handling helpers (argument map mainly). * * An arguments object has exotic behavior for some numeric indices. * Accesses may translate to identifier operations which may have * arbitrary side effects (potentially invalidating any duk_tval * pointers).

40117. NULL if not an object

40118. Catches >0x100000000 and negative values.

40119. currently required

40120. **comment:** XXX: Extensibility check for target uses IsExtensible(). If we * implemented the isExtensible trap and didn't reject proxies as * proxy targets, it should be respected here.**label:** code-design

40121. Currently there are no deletable virtual properties, but * with force_flag we might attempt to delete one.

40122. * Start doing property attributes updates. Steps 12-13. * * Start by computing new attribute flags without writing yet. * Property type conversion is done above if necessary.

40123. **comment:** Note: array entries are always writable, so the writability check * above is pointless for them. The check could be avoided with some * refactoring but is probably not worth it.**label:** code-design40124. **comment:** XXX: for array instances we could take a shortcut here and assume * Array.prototype doesn't contain an array index property.**label:** code-design

40125. retval indicates delete failed

40126. E5 Section 15.4.5.1, steps 4.e.i - 4.e.ii

40127. **comment:** XXX: handling for array part missing now; this doesn't affect * compliance but causes array entry writes using defineProperty() * to always abandon array part.**label:** code-design

40128. Caller doesn't need to check exotic proxy behavior (but does so for * some fast paths).

40129. fall through

40130. * HASPROP: EcmaScript property existence check ("in" operator). * * Interestingly, the 'in' operator does not do any coercion of * the target object.

40131. **comment:** XXX: write protect after flag? -> any chance of handling it here?**label:** code-design

40132. If neutered must return 0; length is zeroed during * neutering.

40133. array case is handled comprehensively above

40134. Note: array part values are [[Writable]], [[Enumerable]], * and [[Configurable]] which matches the required attributes * here.

40135. [key setter this val] -> [key retval]

40136. stage 3: update length (done by caller), decide return code

40137. * Not found as concrete or virtual

40138. minimum new length is highest_arr_idx + 1

40139. property is configurable and

40140. consistency requires this

40141. * Coercion and fast path processing

40142. **comment:** XXX: Refactor key coercion so that it's only called once. It can't * be trivially lifted here because the object must be type checked * first.**label:** code-design

40143. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside object 'a_size'.

40144. The coercion order must match the ToPropertyDescriptor() algorithm * so that side effects in coercion happen in the correct order. * (This order also happens to be compatible with duk_def_prop(), * although it doesn't matter in practice.)

40145. relevant array index is non-configurable, blocks write

40146. Careful with wrapping: arr_idx upshift may easily wrap, whereas * length downshift won't.

40147. **comment:** Note: we could return the hash index here too, but it's not * needed right now.
label: code-design

40148. P

40149. * Internal helper for defining an accessor property, ignoring * normal semantics such as extensibility, write protection etc. * Overwrites any existing value and attributes. This is called * very rarely, so the implementation first sets a value to undefined * and then changes the entry to an accessor (this is to save code space).

40150. index/length check guarantees

40151. **comment:** XXX: At the moment Duktape accesses internal keys like _Finalizer using a * normal property set/get which would allow a proxy handler to interfere with * such behavior and to get access to internal key strings. This is not a problem * as such because internal key strings can be created in other ways too (e.g. * through buffers). The best fix is to change Duktape internal lookups to * skip proxy behavior. Until that, internal property accesses bypass the * proxy and are applied to the target (as if the handler did not exist). * This has some side effects, see test-bi-proxy-internal-keys.js.
label: code-design

40152. new value

40153. actually used, non-NULL entries

40154. Do decrefs only with safe pointers to avoid side effects * disturbing e_idx.

40155. shared checks for all descriptor types

40156. strict flag for putvar comes from our caller (currently: fixed)

40157. * Coercion and fast path processing.

40158. Not strictly necessary because if key == NULL, flag MUST be ignored.

40159. caller ensures

40160. traits are separate; in particular, arguments not an array

40161. 0 = don't push current value

40162. Note: new_e_next matches pushed temp key count, and nothing can * fail above between the push and this point.

40163. fill new entries with -unused- (required, gc reachable)

40164. duk__get_min_grow_a() is always >= 1

40165. [key getter this key] -> [key retval]

40166. * New length not lower than old length => no changes needed * (not even array allocation).

40167. **comment:** * Write to 'length' of an array is a very complex case * handled in a helper which updates both the array elements * and writes the new 'length'. The write may result in an * unconditional RangeError or a partial write (indicated * by a return code). * * Note: the helper has an unnecessary writability check * for 'length', we already know it is writable.
label: code-design

40168. important for callers

40169. * Arguments exotic behavior not possible for new properties: all * magically bound properties are initially present in the arguments * object, and if they are deleted, the binding is also removed from * parameter map.

40170. clear array part flag only after switching

40171. * Writability check

40172. tv1 points to value storage

40173. caller must have decref'd values above new_a_size (if that is necessary)

40174. * XXX: shrink array allocation or entries compaction here?

40175. not found in 'curr', next in prototype chain; impose max depth

40176. FOUND

40177. Buffer has virtual properties similar to string, but indexed values * are numbers, not 1-byte buffers/strings which would perform badly.

40178. **comment:** XXX: unnecessary string coercion for array indices, * intentional to keep small; some overlap with string * handling.
label: code-design

40179. entry part must not contain any configurable properties, or * writable properties (if is_frozen).

40180. t >= 0 always true, unsigned

40181. Storing the entry top is cheaper here to ensure stack is correct at exit, * as there are several paths out.

40182. Lookup 'key' from arguments internal 'map', delete mapping if found. * Used in E5 Section 10.6 algorithm for [[Delete]]. Note that the * variable/argument itself (where the map points) is not deleted.

40183. Set property slot to an empty state. Careful not to invoke * any side effects while using desc.e_idx so that it doesn't * get invalidated by a finalizer mutating our object.

40184. target

40185. fall thru

40186. [key setter this val]

40187. **comment:** Note: we can reuse 'desc' here
label: code-design

40188. * Array exotic behaviors can be implemented at this point. The local variables * are essentially a 'value copy' of the input descriptor (Desc), which is modified * by the Array [[DefineOwnProperty]] (E5 Section 15.4.5.1).

40189. data property or accessor without getter

40190. **comment:** XXX: fastint
label: code-design

40191. required to guarantee success of rehashing, * intentionally use unadjusted new_e_size

40192. Regardless of whether property is found in entry or array part, * it may have arguments exotic behavior (array indices may reside * in entry part for abandoned / non-existent array parts).

40193. Careful with wrapping (left shifting idx would be unsafe).

40194. -> [... obj key trap handler]

40195. [...val] -> [...]

40196. currently used -> new size

40197. mask out flags not actually stored

40198. varenv remains reachable through 'obj'

40199. Careful with wrapping: arr_idx upshift may easily wrap, whereas * length downshift won't.

40200. * New length is smaller than old length, need to delete properties above * the new length. * * If array part exists, this is straightforward: array entries cannot * be non-configurable so this is guaranteed to work. * * If array part does not exist, array-indexed values are scattered * in the entry part, and some may not be configurable (preventing length * from becoming lower than their index + 1). To handle the algorithm * in E5 Section 15.4.5.1, step 1 correctly, we scan the entire property * set twice.

40201. **comment:** XXX: optimize this filling behavior later
label: code-design

40202. **comment:** * Property count check. This is the only point where we ensure that * we don't get more (allocated) property space that we can handle. * There aren't hard limits as such, but some algorithms fail (e.g. * finding next higher prime, selecting hash part size) if we get too * close to the 4G property limit. * * Since this works based on allocation size (not actually used size), * the limit is a bit approximate but good enough in practice.
label: code-design

40203. All lightfunc own properties are non-writable and the lightfunc * is considered non-extensible. However, the write may be captured * by an inherited setter which means we can't stop the lookup here.

40204. Convert a duk_tval fastint (caller checks) to a 32-bit index.
40205. [key result] -> [result]
40206. * Standard algorithm succeeded without errors, check for exotic post-behaviors. ** Arguments exotic behavior in E5 Section 10.6 occurs after the standard * [[DefineOwnProperty]] has completed successfully. ** Array exotic behavior in E5 Section 15.4.5.1 is implemented partly * prior to the default [[DefineOwnProperty]], but: * - for an array index key (e.g. "10") the final 'length' update occurs here * - for 'length' key the element deletion and 'length' update occurs here
40207. map is reachable through obj
40208. 0 if no used entries
40209. * All defined array-indexed properties are in the array part * (we assume the array part is comprehensive), and all array * entries are writable, configurable, and enumerable. Thus, * nothing can prevent array entries from being deleted.
40210. resume check from proxy target
40211. **comment:** Count actually used array part entries and array minimum size. * NOTE: 'out_min_size' can be computed much faster by starting from the * end and breaking out early when finding first used entry, but this is * not needed now.
label: code-design
40212. arguments MUST have an initialized lexical environment reference
40213. if new_p == NULL, all of these pointers are NULL
40214. If index is not valid, idx will be DUK_NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside bufferobject length.
40215. automatic length update
40216. always grow the array, no sparse / abandon support here
40217. **comment:** remove old value
label: code-design
40218. **comment:** NULL always indicates alloc failure because * new_alloc_size > 0.
label: code-design
40219. [...] -> [...]
40220. always in entry part, no need to look up parents etc
40221. * Copy keys and values in the entry part (compacting them at the same time).
40222. E5 Section 15.4.5.1, step 3, steps a - i are implemented here, j - n at the end
40223. no need to compact since we already did that in duk_abandon_array_checked() * (regardless of whether an array part existed or not).
40224. XXX: C recursion limit if proxies are allowed as handler/target values
40225. **comment:** XXX: assertion that entries >= old_len are already unused
label: code-design
40226. Arrays never have other exotic behaviors.
40227. * Create a new property in the original object. ** Exotic properties need to be reconsidered here from a write * perspective (not just property attributes perspective). * However, the property does not exist in the object already, * so this limits the kind of exotic properties that apply.
40228. Initial value for highest_idx is -1 coerced to unsigned. This * is a bit odd, but (highest_idx + 1) will then wrap to 0 below * for out_min_size as intended.
40229. * Write to array part? ** Note: array abandoning requires a property resize which uses * 'rechecks' valstack for temporaries and may cause any existing * valstack pointers to be invalidated. To protect against this, * tv_obj, tv_key, and tv_val are copies of the original inputs.
40230. copy existing entries as is
40231. value from hook
40232. **comment:** * Shallow fast path checks for accessing array elements with numeric * indices. The goal is to try to avoid coercing an array index to an * (interned) string for the most common lookups, in particular, for * standard Array objects. ** Interning is avoided but only for a very narrow set of cases: * - Object has array part, index is within array allocation, and * value is not unused (= key exists) * - Object has no interfering exotic behavior (e.g. arguments or * string object exotic behaviors interfere, array exotic * behavior does not). ** Current shortcoming: if key does not exist (even if it is within * the array allocation range) a slow path lookup with interning is * always required. This can probably be fixed so that there is a * quick fast path for non-existent elements as well, at least for * standard Array objects.
label: code-design
40233. [... put_value varname]
40234. number
40235. Get minimum entry part growth for a certain size.
40236. if accessor without getter, return value is undefined
40237. undefined is accepted
40238. [obj key desc value get set curr_value varname]
40239. key must not already exist in entry part
40240. * Note: currently no fast path for array index writes. * They won't be possible anyway as strings are immutable.
40241. * Object.seal() and Object.freeze() (E5 Sections 15.2.3.8 and 15.2.3.9) ** Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. ** Note: virtual (non-concrete) properties which are non-configurable but * writable would pose some problems, but such properties do not currently * exist (all virtual properties are non-configurable and non-writable). * If they did exist, the non-configurability does NOT prevent them from * becoming non-writable. However, this change should be recorded somehow * so that it would turn up (e.g. when getting the property descriptor), * requiring some additional flags in the object.
40242. **comment:** * HASPROP variant used internally. ** This primitive must never throw an error, callers rely on this. * In particular, don't throw an error for prototype loops; instead, * pretend like the property doesn't exist if a prototype sanity limit * is reached. ** Does not implement proxy behavior: if applied to a proxy object, * returns key existence on the proxy object itself.
label: code-design
40243. **comment:** The fast path for array property put is not fully compliant: * If one places conflicting number-indexed properties into * Array.prototype (for example, a non-writable Array.prototype[7]) * the fast path will incorrectly ignore them. ** This fast path could be made compliant by falling through * to the slow path if the previous value was UNUSED. This would * also remove the need to check for extensibility. Right now a * non-extensible array is slower than an extensible one as far * as writes are concerned. ** The fast path behavior is documented in more detail here: * tests/ecmascript/test-misc-array-fast-write.js
label: code-design
40244. * Because buffer values may be looped over and read/written * from, an array index fast path is important.
40245. Note: only numbered indices are relevant, so arr_idx fast reject * is good (this is valid unless there are more than 4**32-1 arguments).
40246. entry allocation updates hash part and increases the key * refcount; may need a props allocation resize but doesn't * 'recheck' the valstack.
40247. * Actual Object.defineProperty() default algorithm.
40248. **comment:** Linear scan: more likely because most objects are small. * This is an important fast path. ** XXX: this might be worth inlining for property lookups.
label: code-design
40249. [...] value? getter? setter?]
40250. may become sparse...
40251. Get Proxy target object. If the argument is not a Proxy, return it as is. * If a Proxy is revoked, an error is thrown.
40252. **comment:** * Object.defineProperty() related helper (E5 Section 15.2.3.6) ** Inlines all [[DefineOwnProperty]] exotic behaviors. ** Note: Ecmascript compliant [[DefineOwnProperty]](P, Desc, Throw) is not * implemented directly, but Object.defineProperty() serves its purpose. * We don't need the [[DefineOwnProperty]] internally and we don't have a * property descriptor with 'missing values' so it's easier to avoid it * entirely. * * Note: this is only called for actual objects, not primitive values. * This must support virtual properties for full objects (e.g. Strings) * but not for plain values (e.g. strings). Lighfuncs, even though * primitive in a sense, are treated like objects and accepted as target * values.
label: code-design
40253. **comment:** * Array needs to grow, but we don't want it becoming too sparse. * If it were to become sparse, abandon array part, moving all * array entries into the entries part (for good). ** Since we don't keep track of actual density (used vs. size) of * the array part, we need to estimate somehow. The check is made * in two parts: * * - Check whether the resize need is small compared to the * current size (relatively); if so, resize without further * checking (essentially we assume that

the original part is * "dense" so that the result would be dense enough). * * - Otherwise, compute the resize using an actual density * measurement based on counting the used array entries.

label: code-design

40254. * Compute new alloc size and alloc new area. * * The new area is allocated as a dynamic buffer and placed into the * valstack for reachability. The actual buffer is then detached at * the end. * * Note: heap_mark_and_sweep_base_flags are altered here to ensure * no-one touches this object while we're resizing and rehashing it. * The flags must be reset on every exit path after it. Finalizers * and compaction is prevented currently for all objects while it * would be enough to restrict it only for the current object.

40255. **comment:** * Make a copy of tv_obj, tv_key, and tv_val to avoid any issues of * them being invalidated by a valstack resize. * * XXX: this is an overkill for some paths, so optimize this later * (or maybe switch to a stack arguments model entirely).

label: code-design

40256. **comment:** re-lookup to update curr.flags * XXX: would be faster to update directly

label: code-design

40257. This should not happen because DUK_TAG_OBJECT case checks * for this already, but check just in case.

40258. * Hobject property set/get functionality. * * This is very central functionality for size, performance, and compliance. * It is also rather intricate; see hobject-algorithms.rst for discussion on * the algorithms and memory-management.rst for discussion on refcounts and * side effect issues. * * Notes: * * - It might be tempting to assert "refcount nonzero" for objects * being operated on, but that's not always correct: objects with * a zero refcount may be operated on by the refcount implementation * (finalization) for instance. Hence, no refcount assertions are made. * * - Many operations (memory allocation, identifier operations, etc) * may cause arbitrary side effects (e.g. through GC and finalization). * These side effects may invalidate duk_tval pointers which point to * areas subject to reallocation (like value stack). Heap objects * themselves have stable pointers. Holding heap object pointers or * duk_tval copies is not problematic with respect to side effects; * care must be taken when holding and using argument duk_tval pointers. * * - If a finalizer is executed, it may operate on the same object * we're currently dealing with. For instance, the finalizer might * delete a certain property which has already been looked up and * confirmed to exist. Ideally finalizers would be disabled if GC * happens during property access. At the moment property table realloc * disables finalizers, and all DECREFs may cause arbitrary changes so * handle DECREF carefully. * * - The order of operations for a DECREF matters. When DECREF is executed, * the entire object graph must be consistent; note that a refzero may * lead to a mark-and-sweep through a refcount finalizer.

40259. **comment:** * Entries part is a bit more complex

label: code-design

40260. remove key

40261. array 'length' is always a number, as we coerce it

40262. = IsAccessorDescriptor(Desc)

40263. Reject attempt to change a read-only object.

40264. idx_value may be < 0 (no value), set and get may be NULL

40265. Is whole and within 32 bit range. If the value happens to be 0xFFFFFFFF, * it's not a valid array index but will then match DUK_NO_ARRAY_INDEX.

40266. * Find an existing key from entry part either by linear scan or by * using the hash index (if it exists). * * Sets entry index (and possibly the hash index) to output variables, * which allows the caller to update the entry and hash entries in-place. * If entry is not found, both values are set to -1. If entry is found * but there is no hash part, h_idx is set to -1.

40267. -> [... handler trap]

40268. DUK_USE_ES6_PROXY

40269. not reachable

40270. marker values for hash part

40271. 'varname' is in stack in this else branch, leaving an unbalanced stack below, * but this doesn't matter now.

40272. no need for 'caller' post-check, because 'key' must be an array index

40273. remove in_val

40274. Grow entry part allocation for one additional entry.

40275. * Internal helper to define a property with specific flags, ignoring * normal semantics such as extensibility, write protection etc. * Overwrites any existing value and attributes unless caller requests * that value only be updated if it doesn't already exists. * * Does not support: * - virtual properties (error if write attempted) * - getter/setter properties (error if write attempted) * - non-default (!= WEC) attributes for array entries (error if attempted) * - array abandoning: if array part exists, it is always extended * - array 'length' updating * * Stack: [... in_val] -> [] * * Used for e.g. built-in initialization and environment record * operations.

40276. for zero size, don't push anything on valstack

40277. [key result]

40278. remaining actual steps are carried out if standard DefineOwnProperty succeeds

40279. curr is accessor -> cannot be in array part

40280. E5 Section 15.5.5.2

40281. equality not actually possible

40282. This is not strictly necessary, but avoids compiler warnings; e.g. * gcc won't reliably detect that no uninitialized data is read below.

40283. Avoid zero copy with an invalid pointer. If obj->p is NULL, * the 'new_a' pointer will be invalid which is not allowed even * when copy size is zero.

40284. ignore result

40285. cannot be e.g. arguments exotic, since exotic 'traits' are mutually exclusive

40286. * Arguments objects have exotic [[DefineOwnProperty]] which updates * the internal 'map' of arguments for writes to currently mapped * arguments. More concretely, writes to mapped arguments generate * a write to a bound variable. * * The [[Put]] algorithm invokes [[DefineOwnProperty]] for existing * data properties and new properties, but not for existing accessors. * Hence, in E5 Section 10.6 ([[DefinedOwnProperty]] algorithm), we * have a Desc with 'Value' (and possibly other properties too), and * we end up in step 5.b.i.

40287. * Helper: handle Array object 'length' write which automatically * deletes properties, see E5 Section 15.4.5.1, step 3. This is * quite tricky to get right. * * Used by duk_hobject_putprop().

40288. **comment:** XXX: is valstack top best place for argument?

40339. guaranteed to finish

40340. Leave 'setter' on stack

40341. If 16-bit hash is in use, stuff it into duk_heapheader_string flags.

40342. string is 'eval' or 'arguments'

40343. Slightly smaller code without explicit flag, but explicit flag * is very useful when 'clen' is dropped.

40344. computed live

40345. **comment:** XXX: could add flags for "is valid CESU-8" (EcmaScript compatible strings), * "is valid UTF-8", "is valid extended UTF-8" (internal strings are not, * regexp bytecode is), and "contains non-BMP characters". These are not * needed right now.
label: code-design

40346. * For an external string, the NUL-terminated string data is stored * externally. The user must guarantee that data behind this pointer * doesn't change while it's used.

40347. get array index related to string (or return DUK_HSTRING_NO_ARRAY_INDEX); * avoids helper call if string has no array index value.

40348. * Prototypes

40349. string hash

40350. The external string struct is defined even when the feature is inactive.

40351. string is a reserved word (strict)

40352. slower but more compact variant

40353. marker value; in E5 2^32-1 is not a valid array index (2^32-2 is highest valid)

40354. Impose a maximum string length for now. Restricted artificially to * ensure adding a heap header length won't overflow size_t. The limit * should be synchronized with DUK_HBUFFER_MAX_BYTELEN. ** E5.1 makes provisions to support strings longer than 4G characters. * This limit should be eliminated on 64-bit platforms (and increased * closer to maximum support on 32-bit platforms).

40355. string is a reserved word (non-strict)

40356. string is ASCII, clen == blen

40357. * String value of 'blen+1' bytes follows (+1 for NUL termination * convenience for C API). No alignment needs to be guaranteed * for strings, but fields above should guarantee alignment-by-4 * (but not alignment-by-8).

40358. **comment:** should never be called
label: code-design

40359. placed in duk_heapheader_string

40360. length in codepoints (must be E5 compatible)

40361. Note: we could try to stuff a partial hash (e.g. 16 bits) into the * shared heap header. Good hashing needs more hash bits though.

40362. * Heap string representation. ** Strings are byte sequences ordinarily stored in extended UTF-8 format, * allowing values larger than the official UTF-8 range (used internally) * and also allowing UTF-8 encoding of surrogate pairs (CESU-8 format). * Strings may also be invalid UTF-8 altogether which is the case e.g. with * strings used as internal property names and raw buffers converted to * strings. In such cases the 'clen' field contains an inaccurate value. * * EcmaScript requires support for 32-bit long strings. However, since each * 16-bit codepoint can take 3 bytes in CESU-8, this representation can only * support about 1.4G codepoint long strings in extreme cases. This is not * really a practical issue.

40363. string is a valid array index

40364. string is internal

40365. string data is external (duk_hstring_external)

40366. **comment:** Smaller heapheader than for other objects, because strings are held * in string intern table which requires no link pointers. Much of * the 32-bit flags field is unused by flags, so we can stuff a 16-bit * field in there.

40377. allocation size
40378. idx_bottom and idx_retval are only used for book-keeping of * Ecmascript-initiated calls, to allow returning to an Ecmascript * function properly. They are duk_size_t to match the convention * that value stack sizes are duk_size_t and local frame indices * are duk_idx_t.
40379. next to use, highest used is top - 1
40380. flags field: LLLLLLFT, L = label (24 bits), F = flags (4 bits), T = type (4 bits)
40381. current lexical environment (may be NULL if delayed)
40382. Current compiler state (if any), used for augmenting SyntaxErrors.
40383. No field needed when strings are in ROM.
40384. * Catcher defines
40385. end of valstack allocation (exclusive)
40386. function executes as a constructor (called via "new")
40387. cached: valstack_end - valstack (in entries, not bytes)
40388. internal extra elements assumed on function entry, * always added to user-defined 'extra' for e.g. the * duk_check_stack() call.
40389. **comment:** Builtin-objects; may or may not be shared with other threads, * threads existing in different "compartments" will have different * built-ins. Must be stored on a per-thread basis because there * is no intermediate structure for a thread group / compartment. * This takes quite a lot of space, currently 43x4 = 172 bytes on * 32-bit platforms. * * In some cases the builtins array could be ROM based, but it's * sometimes edited (e.g. for sandboxing) so it's better to keep * this array in RAM.
 label: code-design
40390. catch part will catch
40391. Note: DUK_VALSTACK_INITIAL_SIZE must be >= DUK_VALSTACK_API_ENTRY_MINIMUM * + DUK_VALSTACK_INTERNAL_EXTRA so that the initial stack conforms to spare * requirements.
40392. roughly 512 bytes
40393. DUK_USE_ROM_STRINGS
40394. thread has yielded
40395. roughly 256 bytes
40396. who resumed us (if any)
40397. callstack index of related activation
40398. * Flags for __FILE__ / __LINE__ registered into tracedata
40399. roughly 1 kiB
40400. **comment:** Pointer to bytecode executor's 'curr_pc' variable. Used to copy * the current PC back into the topmost activation when activation * state is about to change (or "syncing" is otherwise needed). This * is rather awkward but important for performance, see execution.rst.
 label: code-design
40401. activation prevents yield (native call or "new")
40402. function executes in strict mode
40403. Note: it's nice if size is 2^N (at least for 32-bit platforms).
40404. Sanity limits for stack sizes.
40405. borrowed: full duk_tval for function being executed; for lightfuncs
40406. indirect allocs
40407. * Assert context is valid: non-NULL pointer, fields look sane. * * This is used by public API call entrypoints to catch invalid 'ctx' pointers * as early as possible; invalid 'ctx' pointers cause very odd and difficult to * diagnose behavior so it's worth checking even when the check is not 100%.
40408. number of activation records in callstack preventing a yield
40409. activation has active breakpoint(s)
40410. Call stack. [0,callstack_top] is GC reachable.
40411. thread not currently running
40412. roughly 1.0 kiB -> but rounds up to DUK_VALSTACK_GROW_STEP in practice
40413. roughly 128 bytes
40414. (reference is valid as long activation exists)
40415. don't report __FILE__ / __LINE__ as fileName/lineNumber
40416. DUK_HTHREAD_H_INCLUDED
40417. borrowed reference to catch variable name (or NULL if none)
40418. roughly 0.5 kiB
40419. bottom of current frame
40420. Note: it's nice if size is 2^N (not 4x4 = 16 bytes on 32 bit)
40421. Return value when returning to this activation (points to caller * reg, not callee reg); index is absolute (only set if activation is * not topmost). * * Note: idx_bottom is always set, while idx_retval is only applicable * for activations below the topmost one. Currently idx_retval for * the topmost activation is considered garbage (and it not initialized * on entry or cleared on return; may contain previous or garbage * values).
40422. thread currently running (only one at a time)
40423. top of current frame (exclusive)
40424. number of elements guaranteed to be user accessible * (in addition to call arguments) on Duktape/C function entry.
40425. * Prototypes
40426. activation has tail called one or more times
40427. Current strictness flag: affects API calls.
40428. Backpointers.
40429. roughly 2 kiB
40430. values for the state field
40431. needed for stepping
40432. Yield/resume book-keeping.
40433. **comment:** XXX: Valstack, callstack, and catchstack are currently assumed * to have non-NULL pointers. Relaxing this would not lead to big * benefits (except perhaps for terminated threads).
 label: code-design
40434. finally part will catch
40435. idx_base and idx_base+1 get completion value and type
40436. Executor interrupt default interval when nothing else requires a * smaller value. The default interval must be small enough to allow * for reasonable execution timeout checking but large enough to keep * impact on execution performance low.
40437. Thread state.
40438. request to create catch binding
40439. nop
40440. start of valstack allocation
40441. next instruction to execute (points to 'func' bytecode, stable pointer), NULL for native calls

40442. * Struct defines
40443. Value stack: these are expressed as pointers for faster stack manipulation. * [valstack, valstack_top[is GC-reachable, [valstack_top, valstack_end[is * not GC-reachable but kept initialized as 'undefined'.
40444. * Heap thread object representation. ** duk_hthread is also the 'context' (duk_context) for exposed APIs * which mostly operate on the topmost frame of the value stack.
40445. activation is a direct eval call
40446. Shared object part
40447. Interrupt counter for triggering a slow path check for execution * timeout, debugger interaction such as breakpoints, etc. The value * is valid for the current running thread, and both the init and * counter values are copied whenever a thread switch occurs. It's * important for the counter to be conveniently accessible for the * bytecode executor inner loop for performance reasons.
40448. start value for current countdown
40449. type and control flags, label number
40450. borrowed: function being executed; for bound function calls, this is the final, real function, NULL for lightfuncs
40451. current variable environment (may be NULL if delayed)
40452. Catch stack. [0, catchstack_top[is GC reachable.
40453. * Stack constants
40454. **comment:** XXX: for a memory-code tradeoff, remove 'func' and make it's access either a function * or a macro. This would make the activation 32 bytes long on 32-bit platforms again.
label: code-design
40455. * Activation defines
40456. Previous value of 'func' caller, restored when unwound. Only in use * when 'func' is non-strict.
40457. thread resumed another thread (active but not running)
40458. roughly 64 bytes
40459. Bottom of valstack for this activation, used to reset * valstack_bottom on return; index is absolute. Note: * idx_top not needed because top is set to 'nregs' always * when returning to an Ecmascript activation.
40460. catch or with binding is currently active
40461. resume execution from pc_base or pc_base+1 (points to 'func' bytecode, stable pointer)
40462. countdown state
40463. * Thread defines
40464. thread has terminated
40465. **comment:** Current 'this' binding is the value just below idx_bottom. * Previously, 'this' binding was handled with an index to the * (calling) valstack. This works for everything except tail * calls, which must not "cumulate" valstack temps.
label: code-design

40556. * For top-level objects, 'length' property has the following * default attributes: non-writable, non-enumerable, non-configurable * (E5 Section 15). * * However, 'length' property for Array.prototype has attributes * expected of an Array instance which are different: writable, * non-enumerable, non-configurable (E5 Section 15.4.5.2). * * This is currently determined implicitly based on class; there are * no attribute flags in the init data.
40557. native function properties
40558. all native functions have NEWENV
40559. push operation normalizes NaNs
40560. **comment:** XXX: This won't be shown in practice now * because this code is not run when builtins * are in ROM.
 label: code-design
40561. no prototype
40562. Copy the property table verbatim; this handles attributes etc. * For ROM objects it's not necessary (or possible) to update * refcounts so leave them as is.
40563. no need to decref
40564. **comment:** XXX: Shrink the stacks to minimize memory usage? May not * be worth the effort because terminated threads are usually * garbage collected quite soon.
 label: code-design
40565. **comment:** XXX: store 'bcode' pointer to activation for faster lookup?
 label: code-design
40566. Write bytecode executor's curr_pc back to topmost activation (if any).
40567. Here we could remove references to built-ins, but it may not be * worth the effort because built-ins are quite likely to be shared * with another (unterminated) thread, and terminated threads are also * usually garbage collected quite quickly. Also, doing DECREFs * could trigger finalization, which would run on the current thread * and have access to only some of the built-ins. Garbage collection * deals with this correctly already.
40568. Order of unwinding is important
40569. ptr_curr_pc != NULL only when bytecode executor is active.

40570. unwinds valstack, updating refcounts
40571. DUK_USE_DEBUGGER_SUPPORT
40572. * Thread support.
40573. side effects, possibly errors
40574. Note: this may cause a corner case situation where a finalizer * may see a currently reachable activation whose 'func' is NULL.
40575. avoid warning (unsigned)
40576. unsigned
40577. * Restore 'caller' property for non-strict callee functions.
40578. **comment:** * Note: must use indirect variant of DUK_REALLOC() because underlying * pointer may be changed by mark-and-sweep.
 label: code-design
40579. true, despite side effect resizes
40580. note: any entries above the callstack top are garbage and not zeroed
40581. cannot grow
40582. With lightfuncs, act 'func' may be NULL
40583. The act->prev_caller should only be set if the entry for 'caller' * exists (as it is only set in that case, and the property is not * configurable), but handle all the cases anyway.
40584. func is NULL for lightfunc
40585. must be, since env was created when catcher was created
40586. note: any entries above the catchstack top are garbage and not zeroed
40587. * Update preventcount
40588. avoid side effect issues
40589. current lex_env of the activation (created for catcher)
40590. Note that multiple catchstack entries may refer to the same * callstack entry.
40591. **comment:** * Manipulation of thread stacks (valstack, callstack, catchstack). * * Ideally unwinding of stacks should have no side effects, which would * then favor separate unwinding and shrink check primitives for each * stack type. A shrink check may realloc and thus have side effects. * * However, currently callstack unwinding itself has side effects, as it * needs to DECREF multiple objects, close environment records, etc. * Stacks must thus be unwound in the correct order by the caller. * * (XXX: This should be probably reworked so that there is a shared * unwind primitive which handles all stacks as requested, and knows * the proper order for unwinding.) * * Valstack entries above 'top' are always kept initialized to * "undefined unused". Callstack and catchstack entries above 'top' * are not zeroed and are left as garbage. * * Value stack handling is mostly a part of the API implementation.
 label: code-design
40592. * Unwind debugger state. If we unwind while stepping * (either step over or step into), pause execution.
40593. Note: any entries above the callstack top are garbage and not zeroed. * Also topmost activation idx_retval is garbage (not zeroed), and must * be ignored.
40594. * Reference count updates * * Note: careful manipulation of refcounts. The top is * not updated yet, so all the activations are reachable * for mark-and-sweep (which may be triggered by decref). * However, the pointers are NULL so this is not an issue.
40595. side effects
40596. no incref needed
40597. Just transfer the refcount from act->prev_caller to tv_caller, * so no need for a refcount update. This is the expected case.
40598. check that there is space for at least one new entry
40599. Because new_size != 0, if condition doesn't need to be * (p != NULL || new_size == 0).
40600. No need for a NULL/zero-size check because new_size > 0
40601. * We could clear the book-keeping variables for the topmost activation, * but don't do so now.
40602. prototype is lex_env before catcher created
40603. avoid side effects
40604. this is a bit approximate (errors out before max is reached); this is OK
40605. Pause for all step types: step into, step over, step out. * This is the only place explicitly handling a step out.
40606. * The loop below must avoid issues with potential callstack * reallocations. A resize (and other side effects) may happen * e.g. due to finalizer/errhandler calls caused by a refzero or * mark-and-sweep. Arbitrary finalizers may run, because when * an environment record is refzero'd, it may refer to arbitrary * values which also become refzero'd. * * So, the pointer 'p' is re-looked-up below whenever a side effect * might have changed it.
40607. **comment:** * Since there are no references in the catcher structure, * unwinding is quite simple. The only thing we need to * look out for is popping a possible lexical environment * established for an active catch clause.
 label: code-design
40608. **comment:** XXX: Here we have a nasty dependency: the need to manipulate * the callstack means that catchstack must always be unwound by * the caller before unwinding the callstack. This should be fixed * later.
 label: code-design
40609. shrink failure is not fatal
40610. There is no need to decref anything else than 'env': if 'env' * becomes unreachable, refzero will handle decref'ing its prototype.
40611. * Close environment record(s) if they exist. * * Only variable environments are closed. If lex_env != var_env, it * cannot currently contain any register bound declarations. * * Only environments created for a NEWENV function are closed. If an * environment is created for e.g. an eval call, it must not be closed.
40612. common case, already closed, so skip
40613. **comment:** * User declarations, e.g. prototypes for user functions used by Duktape * macros. Concretely, if DUK_USE_PANIC_HANDLER is used and the macro * value calls a user function, it needs to be declared for Duktape * compilation to avoid warnings.
 label: code-design
40614. * The 'duktape.h' header provides the public API, but also handles all * compiler and platform specific feature detection, Duktape feature * resolution, inclusion of system headers, etc. These have been merged * because the public API is also dependent on e.g. detecting appropriate * C types which is quite platform/compiler specific especially for a non-C99 * build. The public API is also dependent on the resolved feature set. * * Some actions taken by the merged header (such as including system headers) * are not appropriate for building a user application. The define * DUK_COMPILING_DUKTAPE allows the merged header to skip/include some * sections depending on what is being built.
40615. DUK_INTERNAL_H_INCLUDED
40616. autogenerated: strings and built-in object init data
40617. * Duktape includes (other than duk_features.h) * * The header files expect to be included in an order which satisfies header * dependencies correctly (the headers themselves don't include any other * includes). Forward declarations are used to break circular struct/typedef * dependencies.
40618. builtins need e.g. duk_val tag definitions
40619. * Top-level include file to be used for all (internal) source files. * * Source files should not include individual header files, as they * have not been designed to be individually included.
40620. * Wrapper for jmp_buf. * * This is used because jmp_buf is an array type for backward compatibility. * Wrapping jmp_buf in a struct makes pointer references, sizeof, etc, * behave more intuitively. * * http://en.wikipedia.org/wiki/Setjmp.h#Member_types

40706. may need unwind

40707. * Helper for updating callee 'caller' property.

40708. side effects

40709. bound chain resolved

40710. * Check the function type, handle bound function chains, and prepare * parameters for the rest of the call handling. Also figure out the * effective 'this' binding, which replaces the current value at * idx_func + 1. * * If the target function is a 'bound' one, follow the chain of 'bound' * functions until a non-bound function is found. During this process, * bound arguments are 'prepended' to existing ones, and the "this" * binding is overridden. See E5 Section 15.3.4.5.1. * * Lightfunc detection happens here too. Note that lightweight functions * can be wrapped by (non-lightweight) bound functions so we must resolve * the bound function chain first.

40711. If the debugger is active we need to force an interrupt so that * debugger breakpoints are rechecked. This is important for function * calls caused by side effects (e.g. when doing a DUK_OP_GETPROP), see * GH-303. Only needed for success path, error path always causes a * breakpoint recheck in the executor. It would be enough to set this * only when returning to an Ecmascript activation, but setting the flag * on every return should have no ill effect.

40712. **comment:** XXX: very slow - better to bulk allocate a gap, and copy * from args_array directly (we know it has a compact array * part, etc).

label: code-design

40713. No need to re-lookup 'act' at present: no side effects.

40714. formals for 'func' (may be NULL if func is a C function)

40715. Normal non-bound function.

40716. valstack index of start of args (arg1) (relative to entry valstack_bottom)

40717. should never happen for a strict callee

40718. Backup 'caller' property and update its value.

40719. * Valstack manipulation for results.

40720. no need to handle thread state book-keeping here

40721. out of spec, must be configurable

40722. This may only happen if built-ins are being "torn down". * This behavior is out of specification scope.

40723. same as during entry

40724. Note: careful with indices like '-x'; if 'x' is zero, it refers to bottom

40725. original input stack before nargs/nregs handling must be * intact for 'arguments' object

40726. third arg: absolute index (to entire valstack) of idx_bottom of new activation

40727. strict: non-deletable, non-writable

40728. -> [... func this arg1 ... argN _Args length]

40729. 1 = num actual 'return values'

40730. **comment:** XXX: Is this INCREF necessary? 'func' is always a borrowed * reference reachable through the value stack? If changed, stack * unwind code also needs to be fixed to match.

label: code-design

40731. current thread

40732. * Setup value stack: clamp to 'nargs', fill up to 'nregs' * * Value stack may either grow or shrink, depending on the * number of func registers and the number of actual arguments. * If nregs >= 0, func wants args clamped to 'nargs'; else it * wants all args (= 'num_stack_args').

40733. Currently the bytecode executor and executor interrupt * instruction counts are off because we don't execute the * interrupt handler when we're about to exit from the initial * user call into Duktape. * * If we were to execute the interrupt handler here, the counts * would match. You can enable this block manually to check * that this is the case.

40734. Duktape/C API guaranteed entries (on top of args)

40735. Success path.

40736. XXX: We can't resize the value stack to a size smaller than the * current top, so the order of the resize and adjusting the stack * top depends on the current vs. final size of the value stack. * The operations could be combined to avoid this, but the proper * fix is to only grow the value stack on a function call, and only * shrink it (without throwing if the shrink fails) on function * return.

40737. bound function chain has already been resolved

40738. base of known return values

40739. **comment:** * Call handling. * * Main functions are: * * - duk_handle_call_unprotected(): unprotected call to Ecmascript or * Duktape/C function * - duk_handle_call_protected(): protected call to Ecmascript or * Duktape/C function * - duk_handle_safe_call(): make a protected C call within current * activation * - duk_handle_ecma_call_setup(): Ecmascript-to-Ecmascript calls * (not always possible), including tail calls and coroutine resume * * See 'execution.rst'. * * Note: setjmp() and local variables have a nasty interaction, * see execution.rst; non-volatile locals modified after setjmp() * call are not guaranteed to keep their value.

label: code-design

40740. step 11.c is relevant only if non-strict (checked in 11.c.ii)

40741. * Manipulate valstack so that args are on the current bottom and the * previous caller's 'this' binding (which is the value preceding the * current bottom) is replaced with the new 'this' binding: * * [... this_old | (crud) func this_new arg1 ... argN] * --> [... this_new | arg1 ... argN] * * For tail calling to work properly, the valstack bottom must not grow * here; otherwise crud would accumulate on the valstack.

40742. Return value handling.

40743. **comment:** XXX: because we unwind stacks above, thr->heap->curr_thread is at * risk of pointing to an already freed thread. This was indeed the * case in test-bug-multithread-valgrind.c, until duk_handle_call() * was fixed to restore thr->heap->curr_thread before rethrowing an * uncaught error.

40944. -> [... func this arg1 ... argN _Args]

40945. steps 13-14

40946. no prototype

40947. leave formals on stack for later use

40948. * Return to bytecode executor, which will resume execution from * the topmost activation.

40949. Note: 'func' is popped from valstack here, but it is * already reachable from the activation.

40950. [... func this arg1 ... argN] (not tail call) * [this | arg1 ... argN] (tail call) * * idx_args updated to match

40951. * Native call.

40952. **comment:** XXX: error message is a bit misleading: we reached a recursion * limit which is also essentially the same as a C callstack limit * (except perhaps with some relaxed threading assumptions).
label: code-design

40953. duk_has_prop() popped the second 'name'

40954. A debugger forced interrupt check is not needed here, as * problematic safe calls are not caused by side effects.

40955. **comment:** XXX: block removal API primitive
label: code-design

40956. The final object may be a normal function or a lightfunc. * We need to re-lookup tv_func because it may have changed * (also value stack may have been resized). Loop again to * do that; we're guaranteed not to come here again.

40957. **comment:** * Cleanups (all statement parsing flows through here). * * Pop label site and reset labels. Reset 'next temp' to value at * entry to reuse temps.
label: code-design

40958. * Rewind lexer. * * duk_parse_stmts() expects curr_tok to be set; parse in "allow regexp * literal" mode with current strictness. * * curr_token line number info should be initialized for pass 2 before * generating prologue, to ensure prologue bytecode gets nice line numbers.

40959. only functions can have arguments

40960. **comment:** * Ecmascript compiler. * * Parses an input string and generates a function template result. * Compilation may happen in multiple contexts (global code, eval * code, function code). * * The parser uses a traditional top-down recursive parsing for the * statement level, and an operator precedence based top-down approach * for the expression level. The attempt is to minimize the C stack * depth. Bytecode is generated directly without an intermediate * representation (tree), at the cost of needing two passes over each * function. * * The top-down recursive parser functions are named "duk_parse_XXX". * * Recursion limits are in key functions to prevent arbitrary C recursion: * function body parsing, statement parsing, and expression parsing. * * See doc/compiler.rst for discussion on the design. * * A few typing notes: * * - duk_regconst_t: unsigned, no marker value for "none" * - duk_reg_t: signed, < 0 = none * - PC values: duk_int_t, negative values used as markers
label: code-design

40961. DUK_TOK_SNEQ

40962. DUK_TOK_TRUE

40963. * Variant 2

40964. UnaryExpression

40965. Buffer length is bounded to 0xffff automatically, avoid compile warning.

40966. **comment:** * Shared handling for logical AND and logical OR. * * args = (truthval << 8) + rbp * * Truthval determines when to skip right-hand-side. * For logical AND truthval=1, for logical OR truthval=0. * * See doc/compiler.rst for discussion on compiling logical * AND and OR expressions. The approach here is very simplistic, * generating extra jumps and multiple evaluations of truth values, * but generates code on-the-fly with only local back-patching. * * Both logical AND and OR are syntactically left-associated. * However, logical ANDs are compiled as right associative * expressions, i.e. "A && B && C" as "A && (B && C)", to allow * skip jumps to skip over the entire tail. Similarly for logical OR.
label: code-design

40967. No need to assert, buffer size maximum is 0xffff.

40968. Tailcalls are handled by back-patching the TAILCALL flag to the * already emitted instruction later (in return statement parser). * Since A and C have a special meaning here, they cannot be "shuffled".

40969. inserted jump

40970. curr_token follows 'function'

40971. Output shuffle needed after main operation

40972. DUK_TOK_TRY

40973. evaluate to final form (e.g. coerce GETPROP to code), throw away temp

40974. push before advancing to keep reachable

40975. DUK_TOK_GET

40976. init function state: inits valstack allocations

40977. for storing/restoring the varmap binding for catch variable

40978. convenience helpers

40979. * Build function fixed size 'data' buffer, which contains bytecode, * constants, and inner function references. * * During the building phase 'data' is reachable but incomplete. * Only incref's occur during building (no refzero or GC happens), * so the building process is atomic.

40980. omitted

40981. Check statement type based on the first token type. * * Note: expression parsing helpers expect 'curr_tok' to * contain the first token of the expression upon entry.

40982. -> pushes fixed buffer

40983. Not safe to use 'reg_varbind' as assignment expression * value, so go through a temp.

40984. Ensure compact use of temps.

40985. default case exists: go there if no case matches

40986. **comment:** Temporary structure used to pass a stack allocated region through * duk_safe_call().
label: code-design

40987. eat 'do'

40988. * Do-while statement is mostly trivial, but there is special * handling for automatic semicolon handling (triggered by the * DUK_ALLOW_AUTO_SEMI_ALWAYS) flag related to a bug filed at: * * https://bugs.ecmascript.org/show_bug.cgi?id=8 * * See doc/compiler.rst for details.

40989. -> [... name index]

40990. max # of values initialized in one MPUTARR set

40991. * Reset function state and perform register allocation, which creates * 'varmap' for second pass. Function prologue for variable declarations, * binding value initializations etc is emitted as a by-product. * * Strict mode restrictions for duplicate and invalid argument * names are checked here now that we know whether the function * is actually strict. See: test-dev-strict-mode-boundary.js. * * Inner functions are compiled during pass 1 and are not reset.

40992. Strict equality is NOT enough, because we cannot use the same * constant for e.g. +0 and -0.

40993. e.g. DUK_OP_PREINCV

40994. reuse 'res' as 'left'

40995. Initial bytecode size allocation.

40996. XXX: patch initial size afterwards?

40997. yes, must set array length explicitly

40998. in-place setup

40999. Does not assume that jump_pc contains a DUK_OP_JUMP previously; this is intentional * to allow e.g. an INVALID opcode be overwritten with a JUMP (label management uses this).

41000. **comment:** Delete semantics are a bit tricky. The description in E5 specification * is kind of confusing, because it distinguishes between resolvability of * a reference (which is only known at runtime) seemingly at compile time * (= SyntaxError throwing).
label: code-design

41001. binding power must be high enough to NOT allow comma expressions directly
41002. flags
41003. _Formals: omitted if function is guaranteed not to need a (non-strict) arguments object
41004. Note: these variables must reside in 'curr_func' instead of the global * context: when parsing function expressions, expression parsing is nested.
41005. implicit_return_value
41006. * Initialize function state for a zero-argument function
41007. * Special name handling
41008. eat 'for'
41009. right associative
41010. init 'curr_token'
41011. allow a constant to be returned
41012. DUK_TOK_LBRACKET
41013. XXX: check num_args
41014. DUK_TOK_LPAREN
41015. directly uses slow accesses
41016. **comment:** It'd be nice to do something like this - but it doesn't * work for closures created inside the catch clause.
label: code-design

41017. duk_parse_stmts() expects curr_tok to be set; parse in "allow regexp literal" mode with current strictness
41018. **comment:** XXX: Shuffling support could be implemented here so that LDINT+LDINTX * would only shuffle once (instead of twice). The current code works * though, and has a smaller compiler footprint.
label: code-design

41019. * Post-increment/decrement will return the original value as its * result value. However, even that value will be coerced using * ToNumber() which is quite awkward. Specific bytecode opcodes * are used to handle these semantics. * * Note that post increment/decrement has a "no LineTerminator here" * restriction. This is handled by duk_expr_lbp(), which forcibly terminates * the previous expression if a LineTerminator occurs before '++'/'--'.
41020. DUK_TOK_LT
41021. If duk_ivalue_toplain_raw() allocates a temp, forget it and * restore next temp state.
41022. catch depth from current func
41023. eat colon
41024. **comment:** XXX: since the enumerator may be a memory expensive object, * perhaps clear it explicitly here? If so, break jump must * go through this clearing operation.
label: code-design

41025. [... pattern flags]
41026. * Init compiler and lexer contexts
41027. DUK_TOK_NEQ
41028. * Code emission helpers * * Some emission helpers understand the range of target and source reg/const * values and automatically emit shuffling code if necessary. This is the * case when the slot in question (A, B, C) is used in the standard way and * for opcodes the emission helpers explicitly understand (like DUK_OP_CALL). * * The standard way is that: * - slot A is a target register * - slot B is a source register/constant * - slot C is a source register/constant * * If a slot is used in a non-standard way the caller must indicate this * somehow. If a slot is used as a target instead of a source (or vice * versa), this can be indicated with a flag to trigger proper shuffling * (e.g. DUK_EMIT_FLAG_B_IS_TARGET). If the value in the slot is not * register/const related at all, the caller must ensure that the raw value * fits into the corresponding slot so as to not trigger shuffling. The * caller must set a "no shuffle" flag to ensure compilation fails if * shuffling were to be triggered because of an internal error. * * For slots B and C the raw slot size is 9 bits but one bit is reserved for * the reg/const indicator. To use the full 9-bit range for a raw value, * shuffling must be disabled with the DUK_EMIT_FLAG_NO_SHUFFLE_{B,C} flag. * Shuffling is only done for A, B, and C slots, not the larger BC or ABC slots. * * There is call handling specific understanding in the A-B-C emitter to * convert call setup and call instructions into indirect ones if necessary.
41029. if num_values > 0, MPUTARR emitted by outer loop after break
41030. **comment:** XXX: would be nice to omit this jump when the jump is not * reachable, at least in the obvious cases (such as the case * ending with a 'break'. * * Perhaps duk_parse_stmt() could provide some info on whether * the statement is a "dead end"? * * If implemented, just set pc_prevstmt to -1 when not needed.
label: code-design

41031. **comment:** Two temporaries are preallocated here for variants 3 and 4 which need * registers which are never clobbered by expressions in the loop * (concretely: for the enumerator object and the next enumerated value). * Variants 1 and 2 "release" these temps.
label: code-design

41032. DUK_USE_NONSTD_FUNC_STMT
41033. DUK_TOK_STRING
41034. stmt has non-empty value
41035. for array and object literals
41036. When LHS is not register bound, always go through a * temporary. No optimization for top level assignment.
41037. non-strict eval: env is caller's env or global env (direct vs. indirect call) * global code: env is global env
41038. **comment:** XXX: use the exactly same arithmetic function here as in executor
label: code-design

41039. -1 == not set, -2 == pending (next statement list)
41040. Explicit check for fastint downgrade.
41041. DUK_TOK_RETURN
41042. **comment:** _Varmap: omitted if function is guaranteed not to do slow path identifier * accesses or if it would turn out to be empty of actual register mappings * after a cleanup. When debugging is enabled, we always need the varmap to * be able to lookup variables at any point.
label: code-design

41043. We could rely on max temp/const checks: if they don't exceed BC * limit, nothing here can either (just asserts would be enough). * Currently we check for the limits, which provides additional * protection against creating invalid bytecode due to compiler * bugs.

41044. **comment:** XXX: Currently function source code is not stored, as it is not * required by the standard. Source code should not be stored by * default (user should enable it explicitly), and the source should * probably be compressed with a trivial text compressor; average * compression of 20-30% is quite easy to achieve even with a trivial * compressor (RLE + backwards lookup). * * Debugging needs source code to be useful: sometimes input code is * not found in files as it may be generated and then eval()'d, given * by dynamic C code, etc. * * Other issues: * * - Need tokenizer indices for start and end to substring * - Always normalize function declaration part? * - If we keep _Formals, only need to store body
label: code-design

41045. require initializer for var/const
41046. DUK_TOK_FALSE
41047. fall-through control flow patchup; note that pc_prevstmt may be * < 0 (i.e. no case clauses), in which case this is a no-op.
41048. * Detect iteration statements; if encountered, establish an * empty label.
41049. **comment:** Should never happen but avoid infinite loop just in case.
label: code-design

41050. indirect opcode follows direct
41051. statement parsing
41052. * Function declarations
41053. **comment:** * Parse variant 1 or 2. The first part expression (which differs * in the variants) has already been parsed and its code emitted. * * reg_temps + 0: unused * reg_temps + 1: unused
label: code-design

41054. Valstack should suffice here, required on function valstack init
41055. reg_res should be smallest possible
41056. pushes function template
41057. **comment:** Pick a destination register. If either base value or key * happens to be a temp value, reuse it as the destination. ** XXX: The temp must be a "mutable" one, i.e. such that no * other expression is using it anymore. Here this should be * the case because the value of a property access expression * is neither the base nor the key, but the lookup result.
label: code-design
41058. Note: although there is no 'undefined' literal, undefined * values can occur during compilation as a result of e.g. * the 'void' operator.
41059. Property access expressions are critical for correct LHS ordering, * see comments in duk__expr()!
41060. Identifier, i.e. don't allow reserved words
41061. **comment:** * Emit a final RETURN. ** It would be nice to avoid emitting an unnecessary "return" opcode * if the current PC is not reachable. However, this cannot be reliably * detected; even if the previous instruction is an unconditional jump, * there may be a previous jump which jumps to current PC (which is the * case for iteration and conditional statements, for instance).
label: code-design
41062. **comment:** Parse an inner function, adding the function template to the current function's * function table. Return a function number to be used by the outer function. ** Avoiding O(depth^2) inner function parsing is handled here. On the first pass, * compile and register the function normally into the 'funcs' array, also recording * a lexer point (offset/line) to the closing brace of the function. On the second * pass, skip the function and return the same 'fnum' as on the first pass by using * a running counter. ** An unfortunate side effect of this is that when parsing the inner function, almost * nothing is known of the outer function, i.e. the inner function's scope. We don't * need that information at the moment, but it would allow some optimizations if it * were used.
label: code-design
41063. Slot B
41064. **comment:** * Emit initializers in sets of maximum max_init_values. * Corner cases such as single value initializers do not have * special handling now. ** Elided elements must not be emitted as 'undefined' values, * because such values would be enumerable (which is incorrect). * Also note that trailing elisions must be reflected in the * length of the final array but cause no elements to be actually * inserted.
label: code-design
41065. XXX: to util
41066. Specific assumptions for opcode numbering.

41182. LOGICAL EXPRESSIONS

41183. jump is inserted here

41184. Resolve 'res' directly into the LHS binding, and use * that as the expression value if safe. If not safe, * resolve to a temp/const and copy to LHS.

41185. * Switch is pretty complicated because of several conflicting concerns: * * - Want to generate code without an intermediate representation, * i.e., in one go * * - Case selectors are expressions, not values, and may thus e.g. throw * exceptions (which causes evaluation order concerns) * * - Evaluation semantics of case selectors and default clause need to be * carefully implemented to provide correct behavior even with case value * side effects * * - Fall through case and default clauses; avoiding dead JUMPs if case * ends with an unconditional jump (a break or a continue) * * - The same case value may occur multiple times, but evaluation rules * only process the first match before switching to a "propagation" mode * where case values are no longer evaluated * * See E5 Section 12.11. Also see doc/compiler.rst for compilation * discussion.

41186. Ensure argument name is not a reserved word in current * (final) strictness. Formal argument parsing may not * catch reserved names if strictness changes during * parsing. * * We only need to do this in strict mode because non-strict * keyword are always detected in formal argument parsing.

41187. const flag for C

41614. basereg
41615. a
41616. * Else, must be one of: * - ExpressionStatement, possibly a directive (String) * - LabelledStatement (Identifier followed by ':') * * Expressions beginning with 'function' keyword are covered by a case * above (such expressions are not allowed in standard E5 anyway). * Also expressions starting with '{' are interpreted as block * statements. See E5 Section 12.4. * * Directive detection is tricky; see E5 Section 14.1 on directive * prologue. A directive is an expression statement with a single * string literal and an explicit or automatic semicolon. Escape * characters are significant and no parens etc are allowed: * * 'use strict'; // valid 'use strict' directive * 'use\0020strict'; // valid directive, not a 'use strict' directive * ('use strict'); // not a valid directive * * The expression is determined to consist of a single string literal * based on duk__expr_nud() and duk__expr_led() call counts. The string literal * of a 'use strict' directive is determined to lack any escapes based * num_escapes count from the lexer. Note that other directives may be * allowed to contain escapes, so a directive with escapes does not * terminate a directive prologue. * * We rely on the fact that the expression parser will not emit any * code for a single token expression. However, it will generate an * intermediate value which we will then successfully ignore. * * A similar approach is used for labels.
41617. * Default clause.
41618. Note: 'fast' breaks will jump to pc_label_site + 1, which will * then jump here. The double jump will be eliminated by a * peephole pass, resulting in an optimal jump here. The label * site jumps will remain in bytecode and will waste code size.
41619. Used by duk__emit*() calls so that we don't shuffle the loadints that * are needed to handle indirect opcodes.

41657. forget temp
41658. [...] filename &comp_stk]
41659. break/continue with label (label cannot be a reserved word, production is 'Identifier')
41660. Have a catch variable.
41661. * Intermediate value helpers
41662. * Shared assignment expression handling ** args = (opcode << 8) + rbp ** If 'opcode' is DUK_OP_NONE, plain assignment without arithmetic. * Syntactically valid left-hand-side forms which are not accepted as * left-hand-side values (e.g. as in "f() = 1") must NOT cause a * SyntaxError, but rather a run-time ReferenceError. ** When evaluating X <op>= Y, the LHS (X) is conceptually evaluated * to a temporary first. The RHS is then evaluated. Finally, the * <op> is applied to the initial value of RHS (not the value after * RHS evaluation), and written to X. Doing so concretely generates * inefficient code so we'd like to avoid the temporary when possible. * See: <https://github.com/svaarala/duktape/pull/992>. ** The expression value (final LHS value, written to RHS) is * conceptually copied into a fresh temporary so that it won't * change even if the LHS/RHS values change in outer expressions. * For example, it'd be generally incorrect for the expression value * to be the RHS register binding, unless there's a guarantee that it * won't change during further expression evaluation. Using the * temporary concretely produces inefficient bytecode, so we try to * avoid the extra temporary for some known-to-be-safe cases. * Currently the only safe case we detect is a "top level assignment", * for example "x = y + z;", where the assignment expression value is * ignored. * See: test-dev-assign-expr.js and test-bug-assign-mutate-gh381.js.
41663. TRYCATCH, cannot emit now (not enough info)
41664. reset function state (prepare for pass 2)
41665. **comment:** Lookup active label information. Break/continue distinction is necessary to handle switch * statement related labels correctly: a switch will only catch a 'break', not a 'continue'. ** An explicit label cannot appear multiple times in the active set, but empty labels (unlabelled * iteration and switch statements) can. A break will match the closest unlabelled or labelled * statement. A continue will match the closest unlabelled or labelled iteration statement. It is * a syntax error if a continue matches a labelled switch statement; because an explicit label cannot * be duplicated, the continue cannot match any valid label outside the switch. ** A side effect of these rules is that a LABEL statement related to a switch should never actually * catch a continue abrupt completion at run-time. Hence an INVALID opcode can be placed in the * continue slot of the switch's LABEL statement.
 label: code-design
41666. Value stack slot limits: these are quite approximate right now, and * because they overlap in control flow, some could be eliminated.
41667. **comment:** NOTE: "get" and "set" are not officially ReservedWords and the lexer * currently treats them always like ordinary identifiers (DUK_TOK_GET * and DUK_TOK_SET are unused). They need to be detected based on the * identifier string content.
 label: code-design
41668. **comment:** * Note: currently register bindings must be fixed for the entire * function. So, even though the catch variable is in a register * we know, we must use an explicit environment record and slow path * accesses to read/write the catch binding to make closures created * within the catch clause work correctly. This restriction should * be fixable (at least in common cases) later. ** See: test-bug-catch-binding-2.js. ** XXX: improve to get fast path access to most catch clauses.

41731. **comment:** XXX: support unary arithmetic ivales (useful?)
label: code-design

41732. arguments object would be accessible; note that shadowing * bindings are arguments or function declarations, neither * of which are deletable, so this is safe.

41733. lexing

41734. Main operation

41735. duk_reconst_t is unsigned, so use 0 as dummy value (ignored by caller)

41736. * For global or eval code this is straightforward. For functions * created with the Function constructor we only get the source for * the body and must manufacture the "function ..." part. ** For instance, for constructed functions (v8): * * > a = new Function("foo", "bar", "print(foo)"); * [Function] * > a.toString() * 'function anonymous(foo,bar) {\nprint(foo)\n}' * * Similarly for e.g. getters (v8): * * > x = { get a(foo,bar) { print(foo); } } * { a: [Getter] } * > Object.getOwnPropertyDescriptor(x, 'a').get.toString() * 'function a(foo,bar) { print(foo); }'

41737. initial index

41738. 'new' MemberExpression Arguments

41739. stmt has explicit/implicit semicolon terminator

41740. op_flags

41741. **comment:** * See the following documentation for discussion: * * doc/execution.rst: control flow details * * Try, catch, and finally "parts" are Blocks, not Statements, so * they must always be delimited by curly braces. This is unlike e.g. * the if statement, which accepts any Statement. This eliminates any * questions of matching parts of nested try statements. The Block * parsing is implemented inline here (instead of calling out). ** Finally part has a 'let scoped' variable, which requires a few kinks * here.
label: code-design

41742. XXX: integrate support for this into led() instead? * Similar issue as post-increment/post-decrement.

41743. DUK_TOK_FUNCTION

41744. array writes autoincrement length

41745. * Prototypes

41746. main expression parser function

41747. * 'arguments' binding is special; if a shadowing argument or * function declaration exists, an arguments object will * definitely not be needed, regardless of whether the identifier * 'arguments' is referenced inside the function body.

41748. statements go here (if any) on next loop

41749. **comment:** XXX: make this lenience dependent on flags or strictness?
label: code-design

41750. silence scan-build warning

41751. varname is popped by above code

41752. always allow 'in', coerce to 'tr' just in case

41753. A top-level assignment is e.g. "x = y". For these it's safe * to use the RHS as-is as the expression value, even if the RHS * is a reg-bound identifier. The RHS ('res') is right associative * so it has consumed all other assignment level operations; the * only relevant lower binding power construct is comma operator * which will ignore the expression value provided here. Usually * the top level assignment expression value is ignored, but it * is relevant for e.g. eval code.

41754. Tail call check: if last opcode emitted was CALL(I), and * the context allows it, change the CALL(I) to a tail call. * This doesn't guarantee that a tail call will be allowed at * runtime, so the RETURN must still be emitted. (Duktape * 0.10.0 avoided this and simulated a RETURN if a tail call * couldn't be used at runtime; but this didn't work * correctly with a thread yield/resume, see * test-bug-tailcall-thread-yield-resume.js for discussion.) * * In addition to the last opcode being CALL, we also need to * be sure that 'rc_val' is the result register of the CALL(I). * For instance, for the expression 'return 0, (function () * { return 1; })', 2' the last opcode emitted is CALL (no * bytecode is emitted for '2') but 'rc_val' indicates * constant '2'. Similarly if '2' is replaced by a register * bound variable, no opcodes are emitted but tail call would * be incorrect. ** This is tricky and easy to get wrong. It would be best to * track enough expression metadata to check that 'rc_val' came * from that last CALL instruction. We don't have that metadata * now, so we check that 'rc_val' is a temporary register result * (not a constant or a register bound variable). There should * be no way currently for 'rc_val' to be a temporary for an * expression following the CALL instruction without emitting * some opcodes following the CALL. This proxy check is used * below. ** See: test-bug-comma-expr-gh131.js. ** The non-standard 'caller' property disables tail calls * because they pose some special cases which haven't been * fixed yet.

41755. DUK_TOK_YIELD

41756. DUK_TOK_LNOT

41757. slot C is a target (default: source)
41758. Match labels starting from latest; once label_id no longer matches, we can * safely exit without checking the rest of the labels (only the topmost labels * are ever updated).
41759. reset bytecode buffer but keep current size; pass 2 will * require same amount or more.
41760. The 'else' ambiguity is resolved by 'else' binding to the innermost * construct, so greedy matching is correct here.
41761. **comment:** not allowed in strict mode, regardless of whether resolves; * in non-strict mode DELVAR handles both non-resolving and * resolving cases (the specification description is a bit confusing).
label: code-design
41762. end switch
41763. DUK_TOK_LE
41764. Use 'res' as the expression value (it's side effect * free and may be a plain value, a register, or a * constant) and write it to the LHS binding too.
41765. **comment:** XXX: 'res' setup can be moved to function body level; in fact, two 'res' * intermediate values suffice for parsing of each function. Nesting is needed * for nested functions (which may occur inside expressions).
label: code-design
41766. Parse a single variable declaration (e.g. "i" or "i=10"). A leading 'var' * has already been eaten. These is no return value in 'res', it is used only * as a temporary. * * When called from 'for-in' statement parser, the initializer expression must * not allow the 'in' token. The caller supply additional expression parsing * flags (like DUK_EXPR_FLAG_REJECT_IN) in 'expr_flags'. * * Finally, out_rc_varname and out_reg_varbind are updated to reflect where * the identifier is bound: * * If register bound: out_reg_varbind >= 0, out_rc_varname == 0 (ignore) * If not register bound: out_reg_varbind < 0, out_rc_varname >= 0 * * These allow the caller to use the variable for further assignment, e.g. * as is done in 'for-in' parsing.
41767. XXX: similar coercion issue as in DUK_TOK_PERIOD
41768. borrowed reference
41769. * Statement terminator check, including automatic semicolon * handling. After this step, 'curr_tok' should be the first * token after a possible statement terminator.
41770. bp to use when parsing a top level Expression
41771. Matches both +0 and -0 on purpose.
41772. bp is assumed to be even
41773. The code for writing reg_temps + 0 to the left hand side has already * been emitted.
41774. * Statement value handling. * * Global code and eval code has an implicit return value * which comes from the last statement with a value * (technically a non- "empty" continuation, which is * different from an empty statement). * * Since we don't know whether a later statement will * override the value of the current statement, we need * to coerce the statement value to a register allocated * for implicit return values. In other cases we need * to coerce the statement value to a plain value to get * any side effects out (consider e.g. "foo.bar;").
41775. transfer flags
41776. XXX: valstack handling is awkward. Add a valstack helper which * avoids dup():ing; valstack_copy(src, dst)?
41777. eat 'var'
41778. DUK_TOK_INTERFACE
41779. DUK_TOK_DIV
41780. * Any catch bindings ("catch (e)") also affect identifier binding. * * Currently, the varmap is modified for the duration of the catch * clause to ensure any identifier accesses with the catch variable * name will use slow path.
41781. iteration statements allow continue
41782. reg/const for switch value

41938. **comment:** 'd3' is never NaN, so no need to normalize
label: code-design

41939. * Executor interrupt handling ** The handler is called whenever the interrupt countdown reaches zero * (or below). The handler must perform whatever checks are activated, * e.g. check for cumulative step count to impose an execution step * limit or check for breakpoints or other debugger interaction. ** When the actions are done, the handler must reinit the interrupt * init and counter values. The 'init' value must indicate how many * bytecode instructions are executed before the next interrupt. The * counter must interface with the bytecode executor loop. Concretely, * the new init value is normally one higher than the new counter value. * For instance, to execute exactly one bytecode instruction the init * value is set to 1 and the counter to 0. If an error is thrown by the * interrupt handler, the counters are set to the same value (e.g. both * to 0 to cause an interrupt when the next bytecode instruction is about * to be executed after error handling). ** Maintaining the init/counter value properly is important for accurate * behavior. For instance, executor step limit needs a cumulative step * count which is simply computed as a sum of 'init' values. This must * work accurately even when single stepping.

41940. return value from Duktape.Thread.resume()

41941. Set catcher regs: idx_base+0 = value, idx_base+1 = lj_type.

41942. Result is always fastint compatible.

41943. Handle a BREAK/CONTINUE opcode. Avoid using longjmp() for BREAK/CONTINUE * handling because it has a measurable performance impact in ordinary * environments and an extreme impact in Emscripten (GH-342).

42027. **comment:** LDINTX is not necessarily in FASTINT range, so * no fast path for now. * * XXX: perhaps restrict LDINTX to fastint range, wider * range very rarely needed.

label: code-design

42028. duk_js_call.c is required to restore the stack reserve * so we only need to reset the top.

42029. **comment:** this is not strictly necessary, but helps debugging**label:** code-design

42030. this should never be possible, because the switch-case is * comprehensive

42031. Pre/post inc/dec for register variables, important for loops.

42032. * Avoid nested calls. Concretely this happens during debugging, e.g. * when we eval() an expression. * * Also don't interrupt if we're currently doing debug processing * (which can be initiated outside the bytecode executor) as this * may cause the debugger to be called recursively. Check required * for correct operation of throw intercept and other "exotic" halting * scenarios.

42033. w/o refcounts

42034. fast path

42035. **comment:** XXX: this could be a DUK__CONSTP instead**label:** code-design

42036. stable; precalculated for faster lookups

42037. **comment:** 'val' is never NaN, so no need to normalize**label:** code-design

42038. may be reg or const

42039. +2 = catcher value, catcher lj_type

42040. **comment:** XXX: because we're dealing with 'own' properties of a fresh array, * the array initializer should just ensure that the array has a large * enough array part and write the values directly into array part, * and finally set 'length' manually in the end (as already happens now).**label:** code-design

42041. * Longjmp and other control flow transfer for the bytecode executor. * * The longjmp handler can handle all longjmp types: error, yield, and * resume (pseudotypes are never actually thrown). * * Error policy for longjmp: should not ordinarily throw errors; if errors * occur (e.g. due to out-of-memory) they bubble outwards rather than being * handled recursively.

42042. **comment:** Reg/const access macros: these are very footprint and performance sensitive * so modify with care.**label:** code-design

42043. [... obj] -> [...]

42044. Already declared, update value.

42045. If out of catchstack, cat = thr->catchstack - 1; * new_cat_top will be 0 in that case.

42046. duk_xdef_prop() will define an own property without any array * special behaviors. We'll need to set the array length explicitly * in the end. For arrays with elisions, the compiler will emit an * explicit SETALEN which will update the length.

42047. **comment:** Switch to caller's setjmp() catcher so that if an error occurs * during error handling, it is always propagated outwards instead * of causing an infinite loop in our own handler.**label:** code-design42048. **comment:** XXX: remove heap->dbg_exec_counter, use heap->inst_count_interrupt instead?**label:** code-design

42049. functions always have a NEWENV flag, i.e. they get a * new variable declaration environment, so only lex_env * matters here.

42050. should not happen

42051. A -> flags * BC -> reg_catch; base register for two registers used both during * trycatch setup and when catch is triggered * * If DUK_BC_TRYCATCH_FLAG_CATCH_BINDING set: * reg_catch + 0: catch binding variable name (string). * Automatic declarative environment is established for * the duration of the 'catch' clause. * * If DUK_BC_TRYCATCH_FLAG_WITH_BINDING set: * reg_catch + 0: with 'target value', which is coerced to * an object and then used as a bindind object for an * environment record. The binding is initialized here, for * the 'try' clause. * * Note that a TRYCATCH generated for a 'with' statement has no * catch or finally parts.

42052. [... constructor arg1 ... argN] -> [retval]

42053. Check for breakpoints only on line transition. * Breakpoint is triggered when we enter the target * line from a different line, and the previous line * was within the same function. * * This condition is tricky: the condition used to be * that transition to -or across- the breakpoint line * triggered the breakpoint. This seems intuitively * better because it handles breakpoints on lines with * no emitted opcodes; but this leads to the issue * described in: <https://github.com/svaaraala/duktape/issues/263>.

42054. B -> target register * C -> constant index of identifier name

42055. * Execution timeout check

42056. side effects

42057. E5 Section 11.7.2, steps 7 and 8

42058. updates thread state, minimizes its allocations

42059. **comment:** It might seem that replacing 'thr->heap' with just 'heap' below * might be a good idea, but it increases code size slightly * (probably due to unnecessary spilling) at least on x64.**label:** code-design

42060. use_prev_pc

42061. Must restart in all cases because we NULLed thr->ptr_curr_pc.

42062. checked by Duktape.Thread.resume()

42063. unsigned

42064. duk.bi_duk_object_yield() and duk.bi_duk_object_resume() ensure all of these are met

42065. E5 Section 11.2.3, step 6.a.i

42066. A -> target register (A, A+1) for call setup * (for DUK_OP_CSREGI, 'a' is indirect) * B -> register containing target function (not type checked here)

42067. Must ensure result is 64-bit (no overflow); a * simple and sufficient fast path is to allow only * 32-bit inputs. Avoid zero inputs to avoid * negative zero issues (-1 * 0 = -0, for instance).

42068. lj.value1 is already set

42069. Dispatch loop.

42070. fall through if overflow etc

42071. this may have side effects, so re-lookup act

42072. Assume interrupt init/counter are properly initialized here.

42073. Continue checked execution if there are breakpoints or we're stepping. * Also use checked execution if paused flag is active - it shouldn't be * because the debug message loop shouldn't terminate if it was. Step out * is handled by callstack unwind and doesn't need checked execution. * Note that debugger may have detached due to error or explicit request * above, so we must recheck attach status.

42074. Set a high interrupt counter; the original executor * interrupt invocation will rewrite before exiting.

42075. The compiler should never emit DUK_OP_REGEXEXP if there is no * regexp support.

42076. **comment:** XXX: TRYCATCH handling should be reworked to avoid creating * an explicit scope unless it is actually needed (e.g. function * instances or eval is executed inside the catch block). This * rework is not trivial because the compiler doesn't have an * intermediate representation. When the rework is done, the * opcode format can also be made more straightforward.**label:** code-design

42077. As a first approximation, buffer values are coerced to strings * for addition. This means that adding two buffers currently * results in a string.

42078. must be ecmascript

42079. **comment:** XXX: does not work if thr->catchstack is NULL**label:** code-design

42080. The smallest fastint is no longer 48-bit when * negated. Positive zero becomes negative zero * (cannot be represented) when negated.

42081. allocate catcher and populate it (should be atomic)

42082. E5 Section 11.7.1, steps 7 and 8

42083. No need to check for size of bp_active list, * it's always larger than maximum number of * breakpoints.

42084. YIELDED: Ecmascript activation + Duktape.Thread.yield() activation

42085. * Handling DUK_OP_ADD this way is more compact (experimentally) * than a separate case with separate argument decoding.

42086. INACTIVE: no activation, single function value on valstack

42087. **comment:** * Restart execution by reloading thread state. * * Note that 'thr' and any thread configuration may have changed, * so all local variables are suspect and we need to reinitialize. * * The number of local variables should be kept to a minimum: if * the variables are spilled, they will need to be loaded from * memory anyway. * * Any 'goto restart_execution;' code path in opcode dispatch must * ensure 'curr_pc' is synced back to act->curr_pc before the goto * takes place. * * The interpreter must be very careful with memory pointers, as * many pointers are not guaranteed to be 'stable' and may be * reallocated and relocated on-the-fly quite easily (e.g. by a * memory allocation or a property access). * * The following are assumed to have stable pointers: * - the current thread * - the current function * - the bytecode, constant table, inner function table of the * current function (as they are a part of the function allocation) * * The following are assumed to have semi-stable pointers: * - the current activation entry: stable as long as callstack * is not changed (reallocated by growing or shrinking), or * by any garbage collection invocation (through finalizers) * - Note in particular that ANY DECREF can invalidate the * activation pointer, so for the most part a fresh lookup * is required * * The following are not assumed to have stable pointers at all: * - the value stack (registers) of the current thread * - the catch stack of the current thread * * See execution.rst for discussion.

label: code-design

42088. * Ecmascript bytecode executor. * * Resume execution for the current thread from its current activation. * Returns when execution would return from the entry level activation, * leaving a single return value on top of the stack. Function calls * and thread resumptions are handled internally. If an error occurs, * a longjmp() with type DUK_LJ_TYPE_THROW is called on the entry level * setjmp() jmpbuf. * * Ecmascript function calls and coroutine resumptions are handled * internally (by the outer executor function) without recursive C calls. * Other function calls are handled using duk_handle_call(), increasing * C recursion depth. * * Abrupt completions (= long control transfers) are handled either * directly by reconfiguring relevant stacks and restarting execution, * or via a longjmp. Longjmp-free handling is preferable for performance * (especially Emscripten performance), and is used for: break, continue, * and return. * * For more detailed notes, see doc/execution.rst. * * Also see doc/code-issues.rst for discussion of setjmp(), longjmp(), * and volatile.

42089. Compiler is responsible for selecting property flags (configurability, * writability, etc).

42090. enum_flags

42091. E5 Sections 11.9.1, 11.9.3

42092. * Note: we currently assume that the setjmp() catchpoint is * not re-entrant (longjmp() cannot be called more than once * for a single setjmp()). * * See doc/code-issues.rst for notes on variable assignment * before and after setjmp().

42093. **comment:** * (Re)try handling the longjmp. * * A longjmp handler may convert the longjmp to a different type and * "virtually" rethrow by goto'ing to 'check_longjmp'. Before the goto, * the following must be updated: * - the heap 'lj' state * - 'thr' must reflect the "throwing" thread

label: code-design

42094. Force pause if we were doing "step into" in another activation.

42095. Note: target registers a and a+1 may overlap with DUK_REGP(b) * and DUK_REGCONSTP(c). Careful here.

42096. already set

42097. [... val] --> [... enum]

42098. these are not necessarily 0 or 1 (may be other non-zero), that's ok

42099. +1 = finally

42100. Negative value checked so that a "time jump" works * reasonably. * * Same interval is now used for status sending and * peeking.

42101. Note: 'this' may be bound to any value, not just an object

42102. * Currently only allowed only if yielding thread has only * Ecmascript activations (except for the Duktape.Thread.yield() * call at the callstack top) and none of them constructor * calls. * * This excludes the 'entry' thread which will always have * a preventcount > 0.

42103. + spare

42104. * Process messages and send status if necessary. * * If we're paused, we'll block for new messages. If we're not * paused, we'll process anything we can peek but won't block * for more. Detach (and re-attach) handling is all localized * to duk_debug_process_messages() too. * * Debugger writes outside the message loop may cause debugger * detach1 phase to run, after which dbg_read_cb == NULL and * dbg_detaching != 0. The message loop will finish the detach * by running detach2 phase, so enter the message loop also when * detaching.

42105. must "goto restart_execution", e.g. breakpoints changed

42106. Share yield longjmp handler.

42107. **comment:** * Three possible outcomes: * * A try or finally catcher is found => resume there. * (or) * * The error propagates to the bytecode executor entry * level (and we're in the entry thread) => rethrow * with a new longjmp(), after restoring the previous * catchpoint. * * The error is not caught in the current thread, so * the thread finishes with an error. This works like * a yielded error, except that the thread is finished * and can no longer be resumed. (There is always a * resumer in this case.) * * Note: until we hit the entry level, there can only be * Ecmascript activations.

label: code-design

42108. no need to unwind callstack

42109. unwind to 'yield' caller

42110. 'this binding' is just under bottom

42111. stable

42112. Enter message processing loop for sending Status notifs and * to finish a pending detach.

42113. Duktape.Thread.resume()

42114. +0 = break, +1 = continue

42115. Outer executor with setjmp/longjmp handling.

42116. if debugging disabled

42117. E5 Section 10.4.3

42118. does not modify tv_x

42119. [... func this arg1 ... argN]

42120. Cause an interrupt after executing one instruction.

42121. side effects, perform in-place

42122. 'act' is no longer accessed, scanbuild fix

42123. Ecmascript activation + Duktape.Thread.yield() activation

42124. **comment:** Presence of 'fun' is config based, there's a marginal performance * difference and the best option is architecture dependent.

label: code-design

42125. reg

42126. no compact

42127. restricted to regs

42128. exit bytecode executor by rethrowing an error to caller

42129. **comment:** XXX: side effect handling is quite awkward here

label: code-design

42130. Note: thr->catchstack_top may be 0, so that cat < thr->catchstack * initially. This is OK and intended.

42131. Call setup checks callability.

42132. exit bytecode execution with return value

42133. A -> target reg * B -> object reg/const (may be const e.g. in "'foo'[1]') * C -> key reg/const

42134. There is no eval() special handling here: eval() is never * automatically converted to a lightfunc.

42135. Write curr_pc back for the debugger.

42136. Called for handling both a longjmp() with type DUK_LJ_TYPE_YIELD and * when a RETURN opcode terminates a thread and yields to the resumer.

42137. * Other cases, use C recursion. * * If a tail call was requested we ignore it and execute a normal call. * Since Duktape 0.11.0 the compiler emits a RETURN opcode even after * a tail call to avoid test-bug-tailcall-thread-yield-resume.js. * * Direct eval call: (1) call target (before following bound function * chain) is the built-in eval() function, and (2) call was made with * the identifier 'eval'.

42138. **comment:** Current PC, accessed by other functions through thr->ptr_to_curr_pc. * Critical for performance. It would be safest to make this volatile, * but that eliminates performance benefits; aliasing guarantees * should be enough though.

label: code-design

42139. no refcount changes

42140. 'null' enumerator case -> behave as with an empty enumerator
42141. **comment:** Compared to duk_handle_call(): * - protected call: never * - ignore recursion limit: never
 label: code-design
42142. A -> unused (reserved for flags, for consistency with DUK_OP_CALL) * B -> target register and start reg: constructor, arg1, ..., argN * (for DUK_OP_NEWI, 'b' is indirect) * C -> num args (N)
42143. **comment:** XXX: putvar takes a duk_tval pointer, which is awkward and * should be reworked.
 label: code-design
42144. bottom of current func
42145. duk__handle_return() is guaranteed never to throw, except * for potential out-of-memory situations which will then * propagate out of the executor longjmp handler.
42146. **comment:** XXX: could use at least one fewer loop counters
 label: code-design
42147. A -> flags * B -> return value reg/const * C -> currently unused
42148. Note: left shift, should mask
42149. Ecmascript function
42150. curr_pc synced back above
42151. relookup (side effects)
42152. GH-303
42153. return value from Duktape.Thread.yield()
42154. * Ecmascript modulus ('%') does not match IEEE 754 "remainder" * operation (implemented by remainder() in C99) but does seem * to match ANSI C fmod(). * * Compare E5 Section 11.5.3 and "man fmod".
42155. The counter value is one less than the init value: init value should * indicate how many instructions are executed before interrupt. To * execute 1 instruction (after interrupt handler return), counter must * be 0.
42156. unsigned shift
42157. Note: errors are augmented when they are created, not * when they are thrown. So, don't augment here, it would * break re-throwing for instance.
42158. We request a tail call, but in some corner cases * call handling can decide that a tail call is * actually not possible. * See: test-bug-tailcall-preventyield-assert.c.
42159. **comment:** Not necessary to unwind catchstack: return handling will * do it. The finally flag of 'cat' is no longer set. The * catch flag may be set, but it's not checked by return handling.
 label: code-design
42160. **comment:** Inner executor, performance critical.
 label: code-design
42161. **comment:** This could also be thrown internally (set the error, goto check_longjmp), * but it's better for internal errors to bubble outwards so that we won't * infinite loop in this catchpoint.
 label: code-design
42162. * Assuming a register binds to a variable declared within this * function (a declarative binding), the 'this' for the call * setup is always 'undefined'. E5 Section 10.2.1.1.6.
42163. CATCH flag may be enabled or disabled here; it may be enabled if * the statement has a catch block but the try block does not throw * an error.
42164. * If entering a 'catch' block which requires an automatic * catch variable binding, create the lexical environment. * * The binding is mutable (= writable) but not deletable. * Step 4 for the catch production in E5 Section 12.14; * no value is given for CreateMutableBinding 'D' argument, * which implies the binding is not deletable.
42165. XXX: Set 32-bit result (but must then handle signed and * unsigned results separately).
42166. x
42167. lj.value1 already set
42168. A -> object reg * B -> key reg/const * C -> value reg/const * * Note: intentional difference to register arrangement * of e.g. GETPROP; 'A' must contain a register-only value.
42169. at least one activation, ours
42170. XXX: assert idx_base
42171. not caught by anything before entry level; rethrow and let the * final catcher unwind everything
42172. Quite heavy assert: check valstack policy. Improper * shuffle instructions can write beyond valstack_top/end * so this check catches them in the act.
42173. Note: currently the catch binding is handled without a register * binding because we don't support dynamic register bindings (they * must be fixed for an entire function). So, there is no need to * record regbases etc.
42174. * Breakpoint and step state checks
42175. [... env target target]
42176. Don't allow a zero divisor. Restrict both v1 and * v2 to positive values to avoid compiler specific * behavior.
42177. overflow, fall through
42178. restored if ecma-to-ecma setup fails
42179. type
42180. reset longjmp
42181. **comment:** pseudotypes, not used in actual longjumps
 label: code-design
42182. borrowed reference; although 'tv1' comes from a register, * its value was loaded using LDCONST so the constant will * also exist and be reachable.
42183. A -> target reg * BC -> inner function index
42184. resumee
42185. **comment:** This macro works when a regconst field is 9 bits, [0,0x1ff]. Adding * DUK_LIKELY/DUK_UNLIKELY increases code footprint and doesn't seem to * improve performance on x64 (and actually harms performance in some tests).
 label: code-design
42186. Fast path for the case where the register * is a number (e.g. loop counter).
42187. * Ecmascript bytecode executor.
42188. **comment:** * Four possible outcomes: * * 1. A 'finally' in the same function catches the 'return'. * It may continue to propagate when 'finally' is finished, * or it may be neutralized by 'finally' (both handled by * ENDFIN). * * 2. The return happens at the entry level of the bytecode * executor, so return from the executor (in C stack). * * 3. There is a calling (Ecmascript) activation in the call * stack => return to it, in the same executor instance. * * 4. There is no calling activation, and the thread is * terminated. There is always a resumer in this case, * which gets the return value similarly to a 'yield' * (except that the current thread can no longer be * resumed).
 label: code-design
42189. **comment:** XXX: signalling the need to shrink check (only if unwound)

42317. fastint downgrade check for return values

42318. XXX: optimize reconfig valstack operations so that resize, clamp, and setting * top are combined into one pass.
42319. **comment:** Figure out all active breakpoints. A breakpoint is * considered active if the current function's fileName * matches the breakpoint's fileName, AND there is no * inner function that has matching line numbers * (otherwise a breakpoint would be triggered both * inside and outside of the inner function which would * be confusing). Example: * * function foo() { * print('foo'); * function bar() { <-. breakpoints in these * print('bar'); | lines should not affect * } <-' foo() execution * bar(); * } * * We need a few things that are only available when * debugger support is enabled: (1) a line range for * each function, and (2) access to the function template to access the inner functions (and their * line ranges). * * It's important to have a narrow match for active * breakpoints so that we don't enter checked execution * when that's not necessary. For instance, if we're * running inside a certain function and there's * breakpoint outside in (after the call site), we * don't want to slow down execution of the function.
- label:** code-design
42320. pre-incremented, points to first jump slot
42321. nop
42322. * NEXTENUM checks whether the enumerator still has unenumerated * keys. If so, the next key is loaded to the target register * and the next instruction is skipped. Otherwise the next instruction * will be executed, jumping out of the enumeration loop.
42323. * Note: lj.value1 is 'value', lj.value2 is 'resume'. * This differs from YIELD.
42324. In-place unary operation.
42325. **comment:** Lookup current thread; use the stable 'entry_thread' for this to * avoid clobber warnings. Any valid, reachable 'thr' value would be * fine for this, so using 'entry_thread' is just to silence warnings.
- label:** code-design
42326. Thread may have changed, e.g. YIELD converted to THROW.
42327. Already declared but no initializer value * (e.g. 'var xyz;'), no-op.
42328. throw
42329. unreferenced without assertions
42330. For cross-checking during development: ensure dispatch count * matches cumulative interrupt counter init value sums.
42331. valstack should not need changes
42332. [-0x80000000,0x7fffffff]
42333. Catches both doubles and cases where only one argument is a fastint
42334. x == -Infinity
42335. * Note: prototype chain is followed BEFORE first comparison. This * means that the instanceof lval is never itself compared to the * rval.prototype property. This is apparently intentional, see E5 * Section 15.3.5.3, step 4.a. * * Also note: * * js> (function() {}) instanceof Function * true * js> Function instanceof Function * true * * For the latter, h_proto will be Function.prototype, which is the * built-in Function prototype. Because Function.[[Prototype]] is * also the built-in Function prototype, the result is true.
42336. heap pointer comparison suffices
42337. E5 Section 9.3.1
42338. * Get the values onto the stack first. It would be possible to cover * some normal cases without resorting to the value stack (e.g. if * lval is already a string).
42339. truncate towards zero
42340. func support for [[HasInstance]] checked in the beginning of the loop
42341. prefix matches, lengths matter now
42342. Note: undefined from Section 11.8.5 always results in false * return (see e.g. Section 11.8.3) - hence special treatment here.
42343. normal comparison; known: * - both x and y are not NaNs (but one of them can be) * - both x and y are not zero (but one of them can be) * - x and y may be denormal or infinite
42344. mimic semantics for strings
42345. **comment:** At least 'magic' has a significant impact on function * identity.
- label:** code-design
42346. implementation specific
42347. x == +Infinity
42348. * Get the values onto the stack first. It would be possible to cover * some normal cases without resorting to the value stack. * * The right hand side could be a light function (as they generally * behave like objects). Light functions never have a 'prototype' * property so E5.1 Section 15.3.5.3 step 3 always throws a TypeError. * Using duk_require_hobject() is thus correct (except for error msg).
42349. -> x in J-2**32, 2**32[
42350. String-number-buffer/object -> coerce object to primitive (apparently without hint), then try again.
42351. exposed, used by e.g. duk.bi_date.c
42352. Buffer/string -> compare contents.
42353. * ToNumber() (E5 Section 9.3) * * Value to convert must be on stack top, and is popped before exit. * * See: <http://www.cs.indiana.edu/~burger/FP-Printing-PLDI96.pdf> * <http://www.cs.indiana.edu/~burger/fp/index.html> * * Notes on the conversion: * * - There are specific requirements on the accuracy of the conversion * through a "Mathematical Value" (MV), so this conversion is not * trivial. * * - Quick rejects (e.g. based on first char) are difficult because * the grammar allows leading and trailing white space. * * - Quick reject based on string length is difficult even after * accounting for white space; there may be arbitrarily many * decimal digits. * * - Standard grammar allows decimal values ("123"), hex values * ("0x123") and infinities * * - Unlike source code literals, ToNumber() coerces empty strings * and strings with only whitespace to zero (not NaN).
42354. **comment:** Straightforward algorithm, makes fewer compiler assumptions.
- label:** code-design
42355. Handle lightfuncs through object coercion for now.
42356. **comment:** unused
- label:** code-design
42357. x = sign(x) * floor(abs(x)), i.e. truncate towards zero, keep sign

42360. number
42361. radix
42362. Number/string-or-buffer -> coerce string to number (e.g. "'1.5' -> true).
42363. Undefined/null are considered equal (e.g. "null == undefined" -> true).
42364. **comment:** * ToString() (E5 Section 9.8) * * ==> implemented in the API.
- label:** requirement
42365. * 'func' is now a non-bound object which supports [[HasInstance]] * (which here just means DUK_HOBJECT_FLAG_CALLABLE). Move on * to execute E5 Section 15.3.5.3.
42366. **comment:** XXX: FP_ZERO check can be removed, the else clause handles it * correctly (preserving sign).
- label:** code-design
42367. **comment:** XXX: direct implementation
- label:** requirement
42368. SameValue(NaN, NaN) = true, regardless of NaN sign or extra bits
42369. For all combinations: +0 < +0, +0 < -0, -0 < +0, -0 < -0, * steps e, f, and g.
42370. **comment:** XXX: make fast paths optional for size minimization?
- label:** code-design
42371. **comment:** XXX: expensive, but numconv now expects to see a string
- label:** code-design
42372. * ToInteger() (E5 Section 9.4)
42373. invalidates tv
42374. * E5 Section 11.8.6 describes the main algorithm, which uses * [[HasInstance]]. [[HasInstance]] is defined for only * function objects: * * - Normal functions: * E5 Section 15.3.5.3 * - Functions established with Function.prototype.bind(): * E5 Section 15.3.4.5.3 * * For other objects, a TypeError is thrown. * * Limited

Proxy support: don't support 'getPrototypeOf' trap but * continue lookup in Proxy target if the value is a Proxy.

42375. never here

42376. Note that this is the same operation for strict and loose equality: * - E5 Section 11.9.3, step 1.c (loose) * - E5 Section 11.9.6, step 4 (strict)

42377. DUK_MEMCMP() is guaranteed to return zero (equal) for zero length * inputs so no zero length check is needed.

42378. $y == +\text{Infinity}$

42379. * Same type? * * Note: since number values have no explicit tag in the 8-byte * representation, need the awkward if + switch.

42380. **comment:** Note: reuse variables

label: code-design

42381. * CheckObjectCoercible() (E5 Section 9.10) * * Note: no API equivalent now.

42382. **comment:** Coerce like a string. This makes sense because addition also treats * buffers like strings.

label: code-design

42383. NOTE: fmod(x) result sign is same as sign of x, which * differs from what Javascript wants (see Section 9.6).

42384. equals and strict equals

42385. non-strict equality for buffers compares contents

42386. +(function(){}) -> NaN

42387. * Loose equality, strict equality, and SameValue (E5 Sections 11.9.1, 11.9.4, * 9.12). These have much in common so they can share some helpers. * * Future work notes: * * - Current implementation (and spec definition) has recursion; this should * be fixed if possible. * * - String-to-number coercion should be possible without going through the * value stack (and be more compact) if a shared helper is invoked.

42388. Called by duk_hstring.h macros

42389. Careful overflow handling. When multiplying by 10: * - 0x19999998 x 10 = 0xffffffff: no overflow, and adding * 0...9 is safe. * - 0x19999999 x 10 = 0xfffffff9: no overflow, adding * 0...5 is safe, 6...9 overflows. * - 0x1999999a x 10 = 0x10000004: always overflow.

42390. non-strict equality from here on

42391. +0.0

42392. Better equivalent algorithm. If the compiler is compliant, C and * Ecmascript semantics are identical for this particular comparison. * In particular, NaNs must never compare equal and zeroes must compare * equal regardless of sign. Could also use a macro, but this inlines * already nicely (no difference on gcc, for instance).

42393. * E5 Sections 11.8.7, 8.12.6. * * Basically just a property existence check using [[HasProperty]].

42394. Boolean/any -> coerce boolean to number and try again. If boolean is * compared to a pointer, the final comparison after coercion now always * yields false (as pointer vs. number compares to false), but this is * not special cased.

42395. -> [... lval new_rval]

42396. Using classification has smaller footprint than direct comparison.

42397. coerce lval with ToString()

42398. **comment:** * typeof * * E5 Section 11.4.3. * * Very straightforward. The only question is what to return for our * non-standard tag / object types. * * There is an unfortunate string constant define naming problem with * typeof return values for e.g. "Object" and "object"; careful with * the built-in string defines. The LC_XXX defines are used for the * lowercase variants now.

label: code-design

42399. IEEE requires that zeros compare the same regardless * of their signed, so if both x and y are zeroes, they * are caught above.

42400. * ToObject() (E5 Section 9.9) * * ==> implemented in the API.

42401. * ToBoolean() (E5 Section 9.2)

42402. follow prototype chain

42403. Difference to non-strict/strict comparison is that NaNs compare * equal and signed zero signs matter.

42404. Ordering should not matter (E5 Section 11.8.5, step 3.a) but * preserve it just in case.

42405. combined algorithm matching E5 Sections 9.5 and 9.6

42406. **comment:** XXX: this is possible without resorting to the value stack

label: code-design

42407. Similar to String comparison.

42408. Slow path

42409. **comment:** XXX: this is a very narrow check, and doesn't cover * zeroes, subnormals, infinities, which compare normally.

label: code-design

42410. **comment:** * Ecmascript specification algorithm and conversion helpers. * * These helpers encapsulate the primitive Ecmascript operation * semantics, and are used by the bytecode executor and the API * (among other places). Note that some primitives are only * implemented as part of the API and have no "internal" helper. * (This is the case when an internal helper would not really be * useful; e.g. the operation is rare, uses value stack heavily, * etc.) * * The operation arguments depend on what is required to implement * the operation: * * - If an operation is simple and stateless, and has no side * effects, it won't take an duk_hthread argument and its * arguments may be duk_tval pointers (which are safe as long * as no side effects take place). * * - If complex coercions are required (e.g. a "ToNumber" coercion) * or errors may be thrown, the operation takes an duk_hthread * argument. This also implies that the operation may have * arbitrary side effects, invalidating any duk_tval pointers. * * - For operations with potential side effects, arguments can be * taken in several ways: * * a) as duk_tval pointers, which makes sense if the "common case" * can be resolved without side effects (e.g. coercion); the * arguments are pushed to the valstack for coercion if * necessary * * b) as duk_tval values * * c) implicitly on value stack top * * d) as indices to the value stack * * Future work: * * - Argument styles may not be the most sensible in every case now. * * - In-place coercions might be useful for several operations, if * in-place coercion is OK for the bytecode executor and the API.

42485. lookup name from an open declarative record's registers

42486. env and act may be NULL

42487. [...] env callee]

42488. registers are mutable, non-deletable

42489. side effects

42490. -> [...] closure template newobj]

42491. * Local result type for duk_get_identifier_reference() lookup.

42492. Identifier found in registers (always non-deletable) * or declarative environment record and non-configurable.

42493. [...] env callee varmap key val]

42494. -> [...] closure template]

42495. * PUTVAR ** See E5 Sections: * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * 11.13.1 Simple Assignment [example of where the Reference is PutValue'd] * 8.7.2 PutValue (V,W) [see especially step 3.b, undefined -> automatic global in non-strict mode] * 8.12.4 [[CanPut]] (P) * 8.12.5 [[Put]] (P) ** Note: may invalidate any valstack (or object) duk_tval pointers because * putting a value may reallocate any object or any valstack. Caller beware.

42496. must be found: was found earlier, and cannot be inherited

42497. * Not found: write to global object (non-strict) or ReferenceError * (strict); see E5 Section 8.7.2, step 3.

42498. [... closure]

42499. [... env]

42500. [this value] -> [value this]

42501. * Object environment record. * * Binding (target) object is an external, uncontrolled object. * Identifier may be bound in an ancestor property, and may be * an accessor. Target can also be a Proxy which we must support * here.

42502. non-standard

42503. Note: in strict mode the compiler should reject explicit * declaration of 'eval' or 'arguments'. However, internal * bytecode may declare 'arguments' in the function prologue. * We don't bother checking (or asserting) for these now.

42504. always for register bindings

42505. If function creation fails due to out-of-memory, the data buffer * pointer may be NULL in some cases. That's actually possible for * GC code, but shouldn't be possible here because the incomplete * function will be unwound from the value stack and never instantiated.

42506. can't get value, may be accessor

42507. unsigned

42508. writable but not deletable

42509. may be NULL

42510. assertions: env must be closed in the same thread as where it runs

42511. * "length" maps to number of formals (E5 Section 13.2) for function * declarations/expressions (non-bound functions). Note that 'nargs' * is NOT necessarily equal to the number of arguments.

42512. 1 -> needs a PUTVAR

42513. just check 'env'

42514. It's important that duk_xdef_prop() is a 'raw define' so that any * properties in an ancestor are never an issue (they should never be * e.g. non-writable, but just in case).

42515. * Named function expression, name needs to be bound * in an intermediate environment record. The "outer" * lexical/variable environment will thus be: * * a) { funcname: <func>, __prototype: outer_lex_env } * b) { funcname: <func>, __prototype: <globalenv> } (if outer_lex_env missing)

42516. global object doesn't have array part

42517. * Define new property * * Note: this may fail if the holder is not extensible.

42518. * HASVAR: check identifier binding from a given environment record * without traversing its parents. * * This primitive is not exposed to user code as such, but is used * internally for e.g. declaration binding instantiation. * * See E5 Sections: * 10.2.1.1 HasBinding(N) * 10.2.1.2.1 HasBinding(N) * * Note: strictness has no bearing on this check. Hence we don't take * a 'strict' parameter.

42519. lookup name from current activation record's functions' registers

42520. already closed

42521. -> [... closure template env]

42522. follow parent chain

42523. **comment:** XXX: this is awkward as we use an internal method which doesn't handle * extensibility etc correctly. Basically we'd want to do a [[DefineOwnProperty]] * or Object.defineProperty() here.
label: code-design

42524. **comment:** * Compact the closure, in most cases no properties will be added later. * Also, without this the closures end up having unused property slots * (e.g. in Duktape 0.9.0, 8 slots would be allocated and only 7 used). * A better future solution would be to allocate the closure directly * to correct size (and setup the properties directly without going * through the API).
label: code-design

42525. required if NAMEBINDING set

42526. [... closure template formals]

42527. env[funcname] = closure

42528. Note: we rely on the _Varmap having a bunch of nice properties, like: * - being compacted and unmodified during this process * - not containing an array part * - having correct value types

42529. * GETIDREF: a GetIdentifierReference-like helper. * * Provides a parent traversing lookup and a single level lookup * (for HasBinding). * * Instead of returning the value, returns a bunch of values allowing * the caller to read, write, or delete the binding. Value pointers * are duk_tval pointers which can be mutated directly as long as * refcounts are properly updated. Note that any operation which may * reallocate valstacks or compact objects may invalidate the returned * duk_tval (but not object) pointers, so caller must be very careful. * * If starting environment record 'env' is given, 'act' is ignored. * However, if 'env' is NULL, the caller may identify, in 'act', an * activation which hasn't had its declarative environment initialized * yet. The activation registers are then looked up, and its parent * traversed normally. * * The 'out' structure values are only valid if the function returns * success (non-zero).

42530. Update duk_tval in-place if pointer provided and the * property is writable. If the property is not writable * (immutable binding), use duk_hobject_putprop() which * will respect mutability.

42531. regnum is sane

42532. DUK_HOBJECT_FLAG_ARRAY_PART: don't care

42533. XXX: additional conditions when to close variables? we don't want to do it * unless the environment may have "escaped" (referenced in a function closure). * With delayed environments, the existence is probably good enough of a check.

42534. Note: all references inside 'data' need to get their refcounts * upped too. This is the case because refcounts are decreased * through every function referencing 'data' independently.

42535. * Lookup variable and update in-place if found.

42536. -> [... closure template env funcname]

42537. [... closure template val]

42538. **comment:** order: most frequent to least frequent
label: code-design

42539. * Not found in registers, proceed to the parent record. * Here we need to determine what the parent would be, * if 'env' was not NULL (i.e. same logic as when initializing * the record). * * Note that environment initialization is only deferred when * DUK_HOBJECT_HAS_NEWENV is set, and this only happens for: * - Function code * - Strict eval code * * We only need to check _Lexenv here; _Varev exists only if it * differs from _Lexenv (and thus _Lexenv will also be present).

42540. * Not found (even in global object). * * In non-strict mode this is a silent SUCCESS (!), see E5 Section 11.4.1, * step 3.b. In strict mode this case is a compile time SyntaxError so * we should not come here.

42541. XXX: incrf by count (here 2 times)

42542. * Not found (in registers or record objects). Declare * to current variable environment.

42543. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway

42544. implicit this value always undefined for * declarative environment records.

42545. * Conceptually, we look for the identifier binding by starting from * 'env' and following to chain of environment records (represented * by the prototype chain). * * If 'env' is NULL, the current activation does not yet have an * allocated declarative environment record; this should be treated * exactly as if the environment record existed but had no bindings * other than register bindings. * * Note: we assume that with the DUK_HOBJECT_FLAG_NEWENV cleared * the environment will always be initialized immediately; hence * a NULL 'env' should only happen with the flag set. This is the * case for: (1) function calls, and (2) strict, direct eval calls.

42546. * Not found (even in global object)

42547. * Create a new function object based on a "template function" which contains * compiled bytecode, constants, etc, but lacks a lexical environment. * * ECMAScript requires that each created closure is a separate object, with * its own set of editable properties. However, structured property values * (such as the formal arguments list and the variable map) are shared. * Also the bytecode, constants, and inner functions are shared. * * See E5 Section 13.2 for detailed requirements

on the function objects; * there are no similar requirements for function "templates" which are an * implementation dependent internal feature. Also see function-objects.rst * for a discussion on the function instance properties provided by this * implementation. ** Notes: *** Order of internal properties should match frequency of use, since the * properties will be linearly scanned on lookup (functions usually don't * have enough properties to warrant a hash part). *** The created closure is independent of its template; they do share the * same 'data' buffer object, but the template object itself can be freed * even if the closure object remains reachable.

42548. **comment:** * Identifier access and function closure handling. ** Provides the primitives for slow path identifier accesses: GETVAR, * PUTVAR, DELVAR, etc. The fast path, direct register accesses, should * be used for most identifier accesses. Consequently, these slow path * primitives should be optimized for maximum compactness. ** Ecmascript environment records (declarative and object) are represented * as internal objects with control keys. Environment records have a * parent record ("outer environment reference") which is represented by * the implicit prototype for technical reasons (in other words, it is a * convenient field). The prototype chain is not followed in the ordinary * sense for variable lookups. ** See identifier-handling.rst for more details on the identifier algorithms * and the internal representation. See function-objects.rst for details on * what function templates and instances are expected to look like. ** Care must be taken to avoid duk_tval pointer invalidation caused by * e.g. value stack or object resizing. ** TODO: properties for function instances could be initialized much more * efficiently by creating a property allocation for a certain size and * filling in keys and values directly (and INCREFing both with "bulk incref" * primitives. ** XXX: duk_hobject_getprop() and duk_hobject_putprop() calls are a bit * awkward (especially because they follow the prototype chain); rework * if "raw" own property helpers are added.

label: code-design

42549. **comment:** * Variable already declared, ignore re-declaration. * The only exception is the updated behavior of E5.1 for * global function declarations, E5.1 Section 10.5, step 5.e. * This behavior does not apply to global variable declarations.

label: code-design

42550. assume plain values

42551. SCANBUILD: scan-build produces a NULL pointer dereference warning * below; it never actually triggers because holder is actually never * NULL.

42552. * Function gets no new environment when called. This is the * case for global code, indirect eval code, and non-strict * direct eval code. There is no direct correspondence to the * E5 specification, as global/eval code is not exposed as a * function.

42553. * Some assertions (E5 Section 13.2).

42554. SCANBUILD: NULL pointer dereference, doesn't actually trigger, * asserted above.

42555. ref.value and ref.this.binding invalidated here

42556. * DELVAR ** See E5 Sections: * 11.4.1 The delete operator * 10.2.1.1.5 DeleteBinding (N) [declarative environment record] * 10.2.1.2.5 DeleteBinding (N) [object environment record] * * Variable bindings established inside eval() are deletable (configurable), * other bindings are not, including variables declared in global level. * Registers are always non-deletable, and the deletion of other bindings * is controlled by the configurable flag. ** For strict mode code, the 'delete' operator should fail with a compile * time SyntaxError if applied to identifiers. Hence, no strict mode * run-time deletion of identifiers should ever happen. This function * should never be called from strict mode code!

42557. * Other cases (function declaration, anonymous function expression, * strict direct eval code). The "outer" environment will be whatever * the caller gave us.

42558. **comment:** * Special behavior in E5.1. * * Note that even though parents == 0, the conflicting property * may be an inherited property (currently our global object's * prototype is Object.prototype). Step 5.e first operates on * the existing property (which is potentially in an ancestor) * and then defines a new property in the global object (and * never modifies the ancestor). * * Also note that this logic would become even more complicated * if the conflicting property might be a virtual one. Object * prototype has no virtual properties, though. ** XXX: this is now very awkward, rework.

label: code-design

42559. * Setup environment record properties based on the template and * its flags. * * If DUK_HOBJECT_HAS_NEWENV(fun_temp) is true, the environment * records represent identifiers "outside" the function; the * "inner" environment records are created on demand. Otherwise, * the environment records are those that will be directly used * (e.g. for declarations). * * _Lexenv is always set; _Varenv defaults to _Lexenv if missing, * so _Varenv is only set if _Lexenv != _Varenv. * * This is relatively complex, see doc/identifier-handling.rst.

42560. **comment:** XXX: we could save space by using _Target OR _This. If _Target, assume * this binding is undefined. If _This, assumes this binding is _This, and * target is also _This. One property would then be enough.

label: code-design

42561. Push a new closure on the stack. ** Note: if fun_temp has NEWENV, i.e. a new lexical and variable declaration * is created when the function is called, only outer_lex_env matters * (outer_var_env is ignored and may or may not be same as outer_lex_env).

42562. * Declarative environment record. * * Identifiers can never be stored in ancestors and are * always plain values, so we can use an internal helper * and access the value directly with an duk_tval ptr. * * A closed environment is only indicated by it missing * the "book-keeping" properties required for accessing * register-bound variables.

42563. **comment:** * "name" is a non-standard property found in at least V8, Rhino, smjs. * For Rhino and smjs it is non-writable, non-enumerable, and non-configurable; * for V8 it is writable, non-enumerable, non-configurable. It is also defined * for an anonymous function expression in which case the value is an empty string. * We could also leave name 'undefined' for anonymous functions but that would * differ from behavior of other engines, so use an empty string. ** XXX: make optional? costs something per function.

label: code-design

42564. **comment:** XXX: use helper for size optimization

label: code-design

42565. * Delayed activation environment record initialization (for functions * with NEWENV). ** The non-delayed initialization is handled by duk_handle_call().

42566. [... closure template undefined]

42567. **comment:** XXX: could also copy from template, but there's no way to have any * other value here now (used code has no access to the template).

label: code-design

42568. Note: env_thr != thr is quite possible and normal, so careful * with what thread is used for valstack lookup.

42569. ref.value, ref.this.binding invalidated here by getprop call

42570. lookup results is ignored

42571. **comment:** XXX: duk_hobject_hasprop() would be correct for * non-Proxy objects too, but it is about ~20-25% * slower at present so separate code paths for * Proxy and non-Proxy now.

label: code-design

42572. [... env callee varmap]

42573. env is closed, should be missing _Callee, _Thread, _Regbase

42574. **comment:** * Copy some internal properties directly * * The properties will be writable and configurable, but not enumerable.

label: code-design

42575. **comment:** XXX: use a helper for prototype traversal; no loop check here

label: code-design

42576. ref.holder is global object, holder is the object with the * conflicting property.

42577. * Get holder object

42578. for object-bound identifiers

42579. DUK_HOBJECT_FLAG_NEWENV: handled below

42580. Target may be a Proxy or property may be an accessor, so we must * use an actual, Proxy-aware hasprop check here. ** out->holder is NOT set to the actual duk_hobject where the * property is found, but rather the object binding target object.

42581. **comment:** unused

label: code-design

42582. holder will be set to the target object, not the actual object * where the property was found (see duk_get_identifier_reference()).

42583. * Delayed env creation check

42584. * Delayed initialization only occurs for 'NEWENV' functions.

42585. no prototype, updated below

42586. [... closure template len_value]

42587. [this value]

42588. Here val would be potentially invalid if we didn't make * a value copy at the caller.

42589. **comment:** XXX: slightly awkward

label: code-design

42590. implicit this value always undefined for * declarative environment records.

42591. property attributes for identifier (relevant if value != NULL)

42592. 0 = no throw

42593. * Closing environment records. ** The environment record MUST be closed with the thread where its activation * is. In other words (if 'env' is open): ** - 'thr' must match _env.thread * - 'func' must match _env.callee * - 'regbase' must match _env.regbase ** These are not looked up from the env to minimize code size. ** XXX: should access the own properties directly instead of using the API

42594. * Init/assert flags, copying them where appropriate. Some flags * (like NEWENV) are processed separately below.

42595. compact the prototype

42596. assume keys are compacted

42597. * Try registers

42598. * DECLVAR ** See E5 Sections: * 10.4.3 Entering Function Code * 10.5 Declaration Binding Instantiation * 12.2 Variable Statement * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution ** Variable declaration behavior is mainly discussed in Section 10.5, * and is not discussed in the execution semantics (Sections 11-13). ** Conceptually declarations happen when code (global, eval, function) * is entered, before any user code is executed. In practice, register- * bound identifiers are 'declared' automatically (by virtue of being * allocated to registers with the initial value 'undefined'). Other * identifiers are declared in the function prologue with this primitive. ** Since non-register bindings eventually back to an internal object's * properties, the 'prop_flags' argument is used to specify binding * type: ** - Immutable binding: set DUK_PROPDESC_FLAG_WRTABLE to false * - Non-deletable binding: set DUK_PROPDESC_FLAG_CONFIGURABLE to false * - The flag DUK_PROPDESC_FLAG_ENUMERABLE should be set, although it * doesn't really matter for internal objects * All bindings are non-deletable mutable bindings except: ** - Declarations in eval code (mutable, deletable) * - 'arguments' binding in strict function code (immutable) * - Function name binding of a function expression (immutable) ** Declarations may go to declarative environment records (always * so for functions), but may also go to object environment records * (e.g. global code). The global object environment has special * behavior when re-declaring a function (but not a variable); see * E5.1 specification, Section 10.5, step 5.e. ** Declarations always go to the 'top-most' environment record, i.e. * we never check the record chain. It's not an error even if a * property (even an immutable or non-deletable one) of the same name * already exists. ** If a declared variable already exists, its value needs to be updated * (if possible). Returns 1 if a PUTVAR needs to be done by the caller; * otherwise returns 0.

42599. for register-bound and declarative env identifiers

42600. [... closure template name]

42601. * Check whether already declared. ** We need to check whether the binding exists in the environment * without walking its parents. However, we still need to check * register-bound identifiers and the prototype chain of an object * environment target object.

42602. bound functions are never in act 'func'

42603. **comment:** XXX: copy flags using a mask**label:** code-design

42604. Although NAMEBINDING is not directly needed for using * function instances, it's needed by bytecode dump/load * so copy it too.

42605. **comment:** XXX: more accurate?**label:** code-design

42606. irrelevant when out->value == NULL

42607. **comment:** XXX: if duk_hobject_define_property_internal() was updated * to handle a pre-existing accessor property, this would be * a simple call (like for the ancestor case).**label:** code-design

42642. DUK_USE_REGEXP_SUPPORT

42643. escaped NonEscapeCharacter

42644. The E5.1 specification does not seem to allow IdentifierPart characters * to be used as identity escapes. Unfortunately this includes '\$', which * cannot be escaped as '\$'; it needs to be escaped e.g. as '\u0024'. * Many other implementations (including V8 and Rhino, for instance) do * accept '\$' as a valid identity escape, which is quite pragmatic. * See: test-regexp-identity-escape-dollar.js.

42645. mark range 'direct', bypass canonicalization (see Wiki)

42646. **comment:** * Lexer for source files, ToNumber() string conversions, RegExp expressions, * and JSON. ** Provides a stream of ECMAScript tokens from an UTF-8/CESU-8 buffer. The * caller can also rewind the token stream into a certain position which is * needed by the compiler part for multi-pass scanning. Tokens are * represented as duk_token structures, and contain line number information. * Token types are identified with DUK_TOK_* defines. ** Characters are decoded into a fixed size lookup window consisting of * decoded Unicode code points, with window positions past the end of the * input filled with an invalid codepoint (-1). The tokenizer can thus * perform multiple character lookups efficiently and with few sanity * checks (such as access outside the end of the input), which keeps the * tokenization code small at the cost of performance. ** Character data in tokens, such as identifier names and string literals, * is encoded into CESU-8 format on-the-fly while parsing the token in * question. The string data is made reachable to garbage collection by * placing the token-related values in value stack entries allocated for * this purpose by the caller. The characters exist in Unicode code point * form only in the fixed size lookup window, which keeps character data * expansion (of especially ASCII data) low. ** Token parsing supports the full range of Unicode characters as described * in the E5 specification. Parsing has been

optimized for ASCII characters * because ordinary Ecmascript code consists almost entirely of ASCII * characters. Matching of complex Unicode codepoint sets (such as in the * IdentifierStart and IdentifierPart productions) is optimized for size, * and is done using a linear scan of a bit-packed list of ranges. This is * very slow, but should never be entered unless the source code actually * contains Unicode characters. * * Ecmascript tokenization is partially context sensitive. First, * additional future reserved words are recognized in strict mode (see E5 * Section 7.6.1.2). Second, a forward slash character ('/') can be * recognized either as starting a RegExp literal or as a division operator, * depending on context. The caller must provide necessary context flags * when requesting a new token. * * Future work: * * * Make line number tracking optional, as it consumes space. * * * Add a feature flag for disabling UTF-8 decoding of input, as most * source code is ASCII. Because of Unicode escapes written in ASCII, * this does not allow Unicode support to be removed from e.g. * duk_unicode_is_identifier_start() nor does it allow removal of CESU-8 * encoding of e.g. string literals. * * * Add a feature flag for disabling Unicode compliance of e.g. identifier * names. This allows for a build more than a kilobyte smaller, because * Unicode ranges needed by duk_unicode_is_identifier_start() and * duk_unicode_is_identifier_part() can be dropped. String literals * should still be allowed to contain escaped Unicode, so this still does * not allow removal of CESU-8 encoding of e.g. string literals. * * * Character lookup tables for codepoints above BMP could be stripped. * * * Strictly speaking, E5 specification requires that source code consists * of 16-bit code units, and if not, must be conceptually converted to * that format first. The current lexer processes Unicode code points * and allows characters outside the BMP. These should be converted to * surrogate pairs while reading the source characters into the window, * not after tokens have been formed (as is done now). However, the fix * is not trivial because two characters are decoded from one codepoint. * * * Optimize for speed as well as size. Large if-else ladders are (at * least potentially) slow.

label: code-design

42647. * Parse a RegExp token. The grammar is described in E5 Section 15.10. * Terminal constructions (such as quantifiers) are parsed directly here. * * 0xffffffffU is used as a marker for "infinity" in quantifiers. Further, * DUK_MAX_RE_QUANT_DIGITS limits the maximum number of digits that * will be accepted for a quantifier.

42648. "/=" and not in regexp mode

42649. Note: if DecimalLiteral starts with a '0', it can only be * followed by a period or an exponent indicator which starts * with 'e' or 'E'. Hence the if-check above ensures that * OctalIntegerLiteral is the only valid NumericLiteral * alternative at this point (even if y is, say, '9').

42650. 'C'

42651. * Intern the temporary byte buffer into a valstack slot * (in practice, slot1 or slot2).

42652. Fast path.

42653. '/'

42654. LF line terminator; CR LF and Unicode lineterms are handled in slow path

42655. line tracking

42656. * Interned identifier is compared against reserved words, which are * currently interned into the heap context. See genbuiltins.py. * * Note that an escape in the identifier disables recognition of * keywords; e.g. "\u0069f = 1;" is a valid statement (assigns to * identifier named "if"). This is not necessarily compliant, * see test-dec-escaped-char-in-keyword.js. * * Note: "get" and "set" are awkward. They are not officially * ReservedWords (and indeed e.g. "var set = 1;" is valid), and * must come out as DUK_TOK_IDENTIFIER. The compiler needs to * work around this a bit.

42657. val1 = count

42658. '{'

42659. 0xxx xxxx -> fast path

42660. radix

42661. having this as a separate function provided a size benefit

42662. * E5 Section 7.4. If the multi-line comment contains a newline, * it is treated like a single line terminator for automatic * semicolon insertion.

42663. second, parse flags

42664. * Since character data is only generated by decoding the source or by * the compiler itself, we rely on the input codepoints being correct * and avoid a check here. * * Character data can also come here through decoding of Unicode * escapes ("udead\ubef") so all 16-bit unsigned values can be * present, even when the source file itself is strict UTF-8.

42665. **comment:** * (Re)initialize the temporary byte buffer. May be called extra times * with little impact.

label: code-design

42666. **comment:** XXX: because of the final check below (that the literal is not * followed by a digit), this could maybe be simplified, if we bail * out early from a leading zero (and if there are no periods etc). * Maybe too complex.

label: code-design

42667. dash is already 0

42668. * Various defines and file specific helper macros

42669. multi-character sets not allowed as part of ranges, see * E5 Section 15.10.2.15, abstract operation CharacterRange.

42670. '?'

42671. re-lookup first char on first loop

42672. '\"'

42673. state == 3

42674. * Matching order: * * Punctuator first chars, also covers comments, regexps * LineTerminator * Identifier or reserved word, also covers null/true/false literals * NumericLiteral * StringLiteral * EOF * * The order does not matter as long as the longest match is * always correctly identified. There are order dependencies * in the clauses, so it's not trivial to convert to a switch.

42675. ','

42676. Automatic semicolon insertion is allowed if a token is preceded * by line terminator(s), or terminates a statement list (right curly * or EOF).

42677. no point in supporting encodings of 5 or more bytes

42678. line continuation

42679. Use temporaries and update lex_ctx only when finished.

42680. '|'

42681. check that byte has the form 10xx xxxx

42682. lookup for 0x00a above assumes shortest encoding now

42683. unsigned

42684. form: { DecimalDigits , }, val1 = min count

42685. If input_offset were assigned a negative value, it would * result in a large positive value. Most likely it would be * larger than input_length and be caught here. In any case * no memory unsafe behavior would happen.

42686. note: long live range

42687. 1110 xxxx 10xx xxxx 10xx xxxx

42688. 110x xxxx 10xx xxxx

42689. 0=before period/exp, * 1=after period, before exp * 2=after exp, allow '+' or '-' * 3=after exp and exp sign

42690. re-lookup curr char on first round

42691. NB: duk_lexer_getpoint() is a macro only

42692. lexer character window helpers

42693. eat closing quote

42694. avoid multiply

42695. Not enough data to provide a full window, so "scroll" window to * start of buffer and fill up the rest.

42696. * Parse Ecmascript source InputElementDiv or InputElementRegExp * (E5 Section 7), skipping whitespace, comments, and line terminators. * * Possible results are: * (1) a token * (2) a line terminator (skipped) * (3) a comment (skipped) * (4) EOF * * White space is automatically skipped from the current position (but * not after the input element). If input has already ended, returns * DUK_TOK_EOF indefinitely. If a parse error occurs, uses an DUK_ERROR() * macro call (and hence a longjmp through current heap longjmp context). * Comments and line terminator tokens are automatically skipped. * * The input element being matched is determined by regexp_mode; if set, * parses a InputElementRegExp, otherwise a InputElementDiv. The * difference between these are handling of productions starting with a * forward slash. * * If strict_mode is set, recognizes additional future reserved words * specific to strict mode, and refuses to parse octal literals. * * The matching strategy below is to (currently) use a six character * lookup window to quickly determine which production is the -longest- * matching one, and then parse that. The top-level if-else clauses * match the first character, and the code blocks for each clause * handle -all- alternatives for that first character. Ecmascript * specification uses the "longest match wins" semantics, so the order * of the if-clauses matters. * * Misc notes: * * * Ecmascript numeric literals do not accept a

sign character. * Consequently e.g. "-1.0" is parsed as two tokens: a negative * sign and a positive numeric literal. The compiler performs * the negation during compilation, so this has no adverse impact. * * * There is no token for "undefined": it is just a value available * from the global object (or simply established by doing a reference * to an undefined value). * * * Some contexts want Identifier tokens, which are IdentifierNames * excluding reserved words, while some contexts want IdentifierNames * directly. In the latter case e.g. "while" is interpreted as an * identifier name, not a DUK_TOK_WHILE token. The solution here is * to provide both token types: DUK_TOK_WHILE goes to 't' while * DUK_TOK_IDENTIFIER goes to 't_noes', and 'slot1' always contains * the identifier / keyword name. * * * Directive prologue needs to identify string literals such as * "use strict" and 'use strict', which are sensitive to line * continuations and escape sequences. For instance, "use\u0020strict" * is a valid directive but is distinct from "use strict". The solution * here is to decode escapes while tokenizing, but to keep track of the * number of escapes. Directive detection can then check that the * number of escapes is zero. * * * Multi-line comments with one or more internal LineTerminator are * treated like a line terminator to comply with automatic semicolon * insertion.

42697. got lineterm preceding non-whitespace, non-lineterm token

42698. **comment:** XXX: this duplicates functionality in duk_reEXP.c where a similar loop is * required anyway. We could use that BUT we need to update the regexp compiler * 'nranges' too. Work this out a bit more cleanly to save space.

label: code-design

42699. 1111 0xxx 10xx xxxx 10xx xxxx 10xx xxxx

42700. Call with count == DUK_LEXER_WINDOW_SIZE to fill buffer initially.

42701. **comment:** XXX: shared parsing?

label: code-design

42702. CR LF again a special case

42703. **comment:** XXX: logic for handling character ranges is now incorrect, it will accept * e.g. [\d-z] whereas it should croak from it? SMJS accepts this too, though. *

* Needs a read through and a lot of additional tests.

label: code-design

42704. * E5 Section 7.3: CR LF is detected as a single line terminator for * line numbers. Here we also detect it as a single line terminator * token.

42705. Track number of escapes: necessary for proper keyword * detection.

42706. (?=

42707. re-read to avoid spill / fetch

42708. Note: decimal number may start with a period, but must be followed by a digit

42709. (?:

42710. '}'

42711. **comment:** initialized to avoid warnings of unused var

label: code-design

42712. Three digit octal escape, digits validated.

42713. validation performed by duk_hexval

42714. validation of the regexp is caller's responsibility

42715. character represents itself

42716. '~'

42717. '['

42718. IdentifierStart is stricter than IdentifierPart, so if the first * character is escaped, must have a stricter check here.

42719. '%'

42720. **comment:** not strictly necessary, but avoids "uninitialized variable" warnings

label: code-design

42721. * To avoid creating a heavy intermediate value for the list of ranges, * only the start token ('[or '[^') is parsed here. The regexp * compiler parses the ranges itself.

42722. Note: first character is checked against this. But because * IdentifierPart includes all IdentifierStart characters, and * the first character (if unescaped) has already been checked * in the if condition, this is OK.

42723. **comment:** init is unnecessary but suppresses "may be used uninitialized" warnings

label: code-design

42724. **comment:** temporary, must be signed and 32-bit to hold Unicode code points

label: code-design

42725. eat closing slash

42726. not strictly necessary because of lookahead '}' above

42727. DUK_L0 -> '\ char * DUK_L1 ... DUK_L5 -> more lookup

42728. '+'

42729. default: char escape (two chars)

42730. * Parse an identifier and then check whether it is: * - reserved word (keyword or other reserved word) * - "null" (NullLiteral) * - "true" (BooleanLiteral) * - "false" (BooleanLiteral) * - anything else => identifier * * This does not follow the E5 productions cleanly, but is * useful and compact. * * Note that identifiers may contain Unicode escapes, * see E5 Sections 6 and 7.6. They must be decoded first, * and the result checked against allowed characters. * The above if-clause accepts an identifier start and an * '\ character -- no other token can begin with a '\'. * * Note that "get" and "set" are not reserved words in E5 * specification so they are recognized as plain identifiers * (the tokens DUK_TOK_GET and DUK_TOK_SET are actually not * used now). The compiler needs to work around this. * * Strictly speaking, following Ecmascript longest match * specification, an invalid escape for the first character * should cause a syntax error. However, an invalid escape * for IdentifierParts should just terminate the identifier * early (longest match), and let the next tokenization * fail. For instance Rhino croaks with 'foo\z' when * parsing the identifier. This has little practical impact.

42731. adv = 2 default OK

42732. **comment:** XXX: the handling of character range detection is a bit convoluted. * Try to simplify and make smaller.

label: code-design

42733. * Special parser for character classes; calls callback for every * range parsed and returns the number of ranges present.

42734. fill window

42735. Failed to match the quantifier, restore lexer and parse * opening brace as a literal.

42736. '<'

42737. 10xx xxxx -> invalid

42738. * "/" followed by something in regexp mode. See E5 Section 7.8.5. * * RegExp parsing is a bit complex. First, the regexp body is delimited * by forward slashes, but the body may also contain forward slashes as * part of an escape sequence or inside a character class (delimited by * square brackets). A mini state machine is used to implement these. * * Further, an early (parse time) error must be thrown if the regexp * would cause a run-time error when used in the expression new RegExp(...). * Parsing here simply extracts the (candidate) regexp, and also accepts * invalid regular expressions (which are delimited properly). The caller * (compiler) must perform final validation and regexp compilation. * * RegExp first char may not be '/' (single line comment) or '*' (multi- * line comment). These have already been checked above, so there is no * need below for special handling of the first regexp character as in * the E5 productions. * * About unicode escapes within regexp literals: * * E5 Section 7.8.5 grammar does NOT accept \uHHHH escapes. * However, Section 6 states that regexps accept the escapes, * see paragraph starting with "In string literals...". * The regexp grammar, which sees the decoded regexp literal * (after lexical parsing) DOES have a \uHHHH unicode escape. * So, for instance: * * \u1234/ * * should first be parsed by the lexical grammar as: * * '\u' RegularExpressionBackslashSequence * '1' RegularExpressionNonTerminator * '2' RegularExpressionNonTerminator * '3' RegularExpressionNonTerminator * '4' RegularExpressionNonTerminator * * and the escape itself is then parsed by the regexp engine. * This is the current implementation. * * Minor spec inconsistency: * * E5 Section 7.8.5 RegularExpressionBackslashSequence is: * * '\ RegularExpressionNonTerminator * * while Section A.1 RegularExpressionBackslashSequence is: * * '\ NonTerminator * * The latter is not normative and a typo. *

42739. * Octal escape or zero escape: * \0 (lookahead not DecimalDigit) * \1 ... \7 (lookahead not DecimalDigit) * \ZeroToThree OctalDigit (lookahead not DecimalDigit) * \FourToSeven OctalDigit (no lookahead restrictions) * \ZeroToThree OctalDigit OctalDigit (no lookahead restrictions) * * Zero escape is part of the standard syntax. Octal escapes are * defined in E5 Section B.1.2, and are only allowed in non-strict mode. * Any other productions starting with a decimal digit are invalid.

42740. out_token->lineterm set by caller

42741. (?!

42742. If input_offset were assigned a negative value, it would * result in a large positive value. Most likely it would be * larger than input_length and be caught here. In any case * no memory unsafe behavior would happen.

42743. E5 Section 15.10.2.11
42744. Keep current size
42745. 0=base, 1=esc, 2=class, 3=class+esc
42746. **comment:** Throwing an error this deep makes the error rather vague, but * saves hundreds of bytes of code.
 label: code-design
42747. XXX: potential issue with signed pointers, p_end < p.
42748. lookup shorthands (note: assume context variable is named 'lex_ctx')
42749. **comment:** Zero 'count' is also allowed to make call sites easier. * Arithmetic in bytes generates better code in GCC.

42814. Note: 'e' and 'E' are also accepted here.
42815. Zero escape (also allowed in non-strict mode)
42816. **comment:** * Advance lookup window by N characters, filling in new characters as * necessary. After returning caller is guaranteed a character window of * at least DUK_LEXER_WINDOW_SIZE characters. ** The main function duk__advance_bytes() is called at least once per every * token so it has a major lexer/compiler performance impact. There are two * variants for the main duk__advance_bytes() algorithm: a sliding window * approach which is slightly faster at the cost of larger code footprint, * and a simple copying one. ** Decoding directly from the source string would be another lexing option. * But the lookup window based approach has the advantage of hiding the * source string and its encoding effectively which gives more flexibility * going forward to e.g. support chunked streaming of source from flash. ** Decodes UTF-8/CESU-8 leniently with support for code points from U+0000 to * U+10FFFF, causing an error if the input is unparseable. Leniency means: *** Unicode code point validation is intentionally not performed, * except to check that the codepoint does not exceed 0x10ffff. * * In particular, surrogate pairs are allowed and not combined, which * allows source files to represent all SourceCharacters with CESU-8. * Broken surrogate pairs are allowed, as Ecmascript does not mandate * their validation. *** Allow non-shortest UTF-8 encodings. ** Leniency here causes few security concerns because all character data is * decoded into Unicode codepoints before lexer processing, and is then * re-encoded into CESU-8. The source can be parsed as strict UTF-8 with * a compiler option. However, Ecmascript source characters include -all- * 16-bit unsigned integer codepoints, so leniency seems to be appropriate. * * Note that codepoints above the BMP are not strictly SourceCharacters, * but the lexer still accepts them as such. Before ending up in a string * or an identifier name, codepoints above BMP are converted into surrogate * pairs and then CESU-8 encoded, resulting in 16-bit Unicode data as * expected by Ecmascript. ** An alternative approach to dealing with invalid or partial sequences * would be to skip them and replace them with e.g. the Unicode replacement * character U+FFFD. This has limited utility because a replacement character * will most likely cause a parse error, unless it occurs inside a string. * Further, Ecmascript source is typically pure ASCII. ** See: ** <http://en.wikipedia.org/wiki=UTF-8> * <http://en.wikipedia.org/wiki/CESU-8> * <http://tools.ietf.org/html/fc3629> * http://en.wikipedia.org/wiki/UTF-8#Invalid_byte_sequences ** Future work: *** Reject other invalid Unicode sequences (see Wikipedia entry for examples) * in strict UTF-8 mode. *** Size optimize. An attempt to use a 16-byte lookup table for the first * byte resulted in a code increase though. *** Is checking against maximum 0x10ffff really useful? 4-byte encoding * imposes a certain limit anyway. *** Support chunked streaming of source code. Can be implemented either * by streaming chunks of bytes or chunks of codepoints.
label: code-design
42817. * E5 Section 7.4, allow SourceCharacter (which is any 16-bit * code point).
42818. **comment:** not necessary to init, disabled for faster parsing

label: code-design
42826. 'advtok' indicates how much to advance and which token id to assign * at the end. This shared functionality minimizes code size. All * code paths are required to set 'advtok' to some value, so no default * init value is used. Code paths calling DUK_ERROR() never return so * they don't need to set advtok.
42827. marker: copy t if not changed
42828. eat opening quote on first loop
42829. ''
42830. Note: intentionally allow leading zeroes here, as the * actual parser will check for them.
42831. input offset tracking
42832. Constants for duk_lexer_ctx.buf.
42833. token type (with reserved word identification)
42834. valstack slot for 2nd token value
42835. Lexer context. Same context is used for Ecmascript and Regexp parsing.
42836. identifier names (E5 Section 7.6)
42837. token was preceded by a lineterm
42838. token type (with reserved words as DUK_TOK_IDENTIFIER)
42839. number of tokens parsed
42840. Regexp tokens
42841. Sanity checks for string and token defines
42842. A regexp token value.
42843. number of escapes and line continuations (for directive prologue)
42844. * Lexer defines.
42845. Lexer codepoint with additional info like offset/line number
42846. **comment:** "get" and "set" are tokens but NOT ReservedWords. They are currently * parsed and identifiers and these defines are actually now unused.
label: code-design
42847. A token value. Can be memcpy()'d, but note that slot1/slot2 values are on the valstack. * Some fields (like num, str1, str2) are only valid for specific token types and may have * stale values otherwise.
42848. input linenum at input_offset (not window[0]), init to 1
42849. DUK_USE_REGEX_SUPPORT
42850. returned after EOF (infinite amount)
42851. unicode code points, window[0] is always next, points to 'buffer'
42852. bufwriter for temp accumulation
42853. input offset for window leading edge (not window[0])
42854. Convert heap string index to a token (reserved words)
42855. token allows automatic semicolon insertion (eof or preceded by newline)
42856. named "arithmetic" because result is signed
42857. start byte offset of token in lexer input
42858. A structure for 'snapshotting' a point for rewinding
42859. temp accumulation buffer
42860. * Prototypes
42861. reserved words: additional future reserved words in strict mode
42862. valstack slot for 1st token value
42863. numeric value of token
42864. exclusive
42865. reserved words: keywords
42866. string 1 of token (borrowed, stored to ctx->slot1_idx)
42867. reserved words: future reserved words
42868. input byte length
42869. unicode code points, window[0] is always next
42870. "null", "true", and "false" are always reserved words. * Note that "get" and "set" are not!

42871. DUK_LEXER_H_INCLUDED
42872. valstack slot for temp buffer
42873. currently 6 characters of lookup are actually needed (duk_lexer.c)
42874. token type
42875. numeric value (character, count)
42876. punctuators (unlike the spec, also includes "/" and "/=")
42877. inclusive
42878. maximum token count before error (sanity backstop)
42879. start line of token (first char)
42880. literals (E5 Section 7.8), except null, true, false, which are treated * like reserved words (above).
42881. input string (may be a user pointer)
42882. Sanity check
42883. * A token is interpreted as any possible production of InputElementDiv * and InputElementRegExp, see E5 Section 7 in its entirety. Note that * the E5 "Token" production does not cover all actual tokens of the * language (which is explicitly stated in the specification, Section 7.5). * Null and boolean literals are defined as part of both ReservedWord * (E5 Section 7.6.1) and Literal (E5 Section 7.8) productions. Here, * null and boolean values have literal tokens, and are not reserved * words. * * Decimal literal negative/positive sign is -not- part of DUK_TOK_NUMBER. * The number tokens always have a non-negative value. The unary minus * operator in "-1.0" is optimized during compilation to yield a single * negative constant. * * Token numbering is free except that reserved words are required to be * in a continuous range and in a particular order. See genstrings.py.
42884. string 2 of token (borrowed, stored to ctx->slot2_idx)
42885. thread; minimizes argument passing
42886. Pad significand with "virtual" zero digits so that Dragon4 will * have enough (apparent) precision to work with.
42887. need to normalize, may even cancel to 0
42888. Zero special case: fake requested number of zero digits; ensure * no sign bit is printed. Relative and absolute fixed format * require separate handling.
42889. This may happen even after the fast path check, if exponent is * not balanced (e.g. "0e1"). Remember to respect zero sign.
42890. * seeeeeeee eeeeefff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H * * s sign bit * eee... exponent field * fff... fraction * * ieee value = 1.ffff... * 2^(e - 1023) (normal) * = 0.ffff... * 2^(-1022) (denormal) * * algorithm v = f * b^e
42891. Note: 'count' is currently not adjusted by rounding (i.e. the * digits are not "chopped off". That shouldn't matter because * the digit position (absolute or relative) is passed on to the * convert-and-push function.
42892. (\geq e 0) AND (not ($=$ f (expt b (- p 1)))) * * be <- (expt b e) == b^e * r <- (* f be 2) == 2 * f * b^e [if b==2 -> f * b^(e+1)] * s <- 2 * m+ <- be == b^e * m- <- be == b^e * k < 0 * B <- B * low_ok <- round * high_ok <- round
42893. DUK_USE_64BIT_OPS
42894. zero handled by caller
42895. Don't check for Infinity unless the context allows it. * 'Infinity' is a valid integer literal in e.g. base-36: * * parseInt('Infinity', 36) * 1461559270678
42896. borrow literal Infinity from builtin string
42897. d <- (quotient (* r B) s) (in range 0...B-1)
42898. exponential notation forced
42899. mp <- b^(e+1)
42900. input radix
42901. **comment:** * The string conversion here incorporates all the necessary Ecmascript * semantics without attempting to be generic. nc_ctx->digits contains * nc_ctx->count digits (\geq 1), with the topmost digit's 'position' * indicated by nc_ctx->k as follows: * * digits="123" count=3 k=0 --> 0.123 * digits="123" count=3 k=1 --> 1.23 * digits="123" count=3 k=5 --> 12300 * digits="123" count=3 k=-1 --> 0.0123 * * Note that the identifier names used for format selection are different * in Burger-Dybvig paper and Ecmascript specification (quite confusingly * so, because e.g. 'k' has a totally different meaning in each). See * documentation for discussion. * * Ecmascript doesn't specify any specific behavior for format selection * (e.g. when to use exponent notation) for non-base-10 numbers. * * The bigint space in the context is reused for string output, as there * is more than enough space for that (>1kB at the moment), and we avoid * allocating even more stack.
label: code-design
42902. 0 or -1
42903. **comment:** XXX: this could be optimized; there is only one call site now though
label: code-design
42904. x <- y + z
42905. exponent digit
42906. **comment:** XXX: this could be optimized

42907. * Convert and push final string.
42908. mm <- b^e
42909. e.g. 12.3 -> digits="123" k=2 -> 1.23e1
42910. **comment:** This is essentially the 'scale' algorithm, with recursion removed. * Note that 'k' is either correct immediately, or will move in one * direction in the loop. There's no need to do the low/high checks * on every round (like the Scheme algorithm does). * * The scheme algorithm finds 'k' and updates 's' simultaneously, * while the logical algorithm finds 'k' with 's' having its initial * value, after which 's' is updated separately (see the Burger-Dybvig * paper, Section 3.1, steps 2 and 3). * * The case where m+ == m- (almost always) is optimized for, because * it reduces the bigint operations considerably and almost always * applies. The scale loop only needs to work with m+, so this works.
label: code-design
42911. **comment:** Currently about 7*152 = 1064 bytes. The space for these * duk__bigints is used also as a temporary buffer for generating * the final string. This is a bit awkward; a union would be * more correct.
label: code-design
42912. s <- 2
42913. (quotient-remainder (* r B) s) using a dummy subtraction loop
42914. * Scan number and setup for Dragon4. * * The fast path case is detected during setup: an integer which * can be converted without rounding, no net exponent. The fast * path could be implemented as a separate scan, but may not really * be worth it: the multiplications for building 'f' are not * expensive when 'f' is small. * * The significand ('f') must contain enough bits of (apparent) * accuracy, so that Dragon4 will generate enough binary output digits. * For decimal numbers, this means generating a 20-digit significand, * which should yield enough practical accuracy to parse IEEE doubles. * In fact, the Ecmascript specification explicitly allows an * implementation to treat digits beyond 20 as zeroes (and even * to round the 20th digit upwards). For non-decimal numbers, the * appropriate number of digits has been precomputed for comparable * accuracy. * * Digit counts: * * [dig_lzero] * | * .+-...-[dig_prec]---. * || | * 0000123.45678901234567890e+123456 * | | | | * `--+-`-----[dig_frac]-----`-+-` * || * [dig_whole] [dig_expt] * * dig_frac and dig_expt are -1 if not present * dig_lzero is only computed for whole number part * * Parsing state * * Parsing whole part dig_frac < 0 AND dig_expt < 0 * Parsing fraction part dig_frac >= 0 AND dig_expt < 0 * Parsing exponent part dig_expt >= 0 (dig_frac may be < 0 or >= 0) * * Note: in case we hit an implementation limit (like exponent range), * we should throw an error, NOT return NaN or Infinity. Even with * very large exponent (or significand) values the final result may be * finite, so NaN/Infinity would be incorrect.
42915. 12 to 21
42916. r <- (2 * f) * b^(e+1)

42976. position of highest digit changed
42977. * Round-up limit. * * For even values, divides evenly, e.g. 10 -> roundup_limit=5. * * For odd values, rounds up, e.g. 3 -> roundup_limit=2. * If radix is 3, 0/3 -> down, 1/3 -> down, 2/3 -> up.
42978. Note: computes with 'idx' in assertions, so caller beware. * 'idx' is preincremented, i.e. '1' on first call, because it * is more convenient for the caller.
42979. * Digit generation loop. * * Different termination conditions: * * 1. Free format output. Terminate when shortest accurate * representation found. * * 2. Fixed format output, with specific number of digits. * Ignore termination conditions, terminate when digits * generated. Caller requests an extra digit and rounds. * * 3. Fixed format output, with a specific absolute cut-off * position (e.g. 10 digits after decimal point). Note * that we always generate at least one digit, even if * the digit is below the cut-off point already.
42980. number of digits changed
42981. **comment:** No NUL term checks in this debug code.
label: code-design
42982. triggers garbage digit check below
42983. digit count
42984. impose a reasonable exponent limit, so that exp * doesn't need to get tracked using a bigint.
42985. interpret e.g. '09' as '0', not NaN
42986.toFixed()
42987. * Tables generated with src/gennumdigits.py. * * duk_str2num_digits_for_radix indicates, for each radix, how many input * digits should be considered significant for string-to-number conversion. * The input is also padded to this many digits to give the Dragon4 * conversion enough (apparent) precision to work with. * * duk_str2num_exp_limits indicates, for each radix, the radix-specific * minimum/maximum exponent values (for a Dragon4 integer mantissa) * below and above which the number is guaranteed to underflow to zero * or overflow to Infinity. This allows parsing to keep bigint values * bounded.
42988. Detect zero special case.
42989. Number and (minimum) size of bigints in the nc_ctx structure.
42990. Careful with borrow condition: * - If borrow not subtracted: 0x12345678 - 0 - 0xffffffff = 0x12345679 (> 0x12345678) * - If borrow subtracted: 0x12345678 - 1 - 0xffffffff = 0x12345678 (== 0x12345678)
42991. **comment:** Note: not honoring round-to-even should work but now generates incorrect * results. For instance, 1e23 serializes to "a000...", i.e. the first digit * equals the radix (10). Scaling stops one step too early in this case. * Don't know why this is the case, but since this code path is unused, it * doesn't matter.
label: code-design
42992. r <- (2 * f) * b^e

42993. -Infinity

42994. * Exponent notation for non-base-10 numbers isn't specified in Ecmascript * specification, as it never explicitly turns up: non-decimal numbers can * only be formatted with Number.prototype.toString([radix]) and for that, * behavior is not explicitly specified. * * Logical choices include formatting the exponent as decimal (e.g. binary * 100000 as 1e+5) or in current radix (e.g. binary 100000 as 1e+101). * The Dragon4 algorithm (in the original paper) prints the exponent value * in the target radix B. However, for radix values 15 and above, the * exponent separator 'e' is no longer easily parseable. Consider, for * instance, the number "1.faecee+1c".

42995. Start position (inclusive) and end position (exclusive)

42996. * Preliminaries: trim, sign, Infinity check * * We rely on the interned string having a NUL terminator, which will * cause a parse failure wherever it is encountered. As a result, we * don't need separate pointer checks. * * There is no special parsing for 'NaN' in the specification although * 'Infinity' (with an optional sign) is allowed in some contexts. * Some contexts allow plus/minus sign, while others only allow the * minus sign (like JSON.parse()). * * Automatic hex number detection (leading '0x' or '0X') and octal * number detection (leading '0' followed by at least one octal digit) * is done here too.

42997. denormal

42998. max possible

42999. fixed-format

43000. Count is incremented before DUK__DRAGON4_OUTPUT_PREINC() call * on purpose, which is taken into account by the macro.

43001. Sometimes this assert is not true right now; it will be true after * rounding. See: test-bug-numconv-mantissa-assert.js.

43002. IEEE exp without bias

43003. Exponent handling: if exponent format is used, record exponent value and * fake k such that one leading digit is generated (e.g. digits=123 -> "1.23"). * * toFixed() prevents exponent use; otherwise apply a set of criteria to * match the other API calls (toString(), toPrecision, etc).

43004. low 32 bits is complete

43005. Validity checks for various fraction formats ("0.1", ".1", "1.", ".").

43006. generate mantissa with a single leading whole number digit

43007. requested number of output digits; 0 = free-format

43056. x <- b^y; use t1 and t2 as temps

43057. $k > 0 \rightarrow k$ was too low, and cannot be too high
43058. * Exposed string-to-number API ** Input: [string] * Output: [number] ** If number parsing fails, a NaN is pushed as the result. If number parsing * fails due to an internal error, an InternalError is thrown.
43059. $x <- y - z$, require $x \geq y \Rightarrow z \geq 0$, i.e. $y \geq z$
43060. $m \leftarrow (* m - B)$
43061. Exponent
43062. $x <- y$
43063. terminating conditions
43064. $t1 = (+ r m +)$
43065. if 1, doing a string-to-number; else doing a number-to-string
43066. (e.g. $k=3$, digits=2 \rightarrow "12X")
43067. For string-to-number, pretend we never have the lowest mantissa as there * is no natural "precision" for inputs. Having lowest_mantissa == 0, we'll * fall into the base cases for both $e \geq 0$ and $e < 0$.
43068. whole or fraction digit
43069. * A Dragon4 number-to-string variant, based on: ** Guy L. Steele Jr., Jon L. White: "How to Print Floating-Point Numbers * Accurately" ** Robert G. Burger, R. Kent Dybvig: "Printing Floating-Point Numbers * Quickly and Accurately" ** The current algorithm is based on Figure 1 of the Burger-Dybvig paper, * i.e. the base implementation without logarithm estimation speedups * (these would increase code footprint considerably). Fixed-format output * does not follow the suggestions in the paper; instead, we generate an * extra digit and round-with-carry. ** The same algorithm is used for number parsing (with $b=10$ and $B=2$) * by generating one extra digit and doing rounding manually. * See doc/number-conversion.rst for limitations.
43070. essentially tracks digit position of lowest 'f' digit
43071. Some contexts don't allow fractions at all; this can't be a * post-check because the state ('f' and expt) would be incorrect.
43072. $r \leftarrow 2 * f$
43073. lead zero + 'digits' fractions + 1 for rounding
43074. A leading digit is not required in some cases, e.g. accept ".123". * In other cases (JSON.parse()) a leading digit is required. This * is checked for after the loop.
43075. Note: we don't parse back exponent notation for anything else * than radix 10, so this is not an ambiguous check (e.g. hex * exponent values may have 'e' either as a significand digit * or as an exponent separator). ** If the exponent separator occurs twice, 'e' will be interpreted * as a digit (= 14) and will be rejected as an invalid decimal * digit.
43076. "123.456"
43077. for
43078. Bigint is 2^{52} . Used to detect normalized IEEE double mantissa values * which are at the lowest edge (next floating point value downwards has * a different exponent). The lowest mantissa has the form: ** 1000.....000 (52 zeroes; only "hidden bit" is set)
43079. distinct bignums, easy mistake to make
43080. \rightarrow sets 'f' and 'e'
43081. **comment:** Leading / trailing whitespace is sometimes accepted and * sometimes not. After white space trimming, all valid input * characters are pure ASCII.
 label: code-design
43082. NB: use 's' as temp on purpose
43083. **comment:** XXX: could accept numbers larger than 32 bits, e.g. up to 53 bits?
 label: code-design
43084. Significand ('f') padding.
43085. **comment:** XXX: join these ops (multiply-accumulate), but only if * code footprint decreases.
 label: code-design
43086. Exponent without digits (e.g. "1e" or "1e+"). If trailing garbage is * allowed, ignore exponent part as garbage (= parse as "1", i.e. exp 0).
43087. don't increase 'count'
43088. this is the case for normalized numbers
43089. arbitrary marker, outside valid exp range
43090. **comment:** XXX: union would be more correct
 label: code-design
43091. NaN sign bit is platform specific with unpacked, un-normalized NaNs
43092. * Conversion helpers
43093. add AD* 2^{16}
43094. Fast path is triggered for no exponent and also for balanced exponent * and fraction parts, e.g. for "1.23e2" == "123". Remember to respect * zero sign.
43095. normal
43096. use bigint area as a temp
43097. "123"
43098. is normalized
43099. lowest mantissa for this exponent
43100. $mm \leftarrow mp$
43101. Round up digits to a given position. If position is out-of-bounds, * does nothing. If carry propagates over the first digit, a '1' is * prepended to digits and 'k' will be updated. Return value indicates * whether carry propagated over the first digit. ** Note that nc_ctx->count is NOT updated based on the rounding position * (it is updated only if carry overflows over the first digit and an * extra digit is prepended).
43102. * Figure out how generated digits match up with the mantissa, * and then perform rounding. If mantissa overflows, need to * recompute the exponent (it is bumped and may overflow to * infinity). ** For normal numbers the leading '1' is hidden and ignored, * and the last bit is used for rounding; ** rounding pt * <-----52----->| * 1 x x x x ... x x x |y ==> x x x x ... x x x x * * For denormals, the leading '1' is included in the number, * and the rounding point is different: ** rounding pt * <--52 or less--->| * 1 x x x x ... x x |x y ==> 0 0 ... 1 x x ... x x * * The largest denormals will have a mantissa beginning with * a '1' (the explicit leading bit); smaller denormals will * have leading zero bits. ** If the exponent would become too high, the result becomes * Infinity. If the exponent is so small that the entire * mantissa becomes zero, the result becomes zero. ** Note: the Dragon4 'k' is off-by-one with respect to the IEEE * exponent. For instance, $k==0$ indicates that the leading '1' * digit is at the first binary fraction position (0.1xxx...); * the corresponding IEEE exponent would be -1.
43103. ".123"
43104. no negative sign for zero
43105. (Number.MAX_VALUE).toString(2).length == 1024, + spare
43106. normal: implicit leading 1-bit
43107. **comment:** Should not be required because the code below always sets both high * and low parts, but at least gcc-4.4.5 fails to deduce this correctly * (perhaps because the low part is set (seemingly) conditionally in a * loop), so this is here to avoid the bogus warning.
 label: code-design
43108. 'roundpos' is relative to nc_ctx->k and increases to the right * (opposite of how 'k' changes).
43109. $r \leftarrow (2 * b) * f$
43110. digit position is absolute, not relative
43111. $x \leftarrow x * y$, use t as temp
43112. $t1 \leftarrow t1 - s$
43113. Assume IEEE round-to-even, so that shorter encoding can be used * when round-to-even would produce correct result. By removing * this check (and having low_ok == high_ok == 0) the results would * still be accurate but in some cases longer than necessary.
43114. When doing string-to-number, lowest_mantissa is always 0 so * the exponent check, while incorrect, won't matter.
43115. $(\leftarrow (* r 2) s)$
43116. not minimum exponent
43117. add F
43118. output radix
43119. **comment:** Quick reject of too large or too small exponents. This check * would be incorrect for zero (e.g. "0e1000" is zero, not Infinity) * so zero check must be above.

43172. DUK_USE_REGEX_SUPPORT

43173. retval (sub-atom char length) unused, tainted as complex above

43174. return '(?:)'

43175. two encoding attempts suffices

43176. * The remaining matches are emitted as sequence of SPLITs and atom * copies; the SPLITs skip the remaining copies and match the sequel. * This sequence needs to be emitted starting from the last copy * because the SPLITs are variable length due to the variable length * skip offset. This causes a lot of memory copying now. * * Example structure (greedy, match maximum # atoms): ** SPLIT1 LSEQ * (atom) * SPLIT1 LSEQ ; <- the byte length of this instruction is needed * (atom) ; to encode the above SPLIT1 correctly * ... * LSEQ:

43177. -> [...] escaped_source bytecode]

43178. prefer direct execution

43179. flags always encodes to 1 byte

43180. **comment:** These are not needed to implement quantifier capture handling, * but might be needed at some point.**label:** requirement

43181. * duk_re_range_callback for generating character class ranges. ** When ignoreCase is false, the range is simply emitted as is. * We don't, for instance, eliminate duplicates or overlapping * ranges in a character class. ** When ignoreCase is true, the range needs to be normalized through * canonicalization. Unfortunately a canonicalized version of a * continuous range is not necessarily continuous (e.g. [x-{ }] is * continuous but [X-{ }] is not). The current algorithm creates the * canonicalized range(s) space efficiently at the cost of compile * time execution time (see doc/regexp.rst for discussion). ** Note that the ctx->nranges is a context-wide temporary value * (this is OK because there cannot be multiple character classes * being parsed simultaneously).

43182. * Complex atom * * The original code is used as a template, and removed at the end * (this differs from the handling of simple quantifiers). ** NOTE: there is no current solution for empty atoms in complex * quantifiers. This would need some sort of a 'progress' instruction. ** XXX: impose limit on maximum result size, i.e. atom_code_len * atom_copies?

43183. mark as complex

43184. **comment:** unused
label: code-design

43185. insert (DUK_REOP_WIPERANGE, start, count) in reverse order so the order ends up right

43186. reuse last emitted atom for remaining 'infinite' quantifier

43187. [... pattern flags escaped_source]

43188. [... pattern flags escaped_source bytecode]

43189. qmin and qmax will be 0 or 1

43190. bytecode start offset of the atom parsed in this loop * (allows quantifiers to copy the atom bytecode)

43191. [... regexp_object escaped_source bytecode]

43192. * Exposed regexp compilation primitive. * * Sets up a regexp compilation context, and calls duk_parse_disjunction() to do the * actual parsing. Handles generation of the compiled regexp header and the * "boilerplate" capture of the matching substring (save 0 and 1). Also does some * global level regexp checks after recursive compilation has finished. * * An escaped version of the regexp source, suitable for use as a RegExp instance * 'source' property (see E5 Section 15.10.3), is also left on the stack. * * Input stack: [pattern flags] * Output stack: [bytecode escaped_source] (both as strings)

43193. * Insert a jump offset at 'offset' to complete an instruction * (the jump offset is always the last component of an instruction). * The 'skip' argument must be computed relative to 'offset', * -without- taking into account the skip field being inserted. * * ... A B C ins X Y Z ... (ins may be a JUMP, SPLIT1/SPLIT2, etc) * => ... A B C ins SKIP X Y Z * * Computing the final (adjusted) skip value, which is relative to the * first byte of the next instruction, is a bit tricky because of the * variable length UTF-8 encoding. See doc/regexp.rst for discussion.

43194. * Encoding helpers * * Some of the typing is bytecode based, e.g. slice sizes are unsigned 32-bit * even though the buffer operations will use duk_size_t.

43195. insert range count

43196. * Create escaped RegExp source (E5 Section 15.10.3). * * The current approach is to special case the empty RegExp * (" -> '(?:')") and otherwise replace unescaped '/' characters * with '/' regardless of where they occur in the regexp. * * Note that normalization does not seem to be necessary for * RegExp literals (e.g. '/foo/') because to be acceptable as * a RegExp literal, the text between forward slashes must * already match the escaping requirements (e.g. must not contain * unescaped forward slashes or be empty). Escaping IS needed * for expressions like 'new RegExp("...","")' however. * Currently, we re-escape in either case. * * Also note that we process the source here in UTF-8 encoded * form. This is correct, because any non-ASCII characters are * passed through without change.

43197. prefer direct

43198. **comment:** * Check for invalid backreferences; note that it is NOT an error * to back-reference a capture group which has not yet been introduced * in the pattern (as in /1(foo)/; in fact, the backreference will * always match! It IS an error to back-reference a capture group * which will never be introduced in the pattern. Thus, we can check * for such references only after parsing is complete.

label: code-design

43199. * Init compilation context

43200. [... escaped_source bytecode]

43201. -1 if disjunction is complex, char length if simple

43202. insert ranges instruction, range count patched in later

43203. add a new pending split to the beginning of the entire disjunction

43204. never here

43205. wipe the capture range made by the atom (if any)

43206. negative -> complex atom

43207. -1 for opcode

43208. no change

43209. 'aint' result as complex

43210. * Helper macros

43211. * Disjunction struct: result of parsing a disjunction

43212. [... escape_source bytecode]

43213. [... pattern flags]

43214. -> [... flags escaped_source bytecode]

43215. **comment:** note: ctx-wide temporary
label: code-design

43216. * Create normalized 'source' property (E5 Section 15.10.3).

43217. * Compilation

43218. set by atom case clauses

43219. value of re_ctx->captures at start of atom

43220. remove the original 'template' atom

43221. * Flags parsing (see E5 Section 15.10.4.1).

43222. * Init lexer

43223. -> [... escaped_source]

43224. Special case: original qmin was zero so there is nothing * to repeat. Emit an atom copy but jump over it here.

43225. insert the required matches (qmin) by copying the atom

43226. expect_eof

43227. coerce to string

43228. * Range parsing is done with a special lexer function which calls * us for every range parsed. This is different from how rest of * the parsing works, but avoids a heavy, arbitrary size intermediate * value type to hold the ranges. * * Another complication is the handling of character ranges when * case insensitive matching is used (see docs for discussion). * The range handler callback given to the lexer takes care of this * as well. * * Note that duplicate ranges are not eliminated when parsing character * classes, so that canonicalization of * * [0-9a-fA-Fx-{}]* creates the result (note the duplicate ranges): * * [0-9A-FA-FX-Z-{}]* where [x-{}] is split as a result of canonicalization. The duplicate * ranges are not a semantics issue: they work correctly.

43229. +1 for opcode

43230. * Finalize stack

43231. always at least the header

43232. Unescaped '/' ANYWHERE in the regexp (in disjunction, * inside a character class, ...) => same escape works.

43233. * Emit compiled regexp header: flags, ncaptures * (insertion order inverted on purpose)

43234. Note: successive characters could be joined into string matches * but this is not trivial (consider e.g. '/xyz+/'; see docs for * more discussion).

43235. complete 'sub atom'

43236. * Create a RegExp instance (E5 Section 15.10.7). * * Note: the output stack left by duk_compile() is directly compatible * with the input here. * * Input stack: [escaped_source bytecode] (both as strings) * Output stack: [RegExp]

43237. XXX: the insert helpers should ensure that the bytecode result is not * larger than expected (or at least assert for it). Many things in the * bytecode, like skip offsets, won't work correctly if the bytecode is * larger than say 2G.

43238. char length of the atom parsed in this loop

43239. * Regexp compilation. * * See doc/regexp.rst for a discussion of the compilation approach and * current limitations. * * Regexp bytecode assumes jumps can be expressed with signed 32-bit * integers. Consequently the bytecode size must not exceed 0x7fffffffL. * The implementation casts duk_size_t (buffer size) to duk_(u)int32_t * in many places. Although this could be changed, the bytecode format * limit would still prevent regexps exceeding the signed 32-bit limit * from working. * * XXX: The implementation does not prevent bytecode from exceeding the * maximum supported size. This could be done by limiting the maximum * input string size (assuming an upper bound can be computed for number * of bytecode bytes emitted per input byte) or checking buffer maximum * size when emitting bytecode (slower).

43240. silence scan-build warning

43241. **comment:** * Canonicalize a range, generating result ranges as necessary. * Needs to exhaustively scan the entire range (at most 65536 * code points). If 'direct' is set, caller (lexer) has ensured * that the range is already canonicalization compatible (this * is used to avoid unnecessary canonicalization of built-in * ranges like \W, which are not affected by canonicalization). * * NOTE: here is one place where we don't want to support chars * outside the BMP, because the exhaustive search would be * massively larger.

43281. note: caller 'sp' is intentionally not updated here
43282. * Byte-based matching would be possible for case-sensitive * matching but not for case-insensitive matching. So, we * match by decoding the input and bytecode character normally. * * Bytecode characters are assumed to be already canonicalized. * Input characters are canonicalized automatically by * duk_inp_get_cp() if necessary. * * There is no opcode for matching multiple characters. The * regexp compiler has trouble joining strings efficiently * during compilation. See doc/regexp.rst for more discussion.
43283. must have start and end
43284. * No match, E5 Section 15.10.6.2, step 9.a.i - 9.a.ii apply, regardless * of 'global' flag of the RegExp. In particular, if lastIndex is invalid * initially, it is reset to zero.
43285. * Regexp recursive matching function. * * Returns 'sp' on successful match (points to character after last matched one), * NULL otherwise. * * The C recursion depth limit check is only performed in this function, this * suffices because the function is present in all true recursion required by * regexp execution.
43286. **comment:** not really necessary
 label: code-design
43287. E5 Sections 15.10.2.8, 7.3
43288. match: keep wiped/resaved values
43289. no regexp instance should exist without a non-configurable bytecode property
43290. Note: not necessary to check p against re_ctx->input_end: * the memory access is checked by duk_inp_get_cp(), while * valid compiled regexps cannot write a saved[] entry * which points to outside the string.
43291. **comment:** integer, but may be +/- Infinite, +/- zero (not NaN, though)
 label: code-design
43292. Note: if encoding ends by hitting end of input, we don't check that * the encoding is valid, we just assume it is.
43293. advance by one character (code point) and one char_offset
43294. TypeError if wrong; class check, see E5 Section 15.10.6
43295. fall through
43296. Note: allow backtracking from p == ptr_end
43297. **comment:** * Note: * * - duk_match_regexp() is required not to longjmp() in ordinary "non-match" * conditions; a longjmp() will terminate the entire matching process. * * - Clearing saved[] is not necessary because backtracking does it * * - Backtracking also rewinds ctx.recursion back to zero, unless an * internal/limit error occurs (which causes a longjmp()) * * - If we supported anchored matches, we would break out here * unconditionally; however, ECMAScript regexps don't have anchored * matches. It might make sense to implement a fast bail-out if * the regexp begins with '^' and sp is not 0: currently we'll just * run through the entire input string, trivially failing the match * at every non-zero offset.

label: code-design

43298. never here
43299. * Regexp instance check, bytecode check, input coercion. ** See E5 Section 15.10.6.
43300. * Get starting character offset for match, and initialize 'sp' based on it. ** Note: lastIndex is non-configurable so it must be present (we check the * internal class of the object above, so we know it is). User code can set * its value to an arbitrary (garbage) value though; E5 requires that lastIndex * be coerced to a number before using. The code below works even if the * property is missing: the value will then be coerced to zero. ** Note: lastIndex may be outside Uint32 range even after ToInteger() coercion. * For instance, ToInteger(+Infinity) = +Infinity. We track the match offset * as an integer, but pre-check it to be inside the 32-bit range before the loop. * If not, the check in E5 Section 15.10.6.2, step 9.a applies.
43301. * Matching complete, create result array or return a 'null'. Update lastIndex * if necessary. See E5 Section 15.10.6.2. ** Because lastIndex is a character (not byte) offset, we need the character * length of the match which we conveniently get as a side effect of interning * the matching substring (0th index of result array). ** saved[0] start pointer (~ byte offset) of current match * saved[1] end pointer (~ byte offset) of current match (exclusive) * char_offset start character offset of current match (-> .index of result) * char_end_offset end character offset (computed below)
43302. Assumes that saved[0] and saved[1] are always * set by regexp bytecode (if not, char_end_offset * will be zero). Also assumes clen reflects the * correct char length.
43303. char offset in [0, h_input->clen] (both ends inclusive), checked before entry
43304. backref n -> saved indices [n*2, n*2+1]
43305. Note: ctx.steps is intentionally not reset, it applies to the entire unanchored match
43306. buffer is automatically zeroed
43307. [... res_obj re_obj input bc saved_buf]
43308. **comment:** Note: don't bail out early, we must read all the ranges from * bytecode. Another option is to skip them efficiently after * breaking out of here. Prefer smallest code.
- label:** code-design
43309. NB: 'length' property is automatically updated by the array setup loop
43310. * Regexp executor. ** Safety: the EcmaScript executor should prevent user from reading and * replacing regexp bytecode. Even so, the executor must validate all * memory accesses etc. When an invalid access is detected (e.g. a 'save' * opcode to invalid, unallocated index) it should fail with an internal * error but not cause a segmentation fault. ** Notes: * - Backtrack counts are limited to unsigned 32 bits but should * technically be duk_size_t for strings longer than 4G chars. * This also requires a regexp bytecode change.
43311. avoid calling at end of input, will DUK_ERROR (above check suffices to avoid this)
43312. [... re_obj input] -> [... re_obj input bc]
43313. idx is unsigned, < 0 check is not necessary
43314. * Helpers for UTF-8 handling ** For bytecode readers the duk_uint32_t and duk_int32_t types are correct * because they're used for more than just codepoints.
43315. [... res_obj]
43316. **comment:** XXX: lastIndex handling produces a lot of asm
- label:** code-design
43317. * Exposed matcher function which provides the semantics of RegExp.prototype.exec(). ** RegExp.prototype.test() has the same semantics as exec() but does not return the * result object (which contains the matching string and capture groups). Currently * there is no separate test() helper, so a temporary result object is created and * discarded if test() is needed. This is intentional, to save code space. ** Input stack: [... re_obj input] * Output stack: [... result]
43318. canonicalized by compiler
43319. not a wordchar
43320. Note: if atom were to contain e.g. captures, we would need to * re-match the atom to get correct captures. Simply quantifiers * do not allow captures in their atom now, so this is not an issue.
43321. -> [... re_obj input bc saved_buf lastIndex]
43322. * Note: * - Intentionally attempt (empty) match at char_offset == k_input->clen ** - Negative char_offsets have been eliminated and char_offset is duk_uint32_t * -> no need or use for a negative check
43323. fail: restore saves
43324. [... re_obj input bc saved_buf]
43325. ToInteger(lastIndex)
43326. **comment:** XXX: these last tricks are unnecessary if the function is made * a genuine native function.
- label:** code-design
43327. capture is 'undefined', always matches!
43328. **comment:** Wipe capture range and save old values for backtracking. ** XXX: this typically happens with a relatively small idx_count. * It might be useful to handle cases where the count is small * (say <= 8) by saving the values in stack instead. This would * reduce memory churn and improve performance, at the cost of a * slightly higher code footprint.
- label:** code-design
43329. **comment:** * Needs a save of multiple saved[] entries depending on what range * may be overwritten. Because the regexp parser does no such analysis, * we currently save the entire saved array here. Lookaheads are thus * a bit expensive. Note that the saved array is not needed for just * the lookahead sub-match, but for the matching of the entire sequel. ** The temporary save buffer is pushed on to the valstack to handle * errors correctly. Each lookahead causes a C recursion and pushes * more stuff on the value stack. If the C recursion limit is less * than the value stack spare, there is no need to check the stack. * We do so regardless, just in case.
- label:** code-design
43330. signed integer encoding needed to work with UTF-8
43331. Captures which are undefined have NULL pointers and are returned * as 'undefined'. The same is done when saved[] pointers are insane * (this should, of course, never happen in practice).
43332. * Byte matching for back-references would be OK in case- * sensitive matching. In case-insensitive matching we need * to canonicalize characters, so back-reference matching needs * to be done with codepoints instead. So, we just decode * everything normally here, too. ** Note: back-reference index which is 0 or higher than * NCapturingParens (= number of capturing parens in the * -entire- regexp) is a compile time error. However, a * backreference referring to a valid capture which has * not matched anything always succeeds! See E5 Section * 15.10.2.9, step 5, sub-step 3.
43333. Get a (possibly canonicalized) input character from current sp. The input * itself is never modified, and captures always record non-canonicalized * characters even in case-insensitive matching.
43334. force_global
43335. match: keep saves
43336. * Basic context initialization. ** Some init values are read from the bytecode header * whose format is (UTF-8 codepoints): * * uint flags * uint nsaved (even, 2n+2 where n = num captures)
43337. regexp support disabled
43338. Backtrack utf-8 input and return a (possibly canonicalized) input character.
43339. [... re_obj input bc saved_buf res_obj val]
43340. lastIndex must be ignored for non-global regexps, but get the * value for (theoretical) side effects. No side effects can * really occur, because lastIndex is a normal property and is * always non-configurable for RegExp instances.
43341. **comment:** XXX: Array size is known before and (2 * re_ctx.nsaved) but not taken * advantage of now. The array is not compacted either, as regexp match * objects are usually short lived.
- label:** code-design
43342. and even number
43343. read header
43344. * Match loop. ** Try matching at different offsets until match found or input exhausted.
43345. * E5 Section 15.10.2.6. The previous and current character * should -not- be canonicalized as they are now. However, * canonicalization does not affect the result of IsWordChar() * (which depends on Unicode characters never canonicalizing * into ASCII characters) so this does not matter.
43346. [... re_obj input bc saved_buf res_obj]
43347. **comment:** This variant is needed by String.prototype.split(); it needs to perform * global-style matching on a cloned RegExp which is potentially non-global.

43527. Fall through to handle the rest.
43528. check pointer at end
43529. Full, aligned 4-byte reads.
43530. * "IdentifierStart" production check.
43531. **comment:** XXX: turkish / azeri, lowercase rules
label: code-design
43532. without explicit non-BMP support, assume non-BMP characters * are always accepted as letters.
43533. 0x00...0x0f
43534. **comment:** XXX: there are language sensitive rules for the ASCII range. * If/when language/locale support is implemented, they need to * be implemented here for
the fast path. There are no context * sensitive rules for ASCII range.
label: code-design
43535. NULL is allowed, no output
43536. invalidates h_buf pointer
43537. Decode helper. Return zero on error.
43538. * Unicode range matcher * * Matches a codepoint against a packed bitstream of character ranges. * Used for slow path Unicode matching.
43539. 31 bits
43540. * Canonicalize() abstract operation needed for canonicalization of individual * codepoints during regexp compilation and execution, see E5 Section 15.10.2.8. *
Note that codepoints are canonicalized one character at a time, so no context * specific rules can apply. Locale specific rules can apply, though.
43541. * Fast path tables
43542. * Regexp range tables
43543. 1111 110x 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx [31 bits]
43544. Small variant; roughly 150 bytes smaller than the fast variant.
43545. cp == -1 (EOF) never matches and causes return value 0
43546. * Complex case conversion helper which decodes a bit-packed conversion * control stream generated by unicode/extract_caseconv.py. The conversion * is very
slow because it runs through the conversion data in a linear * fashion to save space (which is why ASCII characters have a special * fast path before arriving here).
* * The particular bit counts etc have been determined experimentally to * be small but still sufficient, and must match the Python script *
(src/extract_caseconv.py). * * The return value is the case converted codepoint or -1 if the conversion * results in multiple characters (this is useful for regexp
Canonicalization * operation). If 'buf' is not NULL, the result codepoint(s) are also * appended to the hbuffer. * * Context and locale specific rules must be
checked before consulting * this function.

43547. Encode to CESU-8; 'out' must have space for at least * DUK_UNICODE_MAX_CESU8_LENGTH bytes; codepoints above U+10FFFF * will encode to garbage but won't overwrite the output buffer.

43548. default: no change

43549. * Final sigma context specific rule. This is a rather tricky * rule and this handling is probably not 100% correct now. * The rule is not locale/language specific so it is supported.

43550. Must match src/extract_chars.py, generate_match_table3()

43551. * E5 Section 7.3 * * A LineTerminatorSequence essentially merges <CR> <LF> sequences * into a single line terminator. This must be handled by the caller.

43552. 1:1 or special conversions, but not locale/context specific: script generated rules

43553. 10xx xxxx -> invalid

43554. * Unicode letter is now taken to be the categories: * * Lu, Ll, Lt, Lm, Lo * * (Not sure if this is exactly correct.) * * The ASCII fast path consists of: * * 0x0041 ... 0x005a ['A' ... 'Z'] * 0x0061 ... 0x007a ['a' ... 'z']

43555. Capital sigma occurred at "end of word", lowercase to * U+03C2 = GREEK SMALL LETTER FINAL SIGMA. Otherwise * fall through and let the normal rules lowercase it to * U+03C3 = GREEK SMALL LETTER SIGMA.

43556. 0x10...0x1f

43557. Align 'p' to 4; the input data may have arbitrary alignment. * End of string check not needed because blen >= 16.

43558. This seems like a good overall approach. Fast path for ASCII in 4 byte * blocks.

43559. on first round, skip

43560. surrogate pairs get encoded here

43561. **comment:** XXX: could add a fast path to process chunks of input codepoints, * but relative benefit would be quite small.
label: code-design

43896. InternalError

43897. Value types, used by e.g. duk_get_type()

43898. **comment:** Duktape specific error codes (must be 8 bits at most, see duk_error.h)
label: code-design

43899. no value, e.g. invalid index

43900. * Stack manipulation (other than push/pop)

43901. Byteswap an IEEE double in the duk_double_union from host to network * order. For a big endian target this is a no-op.

43902. prefer string

43903. external use

43904. Flags for duk_push_string_file_raw()

43905. Duktape debug protocol version used by this build.

43906. **comment:** DUK_COMPILE_xxx bits 0-2 are reserved for an internal 'nargs' argument * (the nargs value passed is direct stack arguments + 1 to account for an * internal extra argument).
label: code-design

43907. fixed or dynamic, garbage collected byte buffer

43908. * Thread management

43909. * Double NaN manipulation macros related to NaN normalization needed when * using the packed duk_tval representation. NaN normalization is necessary * to keep double values compatible with the duk_tval format. ** When packed duk_tval is used, the NaN space is used to store pointers * and other tagged values in addition to NaNs. Actual NaNs are normalized * to a specific quiet NaN. The macros below are used by the implementation * to check and normalize NaN values when they might be created. The macros * are essentially NOPs when the non-packed duk_tval representation is used. ** A FULL check is exact and checks all bits. A NOTFULL check is used by * the packed duk_tval and works correctly for all NaNs except those that * begin with 0x7ff0. Since the 'normalized NaN' values used with packed * duk_tval begin with 0x7ff8, the partial check is reliable when packed * duk_tval is used. The 0x7ff8 prefix means the normalized NaN will be a * quiet NaN regardless of its remaining lower bits. ** The ME variant below is specifically for ARM byte order, which has the * feature that while doubles have a mixed byte order (32107654), unsigned * long long values has a little endian byte order (76543210). When writing * a logical double value through a ULL pointer, the 32-bit words need to be * swapped; hence the #ifdefs below for ULL writes with DUK_USE_DOUBLE_ME. * This is not full ARM support but suffices for some environments.

43910. either not a NaN

43911. convert time value to local time

43912. not directly applicable, byte order differs from a double

43913. end 'extern "C"' wrapper

43914. * Object operations

43915. set writable (effective if DUK_DEFPROP_HAVE_WRITABLE set)

43916. UnsupportedError

43917. **comment:** Internal API call flags, used for various functions in this file. * Certain flags are used by only certain functions, but since the flags * don't overlap, a single flags value can be passed around to multiple * functions. ** The unused top bits of the flags field are also used to pass values * to helpers (duk_get_part_helper() and duk_set_part_helper()). ** (Must be in-sync with genbuiltins.py.)
label: code-design

43918. There are currently no native functions to yield/resume, due to the internal * limitations on coroutine handling. These will be added later.

43919. Concrete macros for NaN handling used by the implementation internals. * Chosen so that they match the duk_tval representation: with a packed * duk_tval, ensure NaNs are properly normalized; with a non-packed duk_tval * these are essentially NOPs.

43920. (internal) no source string on stack

43921. * Function (method) calls

43922. plain

43923. ECMAScript string: CESU-8 / extended UTF-8 encoded

43924. internal flag: don't zero allocated buffer

43925. use strict (outer) context for global, eval, or function code

43926. in non-packed representation we don't care about which NaN is used

43927. * Union for accessing double parts, also serves as packed duk_tval

43928. include date part in string conversion result
43929. internal flag: dynamic buffer
43930. Ecmascript null
43931. enumerate non-enumerable properties in addition to enumerable
43932. **comment:** XXX: replace with RangeError?
 label: code-design
43933. * Push operations * * Push functions return the absolute (relative to bottom of frame) * position of the pushed value for convenience. * * Note: duk_dup() is technically a push.
43934. string
43935. * ROM pointer compression
43936. * Union to access IEEE double memory representation, indexes for double * memory representation, and some macros for double manipulation. * * Also used by packed duk_tval. Use a union for bit manipulation to * minimize aliasing issues in practice. The C99 standard does not * guarantee that this should work, but it's a very widely supported * practice for low level manipulation. * * IEEE double format summary: * * seeeeeeee eeeeefffff ffffffff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H * * s sign bit * eee... exponent field * fff... fraction * * See http://en.wikipedia.org/wiki/Double_precision_floating-point_format. * * NaNs are represented as exponent 0x7ff and mantissa != 0. The NaN is a * signaling NaN when the highest bit of the mantissa is zero, and a quiet * NaN when the highest bit is set. * * At least three memory layouts are relevant here: * * A B C D E F G H Big endian (e.g. 68k) DUK_USE_DOUBLE_BE * H G F E D C B A Little endian (e.g. x86) DUK_USE_DOUBLE_LE * D C B A H G F E Mixed/cross endian (e.g. ARM) DUK_USE_DOUBLE_ME * * ARM is a special case: ARM double values are in mixed/cross endian * format while ARM duk_uint64_t values are in standard little endian * format (H G F E D C B A). When a double is read as a duk_uint64_t * from memory, the register will contain the (logical) value * E F G H A B C D. This requires some special handling below. * * Indexes of various types (8-bit, 16-bit, 32-bit) in memory relative to * the logical (big endian) order: * * byte order duk_uint8_t duk_uint16_t duk_uint32_t * BE 01234567 0123 01 * LE 76543210 3210 10 * ME (ARM) 32107654 1032 01 * * Some processors may alter NaN values in a floating point load+store. * For instance, on X86 a FLD + FSTP may convert a signaling NaN to a * quiet one. This is catastrophic when NaN space is used in packed * duk_tval values. See: misc/clang_aliasing.c.
43937. * Helper macros for reading/writing memory representation parts, used * by duk_numconv.c and duk_tval.h
43938. string conversion: use 'T' instead of '' as a separator
43939. Ecmascript number: double
43940. TypeError
43941. Support array for ROM pointer compression. Only declared when ROM * pointer compression is active.
43942. **comment:** Although extra/top could be an unsigned type here, using a signed type * makes the API more robust to calling code calculation errors or corner * cases (where caller might occasionally come up with negative values). * Negative values are treated as zero, which is better than casting them * to a large unsigned number. (This principle is used elsewhere in the * API too.)
 label: code-design
43943. * Misc conversion
43944. Ecmascript object: includes objects, arrays, functions, threads
43945. URIError
43946. all doubles are considered normalized
43947. AUTHORS.rst
43948. day within month: 0 to 30
43949. setter: call is a time setter (affects hour, min, sec, ms); otherwise date setter (affects year, month, day-in-month)
43950. (internal) no filename on stack
43951. compile eval code (instead of global code)
43952. One problem with this macro is that expressions like the following fail * to compile: "(void) duk_error(...)". But because duk_error() is noreturn, * they make little sense anyway.
43953. set setter (given on value stack)
43954. prefer number, unless input is a Date, in which * case prefer string (E5 Section 8.12.8)
43955. Part indices for internal breakdowns. Part order from DUK_DATE_IDX_YEAR * to DUK_DATE_IDX_MILLISECOND matches argument ordering of Ecmascript API * calls (like Date constructor call). Some functions in duk.bi_date.c * depend on the specific ordering, so change with care. 16 bits are not * enough for all parts (year, specifically). * * (Must be in-sync with genbuiltins.py)
43956. E == 0x7ff, F == 8 => normalized NaN
43957. Enumeration flags for duk_enum()

44001. --- GCC ---
44002. Duktape/C function return value, platform int is enough for now to * represent 0, 1, or negative error code. Must be compatible with * assigning truth values (e.g. `duk_ret_t rc = (foo == bar);`).
44003. Low memory algorithm: separate chaining using arrays, fixed size hash
44004. `__OVERRIDE_DEFINES__`
44005. <http://stackoverflow.com/questions/5919996/how-to-detect-reliably-mac-os-x-ios-linux-windows-in-c-preprocessor>
44006. vbcc + AmigaOS has C99 but no `inttypes.h`
44007. MSVC
44008. * Check whether or not a packed `duk_tval` representation is possible. * What's basically required is that pointers are 32-bit values * (`sizeof(void *) == 4`). Best effort check, not always accurate. * If guess goes wrong, crashes may result; self tests also verify * the guess.
44009. --- Linux ---
44010. --- AmigaOS ---
44011. BCC, assume we're on x86.
44012. Pointer size determination based on `__WORDSIZE` or architecture when * that's not available.
44013. Unsigned index variant.
44014. External provider already defined.
44015. Byte order varies, so rely on autodetect.
44016. `DUK_USE_UNION_INITIALIZERS`: required from compilers, so no fill-in.
44017. **comment:** Special naming to avoid conflict with e.g. `DUK_FREE()` in `duk_heap.h` * (which is unfortunately named). May sometimes need replacement, e.g. * some compilers don't handle zero length or NULL correctly in `realloc()`.
 label: code-design
44018. empty
44019. --- MSVC ---
44020. We're generally assuming that we're working on a platform with a 32-bit * address space. If `DUK_SIZE_MAX` is a typecast value (which is necessary * if `SIZE_MAX` is missing), the check must be avoided because the * preprocessor can't do a comparison.
44021. 64-bit constants. Since LL / ULL constants are not always available, * use computed values. These values can't be used in preprocessor * comparisons; flag them as such.
44022. --- x86 ---
44023. --- MIPS 32-bit ---
44024. XXX: add feature options to force basic types from outside?
44025. Array index values, could be exact 32 bits. * Currently no need for signed `duk_arridx_t`.
44026. `SIZE_MAX` may be missing so use an approximate value for it.
44027. `DUK_F_BCC`
44028. Complex condition broken into separate parts.
44029. POSIX
44030. If not provided, use safe default for alignment.
44031. * Date provider selection * * User may define `DUK_USE_DATE_GET_NOW()` etc directly, in which case we'll * rely on an external provider. If this is not done, revert to previous * behavior and use Unix/Windows built-in provider.
44032. Cannot determine byte order.
44033. --- Cygwin ---
44034. !defined(`DUK_USE_BYTEORDER`) && defined(`__BYTE_ORDER__`)
44035. More or less standard endianness predefines provided by header files. * The ARM hybrid case is detected by assuming that `__FLOAT_WORD_ORDER` * will be big endian, see: <http://lists.mysql.com/internals/443>. * On some platforms some defines may be present with an empty value which * causes comparisons to fail: <https://github.com/svaarala/duktape/issues/453>.
44036. !defined(`DUK_USE_BYTEORDER`)
44037. **comment:** For custom platforms allow user to define byteorder explicitly. * Since endianness headers are not standardized, this is a useful * workaround for custom platforms for which endianness detection * is not directly supported. Perhaps custom hardware is used and * user cannot submit upstream patches.
 label: code-design
44038. **comment:** Don't know how to declare unreachable point, so don't do it; this * may cause some spurious compilation warnings (e.g. "variable used * uninitialized").
 label: code-design
44039. Good default is a bit arbitrary because alignment requirements * depend on target. See <https://github.com/svaarala/duktape/issues/102>.
44040. --- Windows ---
44041. User provided `InitJS`.
44042. These have been tested from VS2008 onwards; may work in older VS versions * too but not enabled by default.
44043. Error codes are represented with platform int. High bits are used * for flags and such, so 32 bits are needed.
44044. Intermediate define for 'have `inttypes.h`'
44045. build is not C99 or C++11, play it safe
44046. GCC: test not very accurate; enable only in relatively recent builds * because of bugs in gcc-4.4 (<http://lists.debian.org/debian-gcc/2010/04/msg00000.html>)
44047. Intel x86 (32-bit), x64 (64-bit) or x32 (64-bit but 32-bit pointers), * define only one of `DUK_F_X86`, `DUK_F_X64`, `DUK_F_X32`. * <https://sites.google.com/site/x32abi/>
44048. Enabled with debug/assertions just so that any issues can be caught.
44049. C99 or compatible
44050. --- Mac OSX, iPhone, Darwin ---
44051. C99 or above
44052. MinGW. Also GCC flags (`DUK_F_GCC`) are enabled now.
44053. This detection is not very reliable.
44054. Support for 48-bit signed integer `duk_tval` with transparent semantics.

44055. GCC and Clang provide endianness defines as built-in predefines, with * leading and trailing double underscores (e.g. __BYTE_ORDER__). See * output of "make gcpredes" and "make clangpredes". Clang doesn't * seem to provide __FLOAT_WORD_ORDER__; assume not mixed endian for clang. * <http://gcc.gnu.org/onlinedocs/cpp/Common-Predefined-Macros.html>
44056. 64-bit type detection is a bit tricky. * * ULLONG_MAX is a standard define. __LONG_LONG_MAX__ and __ULONG_LONG_MAX__ * are used by at least GCC (even if system headers don't provide ULLONG_MAX). * Some GCC variants may provide __LONG_LONG_MAX__ but not __ULONG_LONG_MAX__. * * ULL / LL constants are rejected / warned about by some compilers, even if * the compiler has a 64-bit type and the compiler/system headers provide an * unsupported constant (ULL/LL)! Try to avoid using ULL / LL constants. * As a side effect we can only check that e.g. ULONG_MAX is larger than 32 * bits but can't be sure it is exactly 64 bits. Self tests will catch such * cases.
44057. Convert any input pointer into a "void **", losing a const qualifier. * This is not fully portable because casting through duk_uintptr_t may * not work on all architectures (e.g. those with long, segmented pointers).
44058. Small integers (16 bits or more) can fall back to the 'int' type, but * have a typedef so they are marked "small" explicitly.
44059. **comment:** Most portable, potentially wastes space
label: code-design
44060. PowerPC
44061. --- Solaris ---
44062. **comment:** Technically C99 (C++11) but found in many systems. On some systems * __STDC_LIMIT_MACROS and __STDC_CONSTANT_MACROS must be defined before * including stdint.h (see above).
label: code-design
44063. Missing some obvious constants.
44064. No provider for DUK_USE_DATE_PARSE_STRING(), fall back to ISO 8601 only.
44065. no endian.h or stdint.h
44066. --- Atari ST TOS ---
44067. GCC: assume we have __va_copy() in non-C99 mode.
44068. User forced alignment to 4 or 8.
44069. C99 / C++11 and above: rely on va_copy() which is required.
44070. <http://bellard.org/tcc/tcc-doc.html#SEC9>
44071. Check that architecture is two's complement, standard C allows e.g. * INT_MIN to be -2**31+1 (instead of -2**31).
44072. Based on 'make checkalign' there are no alignment requirements on * Linux MIPS except for doubles, which need align by 4. Alignment * requirements vary based on target though.
44073. AmigaOS on M68k
44074. not configured for DLL build
44075. * You may add overriding #define/#undef directives below for * customization. You of course cannot un-#include or un-typedef * anything; these require direct changes above.
44076. **comment:** cannot detect 64-bit type, not always needed so don't error
label: code-design
44077. --- Generic UNIX ---
44078. std::exception
44079. A few types are assumed to always exist.
44080. Float word order not known, assume not a hybrid.
44081. --- Generic fallback ---
44082. **comment:** --- Generic POSIX ---
label: code-design
44083. no parsing (not an error)
44084. **comment:** ANSI C (various versions) and some implementations require that the * pointer arguments to memset(), memcpy(), and memmove() be valid values * even when byte size is 0 (even a NULL pointer is considered invalid in * this context). Zero-size operations as such are allowed, as long as their * pointer arguments point to a valid memory area. The DUK_MEMSET(), * DUK_MEMCPY(), and DUK_MEMMOVE() macros require this same behavior, i.e.: * (1) pointers must be valid and non-NULL, (2) zero size must otherwise be * allowed. If these are not fulfilled, a macro wrapper is needed. * * <http://stackoverflow.com/questions/5243012/is-it-guaranteed-to-be-safe-to-perform-memcpy0-0-0> * <http://lists.cs.uiuc.edu/pipermail/l1vmdev/2007-October/011065.html> * * Not sure what's the required behavior when a pointer points just past the * end of a buffer, which often happens in practice (e.g. zero size memmoves). * For example, if allocation size is 3, the following pointer would not * technically point to a valid memory byte: * * <-- alloc --> * | 0 | 1 | 2 | * ^- - p=3, points after last valid byte (2)
label: code-design
44085. C++11 or above
44086. SPARC byte order varies so rely on autodetection.
44087. DUK_F_PACKED_TVAL_PROVIDED
44088. <http://www.monkey.org/openbsd/archive/ports/0401/msg00089.html>
44089. VBCC
44090. sigsetjmp() alternative
44091. GCC, Clang also defines __GNUC__ so don't detect GCC if using Clang.
44092. --- SuperH ---
44093. Pre-C99: va_list type is implementation dependent. This replacement * assumes it is a plain value so that a simple assignment will work. * This is not the case on all platforms (it may be a single-array element, * for instance).
44094. **comment:** The best type for an "all around int" in Duktape internals is "at least * 32 bit signed integer" which is most convenient. Same for unsigned type. * Prefer 'int' when large enough, as it is almost always a convenient type.
label: code-design
44095. uclibc
44096. Explicit marker needed; may be 'defined', 'undefined', 'or 'not provided'.
44097. No provider for DUK_USE_DATE_FORMAT_STRING(), fall back to ISO 8601 only.
44098. **comment:** Many platforms are missing fpclassify() and friends, so use replacements * if necessary. The replacement constants (FP_NAN etc) can be anything but * match Linux constants now.
label: code-design
44099. * Checks for config option consistency (DUK_USE_xxx)
44100. autodetect compiler
44101. Rely on C89 headers only; time.h must be here.
44102. These functions don't currently need replacement but are wrapped for * completeness. Because these are used as function pointers, they need * to be defined as concrete C functions (not macros).
44103. --- TI-Nspire ---
44104. **comment:** We need va_copy() which is defined in C99 / C++11, so an awkward * replacement is needed for pre-C99 / pre-C++11 environments. This * will quite likely need portability hacks for some non-C99 * environments.
label: code-design
44105. AmigaOS on M68K or PPC is always big endian.
44106. Feature option forcing.
44107. --- ARM 64-bit ---
44108. * Feature option handling
44109. **comment:** * Wrapper typedefs and constants for integer types, also sanity check types. * * C99 typedefs are quite good but not always available, and we want to avoid * forcibly redefining the C99 typedefs. So, there are Duktape wrappers for * all C99 typedefs and Duktape code should only use these typedefs. Type * detection when C99 is not supported is best effort and may end up detecting * some types incorrectly. * * Pointer sizes are a portability problem: pointers to different types may * have a different size and function pointers are very difficult to manage * portably. * * http://en.wikipedia.org/wiki/C_data_types#Fixed

width_integer_types * * Note: there's an interesting corner case when trying to define minimum * signed integer value constants which leads to the current workaround of * defining e.g. -0x80000000 as (-0x7fffffffL - 1L). See doc/code-issues.txt * for a longer discussion. * * Note: avoid typecasts and computations in macro integer constants as they * can then no longer be used in macro relational expressions (such as * #if DUK_SIZE_MAX < 0xffffffffUL). There is internal code which relies on * being able to compare DUK_SIZE_MAX against a limit.

label: code-design

44110. Not standard but common enough

44111. --- QNX ---

44112. **comment:** Object property allocation layout has implications for memory and code * footprint and generated code size/speed. The best layout also depends * on whether the platform has alignment requirements or benefits from * having mostly aligned accesses.

label: code-design

44113. (v)snprintf() is missing before MSVC 2015. Note that _(v)snprintf() does * NOT NUL terminate on truncation, but Duktape code never assumes that. * http://stackoverflow.com/questions/2915672/snprintf-and-visual-studio-2010

44114. Motorola 68K. Not defined by VBCC, so user must define one of these * manually when using VBCC.

44115. http://msdn.microsoft.com/en-us/library/aa235362(VS.60).aspx

44174. --- SPARC 32-bit ---
44175. --- Clang ---
44176. On some platforms int is 16-bit but long is 32-bit (e.g. PureC)
44177. **comment:** * Byte order and double memory layout detection ** Endianness detection is a major portability hassle because the macros * and headers are not standardized. There's even variance across UNIX * platforms. Even with "standard" headers, details like underscore count * varies between platforms, e.g. both __BYTE_ORDER and _BYTE_ORDER are used * (Crossbridge has a single underscore, for instance). ** The checks below are structured with this in mind: several approaches are * used, and at the end we check if any of them worked. This allows generic * approaches to be tried first, and platform/compiler specific hacks tried * last. As a last resort, the user can force a specific endianness, as it's * not likely that automatic detection will work on the most exotic platforms. ** Duktape supports little and big endian machines. There's also support * for a hybrid used by some ARM machines where integers are little endian * but IEEE double values use a mixed order (12345678 -> 43218765). This * byte order for doubles is referred to as "mixed endian".
label: code-design
44178. **comment:** Check whether we should use 64-bit integers or not. ** Quite incomplete now. Use 64-bit types if detected (C99 or other detection) * unless they are known to be unreliable. For instance, 64-bit types are * available on VBCC but seem to misbehave.
label: code-design
44179. VS2013+ supports union initializers but there's a bug involving union-inside-struct: * <https://connect.microsoft.com/VisualStudio/feedback/details/805981> * The bug was fixed (at least) in VS2015 so check for VS2015 for now: * <https://blogs.msdn.microsoft.com/vcblog/2015/07/01/c-compiler-front-end-fixes-in-vs2015/> * Manually tested using VS2013, CL reports 18.00.31101, so enable for VS2013 too.
44180. no user declarations
44181. DUK_CONFIG_H_INCLUDED
44182. BCC (Bruce's C compiler): this is a "torture target" for compilation
44183. Generic Unix (includes Cygwin)
44184. There was a curious bug where test-bi-date-canceling.js would fail e.g. * on 64-bit Ubuntu, gcc-4.8.1, -m32, and no -std=c99. Some date computations * using doubles would be optimized which then broke some corner case tests. * The problem goes away by adding 'volatile' to the datetime computations. * Not sure what the actual triggering conditions are, but using this on * non-C99 systems solves the known issues and has relatively little cost * on other platforms.
44185. C99 / C++11 and above: rely on va_copy() which is required. * Omit parenthesis on macro right side on purpose to minimize differences * to direct use.
44186. C99 types
44187. DUK_SIZE_MAX (= SIZE_MAX) is often reliable
44188. --- PowerPC 64-bit ---

44212. C++
44213. MIPS. Related defines: __MIPSEB__, __MIPSEL__, __mips_isa_rev, __LP64__
44214. VBCC is missing the built-ins even in C99 mode (perhaps a header issue).
44215. __MSC_VER
44216. **comment:** Macro for suppressing warnings for potentially unreferenced variables. * The variables can be actually unreferenced or unreferenced in some * specific cases only; for instance, if a variable is only debug printed, * it is unreferenced when debug printing is disabled.
label: code-design
44217. Byte order varies, rely on autodetection.
44218. Use __setjmp() on Apple by default, see GH-55.
44219. TI-Nspire (using Ntless)
44220. --- PowerPC 32-bit ---
44221. Some math functions are C99 only. This is also an issue with some * embedded environments using uclibc where uclibc has been configured * not to provide some functions. For now, use replacements whenever * using uclibc.
44222. Most portable
44223. Boolean values are represented with the platform 'int'.
44224. Shared includes: stdint.h is C99
44225. BSD variant
44226. Old uclibcs have a broken memcpy so use memmove instead (this is overly wide * now on purpose): <http://lists.uclibc.org/pipermail/uclibc-cvs/2008-October/025511.html>
44227. date.h is omitted, and included per platform
44228. * Architecture autodetection
44229. The most portable current time provider is time(), but it only has a * one second resolution.
44230. Convenience, e.g. gcc 4.5.1 == 40501; <http://stackoverflow.com/questions/6031819/emulating-gccs-built-in-unreachable>

44231. defined(DUK_USE_BYTEORDER)
44232. In VBCC (1.0 / 0.0) results in a warning and 0.0 instead of infinity. * Use a computed infinity (initialized when a heap is created at the * latest).
44233. For now, hash part is dropped if and only if 16-bit object fields are used.
44234. MSVC dllexport/dllimport: appropriate __declspec depends on whether we're * compiling Duktape or the application.
44235. **comment:** On Windows, assume we're little endian. Even Itanium which has a * configurable endianness runs little endian in Windows.
 label: code-design
44236. **comment:** Compiler specific hackery needed to force struct size to match alignment, * see e.g. duk_hbuffer.h. * * http://stackoverflow.com/questions/11130109/c-struct-size-alignment * http://stackoverflow.com/questions/10951039/specifying-64-bit-alignment
 label: code-design
44237. Index values must have at least 32-bit signed range.
44238. **comment:** Workaround for GH-323: avoid inlining control when compiling from * multiple sources, as it causes compiler portability trouble.
 label: code-design
44239. byte order
44240. Linux
44241. Based on 'make checkalign' there are no alignment requirements on * Linux SH4, but align by 4 is probably a good basic default.
44242. MSVC preprocessor defines: http://msdn.microsoft.com/en-us/library/b0084kay.aspx * _MSC_FULL_VER includes the build number, but it has at least two formats, see e.g. * BOOST_MSVC_FULL_VER in http://www.boost.org/doc/libs/1_52_0/boost/config/compiler/visualc.hpp
44243. ARM
44244. Fast variants of small integers, again for really fast paths like the * executor.
44245. **comment:** When C99 types are not available, we use heuristic detection to get * the basic 8, 16, 32, and (possibly) 64 bit types. The fast/least * types are then assumed to be exactly the same for now: these could * be improved per platform but C99 types are very often now available. * 64-bit types are not available on all platforms; this is OK at least * on 32-bit platforms. * * This detection code is necessarily a bit hacky and can provide typedefs * and defines that won't work correctly on some exotic platform.
 label: code-design
44246. **comment:** * Cleanups (all statement parsing flows through here). * * Pop label site and reset labels. Reset 'next temp' to value at * entry to reuse temps.
 label: code-design
44247. **comment:** * Reference counting helper macros. The macros take a thread argument * and must thus always be executed in a specific thread context. The * thread argument is needed for features like finalization. Currently * it is not required for INCREF, but it is included just in case. * * Note that 'raw' macros such as DUK_HEAPHDR_GET_REFCOUNT() are not * defined without DUK_USE_REFERENCE_COUNTING, so caller must #ifdef * around them.
 label: code-design
44248. alloc external with size zero
44249. 'i' is the first entry we'll keep
44250. If blen <= 0xffffUL, clen is also guaranteed to be <= 0xffffUL.
44251. Set catcher regs: idx_base+0 = value, idx_base+1 = lj_type.
44252. resend state next time executor is about to run

44353. request to create catch binding

44354. for object-bound identifiers
44355. **comment:** XXX: compression (as an option)
 label: code-design
44356. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. ** This handling is now identical for C and Ecmascript functions. * C functions always have the 'NEWENV' flag set, so their * environment record initialization is delayed (which is good). ** Delayed creation (on demand) is handled in duk_js_var.c.
44357. **comment:** * Declaration binding instantiation conceptually happens when calling a * function; for us it essentially means that function prologue. The * conceptual process is described in E5 Section 10.5. ** We need to keep track of all encountered identifiers to (1) create an * identifier-to-register map ("varmap"); and (2) detect duplicate * declarations. Identifiers which are not bound to registers still need * to be tracked for detecting duplicates. Currently such identifiers * are put into the varmap with a 'null' value, which is later cleaned up. ** To support functions with a large number of variable and function * declarations, registers are not allocated beyond a certain limit; * after that limit, variables and functions need slow path access. * Arguments are currently always register bound, which imposes a hard * (and relatively small) argument count limit. ** Some bindings in E5 are not configurable (= deletable) and almost all * are mutable (writable). Exceptions are: ** - The 'arguments' binding, established only if no shadowing argument * or function declaration exists. We handle 'arguments' creation * and binding through an explicit slow path environment record. ** - The "name" binding for a named function expression. This is also * handled through an explicit slow path environment record.

44491. **comment:** * Array built-ins ** Note that most Array built-ins are intentionally generic and work even * when the 'this' binding is not an Array instance. To ensure this, * Array algorithms do not assume "magical" Array behavior for the "length" * property, for instance. ** XXX: the "Throw" flag should be set for (almost?) all [[Put]] and * [[Delete]] operations, but it's currently false throughout. Go through * all put/delete cases and check throw flag use. Need a new API primitive * which allows throws flag to be specified. ** XXX: array lengths above 2G won't work reliably. There are many places * where one needs a full signed 32-bit range ([-0xffffffff, 0xffffffff], * i.e. -33- bits). Although array 'length' cannot be written to be outside * the unsigned 32-bit range (E5.1 Section 15.4.5.1 throws a RangeError if so) * some intermediate values may be above 0xffffffff and this may not be always * correctly handled now (duk_uint32_t is not enough for all algorithms). ** For instance, push() can legitimately write entries beyond length 0xffffffff * and cause a RangeError only at the end. To do this properly, the current * push() implementation tracks the array index using a 'double' instead of a * duk_uint32_t (which is somewhat awkward). See test-bi-array-push-maxlen.js. ** On using "put" vs. "def" prop * ===== * Code below must be careful to use the appropriate primitive as it matters * for compliance. When using "put" there may be inherited properties in * Array.prototype which cause side effects when values are written. When * using "define" there are no such side effects, and many test262 test cases * check for this (for real world code, such side effects are very rare). * Both "put" and "define" are used in the E5.1 specification; as a rule, * "put" is used when modifying an existing array (or a non-array 'this' * binding) and "define" for setting values into a fresh result array. ** Also note that Array instance 'length' should be writable, but not * enumerable and definitely not configurable: even Duktape code internally * assumes that an Array instance will always have a 'length' property. * Preventing deletion of the property is critical.

44906. * Note: assuming new_a_size == 0, and that entry part contains * no conflicting keys, refcounts do not need to be adjusted for * the values, as they remain exactly the same. ** The keys, however, need to be interned, incref'd, and be * reachable for GC. Any intern attempt may trigger a GC and * claim any non-reachable strings, so every key must be reachable * at all times. ** A longjmp must not occur here, as the new_p allocation would * be freed without these keys being decref'd, hence the messy * decref handling if intern fails.

44907. **comment:** * 'props' contains {key,value,flags} entries, optional array entries, and * an optional hash lookup table for non-array entries in a single 'sliced' * allocation. There are several layout options, which differ slightly in * generated code size/speed and alignment/padding; duk_features.h selects * the layout used. * * Layout 1 (DUK_USE_HOBJECT_LAYOUT_1): * * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_propvalue)

bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffleUL = deleted
* * Layout 2 (DUK_USE_HOBJECT_LAYOUT_2): * * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_hstring)
*) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_uint8_t) + pad bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xfffffffleUL = unused,
0xfffffffleUL = deleted * * Layout 3 (DUK_USE_HOBJECT_LAYOUT_3): * * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) *
a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) *
h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xfffffffleUL = unused, 0xfffffffleUL = deleted * e_size * sizeof(duk_uint8_t) bytes
of entry flags (e_next gc reachable) * * In layout 1, the 'e_next' count is rounded to 4 or 8 on platforms * requiring 4 or 8 byte alignment. This ensures proper
alignment * for the entries, at the cost of memory footprint. However, it's * probably preferable to use another layout on such platforms instead. * * In layout 2, the
key and value parts are swapped to avoid padding * the key array on platforms requiring alignment by 8. The flags part * is padded to get alignment for array
entries. The 'e_next' count does * not need to be rounded as in layout 1. * * In layout 3, entry values and array values are always aligned properly, * and assuming
pointers are at most 8 bytes, so are the entry keys. Hash * indices will be properly aligned (assuming pointers are at least 4 bytes). * Finally, flags don't need
additional alignment. This layout provides * compact allocations without padding (even on platforms with alignment * requirements) at the cost of a bit slower
lookups. * * Objects with few keys don't have a hash index; keys are looked up linearly, * which is cache efficient because the keys are consecutive. Larger objects
* have a hash index part which contains integer indexes to the entries part. * * A single allocation reduces memory allocation overhead but requires more * work
when any part needs to be resized. A sliced allocation for entries * makes linear key matching faster on most platforms (more locality) and * skimps on flags size
(which would be followed by 3 bytes of padding in * most architectures if entries were placed in a struct). * * 'props' also contains internal properties distinguished
with a non-BMP * prefix. Often used properties should be placed early in 'props' whenever * possible to make accessing them as fast as possible.

45140. Input value should be on stack top and will be coerced and * popped. Refuse to update an Array's 'length' to a value * outside the 32-bit range. Negative zero is accepted as zero.
45141. shift in zeroes
45142. free object and all auxiliary (non-heap) allocs
45143. Useful for internal call sites where we either expect an object (function) * or a lightfunc. Returns NULL for a lightfunc.
45144. bytes in dest
45145. stack[0] = regexp * stack[1] = string
45146. flags
45147. Check for maximum buffer length.
45148. 'Thread'
45149. **comment:** Pointer to bytecode executor's 'curr_pc' variable. Used to copy * the current PC back into the topmost activation when activation * state is about to change (or "syncing" is otherwise needed). This * is rather awkward but important for performance, see execution.rst.
label: code-design
45150. The Quote(value) operation: quote a string. * * Stack policy: [] -> [].
45151. Output #2: last component name
45152. tc1 = false, tc2 = false
45153. 0
45154. Exponent without a sign or with a +/- sign is accepted * by all call sites (even JSON.parse()).
45155. 0x90-0x9f
45156. **comment:** XXX: Shuffling support could be implemented here so that LDINT+LDINTX * would only shuffle once (instead of twice). The current code works * though, and has a smaller compiler footprint.
label: code-design
45157. * Write to entry part
45158. To use the shared helper need the virtual index.
45159. * Slow delete, but we don't care as we're already in a very slow path. * The delete always succeeds: key has no exotic behavior, property * is configurable, and no resize occurs.
45160. LAYOUT 1
45161. For len == 0, i is initialized to len - 1 which underflows. * The condition (i < len) will then exit the for-loop on the * first round which is correct. Similarly, loop termination * happens by i underflowing.
45162. Raw internal valstack access macros: access is unsafe so call site * must have a guarantee that the index is valid. When that is the case, * using these macro results in faster and smaller code than duk_get_tval(). * Both 'ctx' and 'idx' are evaluated multiple times, but only for asserts.
45163. * Node.js Buffer.isEncoding()
45164. array entries are all plain values
45165. **comment:** Buffer values are encoded in (lowercase) hex to make the * binary data readable. Base64 or similar would be more * compact but less readable, and the point of JX/JC * variants is to be as useful to a programmer as possible.
label: code-design
45166. **comment:** XXX: the helper currently assumes stack top contains new * 'length' value and the whole calling convention is not very * compatible with what we need.
label: code-design
45167. Coerce to number before validating pointers etc so that the * number coercions in duk_hbufferobject_validated_write() are * guaranteed to be side effect free and not invalidate the * pointer checks we do here.
45168. Mark-and-sweep interval is relative to combined count of objects and * strings kept in the heap during the latest mark-and-sweep pass. * Fixed point .8 multiplier and .0 adder. Trigger count (interval) is * decreased by each (re)allocation attempt (regardless of size), and each * refzero processed object. * * 'SKIP' indicates how many (re)allocations to wait until a retry if * GC is skipped because there is no thread do it with yet (happens * only during init phases).
45169. XXX: assert 'c' is an enumerator
45170. two special escapes: '\n' and "", other printables as is
45171. for indexOf, ToInteger(undefined) would be 0, i.e. correct, but * handle both indexOf and lastIndexOf specially here.
45172. DUK_USE_AUGMENT_ERROR_THROW
45173. * Exponent notation for non-base-10 numbers isn't specified in Ecmascript * specification, as it never explicitly turns up: non-decimal numbers can * only be formatted with Number.prototype.toString([radix]) and for that, * behavior is not explicitly specified. * * Logical choices include formatting the exponent as decimal (e.g. binary * 100000 as 1e+5) or in current radix (e.g. binary 100000 as 1e+101). * The Dragon4 algorithm (in the original paper) prints the exponent value * in the target radix B. However, for radix values 15 and above, the * exponent separator 'e' is no longer easily parseable. Consider, for * instance, the number "1.faecce+1c".
45174. Template functions are not strictly constructable (they don't * have a "prototype" property for instance), so leave the * DUK_HOBJECT_FLAG_CONSTRUCTABLE flag cleared here.
45175. **comment:** Most practical strings will go here.
label: code-design
45176. non-strict eval: env is caller's env or global env (direct vs. indirect call) * global code: env is is global env
45177. **comment:** XXX: use the exactly same arithmetic function here as in executor
label: code-design
45178. -> [... lval new_rval]
45179. sep (even before first one)
45180. **comment:** XXX: use advancing pointers instead of index macros -> faster and smaller?
label: code-design
45181. 0x7F is special
45182. IEEE requires that zeros compare the same regardless * of their signed, so if both x and y are zeroes, they * are caught above.
45183. Signed integers always map to 4 bytes now.
45184. Resolve Proxy targets until Proxy chain ends. No explicit check for * a Proxy loop: user code cannot create such a loop without tweaking * internal properties directly.
45185. estimate is valid
45186. Note: it's nice if size is 2^N (not 4x4 = 16 bytes on 32 bit)
45187. always true, arg is unsigned
45188. ArrayBuffer: unlike any other argument variant, create * a view into the existing buffer.
45189. DUK_TOK_DO
45190. * Slow path: potentially requires function calls for coercion
45191. 'ArrayBuffer'
45192. Initialize index so that we skip internal control keys.
45193. flags have been already cleared
45194. * ArrayBuffer, DataView, and TypedArray constructors
45195. **comment:** * XXX: for now, indicate that an expensive catch binding * declarative environment is always needed. If we don't * need it, we don't need the const_varname either.
label: code-design
45196. -> [... this timeval_new timeval_new]

45333. No built-in functions are constructable except the top * level ones (Number, etc).

45334. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed, * and we're in an infinite loop.

45335. Raw helper for getting a value from the stack, checking its tag. * The tag cannot be a number because numbers don't have an internal * tag in the packed representation.

45336. Bernstein hash init value is normally 5381

45337. * DECLVAR ** See E5 Sections: * 10.4.3 Entering Function Code * 10.5 Declaration Binding Instantiation * 12.2 Variable Statement * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution ** Variable declaration behavior is mainly discussed in Section 10.5, * and is not discussed in the execution semantics (Sections 11-13). ** Conceptually declarations happen when code (global, eval, function) * is entered, before any user code is executed. In practice, register- * bound identifiers are 'declared' automatically (by virtue of being * allocated to registers with the initial value 'undefined'). Other * identifiers are declared in the function prologue with this primitive. ** Since non-register bindings eventually back to an internal object's * properties, the 'prop_flags' argument is used to specify binding * type: * * - Immutable binding: set DUK_PROPDESC_FLAG_WRITABLE to false * - Non-deletable binding: set DUK_PROPDESC_FLAG_CONFIGURABLE to false * - The flag DUK_PROPDESC_FLAG_ENUMERABLE should be set, although it * doesn't really matter for internal objects * * All bindings are non-deletable mutable bindings except: * * - Declarations in eval code (mutable, deletable) * - 'arguments' binding in strict function code (immutable) * - Function name binding of a function expression (immutable) ** Declarations may go to declarative environment records (always * so for functions), but may also go to object environment records * (e.g. global code). The global object environment has special * behavior when re-declaring a function (but not a variable); see * E5.1 specification, Section 10.5, step 5.e. ** Declarations always go to the 'top-most' environment record, i.e. * we never check the record chain. It's not an error even if a * property (even an immutable or non-deletable one) of the same name * already exists. ** If a declared variable already exists, its value needs to be updated * (if possible). Returns 1 if a PUTVAR needs to be done by the caller; * otherwise returns 0.

45338. **comment:** duk_handle_call_xxx: call ignores C recursion limit (for errhandler calls)

45388. code emission

45389. **comment:** * obj->props is intentionally left as NULL, and duk_hobject_props.c must deal * with this properly. This is intentional: empty objects consume a minimum * amount of memory. Further, an initial allocation might fail and cause * 'obj' to "leak" (require a mark-and-sweep) since it is not reachable yet.

label: code-design

45390. Term was '.', backtrack resolved name by one component. * q[-1] = previous slash (or beyond start of buffer) * q[-2] = last char of previous component (or beyond start of buffer)

45391. **comment:** This could also be thrown internally (set the error, goto check_longjmp), * but it's better for internal errors to bubble outwards so that we won't * infinite loop in this catchpoint.

label: code-design

45392. * Debugging related API calls

45393. -> [... func this arg1 ... argN _Args length]

45394. 'Float64Array'

45395. 1 1 1 <32 bits> * Encode in two parts to avoid bitencode 24-bit limitation

45396. -> [this]

45397. **comment:** Note: array entries are always writable, so the writability check * above is pointless for them. The check could be avoided with some * refactoring but is probably not worth it.

label: code-design

45398. retval indicates delete failed

45399. formatters always get one-based month/day-of-month

45400. continue matching, set neg_tzoffset flag

45401. bound function chain has already been resolved

45402. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property get right now.

45403. standard JSON; array gaps

45404. Note: array part values are [[Writable]], [[Enumerable]], * and [[Configurable]] which matches the required attributes * here.

45405. 0=before period/exp, * 1=after period, before exp * 2=after exp, allow '+' or '-' * 3=after exp and exp sign

45406. just check 'env'

45407. **comment:** XXX: primitive to make array from valstack slice

label: code-design

45408. **comment:** * Dragon4 setup. * * Convert double from IEEE representation for conversion; * normal finite values have an implicit leading 1-bit. The * slow path algorithm doesn't handle zero, so zero is special * cased here but still creates a valid nc_ctx, and goes * through normal formatting in case special formatting has * been requested (e.g. forced exponential format: 0 -> "0e+0").

label: code-design

45409. consistency requires this

45410. DUK_TOK_CASE

45411. Nothing to initialize, strsf[] is in ROM.

45412. currently 6 characters of lookup are actually needed (duk_lexer.c)

45413. index/length check guarantees

45414. left.x1 -> res.x1

45415. * Case conversion tables generated using src/extract_caseconv.py.

45416. is global code

45417. **comment:** * Macros to set a duk_tval and update refcount of the target (decref the * old value and incref the new value if necessary). This is both performance * and footprint critical; any changes made should be measured for size/speed.

label: code-design

45418. We don't duk_require_stack() here now, but rely on the caller having * enough space.

45419. * Regexp executor. * * Safety: the EcmaScript executor should prevent user from reading and * replacing regexp bytecode. Even so, the executor must validate all * memory accesses etc. When an invalid access is detected (e.g. a 'save' * opcode to invalid, unallocated index) it should fail with an internal * error but not cause a segmentation fault. * * Notes: * * - Backtrack counts are limited to unsigned 32 bits but should * technically be duk_size_t for strings longer than 4G chars. * This also requires a regexp bytecode change.

45420. Note: not a valid stack index if num_stack_args == 0

45421. * Convenience (independent of representation)

45422. no refcounting

45423. duk_handle_ecma_call_setup: setup for a resume()

45424. escape any non-ASCII characters

45425. if 0, 'str' used, if > 0, 'strlist' used

45426. These limits are based on bytecode limits. Max temps is limited * by duk_hcompiledfunction nargs/nregs fields being 16 bits.

45427. * pop(), push()

45428. 'DecEnv'

45429. number of elements guaranteed to be user accessible * (in addition to call arguments) on Duktape/C function entry.

45430. NOTE: The Array special behaviors are NOT invoked by duk_xdef_prop_index() * (which differs from the official algorithm). If no error is thrown, this * doesn't matter as the length is updated at the end. However, if an error * is thrown, the length will be unset. That shouldn't matter because the * caller won't get a reference to the intermediate value.

45431. Torture option to shake out finalizer side effect issues: * make a bogus function call for every finalizable object, * essentially simulating the case where everything has a * finalizer.

45432. [... key]

45433. **comment:** This seems faster than emitting bytes one at a time and * then potentially rewinding.

label: code-design

45434. * Writability check

45435. may be changed by call

45436. DUK_USE_NONSTD_FUNC_CALLER_PROPERTY

45437. DUK_USE_JSON_STRINGIFY_FASTPATH

45438. Update all labels with matching label_id.

45439. guaranteed by duk_to_string()

45440. DUK_USE_TRACEBACKS

45441. **comment:** Formatting function pointers is tricky: there is no standard pointer for * function pointers and the size of a function pointer may depend on the * specific pointer type. This helper formats a function pointer based on * its memory layout to get something useful on most platforms.

label: code-design

45442. ensures callstack_top - 1 >= 0

45443. Count free operations toward triggering a GC but never actually trigger * a GC from a free. Otherwise code which frees internal structures would * need to put in NULLs at every turn to ensure the object is always in * consistent state for a mark-and-sweep.

45444. detached

45445. 'constructor'

45446. disabled for now

45447. idx_replacer

45448. type to represent a straight register reference, with <0 indicating none

45449. continue jump not patched, an INVALID opcode remains there

45450. -> [... enum_target res trap_result]

45451. current (next) array index

45452. fmin() with args -0 and +0 is not guaranteed to return * -0 as EcmaScript requires.

45453. 'const'

45454. all codepoints up to U+10FFFF

45455. **comment:** This is performance critical because it's needed for every DECREF. * Take advantage of the fact that the first heap allocated tag is 8, * so that bit 3 is set for all heap allocated tags (and never set for * non-heap-allocated tags).

label: code-design

45456. if no NaN handling flag, may still be NaN here, but not Inf

45457. thr argument only used for thr->heap, so specific thread doesn't matter

45458. Preshifted << 4. Must use 16-bit entry to allow negative value signaling.

45460. fall through to error
45461. [... key_obj key key]
45462. Specification stripPrefix maps to DUK_S2N_FLAG_ALLOW_AUTO_HEX_INT. * * Don't autodetect octals (from leading zeroes), require user code to * provide an explicit radix 8 for parsing octal. See write-up from Mozilla: * https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/parseInt#ECMAScript_5_Removes_Octal_Interpretation
45463. Process messages until we're no longer paused or we peek * and see there's nothing to read right now.
45464. XXX: callstack unwind may now throw an error when closing * scopes; this is a sandboxing issue, described in: * <https://github.com/svaarala/duktape/issues/476>
45465. since no recursive error handler calls
45466. **comment:** XXX: other properties of function instances; 'arguments', 'caller'.
 label: code-design
45467. numeric label_id (-1 reserved as marker)
45468. irrelevant when out->value == NULL
45469. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed.
45470. **comment:** * Helper to sort array index keys. The keys are in the enumeration object * entry part, starting from DUK__ENUM_START_INDEX, and the entry part is dense. * * We use insertion sort because it is simple (leading to compact code,) * works nicely in-place, and minimizes operations if data is already sorted * or nearly sorted (which is a very common case here). It also minimizes * the use of element comparisons in general. This is nice because element * comparisons here involve re-parsing the string keys into numbers each * time, which is naturally very expensive. * * Note that the entry part values are all "true", e.g. * * "1" -> true, "3" -> true, "2" -> true * * so it suffices to only work in the key part without exchanging any keys, * simplifying the sort. * *
http://en.wikipedia.org/wiki/Insertion_sort * * (Compiles to about 160 bytes now as a stand-alone function.)
 label: code-design
45471. The function object is now reachable and refcounts are fine, * so we can pop off all the temporaries.
45472. Care must be taken to avoid pointer wrapping in the index * validation. For instance, on a 32-bit platform with 8-byte * duk_tval the index 0x20000000UL would wrap the memory space * once.
45473. Convert a duk_tval fastint (caller checks) to a 32-bit index.
45474. Insert bytes in the middle of the buffer from a slice already * in the buffer. Source offset is interpreted "before" the operation.
45475. DUK_USE_STRTAB_CHAIN
45476. Original function instance/template had NAMEBINDING. * Must create a lexical environment on loading to allow * recursive functions like 'function foo() { foo(); }'.
45477. **comment:** the message should be a compile time constant without formatting (less risk); * we don't care about assertion text size because they're not used in production * builds.
 label: code-design
45478. assume value is a number
45479. **comment:** combines steps 3, 6; step 7 is not needed
 label: requirement
45480. * Debugger support
45481. **comment:** XXX: spare handling, slow now
 label: code-design
45482. normal and constructor calls have identical semantics
45483. * A token is interpreted as any possible production of InputElementDiv * and InputElementRegExp, see E5 Section 7 in its entirety. Note that * the E5 "Token" production does not cover all actual tokens of the * language (which is explicitly stated in the specification, Section 7.5). * Null and boolean literals are defined as part of both ReservedWord * (E5 Section 7.6.1) and Literal (E5 Section 7.8) productions. Here, * null and boolean values have literal tokens, and are not reserved * words. * * Decimal literal negative/positive sign is -not- part of DUK_TOK_NUMBER. * The number tokens always have a non-negative value. The unary minus * operator in "-1.0" is optimized during compilation to yield a single * negative constant. * * Token numbering is free except that reserved words are required to be * in a continuous range and in a particular order. See genstrings.py.
45484. Same coercion behavior as for Number.
45485. the outer loop will recheck and exit
45486. **comment:** These are macros for now, but could be separate functions to reduce code * footprint (check call site count before refactoring).
 label: code-design
45487. x == -Infinity
45488. [... source? func_template]
45489. other call
45490. lastIndex already set up for next match
45491. * Macros to access the 'props' allocation.
45492. **comment:** * Struct size/alignment if platform requires it * * There are some compiler specific struct padding pragmas etc in use, this * selftest ensures they're correctly detected and used.
 label: code-design
45493. [... source? filename?] (depends on flags)
45494. ToUint16() coercion is mandatory in the E5.1 specification, but * this non-compliant behavior makes more sense because we support * non-BMP codepoints. Don't use CESU-8 because that'd create * surrogate pairs.
45495. match string
45496. [targetBuffer targetStart sourceStart sourceEnd]
45497. x = sign(x) * floor(abs(x)), i.e. truncate towards zero, keep sign
45498. **comment:** XXX: here again finalizer thread is the heap_thread which needs * to be coordinated with finalizer thread fixes.
 label: code-design
45499. at least one opcode emitted
45500. Slice offsets are element (not byte) offsets, which only matters * for TypedArray views, Node.js Buffer and ArrayBuffer have shift * zero so byte and element offsets are the same. Negative indices * are counted from end of slice, crossed indices are allowed (and * result in zero length result), and final values are clamped * against the current slice. There's intentionally no check * against the underlying buffer here.
45501. side effects, in theory (referenced by global env)
45502. * Object.seal() and Object.freeze() (E5 Sections 15.2.3.8 and 15.2.3.9) * * Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. * * Note: virtual (non-concrete) properties which are non-configurable but * writable would pose some problems, but such properties do not currently * exist (all virtual properties are non-configurable and non-writable). * If they did exist, the non-configurability does NOT prevent them from * becoming non-writable. However, this change should be recorded somehow * so that it would turn up (e.g. when getting the property descriptor), * requiring some additional flags in the object.
45503. additional flags which are passed in the same flags argument as property * flags but are not stored in object properties.
45504. **comment:** XXX: Is this INCREF necessary? 'func' is always a borrowed * reference reachable through the value stack? If changed, stack * unwind code also needs to be fixed to match.
 label: code-design
45505. **comment:** XXX: shared decoding of 'b' and 'c'?
 label: code-design
45506. **comment:** The fast path for array property put is not fully compliant: * If one places conflicting number-indexed properties into * Array.prototype (for example, a non-writable Array.prototype[7]) * the fast path will incorrectly ignore them. * * This fast path could be made compliant by falling through * to the slow path if the previous value was UNUSED. This would * also remove the need to check for extensibility. Right now a * non-extensible array is slower than an extensible one as far * as writes are concerned. * * The fast path behavior is documented in more detail here: * tests/ecmascript/test-misc-array-fast-write.js
 label: code-design
45507. **comment:** XXX: because we unwind stacks above, thr->heap->curr_thread is at * risk of pointing to an already freed thread. This was indeed the * case in test-bug-multithread-valgrind.c, until duk_handle_call() * was fixed to restore thr->heap->curr_thread before rethrowing an * uncaught error.

label: code-design

45508. Allow naked fraction (e.g. ".123")
45509. * Rate limit check for sending status update or peeking into * the debug transport. Both can be expensive operations that * we don't want to do on every opcode. * * Making sure the interval remains reasonable on a wide variety * of targets and bytecode is difficult without a timestamp, so * we use a Date-provided timestamp for the rate limit check. * But since it's also expensive to get a timestamp, a bytecode * counter is used to rate limit getting timestamps.
45510. >>> struct.unpack('>d', '4000112233445566'.decode('hex')) * (2.008366013071895)
45511. Other longjmp types are handled by executor before propagating * the error here.
45512. * E5 Section 11.8.6 describes the main algorithm, which uses * [[HasInstance]]. [[HasInstance]] is defined for only * function objects: * * - Normal functions: * E5 Section 15.3.5.3 * - Functions established with Function.prototype.bind(): * E5 Section 15.3.4.5.3 * * For other objects, a TypeError is thrown. * * Limited Proxy support: don't support 'getPrototypeOf' trap but * continue lookup in Proxy target if the value is a Proxy.
45513. * Ecmascript/native function call or lightfunc call
45514. Halt execution and enter a debugger message loop until execution is resumed * by the client. PC for the current activation may be temporarily decremented * so that the 'current' instruction will be shown by the client. This helper * is callable from anywhere, also outside bytecode executor.
45515. computed live
45516. **comment:** Load a function from bytecode. The function object returned here must * match what is created by duk_js_push_closure() with respect to its flags, * properties, etc. * * NOTE: there are intentionally no input buffer length / bound checks. * Adding them would be easy but wouldn't ensure memory safety as untrusted * or broken bytecode is unsafe during execution unless the opcodes themselves * are validated (which is quite complex, especially for indirect opcodes).
45517. * For an external string, the NUL-terminated string data is stored * externally. The user must guarantee that data behind this pointer * doesn't change while it's used.
45518. Note: masking of 'x' is not necessary because of * range check and shifting -> no bits overlapping * the marker should be set.
45519. **comment:** * Object.defineProperty() related helper (E5 Section 15.2.3.6) * * Inlines all [[DefineOwnProperty]] exotic behaviors. * * Note: Ecmascript compliant [[DefineOwnProperty]](P, Desc, Throw) is not * implemented directly, but Object.defineProperty() serves its purpose. * We don't need the [[DefineOwnProperty]] internally and we don't have a * property descriptor with 'missing values' so it's easier to avoid it * entirely. * * Note: this is only called for actual objects, not primitive values. * This must support virtual properties for full objects (e.g. Strings) * but not for plain values (e.g. strings). Lightfuncs, even though * primitive in a sense, are treated like objects and accepted as target * values.
45520. callstack limits
45521. A...P
45522. Module table: * - module.exports: initial exports table (may be replaced by user) * - module.id is non-writable and non-configurable, as the CommonJS * spec suggests this if possible * - module.filename: not set, defaults to resolved ID if not explicitly * set by modSearch() (note capitalization, not .fileName, matches Node.js) * - module.name: not set, defaults to last component of resolved ID if * not explicitly set by modSearch()
45523. String constructor needs to distinguish between an argument not given at all * vs. given as 'undefined'. We're a vararg function to handle this properly.
45524. Explicit length is only needed if it differs from 'nargs'.
45525. Force restart caused by a function return; must recheck * debugger breakpoints before checking line transitions, * see GH-303. Restart and then handle interrupt_counter * zero again.
45526. Decode 'bits' bits from the input stream (bits must be 1...24). * When reading past bitstream end, zeroes are shifted in. The result * is signed to match duk_bd_decode_flagged.
45527. (?:
45528. Must be restored here to handle e.g. yields properly.
45529. The base ID of the current require() function, resolution base
45530. non-Reference deletion is always 'true', even in strict mode
45531. jump to next loop, using reg_v34_iter as iterated value
45532. Scan error: this shouldn't normally happen; it could happen if * string is not valid UTF-8 data, and clen/blen are not consistent * with the scanning algorithm.
45533. max possible
45534. punctuators (unlike the spec, also includes "/" and "=")
45535. DUK_BUFOBJ_FLOAT32ARRAY
45536. [...] ptr]
45537. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property delete right now.
45538. 12: getDate
45539. * Helper for valstack space * * Caller of DUK_ASSERT_VALSTACK_SPACE() estimates the number of free stack entries * required for its own use, and any child calls which are not (a) Duktape API calls * or (b) Duktape calls which involve extending the valstack (e.g. getter call).
45540. 'modLoaded'
45541. * Assertions before
45542. **comment:** * Buffer writer (dynamic buffer only) * * Helper for writing to a dynamic buffer with a concept of a "spare" area * to reduce resizes. You can ensure there is enough space beforehand and * then write for a while without further checks, relying on a stable data * pointer. Spare handling is automatic so call sites only indicate how * much data they need right now. * * There are several ways to write using bufwriter. The best approach * depends mainly on how much performance matters over code footprint. * The key issues are (1) ensuring there is space and (2) keeping the * pointers consistent. Fast code should ensure space for multiple writes * with one ensure call. Fastest inner loop code can temporarily borrow * the 'p' pointer but must write it back eventually. * * Be careful to ensure all macro arguments (other than static pointers like * 'thr' and 'bw_ctx') are evaluated exactly once, using temporaries if * necessary (if that's not possible, there should be a note near the macro). * Buffer write arguments often contain arithmetic etc so this is * particularly important here.
45543. Ordering should not matter (E5 Section 11.8.5, step 3.a) but * preserve it just in case.
45544. for zero size, don't push anything on valstack
45545. Here we'd have the option of decoding unpadded base64 * (e.g. "xxxxyy" instead of "xxxxyy==". Currently not * accepted.
45546. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway
45547. * Conceptually, we look for the identifier binding by starting from * 'env' and following to chain of environment records (represented * by the prototype chain). * * If 'env' is NULL, the current activation does not yet have an * allocated declarative environment record; this should be treated * exactly as if the environment record existed but had no bindings * other than register bindings. * * Note: we assume that with the DUK_HOBJECT_FLAG_NEWENV cleared * the environment will always be initialized immediately; hence * a NULL 'env' should only happen with the flag set. This is the * case for: (1) function calls, and (2) strict, direct eval calls.
45548. heap level "stash" object (e.g., various reachability roots)
45549. * For global or eval code this is straightforward. For functions * created with the Function constructor we only get the source for * the body and must manufacture the "function ..." part. * * For instance, for constructed functions (v8): * * > a = new Function("foo", "bar", "print(foo)"); * [Function] * > a.toString() * 'function anonymous(foo,bar){\nprint(foo)\n}' * * Similarly for e.g. getters (v8): * * > x = { get a(foo,bar) { print(foo); } } * { a: [Getter] } * > Object.getOwnPropertyDescriptor(x, 'a').get.toString() * 'function a(foo,bar) { print(foo); }'
45550. c recursion check
45551. XXX: optimize by adding the token numbers directly into the * always interned duk_hstring objects (there should be enough * flag bits free for that)?
45552. Continue parsing after padding, allows concatenated, * padded base64.
45553. Check that 'this' is a duk_hbufferobject and return a pointer to it * (NULL if not).
45554. idx_step is +1 for indexOf, -1 for lastIndexOf
45555. is a setter/getter
45556. env created above to stack top
45557. cannot be e.g. arguments exotic, since exotic 'traits' are mutually exclusive
45558. DUK_TOK_LNOT
45559. XXX: sufficient to check 'strict', assert for 'is function'
45560. check final character validity
45561. * Init lexer context

45562. * Inref and decref functions. ** Decref may trigger immediate refzero handling, which may free and finalize * an arbitrary number of objects. *

45563. Generate pc2line data for an instruction sequence, leaving a buffer on stack top.

45564. a dummy undefined value is pushed to make valstack * behavior uniform for caller

45565. idx_step is +1 for reduce, -1 for reduceRight

45566. PatternCharacter, all excluded characters are matched by cases above

45567. Note: -nargs alone would fail for nargs == 0, this is OK

45568. curr and desc are accessors

45569. * Throw the error in the resumed thread's context; the * error value is pushed onto the resumee valstack. ** Note: the callstack of the target may empty in this case * too (i.e. the target thread has never been resumed). The * value stack will contain the initial function in that case, * which we simply ignore.

45570. For string-to-number, pretend we never have the lowest mantissa as there * is no natural "precision" for inputs. Having lowest_mantissa == 0, we'll * fall into the base cases for both e >= 0 and e < 0.

45571. Number built-in accepts a plain number or a Number object (whose * internal value is operated on). Other types cause TypeError.

45572. Encode to extended UTF-8; 'out' must have space for at least * DUK_UNICODE_MAX_XUTF8_LENGTH bytes. Allows encoding of any * 32-bit (unsigned) codepoint.

45573. func.prototype.constructor = func

45574. Accept any pointer-like value; for 'object' dvalue, read * and ignore the class number.

45575. **comment:** Clone the properties of the ROM-based global object to create a * fully RAM-based global object. Uses more memory than the inherit * model but more compliant.
label: code-design

45576. prev value can be garbage, no decref

45577. **comment:** * For/for-in statement is complicated to parse because * determining the statement type (three-part for vs. a * for-in) requires potential backtracking. ** See the helper for the messy stuff.
label: code-design

45578. Stepped? Step out is handled by callstack unwind.

45579. Copy values, the copy method depends on the arguments. ** Copy mode decision may depend on the validity of the underlying * buffer of the source argument; there must be no harmful side effects * from there to here for copy_mode to still be valid.

45580. fills window

45581. Caller must check character offset to be inside the string.

45582. valstack will be unbalanced, which is OK

45583. conservative

45584. unconditional

45585. DUK_USE_FASTINT && DUK_USE_PACKED_TVAL

45586. * NEXTEXNUM checks whether the enumerator still has unenumerated * keys. If so, the next key is loaded to the target register * and the next instruction is skipped. Otherwise the next instruction * will be executed, jumping out of the enumeration loop.

45587. **comment:** Providing access to e.g. act->lex_env would be dangerous: these * internal structures must never be accessible to the application. * Duktape relies on them having consistent data, and this consistency * is only asserted for, not checked for.
label: code-design

45610. 1111 10xx 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx [26 bits]

45611. There is no need to check the first character specially here * (i.e. reject digits): the caller only accepts valid initial * characters and won't call us if the first character is a digit. * This also ensures that the plain string won't be empty.

45612. '\xffBytecode'

45613. Catch a double-to-int64 cast issue encountered in practice.

45614. * DumpHeap command

45615. **comment:** * Lexer for source files, ToNumber() string conversions, RegExp expressions, * and JSON. ** Provides a stream of Ecmascript tokens from an UTF-8/CESU-8 buffer. The * caller can also rewind the token stream into a certain position which is * needed by the compiler part for multi-pass scanning. Tokens are * represented as duk_token structures, and contain line number information. * Token types are identified with DUK_TOK_* defines. ** Characters are decoded into a fixed size lookup window consisting of * decoded Unicode code points, with window positions past the end of the * input filled with an invalid codepoint (-1). The tokenizer can thus * perform multiple character lookups efficiently and with few sanity * checks (such as access outside the end of the input), which keeps the * tokenization code small at the cost of performance. ** Character data in tokens, such as identifier names and string literals, * is encoded into CESU-8 format on-the-fly while parsing the token in * question. The string data is made reachable to garbage collection by * placing the token-related values in value stack entries allocated for * this purpose by the caller. The characters exist in Unicode code point * form only in the fixed size lookup window, which keeps character data * expansion (of especially ASCII data) low. ** Token parsing supports the full range of Unicode characters as described * in the E5 specification. Parsing has been optimized for ASCII characters * because ordinary Ecmascript code consists almost entirely of ASCII * characters. Matching of complex Unicode codepoint sets (such as in the * IdentifierStart and IdentifierPart productions) is optimized for size, * and is done using a linear scan of a bit-packed list of ranges. This is * very slow, but should never be entered unless the source code actually * contains Unicode characters. ** Ecmascript tokenization is partially context sensitive. First, * additional future reserved words are recognized in strict mode (see E5 * Section 7.6.1.2). Second, a forward slash character ('/') can be * recognized either as starting a RegExp literal or as a division operator, * depending on context. The caller must provide necessary context flags * when requesting a new token. ** Future work: * * * Make line number tracking optional, as it consumes space. * * * Add a feature flag for disabling UTF-8 decoding of input, as most * source code is ASCII. Because of Unicode escapes written in ASCII, * this does not allow Unicode support to be removed from e.g. * duk_unicode_is_identifier_start() nor does it allow removal of CESU-8 * encoding of e.g. string literals. * * * Add a feature flag for disabling Unicode compliance of e.g. identifier * names. This allows for a build more than a kilobyte smaller, because * Unicode ranges needed by duk_unicode_is_identifier_start() and * duk_unicode_is_identifier_part() can be dropped. String literals * should still be allowed to contain escaped Unicode, so this still does * not allow removal of CESU-8 encoding of e.g. string literals. * * * Character lookup tables for codepoints above BMP could be stripped. * * * Strictly speaking, E5 specification requires that source code consists * of 16-bit code units, and if not, must be conceptually converted to * that format first. The current lexer processes Unicode code points * and allows characters outside the

BMP. These should be converted to * surrogate pairs while reading the source characters into the window, * not after tokens have been formed (as is done now). However, the fix * is not trivial because two characters are decoded from one codepoint. *** Optimize for speed as well as size. Large if-else ladders are (at * least potentially) slow.

45616. [... buf loop]

45617. **comment:** * Heap object representation. ** Heap objects are used for Ecmascript objects, arrays, and functions, * but also for internal control like declarative and object environment * records. Compiled functions, native functions, and threads are also * objects but with an extended C struct. ** Objects provide the required Ecmascript semantics and exotic behaviors * especially for property access. ** Properties are stored in three conceptual parts: ** 1. A linear 'entry part' contains ordered key-value-attributes triples * and is the main method of string properties. ** 2. An optional linear 'array part' is used for array objects to store a * (dense) range of [0,N[array indexed entries with default attributes * (writable, enumerable, configurable). If the array part would become * sparse or non-default attributes are required, the array part is * abandoned and moved to the 'entry part'. ** 3. An optional 'hash part' is used to optimize lookups of the entry * part; it is used only for objects with sufficiently many properties * and can be abandoned without loss of information. ** These three conceptual parts are stored in a single memory allocated area. * This minimizes memory allocation overhead but also means that all three * parts are resized together, and makes property access a bit complicated.

45651. Step 1 is not necessary because duk_call_method() will take * care of it.

45652. * Code emission helpers * * Some emission helpers understand the range of target and source reg/const * values and automatically emit shuffling code if necessary. This is the * case when the slot in question (A, B, C) is used in the standard way and * for opcodes the emission helpers explicitly understand (like DUK_OP_CALL). ** The standard way is that: * - slot A is a target register * - slot B is a source register/constant * - slot C is a source register/constant * * If a slot is used in a non-standard way the caller must indicate this * somehow. If a slot is used as a target instead of a source (or vice * versa), this can be indicated with a flag to trigger proper shuffling * (e.g. DUK_EMIT_FLAG_B_IS_TARGET). If the value in the slot is not * register/const related at all, the caller must ensure that the raw value * fits into the corresponding slot so as to not trigger shuffling. The * caller must set a "no shuffle" flag to ensure compilation fails if * shuffling were to be triggered because of an internal error. ** For slots B and C the raw slot size is 9 bits but one bit is reserved for * the reg/const indicator. To use the full 9-bit range for a raw value, * shuffling must be disabled with the DUK_EMIT_FLAG_NO_SHUFFLE_{B,C} flag. * Shuffling is only done for A, B, and C slots, not the larger BC or ABC slots. ** There is call handling specific understanding in the A-B-C emitter to * convert call setup and call instructions into indirect ones if necessary.

46020. wipe the capture range made by the atom (if any)

46021. Anything else is not constructable.

46022. attrs in E5 Section 15.3.5.1

46023. * Use the index in the header to find the right starting point

46024. Tolerate act_caller->func == NULL which happens in * some finalization cases; treat like unknown caller.

46025. **comment:** XXX: remove DUK_CALL_FLAG_IGNORE_RECLIMIT flag: there's now the * reclimit bump?
label: code-design

46026. maximum length of standard format tag that we support

46027. buffer size is >= 1

46028. ignore encoding for now

46029. enable manually for dumping

46030. (?=

46031. require to be safe

46032. Parser part count.

46033. for side effects, result ignored

46034. Now we can check offset validity.

46035. Milliseconds between status notify and transport peeks.

46036. Matching separator index is used in the control table

46037. rehash even if old and new sizes are the same to get rid of * DELETED entries.

46038. * Two pass approach to processing the property descriptors. * On first pass validate and normalize all descriptors before * any changes are made to the target object. On second pass * make the actual modifications to the target object. ** Right now we'll just use the same normalize/validate helper * on both passes, ignoring its outputs on the first pass.

46039. * Stringify implementation.

46040. ToNumber() for a double is a no-op.

46041. default: char escape (two chars)

46042. * Hobject allocation. ** Provides primitive allocation functions for all object types (plain object, * compiled function, native function, thread). The object return is not yet * in "heap allocated" list and has a refcount of zero, so caller must careful.

46043. Check actual underlying buffers for validity and that they * cover the copy. No side effects are allowed after the check * so that the validity status doesn't change.

46044. * Special parser for character classes; calls callback for every * range parsed and returns the number of ranges present.

46045. negate result

46046. * Lightfunc

46047. **comment:** * Refzero handling is skipped entirely if (1) mark-and-sweep is * running or (2) execution is paused in the debugger. The objects * are left in the heap, and will be freed by mark-and-sweep or * eventual heap destruction. ** This is necessary during mark-and-sweep because refcounts are also * updated during the sweep phase (otherwise objects referenced by a * swept object would have incorrect refcounts) which then calls here. * This could be avoided by using separate decref macros in * mark-and-sweep; however, mark-and-sweep also calls finalizers which * would use the ordinary decref macros anyway and still call this * function. ** This check must be enabled also when mark-and-sweep support has been * disabled: the flag is also used in heap destruction when running * finalizers for remaining objects, and the flag prevents objects from * being moved around in heap linked lists.

label: code-design

46048. XXX: len >= 0x80000000 won't work below because a signed type * is needed by qsort.

46049. Special handling for year sign.

46050. [arg1 ... argN obj length new_length]

46051. The algorithm in E5.1 Section 15.9.1.12 normalizes month, but * does not normalize the day-of-month (nor check whether or not * it is finite) because it's not necessary for finding the day * number which matches the (year,month) pair. ** We assume that duk_day_from_year() is exact here. ** Without an explicit infinity / NaN check in the beginning, * day_num would be a bogus integer here. ** It's possible for 'year' to be out of integer range here. * If so, we need to return NaN without integer overflow. * This fixes test-bug-setyear-overflow.js.

46052. * Node.js Buffer.prototype.slice([start], [end]) * ArrayBuffer.prototype.slice(begin, [end]) * TypedArray.prototype.slice(begin, [end]) ** The API calls are almost identical; negative indices are counted from end * of buffer, and final indices are clamped (allowing crossed indices). Main * differences: ** - Copy/view behavior; Node.js .slice() and TypedArray .subarray() create * views, ArrayBuffer .slice() creates a copy ** - Resulting object has a different class and prototype depending on the * call (or 'this' argument) ** - TypedArray .subarray() arguments are element indices, not byte offsets

46053. **comment:** When alloc_size == 0 the second allocation may not * actually exist.

46056. eat trailing comma

46057. pruned

46058. * Declarative environment record. ** Identifiers can never be stored in ancestors and are * always plain values, so we can use an internal helper * and access the value directly with an duk_tval ptr. ** A closed environment is only indicated by it missing * the "book-keeping" properties required for accessing * register-bound variables.

46059. For anything other than an Error instance, we calculate the * error location directly from the current activation if one * exists.

46060. Note: there is no requirement that: 'thr->callstack_preventcount == 1' * like for yield.

46061. lookup results is ignored

46062. **comment:** * ToPrimitive() (E5 Section 9.1) ** ==> implemented in the API.

label: requirement

46063. resume caller must be an ecmascript func

46064. e.g. a = -4, b = 5 --> -4 - 5 + 1 / 5 --> -8 / 5 --> -1 * a = -5, b = 5 --> -5 - 5 + 1 / 5 --> -9 / 5 --> -1 * a = -6, b = 5 --> -6 - 5 + 1 / 5 --> -10 / 5 --> -2

46065. stack contains value (if requested), 'out_desc' is set

46066. no issues with empty memcmp()

46067. [str] -> [substr]

46068. func is NULL for lightfunc

46069. property attributes for identifier (relevant if value != NULL)

46070. Default function to format objects. Tries to use toLogString() but falls * back to toString(). Any errors are propagated out without catching.

46071. don't allow continue

46072. respect reclimit, not constructor

46073. * Notation: double underscore used for internal properties which are not * stored in the property allocation (e.g. '__valstack').

46074. 0x60-0x6f

46075. DUK_BUFOBJ_INT32ARRAY

46076. Caller has already eaten the first char so backtrack one byte.

46077. controls for minimum entry part growth

46078. temp accumulation buffer

46079. Unwind.

46080. * Object built-ins

46081. callstack index

46082. **comment:** XXX: The ES5/5.1/6 specifications require that the key in 'key in obj' * must be string coerced before the internal HasProperty() algorithm is * invoked. A fast path skipping coercion could be safely implemented for * numbers (as number-to-string coercion has no side effects). For ES6 * proxy behavior, the trap 'key' argument must be in a string coerced * form (which is a shame).

label: code-design

46083. take last entry

46084. curr is data, desc is accessor

46085. **comment:** XXX: The incref macro takes a thread pointer but doesn't * use it right now.

label: code-design

46086. An object may be in heap_allocated list with a zero * refcount also if it is a temporary object created by * a finalizer; because finalization now runs inside * mark-and-sweep, such objects will not be queued to * refzero_list and will thus appear here with refcount * zero.

46087. Accept 32-bit decimal integers, no leading zeroes, signs, etc. * Leading zeroes are not accepted (zero index "0" is an exception * handled above).

46088. **comment:** Set: currently a finalizer is disabled by setting it to * undefined; this does not remove the property at the moment. * The value could be type checked to be either a function * or something else; if something else, the property could * be deleted.

label: code-design

46089. * Bitstream decoder

46090. statement id allocation (running counter)

46091. 'public'

46092. single match always

46093. Note: 'curr' refers to 'length' propdesc

46094. Use double parts, they tolerate unnormalized time. ** Note: DUK_DATE_IDX_WEEKDAY is initialized with a bogus value (DUK_PL_TZHOUR) * on purpose. It won't be actually used by duk_bi_date_get_timeval_from_dparts(), * but will make the value initialized just in case, and avoid any * potential for Valgrind issues.

46095. Steps 8-10 have been merged to avoid a "partial" variable.

46096. Used during heap destruction: don't actually run finalizers * because we're heading into forced finalization. Instead, * queue finalizable objects back to the heap_allocated list.

46097. duk_safe_call discipline

46098. **comment:** * Unicode tables containing ranges of Unicode characters in a * packed format. These tables are used to match non-ASCII * characters of complex productions by resorting to a linear * range-by-range comparison. This is very slow, but is expected * to be very rare in practical Ecmascript source code, and thus * compactness is most important. ** The tables are matched using uni_range_match() and the format * is described in src/extract_chars.py.

label: code-design

46099. **comment:** XXX: encoding is ignored now.

label: code-design

46100. use 'undefined' for value automatically

46101. [... obj ...]

46102. **comment:** Function pointers do not always cast correctly to void * * (depends on memory and segmentation model for instance), * so they coerce to NULL.

label: code-design

46103. Buffer length is bounded to 0xffff automatically, avoid compile warning.

46104. Integer division which floors also negative values correctly.

46105. consequence of above

46106. * Self tests to ensure execution environment is sane. Intended to catch * compiler/platform problems which cannot be detected at compile time.

46107. DUK_TAG_NUMBER would logically go here, but it has multiple 'tags'

46108. backtrack (safe)

46109. DUK_FLD_32BIT

46110. * Parse a RegExp token. The grammar is described in E5 Section 15.10. * Terminal constructions (such as quantifiers) are parsed directly here. * * 0xffffffffU is used as a marker for "infinity" in quantifiers. Further, * DUK_MAX_RE_QUANT_DIGITS limits the maximum number of digits that * will be accepted for a quantifier.

46111. **comment:** Note: reuse 'curr'

label: code-design

46112. * Convert and push final string.

46113. evaluate to final form (e.g. coerce GETPROP to code), throw away temp

46114. * Selftest code

46115. use existing env (e.g. for non-strict eval); cannot have * an own 'arguments' object (but can refer to the existing one)

46116. duk_tval ptr for 'func' on stack (borrowed reference) or tv_func_copy

46117. * Encoding and decoding basic formats: hex, base64. * * These are in-place operations which may allow an optimized implementation. * * Base-64: <https://tools.ietf.org/html/rfc4648#section-4>

46118. Run mark-and-sweep a few times just in case (unreachable object * finalizers run already here). The last round must rescue objects * from the previous round without running any more finalizers. This * ensures rescued objects get their FINALIZED flag cleared so that * their finalizer is called once more in forced finalization to * satisfy finalizer guarantees. However, we don't want to run any * more finalizer because that'd required one more loop, and so on.

46119. required to keep recursion depth correct

46120. [... buf loop (proplist) (gap) holder ""]

46121. Get default hash part size for a certain entry part size.

46122. Maximum number of digits generated.

46123. [... func buf] -> [... buf]

46124. **comment:** XXX: could share code with duk_js_ops.c, duk_js_compare_helper

label: code-design

46125. Math.pow(+0,y) should be Infinity when y<0. NetBSD pow() * returns -Infinity instead when y is <0 and finite. The * if-clause also catches y == -Infinity (which works even * without the fix).

46126. Free strings in the stringtable and any allocations needed * by the stringtable itself.

46127. e.g. DUK_OP_PREINCV

46128. If neutered must return 0; offset is zeroed during * neutering.

46129. array of declarations: [name1, val1, name2, val2, ...] * valN = (typeN) | (fnum << 8), where fnum is inner func number (0 for vars) * record function and variable declarations in pass 1

46130. breakpoints: [0,breakpoint_count[gc reachable

46131. **comment:** XXX: inefficient loop

label: code-design

46132. * Insert a jump offset at 'offset' to complete an instruction * (the jump offset is always the last component of an instruction). * The 'skip' argument must be computed relative to 'offset', * -without- taking into account the skip field being inserted. * * ... A B C ins X Y Z ... (ins may be a JUMP, SPLIT1/SPLIT2, etc) * => ... A B C ins SKIP X Y Z * * Computing the final (adjusted) skip value, which is relative to the * first byte of the next instruction, is a bit tricky because of the * variable length UTF-8 encoding. See doc/regexp.rst for discussion.

46133. * NYF <int: 5> <int: fatal> <str: msg> <str: filename> <int: linenumber> EOM

46134. Note: not necessary to check p against re_ctx->input_end: * the memory access is checked by duk_inp_get_cp(), while * valid compiled regexps cannot write a saved[] entry * which points to outside the string.

46135. Strings and ROM objects are never placed on the heap allocated list.

46136. [... val root ""] -> [... val val']

46137. **comment:** * JSON built-ins. * * See doc/json.rst. * * Codepoints are handled as duk_uint_fast32_t to ensure that the full * unsigned 32-bit range is supported. This matters to e.g. JX. * * Input parsing doesn't do an explicit end-of-input check at all. This is * safe: input string data is always NUL-terminated (0x00) and valid JSON * inputs never contain plain NUL characters, so that as long as syntax checks * are correct, we'll never read past the NUL. This approach reduces code size * and improves parsing performance, but it's critical that syntax checks are * indeed correct!

46300. preincrement and predecrement
46301. Value would normally be omitted, replace with 'null'.
46302. e.g. require('foo'), empty terms not allowed
46303. string is internal
46304. * Parse regexp Disjunction. Most of regexp compilation happens here. ** Handles Disjunction, Alternative, and Term productions directly without * recursion. The only constructs requiring recursion are positive/negative * lookaheads, capturing parentheses, and non-capturing parentheses. ** The function determines whether the entire disjunction is a 'simple atom' * (see doc/regexp.rst discussion on 'simple quantifiers') and if so, * returns the atom character length which is needed by the caller to keep * track of its own atom character length. A disjunction with more than one * alternative is never considered a simple atom (although in some cases * that might be the case). ** Return value: simple atom character length or < 0 if not a simple atom. * Appends the bytecode for the disjunction matcher to the end of the temp * buffer. ** Regexp top level structure is: ** Disjunction = Term* | Term* | Disjunction ** Term = Assertion * | Atom * | Atom Quantifier ** An empty Term sequence is a valid disjunction alternative (e.g. /|||c||/). ** Notes: ** Tracking of the 'simple-ness' of the current atom vs. the entire * disjunction are separate matters. For instance, the disjunction * may be complex, but individual atoms may be simple. Furthermore, * simple quantifiers are used whenever possible, even if the * disjunction as a whole is complex. ** The estimate of whether an atom is simple is conservative now, * and it would be possible to expand it. For instance, captures * cause the disjunction to be marked complex, even though captures * -can- be handled by simple quantifiers with some minor modifications. ** Disjunction 'tainting' as 'complex' is handled at the end of the * main for loop collectively for atoms. Assertions, quantifiers, * and '| tokens need to taint the result manually if necessary. * Assertions cannot add to result char length, only atoms (and * quantifiers) can; currently quantifiers will taint the result * as complex though.
46305. Get a pointer to the current buffer contents (matching current allocation * size). May be NULL for zero size dynamic/external buffer.

46399. '\xffMap'

46400. The directive prologue flag is cleared by default so that it is * unset for any recursive statement parsing. It is only "revived" * if a directive is detected. (We could also make directives only * allowed if 'allow_source_elem' was true.)

46401. 'NaN'

46402. unsigned 31-bit range

46403. DUK_USE_EXPLICIT_NULL_INIT

46404. valgrind whine without this

46405. **comment:** * Helper for calling a user error handler. * * 'thr' must be the currently active thread; the error handler is called * in its context. The valstack of 'thr' must have the error value on * top, and will be replaced by another error value based on the return * value of the error handler. * * The helper calls duk_handle_call() recursively in protected mode. * Before that call happens, no longjmps should happen; as a consequence, * we must assume that the valstack contains enough temporary space for * arguments and such. * * While the error handler runs, any errors thrown will not trigger a * recursive error handler call (this is implemented using a heap level * flag which will "follow" through any coroutines resumed inside the * error handler). If the error handler is not callable or throws an * error, the resulting error replaces the original error (for Duktape * internal errors, duk_error_throw.c further substitutes this error with * a DoubleError which is not ideal). This would be easy to change and * even signal to the caller. * * The user error handler is stored in 'Duktape.errCreate' or * 'Duktape.errThrow' depending on whether we're augmenting the error at * creation or throw time. There are several alternatives to this approach, * see doc/error-objects.rst for discussion. * * Note: since further longjmp()'s may occur while calling the error handler * (for many reasons, e.g. a labeled 'break' inside the handler), the * caller can make no assumptions on the thr->heap->lj state after the * call (this affects especially duk_error_throw.c). This is not an issue * as long as the caller writes to the lj state only after the error handler * finishes.

label: code-design

46406. * Exposed calls

46407. key encountered as a setter

46408. Don't need to sync curr_pc here; duk_new() will do that * when it augments the created error.

46409. one i_step over

46410. Shared prefix for all buffer types.

46411. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. * * Delayed creation (on demand) is handled in duk_js_var.c

46412. Reject a proxy object as the target because it would need * special handler in property lookups. (ES6 has no such restriction)

46413. must restore reliably before returning

46414. * Basic context initialization. * * Some init values are read from the bytecode header * whose format is (UTF-8 codepoints): * * uint flags * uint nsaved (even, 2n+2 where n = num captures)

46415. return 'res_arr' or 'null'

46416. **comment:** This would be nice, but parsing is faster without resetting the * value slots. The only side effect is that references to temporary * string values may linger until lexing is finished; they're then * freed normally.
label: code-design

46417. break jump

46418. "123"

46419. Note: the only yield-preventing call is Duktape.Thread.yield(), hence check for 1, not 0

46420. range check not necessary because all 4-bit values are mapped

46564. NULL obj->p is OK

46565. * In strict mode E5 protects 'eval' and 'arguments' from being * assigned to (or even declared anywhere). Attempt to do so * should result in a compile time SyntaxError. See the internal * design documentation for details. ** Thus, we should never come here, run-time, for strict code, * and name 'eval' or 'arguments'.

46566. Assume that thr->valstack_bottom has been set-up before getting here.

46567. len: 9

46568. * E5 Section 11.4.9

46569. deal with weak references first

46570. duk_push_sprintf constants

46571. negative: dst info not available

46572. topmost element is the result array already

46573. Fast path, handle units with just actual encoding characters.

46574. out of spec, must be configurable

46575. * Debug logging after adjustment.

46576. * Pushers

46577. **comment:** * Note: each API operation potentially resizes the callstack, * so be careful to re-lookup after every operation. Currently * these is no issue because we don't store a temporary 'act' * pointer at all. (This would be a non-issue if we operated * directly on the array part.)

label: code-design

46578. implicit_return_value

46579. XXX: direct valstack write

46580. [... source? filename]

46581. No resize has occurred so temp_desc->e_idx is still OK

46582. lookup for 0x000a above assumes shortest encoding now

46583. XXX: E5.1 Section 11.1.4 coerces the final length through * ToUint32() which is odd but happens now as a side effect of * 'arr_idx' type.

46584. Read tvals from the message and push them onto the valstack, * then call the request callback to process the request.

46585. true, despite side effect resizes

46586. the stack is unbalanced here on purpose; we only rely on the * initial two values: [name this].

46587. [start end str]

46588. source is eval code (not global)

46589. switch initial byte

46590. Note: pc is unsigned and cannot be negative

46591. * Casting

46592. **comment:** * User declarations, e.g. prototypes for user functions used by Duktape * macros. Concretely, if DUK_USE_PANIC_HANDLER is used and the macro * value calls a user function, it needs to be declared for Duktape * compilation to avoid warnings.

label: code-design

46593. Longjmp handling has restored jmpbuf_ptr.

46594. * Round a number upwards to a prime (not usually the nearest one). ** Uses a table of successive 32-bit primes whose ratio is roughly * constant. This keeps the relative upwards 'rounding error' bounded * and the data size small. A simple 'predict-correct' compression is * used to compress primes to one byte per prime. See genhashsizes.py * for details. ** The minimum prime returned here must be coordinated with the possible * probe sequence steps in duk_hobject and duk_heap stringtable.

46595. -> [... varname val this]

46596. processed one or more messages

46597. [... v1(filename) v2(line+flags)]

46598. must have been, since in array part

46599. slower but more compact variant

46600. TypedArray (or other non-ArrayBuffer duk_hbufferobject). * Conceptually same behavior as for an Array-like argument, * with a few fast paths.

46601. **comment:** parameter passing, not thread safe

label: requirement

46602. **comment:** Two temporaries are preallocated here for variants 3 and 4 which need * registers which are never clobbered by expressions in the loop * (concretely: for the enumerator object and the next enumerated value). * Variants 1 and 2 "release" these temps.

label: code-design

46603. Note: decimal number may start with a period, but must be followed by a digit

46604. main reachability roots

46605. DUK_HBUFFER_H_INCLUDED

46606. Inputs: explicit arguments (nargs), +1 for key, +2 for obj_index/nargs passing. * If the value stack does not contain enough args, an error is thrown; this matches * behavior of the other protected call API functions.

46607. [value offset fieldByteLength noAssert], when ftype == DUK_FLD_VARINT

46608. placed in duk_heap_hdr_string

46609. * Main mark-and-sweep function. ** 'flags' represents the features requested by the caller. The current * heap->mark_and_sweep_base_flags is ORed automatically into the flags; * the base flags mask typically prevents certain mark-and-sweep operations * to avoid trouble.

46610. 'private'
46611. toJSON() can also be a lightfunc
46612. Special behavior for 'caller' property of (non-bound) function objects * and non-strict Arguments objects: if 'caller' -value- (!) is a strict * mode function, throw a TypeError (E5 Sections 15.3.5.4, 10.6). * Quite interestingly, a non-strict function with no formal arguments * will get an arguments object -without- special 'caller' behavior! ** The E5.1 spec is a bit ambiguous if this special behavior applies when * a bound function is the base value (not the 'caller' value): Section * 15.3.4.5 (describing bind()) states that [[Get]] for bound functions * matches that of Section 15.3.5.4 ([[Get]] for Function instances). * However, Section 13.3.5.4 has "NOTE: Function objects created using * Function.prototype.bind use the default [[Get]] internal method." * The current implementation assumes this means that bound functions * should not have the special [[Get]] behavior. ** The E5.1 spec is also a bit unclear if the TypeError throwing is * applied if the 'caller' value is a strict bound function. The * current implementation will throw even for both strict non-bound * and strict bound functions. ** See test-dev-strict-func-as-caller-prop-value.js for quite extensive * tests. ** This exotic behavior is disabled when the non-standard 'caller' property * is enabled, as it conflicts with the free use of 'caller'.
46613. move pivot out of the way
46614. final configuration
46615. -1 == not set, -2 == pending (next statement list)
46616. **comment:** temporary, must be signed and 32-bit to hold Unicode code points

46697. string is ASCII, clen == blen
46698. DUK_USE_HOBJECT_HASH_PART || DUK_USE_STRTAB_PROBE
46699. * Since character data is only generated by decoding the source or by * the compiler itself, we rely on the input codepoints being correct * and avoid a check here. * * Character data can also come here through decoding of Unicode * escapes ("\\udead\\ubef") so all 16-bit unsigned values can be * present, even when the source file itself is strict UTF-8.
46700. **comment:** XXX: more emergency behavior, e.g. find smaller hash sizes etc
label: code-design
46701. * Copy array elements to new array part.
46702. For strings, special form for short lengths.
46703. Setup function properties.
46704. **comment:** * In a fast check we assume old_size equals old_used (i.e., existing * array is fully dense). * * Slow check if: * * (new_size - old_size) / old_size > limit * new_size - old_size > limit * old_size * new_size > (1 + limit) * old_size || limit' is 3 bits fixed point * new_size > (1 + (limit' / 8)) * old_size || * 8 * 8 * new_size > (8 + limit') * old_size || : 8 * new_size > (8 + limit') * (old_size / 8) * new_size > limit" * (old_size / 8) || limit' = 9 -> max 25% increase * arr_idx + 1 > limit" * (old_size / 8) * * This check doesn't work well for small values, so old_size is rounded * up for the check (and the '+ 1' of arr_idx can be ignored in practice): * * arr_idx > limit" * ((old_size + 7) / 8)
label: code-design
46705. **comment:** * A few notes on the algorithm: * - Terms are not allowed to begin with a period unless the term * is either '.' or '..'. This simplifies implementation (and * is within CommonJS modules specification). * - There are few output bound checks here. This is on purpose: * the resolution input is length checked and the output is never * longer than the input. The resolved output is written directly * over the input because it's never longer than the input at any * point in the algorithm. * * - Non-ASCII characters are processed as individual bytes and * need no special treatment. However, U+0000 terminates the * algorithm; this is not an issue because U+0000 is not a * desirable term character anyway.
label: code-design
46706. * Utilities
46707. * Helpers * * The fast path checks are done within a macro to ensure "inlining" * while the slow path actions use a helper (which won't typically be * inlined in size optimized builds).
46708. **comment:** If the platform doesn't support the entire Ecmascript range, we need * to return 0 so that the caller can fall back to the default formatter. * * For now, assume that if time_t is 8 bytes or more, the whole Ecmascript * range is supported. For smaller time_t values (4 bytes in practice), * assumes that the signed 32-bit range is supported. * * XXX: detect this more correctly per platform. The size of time_t is * probably not an accurate guarantee of strftime() supporting or not * supporting a large time range (the full Ecmascript range).
label: code-design
46709. **comment:** XXX: now that pc2line is used by the debugger quite heavily in * checked execution, this should be optimized to avoid value stack * and perhaps also implement some form of pc2line caching (see * future work in debugger.rst).
label: code-design
46710. * Case clause. * * Note: cannot use reg_case as a temp register (for SEQ target) * because it may be a constant.
46711. **comment:** XXX: not sure what the correct semantic details are here, * e.g. handling of missing values (gaps), handling of non-array * trap results, etc. * * For keys, we simply skip non-string keys which seems to be * consistent with how e.g. Object.keys() will process proxy trap * results (ES6, Section 19.1.2.14).
label: code-design
46712. **comment:** XXX: 'copy properties' API call?

47426. Note: no key on stack

47427. [... retval]

47428. DUK_USE_JX

47429. num args

47430. end of _Formals

47431. This would be pointless: we'd return NULL for both lightfuncs and * unexpected types.

47432. 2 when called by debugger

47433. * Top level wrappers

47434. DUK_INTERNAL_H_INCLUDED

47435. Report next pc/line to be executed.

47436. Non-object argument is simply int coerced, matches * V8 behavior (except for "null", which we coerce to * 0 but V8 TypeErrors).
47437. * Build function fixed size 'data' buffer, which contains bytecode, * constants, and inner function references. * * During the building phase 'data' is reachable but incomplete. * Only incref's occur during building (no refzero or GC happens), * so the building process is atomic.
47438. fixed offsets in valstack
47439. * Math built-ins
47440. **comment:** Temporary structure used to pass a stack allocated region through * duk_safe_call().
 label: code-design
47441. check that there is space for at least one new entry
47442. 0xa0...0xaf
47443. eval left argument first
47444. -> [... closure template]
47445. 1 << 52
47446. must match genhashsizes.py
47447. setter and/or getter may be NULL
47448. * Encoding helpers * * Some of the typing is bytecode based, e.g. slice sizes are unsigned 32-bit * even though the buffer operations will use duk_size_t.
47449. current thread
47450. **comment:** Called on a read/write error: NULL all callbacks except the detached * callback so that we never accidentally call them after a read/write * error has been indicated. This is especially important for the transport * I/O callbacks to fulfill guaranteed callback semantics.
 label: code-design
47451. Emit 3 bytes and backtrack if there was padding. There's * always space for the whole 3 bytes so no check needed.
47452. Duktape.Thread.yield() should prevent
47453. encode \xffBar as _Bar if no quotes are applied, this is for * readable internal keys.
47454. LICENSE.txt
47455. [... varname val]
47456. string is 'eval' or 'arguments'
47457. * The default property attributes are correct for all * function valued properties of built-in objects now.
47458. Heap udata, used for allocator functions but also for other heap * level callbacks like pointer compression, etc.
47459. IdentifierStart production with ASCII excluded
47460. nothing to mark
47461. **comment:** XXX: function properties
 label: code-design
47462. prepend regexp to valstack 0 index
47463. act_caller->func may be NULL in some finalization cases, * just treat like we don't know the caller.
47464. convenience
47465. Previous value doesn't need refcount changes because its ownership * is transferred to prev_caller.
47466. * Pop built-ins from stack: they are now INCREF'd and * reachable from the builtins[] array or indirectly * through builtins[].
47467. [obj key value desc]
47468. stmt has non-empty value
47469. -> [... holder name val val ToString(i)]
47470. stage 2: delete configurable entries above target length
47471. When LHS is not register bound, always go through a * temporary. No optimization for top level assignment.
47472. keep key reachable for GC etc; guaranteed not to fail
47473. generate mantissa with a single leading whole number digit
47474. * Complex case conversion helper which decodes a bit-packed conversion * control stream generated by unicode/extract_caseconv.py. The conversion * is very slow because it runs through the conversion data in a linear * fashion to save space (which is why ASCII characters have a special * fast path before arriving here). * * The particular bit counts etc have been determined experimentally to * be small but still sufficient, and must match the Python script * (src/extract_caseconv.py). * * The return value is the case converted codepoint or -1 if the conversion * results in multiple characters (this is useful for regexp Canonicalization * operation). If 'buf' is not NULL, the result codepoint(s) are also * appended to the hbuffer. * * Context and locale specific rules must be checked before consulting * this function.
47475. Stored in duk_heapdr unused flags.
47476. **comment:** * Augmenting errors at their creation site and their throw site. * * When errors are created, traceback data is added by built-in code * and a user error handler (if defined) can process or replace the * error. Similarly, when errors are thrown, a user error handler * (if defined) can process or replace the error. * * Augmentation and other processing at error creation time is nice * because an error is only created once, but it may be thrown and * rethrown multiple times. User error handler registered for processing * an error at its throw site must be careful to handle rethrowing in * a useful manner. * * Error augmentation may throw an internal error (e.g. alloc error). * * Ecmascript allows throwing any values, so all values cannot be * augmented. Currently, the built-in augmentation at error creation * only augments error values which are Error instances (= have the * built-in Error.prototype in their prototype chain) and are also * extensible. User error handlers have no limitations in this respect.
 label: code-design
47477. **comment:** * Emit initializers in sets of maximum max_init_values. * Corner cases such as single value initializers do not have * special handling now. * * Elided elements must not be emitted as 'undefined' values, * because such values would be enumerable (which is incorrect). * Also note that trailing elisions must be reflected in the * length of the final array but cause no elements to be actually * inserted.
 label: code-design
47478. * Initialize built-in objects. Current thread must have a valstack * and initialization errors may longjmp, so a setjmp() catch point * must exist.
47479. terminator
47480. DUK_TOK_EQUALSIGN
47481. * Comparison
47482. DUK_JSON_H_INCLUDED
47483. may have side effects
47484. increases key refcount
47485. on first round, skip
47486. **comment:** * Ecmascript specification algorithm and conversion helpers. * * These helpers encapsulate the primitive Ecmascript operation * semantics, and are used by the bytecode executor and the API * (among other places). Note that some primitives are only * implemented as part of the API and have no "internal" helper. * (This is the case when an internal helper would not really be * useful; e.g. the operation is rare, uses value stack heavily, * etc.) * * The operation arguments depend on what is required to implement * the operation: * * - If an operation is simple and stateless, and has no side * effects, it won't take an duk_hthread argument and its * arguments may be duk_tval pointers (which are safe as long * as no side effects take place). * * - If complex coercions are required (e.g. a "ToNumber" coercion) * or errors may be thrown, the operation takes an duk_hthread * argument. This also implies that the operation may have * arbitrary side effects, invalidating any duk_tval pointers. * * - For operations with potential side effects, arguments can be * taken in several ways: * * a) as duk_tval pointers, which makes sense if the "common case" * can be resolved without side effects (e.g. coercion); the * arguments are pushed to the valstack for coercion if * necessary * * b) as duk_tval values * * c) implicitly on value stack top * * d) as indices to the value stack * * Future work: * * - Argument styles may not be the most sensible in every case now. * * - In-place coercions might be useful for several operations, if * in-place coercion is OK for the bytecode executor and the API.
 label: code-design
47487. Note: may be triggered even if minimal new_size would not reach the limit, * plan limit accordingly (taking DUK_VALSTACK_GROW_STEP into account).
47488. **comment:** A little tricky string approach to provide the flags string. * This depends on the specific flag values in duk_regexp.h, * which needs to be asserted for. In practice this doesn't * produce more compact code than the easier approach in use.
 label: code-design
47489. Note: intentionally use approximations to shave a few instructions: * a_used = old_used (accurate: old_used + 1) * a_size = arr_idx (accurate: arr_idx + 1)
47490. Slot C is used in a non-standard fashion (range of regs), * emitter code has special handling for it (must not set the * "no shuffle" flag).

47491. Note: if atom were to contain e.g. captures, we would need to * re-match the atom to get correct captures. Simply quantifiers * do not allow captures in their atom now, so this is not an issue.

47492. * Criteria for augmenting: * * - augmentation enabled in build (naturally) * - error value internal prototype chain contains the built-in * Error prototype object (i.e. 'val instanceof Error') * * Additional criteria for built-in augmenting: * * - error value is an extensible object

47493. **comment:** XXX: solve into closed form (smaller code)
label: code-design

47494. * Check the function type, handle bound function chains, and prepare * parameters for the rest of the call handling. Also figure out the * effective 'this' binding, which replaces the current value at * idx_func + 1. * * If the target function is a 'bound' one, follow the chain of 'bound' * functions until a non-bound function is found. During this process, * bound arguments are 'prepended' to existing ones, and the "this" * binding is overridden. See E5 Section 15.3.4.5.1. * * If the final target function cannot be handled by an ecma-to-ecma * call, return to the caller with a return value indicating this case. * The bound chain is resolved and the caller can resume with a plain * function call.

47495. must be signed for loop structure

47496. is_extra

47497. **comment:** * Memory calls: relative to heap, GC interaction, but no error throwing. * * XXX: Currently a mark-and-sweep triggered by memory allocation will run * using the heap->heap_thread. This thread is also used for running * mark-and-sweep finalization; this is not ideal because it breaks the * isolation between multiple global environments. * * Notes: * * - DUK_FREE() is required to ignore NULL and any other possible return * value of a zero-sized alloc/realloc (same as ANSI C free()). * * - There is no DUK_REALLOC_ZEROED because we don't assume to know the * old size. Caller must zero the reallocated memory. * * - DUK_REALLOC_INDIRECT() must be used when a mark-and-sweep triggered * by an allocation failure might invalidate the original 'ptr', thus * causing a realloc retry to use an invalid pointer. Example: we're * reallocating the value stack and a finalizer resizes the same value * stack during mark-and-sweep. The indirect variant requests for the * current location of the pointer being reallocated using a callback * right before every realloc attempt; this circuitous approach is used * to avoid strict aliasing issues in a more straightforward indirect * pointer (void **) approach. Note: the pointer in the storage * location is read but is NOT updated; the caller must do that.
label: code-design

47498. Here 'x' is a Unicode codepoint

47499. [ToUint32(len) array ToUint32(len)] -> [ToUint32(len) array]

47500. Force a resize so that DELETED entries are eliminated. * Another option would be duk__recheck_strtab_size_probe(); * but since that happens on every intern anyway, this whole * check can now be disabled.

47501. * comp_ctx->curr_func is now ready to be converted into an actual * function template.

47502. Potentially truncated, NUL not guaranteed in any case. * The (int_rc < 0) case should not occur in practice.

47503. If not found, resume existence check from Function.prototype. * We can just substitute the value in this case; nothing will * need the original base value (as would be the case with e.g. * setters/getters).

47504. "-123456\0"

47505. Get the original arguments. Note that obj_index may be a relative * index so the stack must have the same top when we use it.

47506. curr value

47507. These are for rate limiting Status notifications and transport peeking.

47508. * Some E5/E5.1 algorithms require that array indices are iterated * in a strictly ascending order. This is the case for e.g. * Array.prototype.forEach() and JSON.stringify() PropertyList * handling. * * To ensure this property for arrays with an array part (and * arbitrary objects too, since e.g. forEach() can be applied * to an array), the caller can request that we sort the keys * here.

47509. DUK_USE_LEXER_SLIDING_WINDOW

47510. DUK_TOK_NULL

47511. * Must be careful to catch errors related to value stack manipulation * and property lookup, not just the call itself.

47512. The file/line arguments are NULL and 0, they're ignored by DUK_ERROR_RAW() * when non-verbose errors are used.

47513. **comment:** 8-byte format could be: * 1111 1111 10xx xxxx [41 bits] * * However, this format would not have a zero bit following the * leading one bits and would not allow 0xFF to be used as an * "invalid utf-8" marker for internal keys. Further, 8-byte * encodings (up to 41 bit code points) are not currently needed.
label: code-design

47514. -> [... obj value]

 label: code-design
47661. Read value pushed on stack.
47662. * When resizing the valstack, a mark-and-sweep may be triggered for * the allocation of the new valstack. If the mark-and-sweep needs * to use our thread for something, it may cause *the same valstack* to be resized recursively. This happens e.g. when mark-and-sweep * finalizers are called. This is taken into account carefully in * duk_resize_valstack(). ** 'new_size' is known to be <= valstack_max, which ensures that * size_t and pointer arithmetic won't wrap in duk_resize_valstack().
47663. 'null' enumerator case -> behave as with an empty enumerator
47664. Object literal set/get functions have a name (property * name) but must not have a lexical name binding, see * test-bug-getset-func-name.js.
47665. Current compiler state (if any), used for augmenting SyntaxErrors.
47666. push to stack
47667. Note: if DecimalLiteral starts with a '0', it can only be * followed by a period or an exponent indicator which starts * with 'e' or 'E'. Hence the if-check above ensures that * OctalIntegerLiteral is the only valid NumericLiteral * alternative at this point (even if y is, say, '9').
47668. 'catch'
47669. * Special cases like NaN and +/- Infinity are handled explicitly * because a plain C coercion from double to int handles these cases * in undesirable ways. For instance, NaN may coerce to INT_MIN * (not zero), and INT_MAX + 1 may coerce to INT_MIN (not INT_MAX). ** This double-to-int coercion differs from ToInteger() because it * has a finite range (ToInteger() allows e.g. +/- Infinity). It * also differs fromToInt32() because the INT_MIN/INT_MAX clamping * depends on the size of the int type on the platform. In particular, * on platforms with a 64-bit int type, the full range is allowed.
47670. element size shift: * 0 = u8/i8 * 1 = u16/i16 * 2 = u32/i32/float * 3 = double

47721. * Object's finalizer was executed on last round, and * object has been happily rescued.

47722. embed: 0 or 1 (false or true)

47723. Labels can be used for iteration statements but also for other statements, * in particular a label can be used for a block statement. All cases of a * named label accept a 'break' so that flag is set here. Iteration statements * also allow 'continue', so that flag is updated when we figure out the * statement type.

47724. string 2 of token (borrowed, stored to ctx->slot2_idx)

47725. UNARY EXPRESSIONS

47726. * Not found (even in global object). ** In non-strict mode this is a silent SUCCESS (!), see E5 Section 11.4.1, * step 3.b. In strict mode this case is a compile time SyntaxError so * we should not come here.

47727. should actually never happen, but check anyway

47728. input offset for window leading edge (not window[0])

47729. * Init object properties ** Properties should be added in decreasing order of access frequency. * (Not very critical for function templates.)

47730. [... fallback constructor fallback(this) arg1 ... argN]; * Note: idx_cons points to first 'fallback', not 'constructor'.

47731. **comment:** * Canonicalize a range, generating result ranges as necessary. * Needs to exhaustively scan the entire range (at most 65536 * code points). If 'direct' is set, caller (lexer) has ensured * that the range is already canonicalization compatible (this * is used to avoid unnecessary canonicalization of built-in * ranges like \W, which are not affected by canonicalization). ** NOTE: here is one place where we don't want to support chars * outside the BMP, because the exhaustive search would be * massively larger.
label: code-design

47732. continuation byte

47733. Note: the realloc may have triggered a mark-and-sweep which may * have resized our valstack internally. However, the mark-and-sweep * MUST NOT leave the stack bottom/top in a different state. Particular * assumptions and facts: * * - The thr->valstack pointer may be different after realloc, * and the offset between thr->valstack_end <-> thr->valstack * may have changed. * - The offset between thr->valstack_bottom <-> thr->valstack * and thr->valstack_top <-> thr->valstack MUST NOT have changed, * because mark-and-sweep must adhere to a strict stack policy. * In other words, logical bottom and top MUST NOT have changed. * - All values above the top are unreachable but are initialized * to UNDEFINED, up to the post-realloc valstack_end. * - 'old_end_offset' must be computed after realloc to be correct.

47734. Note: hstring is in heap but has refcount zero and is not strongly reachable. * Caller should increase refcount and make the hstring reachable before any * operations which require allocation (and possible gc).

47735. **comment:** * "name" is a non-standard property found in at least V8, Rhino, smjs. * For Rhino and smjs it is non-writable, non-enumerable, and non-configurable; * for V8 it is writable, non-enumerable, non-configurable. It is also defined * for an anonymous function expression in which case the value is an empty string. * We could also leave name 'undefined' for anonymous functions but that would * differ from behavior of other engines, so use an empty string. ** XXX: make optional? costs something per function.
label: code-design

47736. **comment:** * duk_hbuffer operations such as resizing and inserting/appending data to * a dynamic buffer. ** Append operations append to the end of the buffer and they are relatively * efficient: the buffer is grown with a "spare" part relative to the buffer * size to minimize reallocations. Insert operations need to move existing * data forward in the buffer with memmove() and are not very efficient. * They are used e.g. by the regexp compiler to "backpatch" regexp bytecode.
label: code-design

47737. steps 11.c.ii.1 - 11.c.ii.4, but our internal book-keeping * differs from the reference model

47864. XXX: Currently no inspection of threads, e.g. value stack, call * stack, catch stack, etc.

47865. [... v1(func) v2(pc+flags)]

47866. Matches both +0 and -0 on purpose.

47867. Note: ToPrimitive(object,hint) == [[DefaultValue]](object,hint), * so use [[DefaultValue]] directly.

47868. The code for writing reg_temps + 0 to the left hand side has already * been emitted.

47869. start line of token (first char)

47870. 10: getMonth

47871. If caller is global/eval code, 'caller' should be set to * 'null'. * * XXX: there is no exotic flag to infer this correctly now. * The NEWENV flag is used now which works as intended for * everything (global code, non-strict eval code, and functions) * except strict eval code. Bound functions are never an issue * because 'func' has been resolved to a non-bound function.

47872. x <- y

47873. eat 'var'

47874. cannot have >4G captures

47875. **comment:** not caught by current thread, thread terminates (yield error to resumer); * note that this may cause a cascade if the resumer terminates with an uncaught * exception etc (this is OK, but needs careful testing)

label: code-design

47876. normalize NaN which may not match our canonical internal NaN

47877. Recompute argument count: bound function handling may have shifted.

47878. [... key val] -> [...]

47879. minval

47880. if len_x == len_y == 0, buf_x and/or buf_y may * be NULL, but that's OK.

47881. DUK_TOK_ARSHIFT_EQ

47882. Slightly smaller code without explicit flag, but explicit flag * is very useful when 'cлен' is dropped.

47883. Here again we parse bytes, and non-ASCII UTF-8 will cause end of * parsing (which is correct except if there are non-shortest encodings). * There is also no need to check explicitly for end of input buffer as * the input is NUL padded and NUL will exit the parsing loop. * * Because no unescaping takes place, we can just scan to the end of the * plain string and intern from the input buffer.

47884. **comment:** XXX: merge this with duk_js_call.c, as this function implements * core semantics (or perhaps merge the two files altogether).

label: code-design

47885. * New length lower than old length => delete elements, then * update length. * * Note: even though a bunch of elements have been deleted, the 'desc' is * still valid as properties haven't been resized (and entries compacted).

47886. * Program code (global and eval code) has an implicit return value * from the last statement value (e.g. eval("1; 2+3;") returns 3). * This is not the case with functions. If implicit statement return * value is requested, all statements are coerced to a register * allocated here, and used in the implicit return statement below.

47887. * Pass 1

47888. Use unsigned arithmetic to optimize comparison.

47889. type and control flags, label number

47890. DUK_TOK_RSHIFT_EQ

47891. probe steps (see genhashsizes.py), currently assumed to be 32 entries long * (DUK_UTIL_GET_HASH_STEP macro).

47892. [... enum_target res trap_result]

47893. 1111 1110 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx [36 bits]

47894. * Conversions and coercions * * The conversion/coercions are in-place operations on the value stack. * Some operations are implemented here directly, while others call a * helper in duk_js_ops.c after validating arguments.

47895. **comment:** Select a thread for mark-and-sweep use. * * XXX: This needs to change later.

label: code-design

47917. * A tiny random number generator. * * Currently used for Math.random(). * * <http://www.woodmann.com/forum/archive/index.php/t-3100.html>

47918. 'func' on stack (borrowed reference)

47919. **comment:** * "prototype" is, by default, a fresh object with the "constructor" * property. * * Note that this creates a circular reference for every function * instance (closure) which prevents refcount-based collection of * function instances. * * XXX: Try to avoid creating the default prototype object, because * many functions are not used as constructors and the default * prototype is unnecessary. Perhaps it could be created on-demand * when it is first accessed?

label: code-design

47920. -> [... val this]

47921. **comment:** code emission temporary

label: code-design

47922. * TypedArray.prototype.set() * * TypedArray set() is pretty interesting to implement because: * * - The source argument may be a plain array or a typedarray. If the * source is a TypedArray, values are decoded and re-encoded into the * target (not as a plain byte copy). This may happen even when the * element byte size is the same, e.g. integer values may be re-encoded * into floats. * * - Source and target may refer to the same underlying buffer, so that * the set() operation may overlap. The specification requires that this * must work as if a copy was made before the operation. Note that this * is NOT a simple memmove() situation because the source and target * byte sizes may be different -- e.g. a 4-byte source (Int8Array) may * expand to a 16-byte target (Uint32Array) so that the target overlaps * the source both from beginning and the end (unlike in typical memmove). * * - Even if 'buf' pointers of the source and target differ, there's no * guarantee that their memory areas don't overlap. This may be the * case with external buffers. * * Even so, it is nice to optimize for the common case: * * - Source and target separate buffers or non-overlapping. * * - Source and target have a compatible type so that a plain byte copy * is possible. Note that while e.g. uint8 and int8 are compatible

* (coercion one way or another doesn't change the byte representation), * e.g. int8 and uint8clamped are NOT compatible when writing int8 * values into uint8clamped typedarray (-1 would clamp to 0 for instance). ** See test-bi-typedarray-proto-set.js.

47923. (quotient-remainder (* r B) s) using a dummy subtraction loop

47924. Note: either pointer may be NULL (at entry), so don't assert

47925. String-number-buffer/object -> coerce object to primitive (apparently without hint), then try again.

47926. * Property handling ** The API exposes only the most common property handling functions. * The caller can invoke EcmaScript built-ins for full control (e.g. * defineProperty, getOwnPropertyDescriptor).

47927. Format of magic, bits: * 0...1: elem size shift (0-3) * 2...5: elem type (DUK_HBUFFEROBJECT_ELEM_xxx)

47928. **comment:** Slow gathering of value using either 64-bit arithmetic * or IEEE doubles if 64-bit types not available. Handling * of negative numbers is a bit non-obvious in both cases.

label: code-design

47929. Built-in 'name' is not writable by default. Function '.name' * is writable to allow user code to set a '.name' on a native * function.

48071. Must match src/extract_chars.py, generate_match_table3().
48072. Resize target buffer for requested size. Called by the macro only when the * fast path test (= there is space) fails.
48073. Ready to make the copy. We must proceed element by element * and must avoid any side effects that might cause the buffer * validity check above to become invalid. * * Although we work through the value stack here, only plain * numbers are handled which should be side effect safe.
48074. **comment:** * Compared to a direct macro expansion this wrapper saves a few * instructions because no heap dereferencing is required.
label: code-design
48075. Force pause if we were doing "step into" in another activation.
48076. allow fmt==NULL
48077. **comment:** * Relocate property allocation, moving properties to the new allocation. * * Includes key compaction, rehashing, and can also optionally abandoning * the array part, 'migrating' array entries into the beginning of the * new entry part. Arguments are not validated here, so e.g. new_h_size * MUST be a valid prime. * * There is no support for in-place reallocation or just compacting keys * without resizing the property allocation. This is intentional to keep * code size minimal. * * The implementation is relatively straightforward, except for the array * abandonment process. Array abandonment requires that new string keys * are interned, which may trigger GC. All keys interned so far must be * reachable for GC at all times; valstack is used for that now. * * Also, a GC triggered during this reallocation process must not interfere * with the object being resized. This is currently controlled by using * heap->mark_and_sweep_base_flags to indicate that no finalizers will be * executed (as they can affect ANY object) and no objects are compacted * (it would suffice to protect this particular object only, though). * * Note: a non-checked variant would be nice but is a bit tricky to * implement for the array abandonment process. It's easy for * everything else. * * Note: because we need to potentially resize the valstack (as part * of abandoning the array part), any tval pointers to the valstack * will become invalid after this call.

 label: code-design
48145. * Variant 1 or 3
48146. 'enumerable'
48147. **comment:** * There are two [[Construct]] operations in the specification: * * - E5 Section 13.2.2: for Function objects * - E5 Section 15.3.4.5.2: for "bound" Function objects * * The chain of bound functions is resolved in Section 15.3.4.5.2, * with arguments "piling up" until the [[Construct]] internal * method is called on the final, actual Function object. Note * that the "prototype" property is looked up *only* from the * final object, *before* calling the constructor. * * Currently we follow the bound function chain here to get the * "prototype" property value from the final, non-bound function. * However, we let duk_handle_call() handle the argument "piling" * when the constructor is called. The bound function chain is * thus now processed twice. * * When constructing new Array instances, an unnecessary object is * created and discarded now: the standard [[Construct]] creates an * object, and calls the Array constructor. The Array constructor * returns an Array instance, which is used as the result value for * the "new" operation; the object created before the Array constructor * call is discarded. * * This would be easy to fix, e.g. by knowing that the Array constructor * will always create a replacement object and skip creating the fallback * object in that case. * * Note: functions called via "new" need to know they are called as a * constructor. For instance, built-in constructors behave differently * depending on how they are called.

48244. regexp compiler should catch these

48245. **comment:** Current 'this' binding is the value just below idx_bottom. * Previously, 'this' binding was handled with an index to the * (calling) valstack. This works for everything except tail * calls, which must not "cumulate" valstack temps.
label: code-design

48246. * ctx->prev_token token to process with duk__expr_nud() * ctx->curr_token updated by caller * * Note: the token in the switch below has already been eaten.
48247. -> [... voidp true]

48248. The E5.1 specification does not seem to allow IdentifierPart characters * to be used as identity escapes. Unfortunately this includes '\$', which * cannot be escaped as '\\$'; it needs to be escaped e.g. as '\u0024'. * Many other implementations (including V8 and Rhino, for instance) do * accept '\$' as a valid identity escape, which is quite pragmatic. * See: test-regexp-identity-escape-dollar.js.

48249. mp < b^e+1)

48250. * Debugger handling for executor restart * * Check for breakpoints, stepping, etc, and figure out if we should execute * in checked or normal mode. Note that we can't do this when an activation * is created, because breakpoint status (and stepping status) may change * later, so we must recheck every time we're executing an activation. * This primitive should be side effect free to avoid changes during check.

48251. at most sizeof(buf) - 1

48252. val

48253. Old solution: don't iterate, incorrect

48254. * API calls related to general value stack manipulation: resizing the value * stack, pushing and popping values, type checking and reading values, * coercing values, etc. * * Also contains internal functions (such as duk_get_tval()), defined * in duk_api_internal.h, with semantics similar to the public API.

48255. No BC shuffling now.

48256. syntactically left-associative but parsed as right-associative

48257. * Local result type for duk__get_identifier_reference() lookup.

48258. **comment:** XXX: would be nice to enumerate an object at specified index
label: code-design

48259. ''

48260. * Heap stringtable handling, string interning.

48261. By default the global object is read-only which is often much * more of an issue than having read-only built-in objects (like * RegExp, Date, etc). Use a RAM-based copy of the global object * and the global environment object for convenience.

48262. Creation time error augmentation

48263. The casts through duk_intr_pt is to avoid the following GCC warning: * * warning: cast from pointer to integer of different size [-Wpointer-to-int-cast] * * This still generates a /Wp64 warning on VS2010 when compiling for x86.

48264. **comment:** * Note: currently register bindings must be fixed for the entire * function. So, even though the catch variable is in a register * we know, we must use an explicit environment record and slow path * accesses to read/write the catch binding to make closures created * within the catch clause work correctly. This restriction should * be fixable (at least in common cases) later. * * See: test-bug-catch-binding-2.js. * * XXX: improve to get fast path access to most catch clauses.
label: code-design

48265. check that byte has the form 10xx xxxx

48266. * Memory constants

48267. return 'res' (of right part) as our result

48268. -> [func funcname env]

48269. this variant is used when an assert would generate a compile warning by * being always true (e.g. >= 0 comparison for an unsigned value

48270. Stringcache is used for speeding up char-offset-to-byte-offset * translations for non-ASCII strings.

48271. **comment:** Note: strictness is *not* inherited from the current Duktape/C. * This would be confusing because the current strictness state * depends on whether we're running inside a Duktape/C activation * (= strict mode) or outside of any activation (= non-strict mode). * See tests/api/test-eval-strictness.c for more discussion.
label: code-design

48272. * Finalizer check. * * Note: running a finalizer may have arbitrary side effects, e.g. * queue more objects on refzero_list (tail), or even trigger a * mark-and-sweep. * * Note: quick reject check should match vast majority of * objects and must be safe (not throw any errors, ever).

48273. Get Proxy target object. If the argument is not a Proxy, return it as is. * If a Proxy is revoked, an error is thrown.

48274. * Assertion helpers.

48275. is_setget

48276. * Compute new alloc size and alloc new area. * * The new area is allocated as a dynamic buffer and placed into the * valstack for reachability. The actual buffer is then detached at * the end. * * Note: heap_mark_and_sweep_base_flags are altered here to ensure * no-one touches this object while we're resizing and rehashing it. * The flags must be reset on every exit path after it. Finalizers * and compaction is prevented currently for all objects while it * would be enough to restrict it only for the current object.

48277. replacer function

48278. [...]

48279. **comment:** remove the string (mark DELETED), could also call * duk_heap_string_remove() but that would be slow and * pointless because we already know the slot.

48352. initjs data is NUL terminated
48353. this.raw(buffer)
48354. return h_bufres
48355. Here we rely on duk_hstring instances always being zero * terminated even if the actual string is not.
48356. Must coerce key: if key is an object, it may coerce to e.g. 'length'.
48357. -> [... regexp_instance]
48358. Final result is at stack top.
48359. Strict equality is NOT enough, because we cannot use the same * constant for e.g. +0 and -0.
48360. right exists, [[Put]] regardless whether or not left exists
48361. * Return target object.
48362. reuse 'res' as 'left'
48363. st_used remains the same, DELETED is counted as used
48364. is_join
48365. binding power must be high enough to NOT allow comma expressions directly
48366. Note: these variables must reside in 'curr_func' instead of the global * context: when parsing function expressions, expression parsing is nested.
48367. Abandon array part, moving array entries into entries part. * This requires a props resize, which is a heavy operation. * We also compact the entries part while we're at it, although * this is not strictly required.
48368. _Formals
48369. base of known return values
48370. TimeClip(), which also handles Infinity -> NaN conversion
48371. [... obj]
48372. Encoding endianness must match target memory layout, * build scripts and genbuiltins.py must ensure this.

48373. flags used for property attributes in duk_propdesc and packed flags
48374. directly uses slow accesses
48375. * Finalizer torture. Do one fake finalizer call which causes side effects * similar to one or more finalizers on actual objects.
48376. add AC*2^32
48377. result: updated refcount
48378. Entry level info.
48379. catch depth from current func
48380. indexOf: clamp fromIndex to [-len, len] * (if fromIndex == len, for-loop terminates directly) * * lastIndexOf: clamp fromIndex to [-len - 1, len - 1] * (if clamped to -len-1 -> fromIndex becomes -1, terminates for-loop directly)
48381. decoding
48382. inline initializer for coercers[] is not allowed by old compilers like BCC
48383. * Create normalized 'source' property (E5 Section 15.10.3).
48384. variable access
48385. Double casting for pointer to avoid gcc warning (cast from pointer to integer of different size)
48386. **comment:** XXX: refactor out?
 label: code-design
48387. same for both error and each subclass like TypeError
48388. [...] res_obj re_obj input bc saved_buf]
48389. B -> register for writing enumerator object * C -> value to be enumerated (register)
48390. entire string is whitespace
48391. 'multiline'
48392. '+'
48393. * Parse an identifier and then check whether it is: * - reserved word (keyword or other reserved word) * - "null" (NullLiteral) * - "true" (BooleanLiteral) * - "false" (BooleanLiteral) * - anything else => identifier * * This does not follow the E5 productions cleanly, but is * useful and compact. * * Note that identifiers may contain Unicode escapes, * see E5 Sections 6 and 7.6. They must be decoded first, * and the result checked against allowed characters. * The above if-clause accepts an identifier start and an * '\ character -- no other token can begin with a '\'. * * Note that "get" and "set" are not reserved words in E5 * specification so they are recognized as plain identifiers * (the tokens DUK_TOK_GET and DUK_TOK_SET are actually not * used now). The compiler needs to work around this. * * Strictly speaking, following Ecmascript longest match * specification, an invalid escape for the first character * should cause a syntax error. However, an invalid escape * for IdentifierParts should just terminate the identifier * early (longest match), and let the next tokenization * fail. For instance Rhino croaks with 'foo\z' when * parsing the identifier. This has little practical impact.
48394. 'lineNumber'
48395. refer to callstack entries below current
48396. statement parsing
48397. **comment:** Pick a destination register. If either base value or key * happens to be a temp value, reuse it as the destination. * * XXX: The temp must be a "mutable" one, i.e. such that no * other expression is using it anymore. Here this should be * the case because the value of a property access expression * is neither the base nor the key, but the lookup result.
 label: code-design
48398. Property access expressions are critical for correct LHS ordering, * see comments in duk__expr()
48399. ignore retval -> [key]
48400. %ld
48401. * Octal escape or zero escape: * \0 (lookahead not DecimalDigit) * \1 ... \7 (lookahead not DecimalDigit) * \ZeroToThree OctalDigit (lookahead not DecimalDigit) * \FourToSeven OctalDigit (no lookahead restrictions) * \ZeroToThree OctalDigit OctalDigit (no lookahead restrictions) * * Zero escape is part of the standard syntax. Octal escapes are * defined in E5 Section B.1.2, and are only allowed in non-strict mode. * Any other productions starting with a decimal digit are invalid.
48402. **comment:** XXX: for Object.keys() the [[OwnPropertyKeys]] result (trap result) * should be filtered so that only enumerable keys remain. Enumerability * should be checked with [[GetOwnProperty]] on the original object * (i.e., the proxy in this case). If the proxy has a getOwnPropertyDescriptor * trap, it should be triggered for every property. If the proxy doesn't have * the trap, enumerability should be checked against the target object instead. * We don't do any of this now, so Object.keys() and Object.getOwnPropertyNames() * return the same result now for proxy traps. We still do clean up the trap * result, so that Object.keys() and Object.getOwnPropertyNames() will return a * clean array of strings without gaps.
 label: code-design
48403. syntax error
48404. don't push value
48405. 'buffer'
48406. inherit initial strictness from parent
48407. module
48408. Without tracebacks the concrete .fileName and .lineNumber need * to be added directly.
48409. not emergency
48410. * Raw memory calls: relative to heap, but no GC interaction
48411. Lookup 'key' from arguments internal 'map', perform a variable lookup * if mapped, and leave the result on top of stack (and return non-zero). * Used in E5 Section 10.6 algorithms [[Get]] and [[GetOwnProperty]].
48412. Evaluate RHS only when LHS is safe.
48413. debugger detach; used to avoid calling detach handler recursively
48414. no catchers
48415. * Variant 4
48416. 'package'
48417. nothing now
48418. * Reset trigger counter
48419. * Preliminaries
48420. count is already incremented, take into account
48421. **comment:** * Setters. * * Setters are a bit more complicated than getters. Component setters * break down the current time value into its (normalized) component * parts, replace one or more components with -unnormalized- new values, * and the components are then converted back into a time value. As an * example of using unnormalized values: * * var d = new Date(1234567890); * * is equivalent to: * * var d = new Date(0); * d.setUTCMilliseconds(1234567890); * * A shared native helper to provide almost all setters. Magic value * contains a set of flags and also packs the "maxnargs" argument. The * helper provides: * * setMilliseconds() * setUTCMilliseconds() * setSeconds() * setUTCSeconds() * setMinutes() * setUTCMinutes() * setHours() * setUTCHours() * setDate() * setUTCDate() * setMonth() * setUTCMonth() * setFullYear() * setUTCFullYear() * setYear() * * Notes: * * - Date.prototype.setYear() (Section B addition): special year check * is omitted. NaN / Infinity will just flow through and ultimately * result in a NaN internal time value. * * - Date.prototype.setYear() does not have optional arguments for * setting month and day-in-month (like setFullYear()), but we indicate * 'maxnargs' to be 3 to get the year written to the correct component * index in duk__set_part_helper(). The function has nargs == 1, so only * the year will be set regardless of actual argument count.

48627. A -> target reg * BC -> inner function index

48628. refcount code is processing refzero list

48629. [...] retval]; popped below

48630. 0x80...0x8f

48631. Get current EcmaScript time (= UNIX/Posix time, but in milliseconds).

48632. Note: all references inside 'data' need to get their refcounts * upped too. This is the case because refcounts are decreased * through every function referencing 'data' independently.

48633. **comment:** NOTE: level is used only by the debugger and should never be present * for an EcmaScript eval().

label: code-design

48634. entry_top + 1
48635. Set datetime parts from stack arguments, defaulting any missing values. * Day-of-week is not set; it is not required when setting the time value.
48636. * ToBoolean() (E5 Section 9.2)
48637. * Shift to new valstack_bottom.
48638. 0 = don't push current value
48639. "." is not accepted in any format
48640. tmp -> res
48641. [body formals source]
48642. **comment:** XXX: for simple cases like x['y'] an unnecessary LDREG is * emitted for the base value; could avoid it if we knew that * the key expression is safe (e.g. just a single literal).
label: code-design
48643. Other initial bytes.
48644. Similar to String comparison.
48645. Finally, blame the innermost callstack entry which has a *.fileName property.
48646. skip finalizers; queue finalizable objects to heap_allocated
48647. Note that duk_exptrtop() here can clobber any reg above current temp_next, * so any loop variables (e.g. enumerator) must be "preallocated".
48648. * Parse a statement list. ** Handles automatic semicolon insertion and implicit return value. ** Upon entry, 'curr_tok' should contain the first token of the first * statement (parsed in the "allow regexp literal" mode). Upon exit, * 'curr Tok' contains the token following the statement list terminator * (EOF or closing brace).
48649. fixed top level hashtable size (separate chaining)
48650. not present
48651. end marker
48652. handle negative values
48653. invalidated by pushes, so get out of the way
48654. h is NULL for lightfunc
48655. * Error throwing
48656. Non-buffer value is first ToString() coerced, then converted * to a buffer (fixed buffer is used unless a dynamic buffer is * explicitly requested).
48657. **comment:** unused: not accepted in inbound messages
label: code-design
48658. Reuse buffer as is unless buffer has grown large.
48659. Offset is coerced first to signed integer range and then to unsigned. * This ensures we can add a small byte length (1-8) to the offset in * bound checks and not wrap.
48660. internal align target for props allocation, must be 2*n for some n
48661. Set timeval to 'this' from dparts, push the new time value onto the * value stack and return 1 (caller can then tail call us). Expects * the value stack to contain 'this' on the stack top.
48662. target
48663. DUK_FLD_FLOAT
48664. XXX: shared helper fortoFixed(), toExponential(), toPrecision()
48665. **comment:** Run an duk_hobject finalizer. Used for both reference counting * and mark-and-sweep algorithms. Must never throw an error. ** There is no return value. Any return value or error thrown by * the finalizer is ignored (although errors are debug logged). ** Notes: ** - The thread used for calling the finalizer is the same as the * 'thr' argument. This may need to change later. ** - The finalizer thread 'top' assertions are there because it is * critical that strict stack policy is observed (i.e. no cruft * left on the finalizer stack).
label: code-design
48666. -> x in [0, 2**32[
48667. rethrow original error
48668. '\uffThis'
48669. Round up digits to a given position. If position is out-of-bounds, * does nothing. If carry propagates over the first digit, a '1' is * prepended to digits and 'k' will be updated. Return value indicates * whether carry propagated over the first digit. ** Note that nc_ctx->count is NOT updated based on the rounding position * (it is updated only if carry overflows over the first digit and an * extra digit is prepended).
48670. Check if any lookup above had a negative result.
48671. DUK_USE_DEBUGGER_SUPPORT
48672. * For/for-in main variants are: ** 1. for (ExpressionNoIn_opt; Expression_opt; Expression_opt) Statement * 2. for (var VariableDeclarationNoIn; Expression_opt; Expression_opt) Statement * 3. for (LeftHandSideExpression in Expression) Statement * 4. for (var VariableDeclarationNoIn in Expression) Statement ** Parsing these without arbitrary lookahead or backtracking is relatively * tricky but we manage to do so for now. ** See doc/compiler.rst for a detailed discussion of control flow * issues, evaluation order issues, etc.
48673. The specification is a bit vague what to do if the return * value is not a number. Other implementations seem to * tolerate non-numbers but e.g. V8 won't apparently do a * ToNumber().
48674. DUK_TOK_SUB_EQ
48675. * Do a longjmp call, calling the fatal error handler if no * catchpoint exists.
48676. Fixed header info.
48677. nothing to finalize
48678. throw flag irrelevant (false in std alg)
48679. **comment:** This approach is a bit shorter than a straight * if-else-ladder and also a bit faster.
label: code-design
48680. All lightfunc own properties are non-writable and the lightfunc * is considered non-extensible. However, the write may be captured * by an inherited setter which means we can't stop the lookup here.
48681. name
48682. accept string if next char is NUL (otherwise reject)
48683. * "WhiteSpace" production check.
48684. value1 -> yield value, iserror -> error / normal
48685. Number of characters that the atom matches (e.g. 3 for 'abc'), * -1 if atom is complex and number of matched characters either * varies or is not known.
48686. **comment:** 'funcs' is quite rarely used, so no local for it
label: code-design
48687. reachable so pop OK
48688. may be NULL, too
48689. No entry in the catchstack which would actually catch a * throw can refer to the callstack entry being reused. * There *can* be catchstack entries referring to the current * callstack entry as long as they don't catch (e.g. label sites).
48690. * Heap creation and destruction
48691. [... regexp_object escaped_source]
48692. now expected to fit into a 32-bit integer
48693. Duktape.modSearch(resolved_id, fresh_require, exports, module).
48694. bits 0...1: shift
48695. Architecture, OS, and compiler strings
48696. overflow
48697. must fit into duk_small_int_t
48698. 'continue'
48699. 'value'
48700. Non-critical.
48701. **comment:** XXX: tail call: return duk_push_false(ctx)

label: code-design

48702. **comment:** * Sweep garbage and remove marking flags, and move objects with * finalizers to the finalizer work list. ** Objects to be swept need to get their refcounts finalized before * they are swept. In other words, their target object refcounts * need to be decreased. This has to be done before freeing any * objects to avoid decreffing dangling pointers (which may happen * even without bugs, e.g. with reference loops) ** Because strings don't point to other heap objects, similar * finalization is not necessary for strings.

label: code-design

48703. Note: target registers a and a+1 may overlap with DUK__REGCONSTP(b) * and DUK__REGCONSTP(c). Careful here.

48704. DUK_USE_DATE_NOW_GETTIMEOFDAY

48705. **comment:** XXX: what's the safest way of creating a negative zero?

label: code-design

48706. **comment:** XXX: several nice-to-have improvements here: * - Use direct reads avoiding value stack operations * - Avoid triggering getters, indicate getter values to debug client * - If side effects are possible, add error catching

label: code-design

48707. ptr may be NULL

48708. E5 Sections 15.10.2.8, 7.3

48709. Target must be stored so that we can recheck whether or not * keys still exist when we enumerate. This is not done if the * enumeration result comes from a proxy trap as there is no * real object to check against.

48710. * Note: currently no fast path for array index writes. * They won't be possible anyway as strings are immutable.

48711. Important to do a fastint check so that constants are * properly read back as fastints.

48712. remove artificial bump

48713. important to use normalized NaN with 8-byte tagged types

48714. Only objects in heap_allocated may have finalizers. Check that * the object itself has a _Finalizer property (own or inherited) * so that we don't execute finalizers for e.g. Proxy objects.

48715. crossed offsets or zero size

48716. [... escaped_source bytecode]

48717. * E5 Section 11.4.8

48718. * Manipulate valstack so that args are on the current bottom and the * previous caller's 'this' binding (which is the value preceding the * current bottom) is replaced with the new 'this' binding: * * [... this_old | (crud) func this_new arg1 ... argN] * --> [... this_new | arg1 ... argN] * * For tail calling to work properly, the valstack bottom must not grow * here; otherwise crud would accumulate on the valstack.

48719. * ToInteger() (E5 Section 9.4)

48720. invalidates tv

48721. * Fatal error * * There are no fatal error macros at the moment. There are so few call * sites that the fatal error handler is called directly.

48722. num_stack_args

48723. property is virtual: used in duk_propdesc, never stored * (used by e.g. buffer virtual properties)

48724. '\xffVarmap'

48725. Compute (extended) utf-8 length without codepoint encoding validation, * used for string interning. ** NOTE: This algorithm is performance critical, more so than string hashing * in some cases. It is needed when interning a string and needs to scan * every byte of the string with no skipping. Having an ASCII fast path * is useful if possible in the algorithm. The current algorithms were * chosen from several variants, based on x64 gcc -O2 testing. See: * <https://github.com/svaarala/duktape/pull/422> * * NOTE: must match src/dukutil.py:duk_unicode_unvalidated_utf8_length().

48726. Only allow Duktape.Buffer when support disabled.

48727. * Digit generation loop. * * Different termination conditions: * * 1. Free format output. Terminate when shortest accurate * representation found. * * 2. Fixed format output, with specific number of digits. * Ignore termination conditions, terminate when digits * generated. Caller requests an extra digit and rounds. * * 3. Fixed format output, with a specific absolute cut-off * position (e.g. 10 digits after decimal point). Note * that we always generate at least one digit, even if * the digit is below the cut-off point already.

48728. number of digits changed

48729. **comment:** re-lookup to update curr.flags * XXX: would be faster to update directly

label: code-design

48730. * Heap Buffer object representation. Used for all Buffer variants.

48731. **comment:** Note: reuse variables

label: code-design

48732. _Varmap

48733. = 1 + arg count

48734. * Tables generated with src/gennumdigits.py. * * duk__str2num_digits_for_radix indicates, for each radix, how many input * digits should be considered significant for string-to-number conversion. * The input is also padded to this many digits to give the Dragon4 * conversion enough (apparent) precision to work with. * * duk__str2num_exp_limits indicates, for each radix, the radix-specific * minimum/maximum exponent values (for a Dragon4 integer mantissa) * below and above which the number is guaranteed to underflow to zero * or overflow to Infinity. This allows parsing to keep bigint values * bounded.

48735. 'case'

48736. num_pairs and temp_start reset at top of outer loop

48737. Because size > 0, NULL check is correct

48738. 17: getUTCHours

48739. [... enum] -> [... next_key]

48740. * ===== * Duktape license * ===== * * (<http://opensource.org/licenses/MIT>) * * Copyright (c) 2013-2017 by Duktape authors (see AUTHORS.rst) * * Permission is hereby granted, free of charge, to any person obtaining a copy * of this software and associated documentation files (the "Software"), to deal * in the Software without restriction, including without limitation the rights * to use, copy, modify, merge, publish, distribute, sublicense, and/or sell * copies of the Software, and to permit persons to whom the Software is * furnished to do so, subject to the following conditions: * * The above copyright notice and this permission notice shall be included in * all copies or substantial portions of the Software. * * THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR * IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, * FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. 48741. Encode to CESU-8; 'out' must have space for at least * DUK_UNICODE_MAX_CESU8_LENGTH bytes; codepoints above U+10FFFF * will encode to garbage but won't overwrite the output buffer.

48742. if density < L, abandon array part, L = 3-bit fixed point, e.g. 2 -> 2/8 = 25%

48743. * Finalize stack

48744. Only a reg fits into 'A' so coerce 'res' into a register * for PUTVAR. ** XXX: here the current A/B/C split is suboptimal: we could * just use 9 bits for reg_res (and support constants) and 17 * instead of 18 bits for the varname const index.

48745. * Helper for setting up var_env and lex_env of an activation, * assuming it does NOT have the DUK_HOBJECT_FLAG_NEWENV flag.

48746. no need for 'caller' post-check, because 'key' must be an array index

48747. [arg undefined]

48748. "

48749. * String-to-number conversion

48750. We can't shortcut zero here if it goes through special formatting * (such as forced exponential notation).

48751. 0x10...0x1f

48752. Main operation

48753. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8CLAMPED * Note: INT8 is -not- copy compatible, e.g. -1 would coerce to 0x00.

48754. invalidated

48755. DUK_USE_CPP_EXCEPTIONS

48756. max(incl)

48757. * Arguments objects have exotic [[DefineOwnProperty]] which updates * the internal 'map' of arguments for writes to currently mapped * arguments. More concretely, writes to mapped arguments generate * a write to a bound variable. * * The [[Put]] algorithm invokes [[DefineOwnProperty]] for existing * data properties and new properties, but not for existing accessors. * Hence, in E5 Section 10.6 ([[DefinedOwnProperty]] algorithm), we * have a Desc with 'Value' (and possibly other properties too), and * we end up in step 5.b.i.

48758. A top-level assignment is e.g. "x = y". For these it's safe * to use the RHS as-is as the expression value, even if the RHS * is a reg-bound identifier. The RHS ('res') is right associative * so it has consumed all other assignment level operations; the * only relevant lower binding power construct is comma operator * which will ignore the expression value provided here. Usually * the top level assignment expression value is ignored, but it * is relevant for e.g. eval code.

48759. **comment:** XXX: use helper for size optimization
label: code-design

48760. 'ignoreCase'

48761. Note: env_thr != thr is quite possible and normal, so careful * with what thread is used for valstack lookup.

48762. frozen and sealed

48763. tv -> value just before prev top value; must relookup

48764. * Found existing inherited plain property. * Do an access control check, and if OK, write * new property to 'orig'.

48765. initial estimate for ASCII only codepoints

48766. Parser separator masks.

48767. just in case callback is broken and won't write 'x'

48768. **comment:** NEXTENUM needs a jump slot right after the main opcode. * We need the code emitter to reserve the slot: if there's * target shuffling, the target shuffle opcodes must happen * after the jump slot (for NEXTENUM the shuffle opcodes are * not needed if the enum is finished).
label: code-design

48769. then to a register

48770. retval to result[i]

48771. Sanity limit on max number of properties (allocated, not necessarily used). * This is somewhat arbitrary, but if we're close to 2**32 properties some * algorithms will fail (e.g. hash size selection, next prime selection). * Also, we use negative array/entry table indices to indicate 'not found', * so anything above 0x80000000 will cause trouble now.

48772. expect EOF instead of }

48773. resizing parameters

48774. value from target

48775. this is especially critical to avoid another write call in detach1()

48776. **comment:** Stripping the filename might be a good idea * ("foo/bar/quux.js" -> logger name "quux"), * but now used verbatim.
label: code-design

48777. return the argument object

48778. new buffer of specified size

48779. * Conversion helpers

48780. %x; only 16 bits are guaranteed

48781. mix-in value for computing string hashes; should be reasonably unpredictable

48782. 'debug'

48783. keep default instance

48784. Make buffer compact, matching current written size.

48785. explicit semi follows

48786. * Packed 8-byte representation

48787. **comment:** XXX: currently no handling for non-allowed identifier characters, * e.g. a '{' in the function name.
label: code-design

48788. No support for lvalues returned from new or function call expressions. * However, these must NOT cause compile-time SyntaxErrors, but run-time * ReferenceErrors. Both left and right sides of the assignment must be * evaluated before throwing a ReferenceError. For instance: * * f() = g(); * * must result in f() being evaluated, then g() being evaluated, and * finally, a ReferenceError being thrown. See E5 Section 11.13.1.

48789. **comment:** XXX: awkward helpers
label: code-design

48790. advance, expecting current token to be a specific token; parse next token in regexp context

48791. stack prepped for func call: [... trap handler]

48792. '{"_nan":true}'

48793. tagged null pointers should never occur

48794. * Heap header definition and assorted macros, including ref counting. * Access all fields through the accessor macros.

48795. * Finally, longjmp

48796. e.g. DUK_OP_POSTINCP

48797. Allow leading minus sign

48798. copy to buffer with spare to avoid Valgrind gripes from strftime

48799. throw

48800. 4: toLocaleDateString

48801. eat 'with'

48802. [... this func]

48803. setters

48804. step 4.c

48805. Note: cannot assume that a non-zero return value of signbit() would * always be the same -- hence cannot (portably) use something like: * * signbit(x) == signbit(y)

48806. check func supports [[HasInstance]] (this is checked for every function * in the bound chain, including the final one)

48807. There is no need to NUL delimit the sscanf() call: trailing garbage is * ignored and there is always a NUL terminator which will force an error * if no error is encountered before it. It's possible that the scan * would scan further than between [js_ctx->p,p[though and we'd advance * by less than the scanned value. * * Because pointers are platform specific, a failure to scan a pointer * results in a null pointer which is a better placeholder than a missing * value or an error.

48808. **comment:** XXX: relocate
label: code-design

48809. match fail

48810. * Make a value copy of the input val. This ensures that * side effects cannot invalidate the pointer.

48811. DUK_USE_DATE_TZO_GMTIME

48812. Treat like debugger statement: nop

48813. Get valstack index for the func argument or throw if insane stack.

48814. **comment:** 'd3' is never NaN, so no need to normalize
label: code-design

48815. XXX: push_uint_string / push_u32_string

48816. return value from Duktape.Thread.resume()

48817. For the case n==1 Node.js doesn't seem to type check * the sole member but we do it before returning it. * For this case only the original buffer object is * returned (not a copy).

48818. end of loop (careful with len==0)

48819. Result is always fastint compatible.

48820. Handle a BREAK/CONTINUE opcode. Avoid using longjmp() for BREAK/CONTINUE * handling because it has a measurable performance impact in ordinary * environments and an extreme impact in Emscripten (GH-342).

48821. DUK_TOK_TRY

48822. Optional UTC conversion.

48823. 6
48824. [requested_id require require.id resolved_id last_comp Duktape Duktape.modLoaded undefined fresh_require exports module]
48825. provideThis=false
48826. * Self test main
48827. prototype is lex_env before catcher created
48828. ToInteger() coercion; NaN -> 0, infinities are clamped to 0 and 10
48829. Keep throwing an error whenever we get here. The unusual values * are set this way because no instruction is ever executed, we just * throw an error until all try/catch/finally and other catchpoints * have been exhausted. Duktape/C code gets control at each protected * call but whenever it enters back into Duktape the RangeError gets * raised. User exec timeout check must consistently indicate a timeout * until we've fully bubbled out of Duktape.
48830. tc1 = true, tc2 = false
48831. no need to handle thread state book-keeping here
48832. Not found. Empty string case is handled specially above.
48833. 4 low bits
48834. **comment:** XXX: option to pretend property doesn't exist if sanity limit is * hit might be useful.
label: code-design
48835. Use explicit steps in computation to try to ensure that * computation happens with intermediate results coerced to * double values (instead of using something more accurate). * E.g. E5.1 Section 15.9.1.11 requires use of IEEE 754 * rules (= Ecmascript 'l' and '**' operators). ** Without 'volatile' even this approach fails on some platform * and compiler combinations. For instance, gcc 4.8.1 on Ubuntu * 64-bit, with -m32 and without -std=c99, test-bi-date-canceling.js * would fail because of some optimizations when computing tmp_time * (MakeTime below). Adding 'volatile' to tmp_time solved this * particular problem (annoyingly, also adding debug prints or * running the executable under valgrind hides it).
48836. **comment:** Smaller heapdr than for other objects, because strings are held * in string intern table which requires no link pointers. Much of * the 32-bit flags field is unused by flags, so we can stuff a 16-bit * field in there.
label: code-design
48837. **comment:** Delete semantics are a bit tricky. The description in E5 specification * is kind of confusing, because it distinguishes between resolvability of * a reference (which is only known at runtime) seemingly at compile time * (= SyntaxError throwing).
label: code-design
48838. [...] -> [...]]
48839. * Augment an error being created using Duktape specific properties * like _Tracedata or .fileName/.lineNumber.

48871. * ToObject() (E5 Section 9.9) * ==> implemented in the API.
48872. DUK_USE_MARKANDSWEEP_FINALIZER_TORTURE
48873. **comment:** * Handle integers in 32-bit range (that is, [-(2**32-1),2**32-1]) * specially, as they're very likely for embedded programs. This * is now done for all radix values. We must be careful not to use * the fast path when special formatting (e.g. forced exponential) * is in force. ** XXX: could save space by supporting radix 10 only and using * sprintf "%lu" for the fast path and for exponent formatting.
label: code-design
48874. !(p < r)
48875. Maximum exponent value when parsing numbers. This is not strictly * compliant as there should be no upper limit, but as we parse the * exponent without a bigint, impose some limit.
48876. num_stack_args
48877. **comment:** Executor interrupt counter check, used to implement breakpoints, * debugging interface, execution timeouts, etc. The counter is heap * specific but is maintained in the current thread to make the check * as fast as possible. The counter is copied back to the heap struct * whenever a thread switch occurs by the DUK_HEAP_SWITCH_THREAD() macro.
label: code-design
48878. complete 'sub atom'
48879. * Intern key via the valstack to ensure reachability behaves * properly. We must avoid longjmp's here so use non-checked * primitives. ** Note: duk_check_stack() potentially reallocs the valstack, * invalidating any duk_tval pointers to valstack. Callers * must be careful.

48880. round out to 8 bytes
48881. for convenience
48882. buffer limits
48883. Handle TypedArray vs. Node.js Buffer arg differences
48884. DUK_TOK_WHILE
48885. offset/value order different from Node.js
48886. * Other cases (function declaration, anonymous function expression, * strict direct eval code). The "outer" environment will be whatever * the caller gave us.
48887. * Setup environment record properties based on the template and * its flags. * * If DUK_HOBJECT_HAS_NEWENV(fun_temp) is true, the environment * records represent identifiers "outside" the function; the * "inner" environment records are created on demand. Otherwise, * the environment records are those that will be directly used * (e.g. for declarations). * * _Lexenv is always set; _Varenv defaults to _Lexenv if missing, * so _Varenv is only set if _Lexenv != _Varenv. * * This is relatively complex, see doc/identifier-handling.rst.
48888. continue matched this label -- we can only continue if this is the empty * label, for which duplication is allowed, and thus there is hope of * finding a match deeper in the label stack.
48889. Plus sign must be accepted for positive exponents * (e.g. '1.5e+2'). This clause catches NULs.
48890. DUK_TOK_VOID
48891. DUK_USE_PC2LINE
48892. DUK_HOBJECT_FLAG_STRICT varies
48893. [... errval errhandler]
48894. **comment:** XXX: Valstack, callstack, and catchstack are currently assumed * to have non-NULL pointers. Relaxing this would not lead to big * benefits (except perhaps for terminated threads).
 label: code-design
48895. serialize the wrapper with empty string key
48896. * Free a heap object. * * Free heap object and its internal (non-heap) pointers. Assumes that * caller has removed the object from heap allocated list or the string * intern table, and any weak references (which strings may have) have * been already dealt with.
48897. BITWISE EXPRESSIONS
48898. **comment:** * Copy some internal properties directly * * The properties will be writable and configurable, but not enumerable.
 label: code-design
48899. Valstack resize flags
48900. **comment:** XXX: Hex encoded, length limited buffer summary here?

 label: code-design
48929. LOGICAL EXPRESSIONS
48930. %lf, %ld etc
48931. * Switch is pretty complicated because of several conflicting concerns: * * - Want to generate code without an intermediate representation, * i.e., in one go * * - Case selectors are expressions, not values, and may thus e.g. throw * exceptions (which causes evaluation order concerns) * * - Evaluation semantics of case selectors and default clause need to be * carefully implemented to provide correct behavior even with case value * side effects * * - Fall through case and default clauses; avoiding dead JUMPs if case * ends with an unconditional jump (a break or a continue) * * - The same case value may occur multiple times, but evaluation rules * only process the first match before switching to a "propagation" mode * where case values are no longer evaluated * * See E5 Section 12.11. Also see doc/compiler.rst for compilation * discussion.
48932. 8: getFullYear
48933. * Debug connection peek and flush primitives
48934. 'do'
48935. duk_xdef_prop() will define an own property without any array * special behaviors. We'll need to set the array length explicitly * in the end. For arrays with elisions, the compiler will emit an * explicit SETALEN which will update the length.
48936. exponential notation forced
48937. NB: 'val' may be invalidated here because put_value may realloc valstack, * caller beware.
48938. Here we'd have the option to normalize -0 to +0.
48939. **comment:** XXX: share helper from lexer; duk_lexer.c / hexval().
 label: code-design
48940. **comment:** * Create an internal enumerator object E, which has its keys ordered * to match desired enumeration ordering. Also initialize internal control * properties for enumeration. * * Note: if an array was used to hold enumeration keys instead, an array * scan would be needed to eliminate duplicates found in the prototype chain.
 label: code-design

48941. **comment:** This is essentially the 'scale' algorithm, with recursion removed. * Note that 'k' is either correct immediately, or will move in one * direction in the loop. There's no need to do the low/high checks * on every round (like the Scheme algorithm does). ** The scheme algorithm finds 'k' and updates 's' simultaneously, * while the logical algorithm finds 'k' with 's' having its initial * value, after which 's' is updated separately (see the Burger-Dybvig * paper, Section 3.1, steps 2 and 3). ** The case where $m+ == m-$ (almost always) is optimized for, because * it reduces the bigint operations considerably and almost always * applies. The scale loop only needs to work with $m+$, so this works.
- label:** code-design
48942. A -> flags * BC -> regCatch; base register for two registers used both during * trycatch setup and when catch is triggered ** If DUK_BC_TRYCATCH_FLAG_CATCH_BINDING set: * regCatch + 0: catch binding variable name (string). * Automatic declarative environment is established for * the duration of the 'catch' clause. ** If DUK_BC_TRYCATCH_FLAG_WITH_BINDING set: * regCatch + 0: with 'target value', which is coerced to * an object and then used as a bindind object for an * environment record. The binding is initialized here, for * the 'try' clause. ** Note that a TRYCATCH generated for a 'with' statement has no * catch or finally parts.
48943. default: false
48944. **comment:** fill new_h with u32 0xff = UNUSED
- label:** code-design
48945. A non-extensible object cannot gain any more properties, * so this is a good time to compact.
48946. if direct eval, calling activation must exist
48947. **comment:** XXX: because of the final check below (that the literal is not * followed by a digit), this could maybe be simplified, if we bail * out early from a leading zero (and if there are no periods etc). * Maybe too complex.
- label:** code-design
48948. * Create escaped RegExp source (E5 Section 15.10.3). ** The current approach is to special case the empty RegExp * (" -> '(?:')") and otherwise replace unescaped '/' characters * with '\' regardless of where they occur in the regexp. ** Note that normalization does not seem to be necessary for * RegExp literals (e.g. '/foo/') because to be acceptable as * a RegExp literal, the text between forward slashes must * already match the escaping requirements (e.g. must not contain * unescaped forward slashes or be empty). Escaping IS needed * for expressions like 'new RegExp("...","")' however. * Currently, we re-escape in either case. ** Also note that we process the source here in UTF-8 encoded * form. This is correct, because any non-ASCII characters are * passed through without change.
48949. Value stack is used to ensure reachability of constants and * inner functions being loaded. Require enough space to handle * large functions correctly.
48950. **comment:** Automatic defaulting of logger name from caller. This would * work poorly with tail calls, but constructor calls are currently * never tail calls, so tail calls are not an issue now.
- label:** code-design
48951. Fast check for extending array: check whether or not a slow density check is required.
48952. **comment:** XXX: using duk_put_prop_index() would cause obscure error cases when Array.prototype * has write-protected array index named properties. This was seen as DoubleErrors * in e.g. some test262 test cases. Using duk_xdef_prop_index() is better but heavier. * The best fix is to fill in the tracedata directly into the array part. There are * no side effect concerns if the array part is allocated directly and only INCREFS * happen after that.
- label:** code-design
48953. filename may be NULL in which case file/line is not recorded
48954. unsigned
48955. **comment:** XXX: function flag to make this automatic?
- label:** requirement
48956. Must have array part and no conflicting exotic behaviors. * Doesn't need to have array special behavior, e.g. Arguments * object has array part.
48957. Breakpoint entries above the used area are left as garbage.
48958. allow_source_elem
48959. JSON parsing code is allowed to read [p_start,p_end]: p_end is * valid and points to the string NUL terminator (which is always * guaranteed for duk_hstrings).
48960. fall through if overflow etc
48961. inner function numbering
48962. **comment:** XXX: could write output in chunks with fewer ensure calls, * but relative benefit would be small here.
- label:** code-design
48963. Assumes that saved[0] and saved[1] are always * set by regexp bytecode (if not, char_end_offset * will be zero). Also assumes clen reflects the * correct char length.
48964. **comment:** XXX: V8 throws a TypeError for negative values. Would it * be more useful to interpret negative offsets here from the * end of the buffer too?
- label:** code-design
48965. function needs shuffle registers
48966. The compiler should never emit DUK_OP_REGEXP if there is no * regexp support.
48967. invalid padding
48968. Note: here we must be wary of the fact that a pointer may be * valid and be a NULL.
48969. **comment:** Here we can choose either to end parsing and ignore * whatever follows, or to continue parsing in case * multiple (possibly padded) base64 strings have been * concatenated. Currently, keep on parsing.
- label:** code-design
48970. [requested_id require require.id resolved_id last_comp]
48971. advance to get one step of lookup
48972. Write signed 32-bit integer.
48973. * Canonicalize() abstract operation needed for canonicalization of individual * codepoints during regexp compilation and execution, see E5 Section 15.10.2.8. * Note that codepoints are canonicalized one character at a time, so no context * specific rules can apply. Locale specific rules can apply, though.
48974. This should not be necessary because no-one should tamper with the * regexp bytecode, but is prudent to avoid potential segfaults if that * were to happen for some reason.
48975. Needs lookahead
48976. * Churn refzero_list until empty
48977. Note: 'q_instr' is still used below
48978. duk_unicode_caseconv_uc[]
48979. **comment:** * Make a copy of tv_obj, tv_key, and tv_val to avoid any issues of * them being invalidated by a valstack resize. ** XXX: this is now an overkill for many fast paths. Rework this * to be faster (although switching to a valstack discipline might * be a better solution overall).
- label:** code-design
48980. failed, resize and try again
48981. extend with undefined
48982. **comment:** * Traceback handling ** The unified helper decodes the traceback and produces various requested * outputs. It should be optimized for size, and may leave garbage on stack, * only the topmost return value matters. For instance, traceback separator * and decoded strings are pushed even when looking for filename only. * * NOTE: although _Tracedata is an internal property, user code can currently * write to the array (or replace it with something other than an array). * The code below must tolerate arbitrary _Tracedata. It can throw errors * etc, but cannot cause a segfault or memory unsafe behavior.
- label:** code-design

48991. input 'd' in Windows UTC, 100ns units
48992. Keep current size
48993. 50x heap size

48994. Dynamic buffer with 'curr_alloc' pointing to a dynamic area allocated using * heap allocation primitives. Also used for external buffers when low memory * options are not used.

48995. [name this]

48996. [... holder name val enum obj_key new_elem]

48997. patched later

48998. [... regexp_object]

48999. **comment:** * Note: the description in E5 Section 15.10.2.6 has a typo, it * contains 'A' twice and lacks 'a'; the intent is [0-9a-zA-Z_].
label: documentation

49000. This was the last term, and q_last was * updated to match this term at loop top.

49001. x <- b^y; use t1 and t2 as temps

49002. prev_token.start_offset points to the closing brace here; when skipping * we're going to reparse the closing brace to ensure semicolon insertion * etc work as expected.

49003. more initializers

49004. ref.holder is global object, holder is the object with the * conflicting property.

49005. essentially tracks digit position of lowest 'f' digit

49006. **comment:** Prevent any side effects on the string table and the caller provided * str/blen arguments while interning is in progress. For example, if * the caller provided str/blen from a dynamic buffer, a finalizer might * resize that dynamic buffer, invalidating the call arguments.
label: code-design

49007. binding power "levels" (see doc/compiler.rst)

49008. Enter message processing loop for sending Status notifys and * to finish a pending detach.

49009. result reg

49010. strings are only tracked by stringtable

49011. to avoid relookups

49012. abandoning requires a props allocation resize and * 'rechecks' the valstack, invalidating any existing * valstack value pointers!

49013. If object has a . toJSON() property, we can't be certain * that it wouldn't mutate any value arbitrarily, so bail * out of the fast path. * * If an object is a Proxy we also can't avoid side effects * so abandon.

49014. Reviving an object using a heap pointer is a dangerous API * operation: if the application doesn't guarantee that the * pointer target is always reachable, difficult-to-diagnose * problems may ensue. Try to validate the 'ptr' argument to * the extent possible.

49015. '.'

49016. **comment:** Unlike in duk_hex_encode() 'dst' is not necessarily aligned by 2. * For platforms where unaligned accesses are not allowed, shift 'dst' * ahead by 1 byte to get alignment and then DUK_MEMMOVE() the result * in place. The faster encoding loop makes up the difference. * There's always space for one extra byte because a terminator always * follows the hex data and that's been accounted for by the caller.
label: code-design

49017. E5 Section 7.3, treat the following as newlines: * LF * CR [not followed by LF] * LS * PS * * For CR LF, CR is ignored if it is followed by LF, and the LF will bump * the line number.

49018. **comment:** * 'nregs' registers are allocated on function entry, at most 'nargs' * are initialized to arguments, and the rest to undefined. Arguments * above 'nregs' are not mapped to registers. All registers in the * active stack range must be initialized because they are GC reachable. * 'nargs' is needed so that if the function is given more than 'nargs' * arguments, the additional arguments do not 'clobber' registers * beyond 'nregs' which must be consistently initialized to undefined. * * Usually there is no need to know which registers are mapped to * local variables. Registers may be allocated to variable in any * way (even including gaps). However, a register-variable mapping * must be the same for the duration of the function execution and * the register cannot be used for anything else. * * When looking up variables by name, the '_Varmap' map is used. * When an activation closes, registers mapped to arguments are * copied into the environment record based on the same map. The * reverse map (from register to variable) is not currently needed * at run time, except for debugging, so it is not maintained.
label: code-design

49019. Slice starting point is beyond current length.

49020. ... target is extensible

49021. duk_unicode_support.c

49022. **comment:** XXX: easier check with less code?
label: code-design

49023. Used when precision is undefined; also used for NaN (-> "NaN"), * and +/- infinity (-> "Infinity", "-Infinity").

49024. x <- x * y, use t as temp

49025. [... v1 v2 str] -> [... str v2]

49026. Zero 'count' is also allowed to make call sites easier.

49027. **comment:** XXX: size optimize

49028. != 0 => post-update for array 'length' (used when key is an array index)

49029. **comment:** has inner functions which may slow access (XXX: this can be optimized by looking at the inner functions)
label: code-design

49030. **comment:** XXX: need to determine LHS type, and check that it is LHS compatible
label: code-design

49031. false

49032. * Built-in strings

49033. * Clear (reachable) flags of finalize_list * * We could mostly do in the sweep phase when we move objects from the * heap into the finalize_list. However, if a finalizer run is skipped * during a mark-and-sweep, the objects on the finalize_list will be marked * reachable during the next mark-and-sweep. Since they're already on the * finalize_list, no-one will be clearing their REACHABLE flag so we do it * here. (This now overlaps with the sweep handling in a harmless way.)

49034. * Variant 3

49035. * On second pass, skip the function.

49036. OK for NULL.

49037. Note: key issue here is to re-lookup the base pointer on every attempt. * The pointer being reallocated may change after every mark-and-sweep.

49038. -> [... key val toJSON val]

49039. **comment:** XXX: It would be nice to build the string directly but ToUint16() * coercion is needed so a generic helper would not be very * helpful (perhaps coerce the value stack first here and then * build a string from a duk_tval number sequence in one go?).
label: code-design

49040. Note: getprop may invoke any getter and invalidate any * duk_tval pointers, so this must be done first.

49041. [obj trap_result res_arr propname]

49042. split1: prefer direct execution (no jump)

49043. in resumer's context

49044. Conceptually we'd extract the plain underlying buffer * or its slice and then do a type mask check below to * see if we should reject it. Do the mask check here * instead to avoid making a copy of the buffer slice.

49045. 'try'

49046. -> [in_val]

49047. **comment:** Currently all built-in native functions are strict. * This doesn't matter for many functions, but e.g. * String.prototype.charAt (and other string functions) * rely on being strict so that their 'this' binding is * not automatically coerced.
label: code-design

49048. **comment:** * Helper for handling an Ecmascript-to-Ecmascript call or an Ecmascript * function (initial) Duktape.Thread.resume(). * * Compared to normal calls handled by duk_handle_call(), there are a * bunch of differences: * * - the call is never protected * - there is no C recursion depth increase (hence an "ignore recursion * limit" flag is not applicable) * - instead of making the call, this helper just performs the thread * setup and returns; the bytecode executor then restarts execution * internally * - ecmascript functions are never 'vararg' functions (they access * varargs through the 'arguments' object) * * The callstack of the target contains an earlier Ecmascript call in case * of an Ecmascript-to-Ecmascript call (whose idx_retval is updated), or * is empty in case of an initial

Duktape.Thread.resume(). * * The first thing to do here is to figure out whether an ecma-to-ecma * call is actually possible. It's not always the case if the target is * a bound function; the final function may be native. In that case, * return an error so caller can fall back to a normal call path.

label: code-design

49049. Note: 0xff != DUK_BC_B_MAX

49050. * Unions and structs for self tests

49051. Note: masking is done for 'i' to deal with negative numbers correctly

49052. * For property layout 1, tweak e_size to ensure that the whole entry * part (key + val + flags) is a suitable multiple for alignment * (platform specific). * * Property layout 2 does not require this tweaking and is preferred * on low RAM platforms requiring alignment.

49053. don't run finalizers; queue finalizable objects back to heap_allocated

49054. val1 = count

49055. * Function declaration, function expression, or (non-standard) * function statement. * * The E5 specification only allows function declarations at * the top level (in "source elements"). An ExpressionStatement * is explicitly not allowed to begin with a "function" keyword * (E5 Section 12.4). Hence any non-error semantics for such * non-top-level statements are non-standard. Duktape semantics * for function statements are modelled after V8, see * test-dev-func-decl-outside-top.js.

49056. Get minimum array part growth for a certain size.

49057. **comment:** XXX: very slow - better to bulk allocate a gap, and copy * from args_array directly (we know it has a compact array * part, etc).

label: code-design

49058. 'enumerate'

49059. DUK_TOK_RSHIFT

49060. roughly 256 bytes

49061. **comment:** For now, just use duk_safe_call() to wrap duk_new(). We can't * simply use a protected duk_handle_call() because there's post * processing which might throw. It should be possible to ensure * the post processing never throws (except in internal errors and * out of memory etc which are always allowed) and then remove this * wrapper.

label: code-design

49062. object is now reachable

49063. flags: "im"

49064. Copy trap result keys into the enumerator object.

49065. * Mark-and-sweep flags * * These are separate from heap level flags now but could be merged. * The heap structure only contains a 'base mark-and-sweep flags' * field and the GC caller can impose further flags.

49066. Success path.

49067. * If entering a 'catch' block which requires an automatic * catch variable binding, create the lexical environment. * * The binding is mutable (= writable) but not deletable. * Step 4 for the catch production in E5 Section 12.14; * no value is given for CreateMutableBinding 'D' argument, * which implies the binding is not deletable.

49068. t1 <- (* r B)

49069. DUK_BUFOBJ_UINT8ARRAY

49070. Accept any duk_hbufferobject, though we're only normally * called for Duktape.Buffer values.

49071. Lenient: allow function declarations outside top level in * non-strict mode but reject them in strict mode.

49072. assertions: env must be closed in the same thread as where it runs

49073. EOF (-1) will be cast to an unsigned value first * and then re-cast for the switch. In any case, it * will match the default case (syntax error).

49074. refzero not running -> must be empty

49075. **comment:** XXX: differentiate null pointer from empty string?

label: code-design

49076. Normal object which doesn't get automatically coerced to a * primitive value. Functions are checked for specially. The * primitive value coercions for Number, String, Pointer, and * Boolean can't result in functions so suffices to check here.

49077. DUK_USE_MARK_AND_SWEEP

49078. * Coercion and fast path processing

49079. y == +Infinity

49080. caller required to know

49081. * Function name (if any) * * We don't check for prohibited names here, because we don't * yet know whether the function will be strict. Function body * parsing handles this retroactively. * * For function expressions and declarations function name must * be an Identifier (excludes reserved words). For setter/getter * it is a PropertyName which allows reserved words and also * strings and numbers (e.g. "{ get 1) { ... } }").

49082. **comment:** XXX: There are no format strings in duk_config.h yet, could add * one for formatting duk_int64_t. For now, assumes "%lld" and that * "long long" type exists. Could also rely on C99 directly but that * won't work for older MSVC.

label: code-design

49083. toLocaleString'

49084. * Manipulate value stack so that exactly 'num_stack_rets' return * values are at 'idx_rebase' in every case, assuming there are * 'rc' return values on top of stack. * * This is a bit tricky, because the called C function operates in * the same activation record and may have e.g. popped the stack * empty (below idx_rebase).

49085. Exotic behaviors are only enabled for arguments objects * which have a parameter map (see E5 Section 10.6 main * algorithm, step 12). * * In particular, a non-strict arguments object with no * mapped formals does *NOT* get exotic behavior, even * for e.g. "caller" property. This seems counterintuitive * but seems to be the case.

49086. buffer is automatically zeroed

49087. num_args

49088. DUK_OP_EXTRA, sub-operation in A

49089. insert the required matches (qmin) by copying the atom

49090. DUK_USE_INTEGER_BE

49091. out_clamped

49092. adv = 2 default OK

49093. There is no need to decref anything else than 'env': if 'env' * becomes unreachable, refzero will handle decref'ing its prototype.

49094. '-0'

49095. module table remains registered to modLoaded, minimize its size

49096. * Detach handling

49097. write back

49098. [... filename (temps) func]

49099. **comment:** It's not strictly necessary to track the current size, but * it is useful for writing robust native code.

label: code-design

49100. * Second pass parsing.

49101. **comment:** Note: cannot portably debug print a function pointer, hence 'func' not printed!

label: code-design

49102. * Arbitrary byteswap for potentially unaligned values * * Used to byteswap pointers e.g. in debugger code.

49103. **comment:** XXX: There's some overlap with duk_js_closure() here, but * seems difficult to share code. Ensure that the final function * looks the same as created by duk_js_closure().

label: code-design

49104. **comment:** It is important not to call this if the last byte read was an EOM. * Reading ahead in this scenario would cause unnecessary blocking if * another message is not available.

label: code-design

49255. E5 Section 9.3.1
49256. * GETVAR * * See E5 Sections: * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * 11.13.1 Simple Assignment [example of where the Reference is GetValue'd] * 8.7.1 GetValue (V) * 8.12.1 [[GetOwnProperty]] (P) * 8.12.2 [[GetProperty]] (P) * 8.12.3 [[Get]] (P) * * If 'throw' is true, always leaves two values on top of stack: [val this]. * * If 'throw' is false, returns 0 if identifier cannot be resolved, and the * stack will be unaffected in this case. If identifier is resolved, returns * 1 and leaves [val this] on top of stack. * * Note: the 'strict' flag of a reference returned by GetIdentifierReference * is ignored by GetValue. Hence we don't take a 'strict' parameter. * * The 'throw' flag is needed for implementing 'typeof' for an unreferenced * identifier. An unreferenced identifier in other contexts generates a * ReferenceError.
49257. **comment:** XXX: top of stack must contain value, which helper doesn't touch, * rework to use tv_val directly?
 label: code-design
49258. * Executor interrupt handling * * The handler is called whenever the interrupt countdown reaches zero * (or below). The handler must perform whatever checks are activated, * e.g. check for cumulative step count to impose an execution step * limit or check for breakpoints or other debugger interaction. * * When the actions are done, the handler must reinit the interrupt * init and counter values. The 'init' value must indicate how many * bytecode instructions are executed before the next interrupt. The * counter must interface with the bytecode executor loop. Concretely, * the new init value is normally one higher than the new counter value. * For instance, to execute exactly one bytecode instruction the init * value is set to 1 and the counter to 0. If an error is thrown by the * interrupt handler, the counters are set to the same value (e.g. both * to 0 to cause an interrupt when the next bytecode instruction is about * to be executed after error handling). * * Maintaining the init/counter value properly is important for accurate * behavior. For instance, executor step limit needs a cumulative step * count which is simply computed as a sum of 'init' values. This must * work accurately even when single stepping.

49324. A -> target register * B -> bytecode (also contains flags) * C -> escaped source

49325. Fast path, decode as is.

49326. * "/" followed by something in regexp mode. See E5 Section 7.8.5. * * RegExp parsing is a bit complex. First, the regexp body is delimited * by forward slashes, but the body may also contain forward slashes as * part of an escape sequence or inside a character class (delimited by * square brackets). A mini state machine is used to implement these. * * Further, an early (parse time) error must be thrown if the regexp * would cause a run-time error when used in the expression new RegExp(...). * Parsing here simply extracts the (candidate) regexp, and also accepts * invalid regular expressions (which are delimited properly). The caller * (compiler) must perform final validation and regexp compilation. * * RegExp first char may not be '/' (single line comment) or '*' (multi- * line comment). These have already been checked above, so there is no * need below for special handling of the first regexp character as in * the E5 productions. * * About unicode escapes within regexp literals: * * E5 Section 7.8.5 grammar does NOT accept \uHHHH escapes. * However, Section 6 states that regexps accept the escapes, * see paragraph starting with "In string literals...". * The regexp grammar, which sees the decoded regexp literal * (after lexical parsing) DOES have a \uHHHH unicode escape. * So, for instance: * * \u1234/ * * should first be parsed by the lexical grammar as: * * \'u' RegularExpressionBackslashSequence * '1' RegularExpressionNonTerminator * '2' RegularExpressionNonTerminator * '3' RegularExpressionNonTerminator * '4' RegularExpressionNonTerminator * * and the escape itself is then parsed by the regexp engine. * This is the current implementation. * * Minor spec inconsistency: * * E5 Section 7.8.5 RegularExpressionBackslashSequence is: * * \ RegularExpressionNonTerminator * * while Section A.1 RegularExpressionBackslashSequence is: * * \ NonTerminator * * The latter is not normative and a typo. *

49327. 'break'

49328. in yielder's context

49329. * E5 Section 15.4.5.1, steps 3.k - 3.n. The order at the end combines * the error case 3.l.iii and the success case 3.m-3.n. * * Note: 'length' is always in entries part, so no array abandon issues for * 'writable' update.

49330. * Avoid a GC if GC is already running. This can happen at a late * stage in a GC when we try to e.g. resize the stringtable * or compact objects.

49331. Reject attempt to change virtual properties: not part of the * standard algorithm, applies currently to e.g. virtual index * properties of buffer objects (which are virtual but writable). * (Cannot "force" modification of a virtual property.)

49332. MakeDay

49333. Push 'this' binding, check that it is a Date object; then push the * internal time value. At the end, stack is: [... this timeval]. * Returns the time value. Local time adjustment is done if requested.

49334. Cannot use duk_to_string() on the buffer because it is usually * larger than 'len'. Also, 'buf' is usually a stack buffer.

49335. non-leap year: sunday, monday, ...

49336. activation has tail called one or more times

49337. extended types: custom encoding

49338. reg

49339. -> [... enum key val]

49340. EOF

49341. XXX: optimize value stack operation

49342. * Proxy object handling

49343. * Then decode the builtins init data (see genbuiltins.py) to * init objects

49344. mark as complex (capture handling)

49345. string is a reserved word (non-strict)

49346. s <- b^(1-e) * 2

49347. * Object inspection commands: GetHeapObjInfo, GetObjPropDesc, * GetObjPropDescRange

49348. * Unreachable object about to be swept. Finalize target refcounts * (objects which the unreachable object points to) without doing * refzero processing. Recursive decrefs are also prevented when * refzero processing is disabled. * * Value cannot be a finalizable object, as they have been made * temporarily reachable for this round.

49349. Map DUK_FLX_xxx to byte size.

49350. Note that we currently parse -bytes-, not codepoints. * All non-ASCII extended UTF-8 will encode to bytes >= 0x80, * so they'll simply pass through (valid UTF-8 or not).

49351. * Get/require

49352. key, getter and setter, now reachable through object

49353. **comment:** * Finalize objects in the finalization work list. Finalized * objects are queued back to heap_allocated with FINALIZED set. * * Since finalizers may cause arbitrary side effects, they are * prevented during string table and object property allocation * resizing using the DUK_MS_FLAG_NO_FINALIZERS flag in * heap->mark_and_sweep_base_flags. In this case the objects * remain in the finalization work list after mark-and-sweep * exits and they may be finalized on the next pass. * * Finalization currently happens inside "MARKANDSWEET_RUNNING" * protection (no mark-and-sweep may be triggered by the * finalizers). As a side effect: * * 1) an out-of-memory error inside a finalizer will not * cause a mark-and-sweep and may cause the finalizer * to fail unnecessarily * * 2) any temporary objects whose refcount decreases to zero * during finalization will not be put into refzero_list; * they can only be collected by another mark-and-sweep * * This is not optimal, but since the sweep for this phase has * already happened, this is probably good enough for now. **label:** code-design

49354. * A Dragon4 number-to-string variant, based on: * * Guy L. Steele Jr., Jon L. White: "How to Print Floating-Point Numbers * Accurately" * * Robert G. Burger, R. Kent Dybvig: "Printing Floating-Point Numbers * Quickly and Accurately" * * The current algorithm is based on Figure 1 of the Burger-Dybvig paper, * i.e.

the base implementation without logarithm estimation speedups * (these would increase code footprint considerably). Fixed-format output * does not follow the suggestions in the paper; instead, we generate an * extra digit and round-with-carry. ** The same algorithm is used for number parsing (with b=10 and B=2) * by generating one extra digit and doing rounding manually. ** See doc/number-conversion.rst for limitations.

49355. holder will be set to the target object, not the actual object * where the property was found (see duk_get_identifier_reference()).

49356. 'Array'

49357. * INITSET/INITGET are only used to initialize object literal keys. * The compiler ensures that there cannot be a previous data property * of the same name. It also ensures that setter and getter can only * be initialized once (or not at all).

49358. extended utf-8 not allowed for URIs

49359. * E5 Section 15.7.2.1 requires that the constructed object * must have the original Number.prototype as its internal * prototype. However, since Number.prototype is non-writable * and non-configurable, this doesn't have to be enforced here: * The default object (bound to 'this') is OK, though we have * to change its class. * * Internal value set to ToNumber(arg) or +0; if no arg given, * ToNumber(undefined) = NaN, so special treatment is needed * (above). String internal value is immutable.

49360. bytecode limits

49361. guaranteed to find an empty slot

49362. Because 'day since epoch' can be negative and is used to compute weekday * using a modulo operation, add this multiple of 7 to avoid negative values * when year is below 1970 epoch. Ecmascript time values are restricted to * +/- 100 million days from epoch, so this adder fits nicely into 32 bits. * Round to a multiple of 7 (= floor(100000000 / 7) * 7) and add margin.

49363. Allow trailing garbage (e.g. treat "123foo" as "123")

49364. **comment:** XXX: Are steps 6 and 7 in E5 Section 15.11.4.4 duplicated by * accident or are they actually needed? The first ToString() * could conceivably return 'undefined'.

label: code-design

49365. **comment:** Size sanity check. Should not be necessary because caller is * required to check this, but we don't want to cause a segfault * if the size wraps either in duk_size_t computation or when * storing the size in a 16-bit field.

label: code-design

49457. allow automatic semicolon even without lineterm (compatibility)

49458. Outside any activation -> put to global.

49459. +0 = break, +1 = continue

49460. try locale specific formatter; if it refuses to format the * string, fall back to an ISO 8601 formatted value in local * time.

49461. -> [val arr]

49462. * Byte matching for back-references would be OK in case- * sensitive matching. In case-insensitive matching we need * to canonicalize characters, so back-reference matching needs * to be done with codepoints instead. So, we just decode * everything normally here, too. ** Note: back-reference index which is 0 or higher than * NCapturingParens (= number of capturing parens in the * -entire- regexp) is a compile time error. However, a * backreference referring to a valid capture which has * not matched anything always succeeds! See E5 Section * 15.10.2.9, step 5, sub-step 3.

49463. this is needed for regexp mode

49464. jump to next case clause

49465. pop plain buffer, now reachable through h_bufres

49466. * PUTPROP: Ecmascript property write. ** Unlike Ecmascript primitive which returns nothing, returns 1 to indicate * success and 0 to indicate failure (assuming throw is not set). ** This is an extremely tricky function. Some examples: * * * Currently a decref may trigger a GC, which may compact an object's * property allocation. Consequently, any entry indices (e_idx) will * be potentially invalidated by a decref. * * * Exotic behaviors (strings, arrays, arguments object) require, * among other things: * * - Preprocessing before and postprocessing after an actual property * write. For example, array index write requires pre-checking the * array 'length' property for access control, and may require an * array 'length' update after the actual write has succeeded (but * not if it fails). * * - Deletion of multiple entries, as a result of array 'length' write. * * * Input values are taken as pointers which may point to the valstack. * If valstack is resized because of the put (this may happen at least * when the array part is abandoned), the pointers can be invalidated. * (We currently make a copy of all of the input values to avoid issues.)

49467. add AD*2^16

49468. Proxy handler

49469. **comment:** * Tailcall handling ** Although the callstack entry is reused, we need to explicitly unwind * the current activation (or simulate an unwind). In particular, the * current activation must be closed, otherwise something like * test-bug-reduce-judofy.js results. Also catchstack needs be unwound * because there may be non-error-catching label entries in valid tail calls.

label: code-design

49470. **comment:** Should not be required because the code below always sets both high * and low parts, but at least gcc-4.4.5 fails to deduce this correctly * (perhaps because the low part is set (seemingly) conditionally in a * loop), so this is here to avoid the bogus warning.
label: code-design

49471. Impose a maximum string length for now. Restricted artificially to * ensure adding a heap header length won't overflow size_t. The limit * should be synchronized with DUK_HBUFFER_MAX_BYTELEN. ** E5.1 makes provisions to support strings longer than 4G characters. * This limit should be eliminated on 64-bit platforms (and increased * closer to maximum support on 32-bit platforms).

49472. relookup exports from module.exports in case it was changed by modSearch

49473. * Indexed read/write helpers (also used from outside this file)

49474. adv = 2 - 1 default OK

49475. **comment:** XXX: the key in 'key in obj' is string coerced before we're called * (which is the required behavior in E5/E5.1/E6) so the key is a string * here already.

49528. 0x80-0x8f

49529. * Internal helper for defining an accessor property, ignoring * normal semantics such as extensibility, write protection etc. * Overwrites any existing value and attributes. This is called * very rarely, so the implementation first sets a value to undefined * and then changes the entry to an accessor (this is to save code space).

49530. Debug print which visualizes the qsort partitioning process.

49531. XXX: this placeholder is not always correct, but use for now. * It will fail in corner cases; see test-dev-func-cons-args.js.

49532. r <- (2 * f) * b^e

49533. unreferenced with some options

49534. always terminates led()

49535. (reference is valid as long activation exists)

49536. don't report __FILE__ / __LINE__ as fileName/lineNumber

49537. **comment:** Note: don't bail out early, we must read all the ranges from * bytecode. Another option is to skip them efficiently after * breaking out of here. Prefer smallest code.
label: code-design

49538. Pause for all step types: step into, step over, step out. * This is the only place explicitly handling a step out.

49539. awkward; we assume there is space for this

49540. Peek ahead in the stream one byte.

49541. * Breakpoint management

49542. * Compact an object

49543. slot B is both a target and a source (used by extraops like DUK_EXTRAOP_INSTOF)

49544. alias for above

49545. handle comma and closing brace

49546. shrink case; leave some spare

49547. strictness is not inherited, intentional

49548. only Array.prototype matches

49549. Parse a function-like expression, assuming that 'comp_ctx->curr_func' is * correctly set up. Assumes that curr_token is just after 'function' (or * 'set'/'get' etc).

49550. function: always register bound

49551. **comment:** XXX: fast primitive to set a bunch of values to UNDEFINED
label: code-design

49552. Buffer size needed for duk_bi_date_format_timeval(). * Accurate value is 32 + 1 for NUL termination: * >>> len('+123456-01-23T12:34:56.123+12:34') * 32 *
Include additional space to be safe.

49553. We want to compare the slice/view areas of the arguments. * If either slice/view is invalid (underlying buffer is shorter) * ensure equals() is false, but otherwise the only thing that * matters is to be memory safe.

49554. This seems reasonable overall.

49555. Loop prevention

49556. 'throw'

49557. we're running inside the caller's activation, so no change in call/catch stack or valstack bottom

49558. Assume that the native representation never contains a closing * parenthesis.

49559. varargs marker

49560. entry level reached

49561. Current strictness flag: affects API calls.

49562. Because value stack init policy is 'undefined above top', * we don't need to write, just assert.

49563. '*'

49564. call is from executor, so we know we have a jmpbuf

49565. Yield/resume book-keeping.

49566. finally part will catch

49567. Quite lenient, e.g. allow empty as zero, but don't allow trailing * garbage.

49568. IEEE requires that NaNs compare false

49569. Load inner functions to value stack, but don't yet copy to buffer.

49570. [start end]

49571. **comment:** Try to make do with a stack buffer to avoid allocating a temporary buffer. * This works 99% of the time which is quite nice.
label: code-design

49572. This testcase fails when Emscripten-generated code runs on Firefox. * It's not an issue because the failure should only affect packed * duk_tval representation, which is not used with Emscripten.

49573. **comment:** XXX: keys is an internal object with all keys to be processed * in its (gapless) array part. Because nobody can touch the keys * object, we could iterate its array part directly (keeping in mind * that it can be reallocated).
label: code-design

49574. Return value is like write(), number of bytes written. * The return value matters because of code like: * "off += buf.copy(...)".

49575. Exponent without digits (e.g. "1e" or "1e+"). If trailing garbage is * allowed, ignore exponent part as garbage (= parse as "1", i.e. exp 0).

49576. DUK_TOK_THROW

49577. **comment:** Note: not a typo, "object" is returned for a null value
label: documentation

49578. atom_char_length, atom_start_offset, atom_start_offset reflect the * atom matched on the previous loop. If a quantifier is encountered * on this loop, these are needed to handle the quantifier correctly. * new_atom_char_length etc are for the atom parsed on this round; * they're written to atom_char_length etc at the end of the round.

49579. Original idiom used, minimal code size.

49580. **comment:** 'fun' is quite rarely used, so no local for it
label: code-design

49581. **comment:** XXX: fastint
label: code-design

49582. Note: in integer arithmetic, (x / 4) is same as floor(x / 4) for non-negative * values, but is incorrect for negative ones.

49583. normal

49584. Careful with wrapping (left shifting idx would be unsafe).

49585. **comment:** XXX: for negative input offsets, 'offset' will be a large * positive value so the result here is confusing.
label: code-design

49586. no overflow

49587. "+11:22:0"

49588. borrowed: function being executed; for bound function calls, this is the final, real function, NULL for lightfuncs

49589. **comment:** * Augment error (throw time), unless alloc/double error
label: code-design

49590. -> [... ToObject(this) ToUInt32(length) arg[i]]
49591. The specification has quite awkward order of coercion and * checks for toPrecision(). The operations below are a bit * reordered, within constraints of observable side effects.
49592. caller
49593. match followed by capture(s)
49594. return input buffer, converted to a Duktape.Buffer object * if called as a constructor (no change if called as a * function).
49595. We could use a switch-case for the class number but it turns out * a small if-else ladder on class masks is better. The if-ladder * should be in order of relevancy.
49596. * New length is smaller than old length, need to delete properties above * the new length. * * If array part exists, this is straightforward: array entries cannot * be non-configurable so this is guaranteed to work. * * If array part does not exist, array-indexed values are scattered * in the entry part, and some may not be configurable (preventing length * from becoming lower than their index + 1). To handle the algorithm * in E5 Section 15.4.5.1, step 1 correctly, we scan the entire property * set twice.
49597. 'ptr' is evaluated both as LHS and RHS.
49598. * Ecmascript [[Class]]
49599. **comment:** Quick reject of too large or too small exponents. This check * would be incorrect for zero (e.g. "0e1000" is zero, not Infinity) * so zero check must be above.
label: code-design
49600. finalize_list will always be processed completely
49601. **comment:** XXX: exposed duk_debug_read_pointer
label: code-design
49602. -> [... key val replacer holder]
49603. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside bufferobject length.
49604. open scope information, for compiled functions only
49605. Handle empty separator case: it will always match, and always * triggers the check in step 13.c.iii initially. Note that we * must skip to either end of string or start of first codepoint, * skipping over any continuation bytes! * * Don't allow an empty string to match at the end of the input.
49606. temp reg handling
49607. * Parse function body
49608. x <- y - z
49609. 'Pointer'
49610. relookup if changed
49611. **comment:** * Augment an error at creation time with _Tracedata/fileName/lineNumber * and allow a user error handler (if defined) to process/replace the error. * The error to be augmented is at the stack top. * * thr: thread containing the error value * thr_callstack: thread which should be used for generating callstack etc. * c_filename: C __FILE__ related to the error * c_line: C __LINE__ related to the error * noblame_fileline: if true, don't fileName/line as error source, otherwise use traceback * (needed because user code filename/line are reported but internal ones * are not) * * XXX: rename noblame_fileline to flags field; combine it to some existing * field (there are only a few call sites so this may not be worth it).
label: code-design
49612. throw_flag
49613. * Else, must be one of: * - ExpressionStatement, possibly a directive (String) * - LabelledStatement (Identifier followed by ':') * * Expressions beginning with 'function' keyword are covered by a case * above (such expressions are not allowed in standard E5 anyway). * Also expressions starting with '{' are interpreted as block * statements. See E5 Section 12.4. * * Directive detection is tricky; see E5 Section 14.1 on directive * prologue. A directive is an expression statement with a single * string literal and an explicit or automatic semicolon. Escape * characters are significant and no parens etc are allowed: * * 'use strict'; // valid 'use strict' directive * 'use\u0020strict'; // valid directive, not a 'use strict' directive * ('use strict'); // not a valid directive * * The expression is determined to consist of a single string literal * based on duk__expr_nud() and duk__expr_led() call counts. The string literal * of a 'use strict' directive is determined to lack any escapes based * num_escapes count from the lexer. Note that other directives may be * allowed to contain escapes, so a directive with escapes does not * terminate a directive prologue. * * We rely on the fact that the expression parser will not emit any * code for a single token expression. However, it will generate an * intermediate value which we will then successfully ignore. * * A similar approach is used for labels.
49614. The act->prev_caller should only be set if the entry for 'caller' * exists (as it is only set in that case, and the property is not * configurable), but handle all the cases anyway.
49615. break/continue without label
49616. **comment:** XXX: the best typing needs to be validated by perf measurement: * e.g. using a small type which is the cast to a larger duk_idx_t * may be slower than declaring the variable as a duk_idx_t in the * first place.
label: code-design
49617. **comment:** XXX: conversion errors should not propagate outwards. * Perhaps values need to be coerced individually?
label: code-design
49618. XXX: here we need to know if 'left' is left-hand-side compatible. * That information is no longer available from current expr parsing * state; it would need to be carried into the 'left' ivalue or by * some other means.
49619. non-global regexp: lastIndex never updated on match
49620. Note: undefined from Section 11.8.5 always results in false * return (see e.g. Section 11.8.3) - hence special treatment here.
49621. If there's no catch block, rc_varname will be 0 and duk__patch_trycatch() * will replace the LDCONST with a NOP. For any actual constant (including * constant 0) the DUK__CONST_MARKER flag will be set in rc_varname.
49622. exposed because lexer needs these too
49623. empty match (may happen with empty separator) -> bump and continue
49624. As with all inspection code, we rely on the debug client providing * a valid, non-stale pointer: there's no portable way to safely * validate the pointer here.
49625. Set up curr_pc for opcode dispatch.
49626. [... pattern flags escaped_source]
49627. **comment:** The 'magic' field allows an opaque 16-bit field to be accessed by the * Duktape/C function. This allows, for instance, the same native function * to be used for a set of very similar functions, with the 'magic' field * providing the necessary non-argument flags / values to guide the behavior * of the native function. The value is signed on purpose: it is easier to * convert a signed value to unsigned (simply AND with 0xffff) than vice * versa. * * Note: cannot place nargs/magic into the heapdr flags, because * duk_hobject takes almost all flags already (and needs the spare).
label: code-design
49628. Get minimum entry part growth for a certain size.
49629. valstack index of start of args (arg1) (relative to entry valstack_bottom)
49630. [ToObject(this) item1 ... itemN arr item(i) item(i)[j]]
49631. thr->heap->lj.value2 is 'thread', will be wiped out at the end
49632. break/continue with label (label cannot be a reserved word, production is 'Identifier'
49633. property access
49634. Coerce all finite parts with ToInteger(). ToInteger() must not * be called for NaN/Infinity because it will convert e.g. NaN to * zero. If ToInteger() has already been called, this has no side * effects and is idempotent. * * Don't read dparts[DUK_DATE_IDX_WEEKDAY]; it will cause Valgrind * issues if the value is uninitialized.
49635. internal property functions
49636. Report thrown value to client coerced to string
49637. **comment:** ArrayBuffer argument is handled specially above; the rest of the * argument variants are handled by shared code below.
label: code-design
49638. DUK_USE_USER_INITJS
49639. Range limited to [0, 0x7fffffff] range, i.e. range that can be * represented with duk_int32_t. Use this when the method doesn't * handle the full 32-bit unsigned range correctly.
49640. 110x xxxx 10xx xxxx
49641. Sanity limits for stack sizes.

49642. **comment:** Linear scan: more likely because most objects are small. * This is an important fast path. ** XXX: this might be worth inlining for property lookups.
label: code-design

49643. XXX: will need a force flag if garbage collection is triggered * explicitly during paused state.

49644. Array length is larger than 'asize'. This shouldn't * happen in practice. Bail out just in case.

49645. No net refcount change.

49646. * Assert context is valid: non-NULL pointer, fields look sane. ** This is used by public API call entrypoints to catch invalid 'ctx' pointers * as early as possible; invalid 'ctx' pointers cause very odd and difficult to * diagnose behavior so it's worth checking even when the check is not 100%.

49647. * Setup value stack: clamp to 'nargs', fill up to 'nregs'

49648. This should not happen because DUK_TAG_OBJECT case checks * for this already, but check just in case.

49649. result array is already at the top of stack

49650. args go here as a comma expression in parens

49651. [...] source? filename? &comp_args] (depends on flags)

49652. no extra padding

49653. Start position (inclusive) and end position (exclusive)

49654. tentative, checked later

49655. slot A is a source (default: target)

49656. indexed by recursion_depth

49657. * Fixed buffer helper useful for debugging, requires no allocation * which is critical for debugging.

49658. Order of unwinding is important

49659. * Final sigma context specific rule. This is a rather tricky * rule and this handling is probably not 100% correct now. * The rule is not locale/language specific so it is supported.

49660. tracks maximum initialized index + 1

49661. **comment:** first register that is a temporary (below: variables)
label: code-design

49662. A -> register of target object * B -> first register of value data (start_index, value1, value2, ..., valueN) * C -> number of key/value pairs (N)

49663. Just skip, leaving zeroes in the result.

49664. [...] arr]

49665. Note: successive characters could be joined into string matches * but this is not trivial (consider e.g. '/xyz+'); see docs for * more discussion.

49666. Coerce an duk_alue to a register or constant; result register may * be a temp or a bound register. ** The duk_alue argument ('x') is converted into a regconst as a * side effect.

49667. bytes in source

49668. no voluntary gc

49669. A -> result reg * B -> object reg * C -> key reg/const

49670. An object may have FINALIZED here if it was finalized by mark-and-sweep * on a previous run and refcount then decreased to zero. We won't run the * finalizer again here.

49671. **comment:** XXX: allow object to be a const, e.g. in 'foo'.toString()? * On the other hand, DUK_REGCONSTP() is slower and generates * more code.
label: code-design

49672. refcount

49673. regexp res_obj is at index 4

49674. stack[0] = callback fn * stack[1] = initialValue * stack[2] = object (coerced this) * stack[3] = length (not needed, but not popped above) * stack[4] = accumulator

49675. **comment:** Node.js Buffer variable width integer field. We don't really * care about speed here, so aim for shortest algorithm.
label: code-design

49676. The spec algorithm first does "R = ToString(separator)" before checking * whether separator is undefined. Since this is side effect free, we can * skip the ToString() here.

49677.]'

49678. NULL with zero length represents an empty string; NULL with higher * length is also now treated like an empty string although it is * a bit dubious. This is unlike duk_push_string() which pushes a * 'null' if the input string is a NULL.

49679. -> [func funcname env funcname func]

49680. true, because v[1] has at least one bit set

49681. bp to use when parsing a top level Expression

49682. Caller will finish the marking process if we hit a recursion limit.

49683. y

49684. **comment:** * E5 Section 7.6: ** IdentifierStart: * UnicodeLetter * \$ * _ * \ UnicodeEscapeSequence ** IdentifierStart production has one multi-character production: ** \ UnicodeEscapeSequence ** The '\ character is -not- matched by this function. Rather, the caller * should decode the escape and then call this function to check whether the * decoded character is acceptable (see discussion in E5 Section 7.6). ** The "UnicodeLetter" alternative of the production allows letters * from various Unicode categories. These can be extracted with the * 'src/extract_chars.py' script. ** Because the result has hundreds of Unicode codepoint ranges, matching * for any values >= 0x80 are done using a very slow range-by-range scan * and a packed range format. ** The ASCII portion (codepoints 0x00 ... 0x7f) is fast-patched below because * it matters the most. The ASCII related ranges of IdentifierStart are: ** 0x0041 ... 0x005a ['A' ... 'Z'] * 0x0061 ... 0x007a ['a' ... 'z'] * 0x0024 ['\$'] * 0x005f['_']
label: code-design

label: code-design
49731. omitted
49732. toGMTString'
49733. * Object related * * Note: seal() and freeze() are accessible through Ecmascript bindings, * and are not exposed through the API.
49734. * ISO 8601 subset parser.
49735. Internal keys are prefixed with 0xFF in the stringtable * (which makes them invalid UTF-8 on purpose).
49736. without explicit non-BMP support, assume non-BMP characters * are always accepted as identifier characters.
49737. [res]
49738. dash is already 0
49739. Object flag. There are currently 26 flag bits available. Make sure * this stays in sync with debugger object inspection code.
49740. This may only happen if built-ins are being "torn down". * This behavior is out of specification scope.
49741. Not possible because array object 'length' is present * from its creation and cannot be deleted, and is thus * caught as an existing property above.
49742. Note: strictness is not inherited from the current Duktape/C * context. Otherwise it would not be possible to compile * non-strict code inside a Duktape/C activation (which is * always strict now). See tests/api/test-eval-strictness.c * for discussion.
49743. A -> flags * B -> base register for call (base -> func, base+1 -> this, base+2 -> arg1 ... base+2+N-1 -> argN) * (for DUK_OP_CALLI, 'b' is indirect) * C -> nargs
49744. * Wrapper for jmp_buf. * * This is used because jmp_buf is an array type for backward compatibility. * Wrapping jmp_buf in a struct makes pointer references, sizeof, etc, * behave more intuitively. * * http://en.wikipedia.org/wiki/Setjmp.h#Member_types
49745. * This is a bit tricky to implement portably. The result depends * on the timestamp (specifically, DST depends on the timestamp). * If e.g. UNIX APIs are used, they'll have portability issues with * very small and very large years. * * Current approach: * * - Stay within portable UNIX limits by using equivalent year mapping. * Avoid year 1970 and 2038 as some conversions start to fail, at * least on some platforms. Avoiding 1970 means that there are * currently DST discrepancies for 1970. * * - Create a UTC and local time breakdowns from 't'. Then create * a time_t using gmtime() and localtime() and compute the time * difference between the two. * * Equivalent year mapping (E5 Section 15.9.1.8): * * If the host environment provides functionality for determining * daylight saving time, the implementation of ECMAScript is free * to map the year in question to an equivalent year (same * leap-year-ness and same starting week day for the year) for which * the host environment provides daylight saving time information. * The only restriction is that all equivalent years should produce * the same result. * * This approach is quite reasonable but not entirely correct, e.g. * the specification also states (E5 Section 15.9.1.8): * * The implementation of ECMAScript should not try to determine * whether the exact time was subject to daylight saving time, but * just whether daylight saving time would have been in effect if * the _current daylight saving time algorithm_ had been used at the * time. This avoids complications such as taking into account the * years that the locale observed daylight saving time year round. * * Since we rely on the platform APIs for conversions between local * time and UTC, we can't guarantee the above. Rather, if the platform * has historical DST rules they will be applied. This seems to be the * general preferred direction in Ecmascript standardization (or at least * implementations) anyway, and even the equivalent year mapping should * be disabled if the platform is known to handle DST properly for the * full Ecmascript range. * * The following has useful discussion and links: * * https://bugzilla.mozilla.org/show_bug.cgi?id=351066

49764. custom; implies DUK_HOBJECT_IS_THREAD
49765. [thisArg arg1 ... argN]
49766. for array and object literals
49767. validation of the regexp is caller's responsibility
49768. regnum is sane
49769. * To avoid creating a heavy intermediate value for the list of ranges, * only the start token ('[or '[^') is parsed here. The regexp * compiler parses the ranges itself.
49770. **comment:** XXX: Currently function source code is not stored, as it is not * required by the standard. Source code should not be stored by * default (user should enable it explicitly), and the source should * probably be compressed with a trivial text compressor; average * compression of 20-30% is quite easy to achieve even with a trivial * compressor (RLE + backwards lookup). * * Debugging needs source code to be useful: sometimes input code is * not found in files as it may be generated and then eval()'d, given * by dynamic C code, etc. * * Other issues: * * - Need tokenizer indices for start and end to substring * - Always normalize function declaration part? * - If we keep _Formals, only need to store body
label: code-design
49771. Preinc/predec for var-by-name, slow path.

49772. tm_isdst is both an input and an output to mktime(), use 0 to * avoid DST handling in mktime(): * - https://github.com/svaarala/duktape/issues/406 * - http://stackoverflow.com/questions/8558919/mktime-and-tm-isdst

49773. Small variant; roughly 150 bytes smaller than the fast variant.

49774. -> [... closure template env funcname]

49775. * Free the heap. * * Frees heap-related non-heap-tracked allocations such as the * string intern table; then frees the heap allocated objects; * and finally frees the heap structure itself. Reference counts * and GC markers are ignored (and not updated) in this process, * and finalizers won't be called. * * The heap pointer and heap object pointers must not be used * after this call.

49776. rescue no longer supported

49777. res->mark_and_sweep_trigger_counter == 0 -> now causes immediate GC; which is OK

49778. _Pc2line

49779. Sanity checks for string and token defines

49780. number of escapes and line continuations (for directive prologue)

49781. MakeTime

49782. **comment:** XXX: this is possible without resorting to the value stack
label: code-design

49783. ignored

49784. NULL for lightfunc

49785. lookup shorthands (note: assume context variable is named 'lex_ctxt')

49786. Other callbacks are optional.

49787. truncated in case pass 3 needed

49788. With constants and inner functions on value stack, we can now * atomically finish the function 'data' buffer, bump refcounts, * etc. * * Here we take advantage of the value stack being just a duk_tval * array: we can just memcpy() the constants as long as we incref * them afterwards.

49789. DUK_USE_NONSTD_FUNC_SOURCE_PROPERTY

49790. Leave 'getter' on stack

49791. Called as a function, pattern has [[Class]] "RegExp" and * flags is undefined -> return object as is.

49792. Q...f

49793. x < y

49794. set exotic behavior only after we're done

49795. **comment:** Default function to write a formatted log line. Writes to stderr, * appending a newline to the log line. * * The argument is a buffer whose visible size contains the log message. * This function should avoid coercing the buffer to a string to avoid * string table traffic.
label: code-design

49796. Current size is about 152 bytes.

49797. **comment:** These base values are never used, but if the compiler doesn't know * that DUK_ERROR() won't return, these are needed to silence warnings. * On the other hand, scan-build will warn about the values not being * used, so add a DUK_UNREF.
label: code-design

49798. hash size relative to entries size: for value X, approx. hash_prime(e_size + e_size / X)

49799. while repl

49800. Note: we don't parse back exponent notation for anything else * than radix 10, so this is not an ambiguous check (e.g. hex * exponent values may have 'e' either as a significand digit * or as an exponent separator). * * If the exponent separator occurs twice, 'e' will be interpreted * as a digit (= 14) and will be rejected as an invalid decimal * digit.

49801. DUK_HEAPHDR_HAS_FINALIZED may be set if we're doing a * refzero finalization and mark-and-sweep gets triggered * during the finalizer.

49802. Setup state. Initial ivalue is 'undefined'.

49803. 'object'

49804. If we processed any debug messages breakpoints may have * changed; restart execution to re-check active breakpoints.

49805. 1 1 1 <32 bits>

49806. **comment:** Leading / trailing whitespace is sometimes accepted and * sometimes not. After white space trimming, all valid input * characters are pure ASCII.
label: code-design

49807. patch in range count later

49808. * If tracebacks are disabled, 'fileName' and 'lineNumber' are added * as plain own properties. Since Error.prototype has accessors of * the same name, we need to define own properties directly (cannot * just use e.g. duk_put_prop_stridx). Existing properties are not * overwritten in case they already exist.

49809. 0: toString

49810. **comment:** XXX: unnecessary string coercion for array indices, * intentional to keep small.
label: code-design

49811. UTF-8 encoded bytes escaped as %xx%xx%xx... -> 3 * nbytes. * Codepoint range is restricted so this is a slightly too large * but doesn't matter.

49812. lowest mantissa for this exponent

49813. * Traceback handling when tracebacks disabled. * * The fileName / lineNumber stubs are now necessary because built-in * data will include the accessor properties in Error.prototype. If those * are removed for builds without tracebacks, these can also be removed. * 'stack' should still be present and produce a ToString() equivalent: * this is useful for user code which prints a stacktrace and expects to * see something useful. A normal stacktrace also begins with a ToString() * of the error so this makes sense.

49814. all we need to know

49815. ASSIGNMENT EXPRESSION

49816. IdentityEscape

49817. Must decrease recursion depth before returning.

49818. note: mixing len into seed improves hashing when skipping

49819. For join(), nargs is 1. For toLocaleString(), nargs is 0 and * setting the top essentially pushes an undefined to the stack, * thus defaulting to a comma separator.

49820. Return with final function pushed on stack top.

49821. Note: 'e' and 'E' are also accepted here.

49822. %c', passed concretely as int

49823. thread resumed another thread (active but not running)

label: code-design

49840. * An array must have a 'length' property (E5 Section 15.4.5.2). * The special array behavior flag must only be enabled once the * length property has been added. *
* The internal property must be a number (and preferably a * fastint if fastint support is enabled).

49841. * Create a hstring and insert into the heap. The created object * is directly garbage collectable with reference count zero. * * The caller must place the interned string into the stringtable * immediately (without chance of a longjmp); otherwise the string * is lost.

49842. Note: this is correct even for default clause statements: * they participate in 'fall-through' behavior even if the * default clause is in the middle.

49843. exposed, used by e.g. duk.bi_date.c

49844. * Parsing of ints and floats

49845. flags: "gi"

49846. For TypedArrays 'undefined' return value is specified * by ES6 (matches V8).

49847. * Return target object

49848. side effects

49849. [... result]

49850. only objects have finalizers

49851. interpret e.g. '0x' and '0xg' as a NaN (= parse error)

49852. **comment:** * Get and call the finalizer. All of this must be wrapped * in a protected call, because even getting the finalizer * may trigger an error (getter may throw one, for instance).
label: code-design

49853. **comment:** * String/JSON conversions * * Human readable conversions are now basically ISO 8601 with a space * (instead of 'T') as the date/time separator. This is a good baseline * and is platform independent. * * A shared native helper to provide many conversions. Magic value contains * a set of flags. The helper provides: * * toString() * toDateString() * toTimeString() * toLocaleString() * toLocaleDateString() * toLocaleTimeString() * toUTCString() * toISOString() * * Notes: * * - Date.prototype.toGMTString() and Date.prototype.toUTCString() are * required to be the same Ecmascript function object (!), so it is * omitted from here. * * - Date.prototype.toUTCString(): E5.1 specification does not require a * specific format, but result should be human readable. The * specification suggests using ISO 8601 format with a space (instead of 'T') separator if a more human readable format is not available. * * - Date.prototype.toISOString(): unlike other conversion functions, * toISOString() requires a RangeError for invalid date values.
label: code-design

49854. * Thread support.

49855. bytecode start offset of the atom parsed in this loop * (allows quantifiers to copy the atom bytecode)

49856. temp copy, write back for next loop

49857. char loop

49858. basic platform types

49859. we currently assume virtual properties are not configurable (as none of them are)

49860. Stage 1: find highest preventing non-configurable entry (if any). * When forcing, ignore non-configurability.

49861. **comment:** XXX: keep property attributes or tweak them here? * Properties will now be non-configurable even when they're * normally configurable for the global object.
label: code-design

49862. address

49863. * Property already exists. Steps 5-6 detect whether any changes need * to be made.

49864. may be NULL

49865. * Parse Ecmascript source InputElementDiv or InputElementRegExp * (E5 Section 7), skipping whitespace, comments, and line terminators. * * Possible results are: * (1) a token * (2) a line terminator (skipped) * (3) a comment (skipped) * (4) EOF * * White space is automatically skipped from the current position (but * not after the input element). If input has already ended, returns * DUK_TOK_EOF indefinitely. If a parse error occurs, uses an DUK_ERROR() * macro call (and hence a longjmp through current heap longjmp context). * Comments and line terminator tokens are automatically skipped. * * The input element being matched is determined by regexp_mode; if set, * parses a InputElementRegExp, otherwise a InputElementDiv. The * difference between these are handling of productions starting with a * forward slash. * * If strict_mode is set, recognizes additional future reserved words * specific to strict mode, and refuses to parse octal literals. * * The matching strategy below is to (currently) use a six character * lookup window to quickly determine which production is the -longest- * matching one, and then parse that. The top-level if-else clauses * match the first character, and the code blocks for each clause * handle -all- alternatives for that first character. Ecmascript * specification uses the "longest match wins" semantics, so the order * of the if-clauses matters. * * Misc notes: * * * Ecmascript numeric literals do not accept a sign character. * Consequently e.g. "-1.0" is parsed as two tokens: a negative * sign and a positive numeric literal. The compiler performs * the negation during compilation, so this has no adverse impact. * * * There is no token for "undefined": it is just a value available * from the global object (or simply established by doing a reference * to an undefined value). * * * Some contexts want Identifier tokens, which are IdentifierNames * excluding reserved words, while some contexts want IdentifierNames * directly. In the latter case e.g. "while" is interpreted as an * identifier name, not a DUK_TOK WHILE token. The solution here is * to provide both token types: DUK_TOK WHILE goes to 't' while * DUK_TOK_IDENTIFIER goes to 't_nores', and 'slot1' always contains * the identifier / keyword name. * * * Directive prologue needs to identify string literals such as * "use strict" and 'use strict', which are sensitive to line * continuations and escape sequences. For instance, "use\0020strict" * is a valid directive but is distinct from "use strict". The solution * here is to decode escapes while tokenizing, but to keep track of the * number of escapes. Directive detection can then check that the * number of escapes is zero. * * * Multi-line comments with one or more internal LineTerminator are * treated like a line terminator to comply with automatic semicolon * insertion.

49866. IEEE double is approximately 16 decimal digits; print a couple extra

49867. * Resizing and hash behavior

49868. String sanitizer which escapes ASCII control characters and a few other * ASCII characters, passes Unicode as is, and replaces invalid UTF-8 with * question marks. No errors are thrown for any input string, except in out * of memory situations.

49869. **comment:** Try to optimize X <op>= Y for reg-bound * variables. Detect side-effect free RHS * narrowly by seeing whether it emits code. * If not, rewind the code emitter and overwrite * the unnecessary temp reg load.

label: code-design
50094. helper to insert a (non-string) heap object into heap allocated list
50095. * Internal API calls which have (stack and other) semantics similar * to the public API.
50096. retval is directly usable
50097. **comment:** * Error throwing helpers ** The goal is to provide verbose and configurable error messages. Call * sites should be clean in source code and compile to a small footprint. * Small footprint is also useful for performance because small cold paths * reduce code cache pressure. Adding macros here only makes sense if there * are enough call sites to get concrete benefits.
label: code-design
50098. digit count
50099. * Hobject property set/get functionality. ** This is very central functionality for size, performance, and compliance. * It is also rather intricate; see hobject-algorithms.rst for discussion on * the algorithms and memory-management.rst for discussion on refcounts and * side effect issues. ** Notes: ** - It might be tempting to assert "refcount nonzero" for objects * being operated on, but that's not always correct: objects with * a zero refcount may be operated on by the refcount implementation * (finalization) for instance. Hence, no refcount assertions are made. ** - Many operations (memory allocation, identifier operations, etc) * may cause arbitrary side effects (e.g. through GC and finalization). * These side effects may invalidate duk_tval pointers which point to * areas subject to reallocation (like value stack). Heap objects * themselves have stable pointers. Holding heap object pointers or * duk_tval copies is not problematic with respect to side effects; * care must be taken when holding and using argument duk_tval pointers. ** - If a finalizer is executed, it may operate on the same object * we're currently dealing with. For instance, the finalizer might * delete a certain property which has already been looked up and * confirmed to exist. Ideally finalizers would be disabled if GC * happens during property access. At the moment property table realloc * disables finalizers, and all DECREFs may cause arbitrary changes so * handle DECREF carefully. ** - The order of operations for a DECREF matters. When DECREF is executed, * the entire object graph must be consistent; note that a refzero may * lead to a mark-and-sweep through a refcount finalizer.
50100. **comment:** * Compact the closure, in most cases no properties will be added later. * Also, without this the closures end up having unused property slots * (e.g. in Duktape 0.9.0, 8 slots would be allocated and only 7 used). * A better future solution would be to allocate the closure directly * to correct size (and setup the properties directly without going * through the API).
label: code-design
50101. 2/3 -> 1/8 = 12.5% min growth
50102. * Reference count updates ** Note: careful manipulation of refcounts. The top is * not updated yet, so all the activations are reachable * for mark-and-sweep (which may be triggered by decref). * However, the pointers are NULL so this is not an issue.
50103. 'hex'
50104. borrowed label name
50105. * String table algorithm: closed hashing with a probe sequence ** This is the default algorithm and works fine for environments with * minimal memory constraints.
50106. Longjmp state is kept clean in success path
50107. Longjmp callers are required to sync-and-null thr->ptr_curr_pc * before longjmp.
50108. Would indicate corrupted lists.
50109. Return invalid index; if caller uses this without checking * in another API call, the index won't map to a valid stack * entry.
50110. **comment:** XXX: faster internal way to get this
label: code-design
50111. old value is number: no refcount
50112. Using classification has smaller footprint than direct comparison.
50113. DUK_USE_ROM_GLOBAL_CLONE || DUK_USE_ROM_GLOBAL_INHERIT
50114. leading byte of match string
50115. **comment:** * Formal argument list ** We don't check for prohibited names or for duplicate argument * names here, because we don't yet know whether the function will * be strict. Function body parsing handles this retroactively.

50146. ignore reclimit, not constructor
50147. '\xffCallee'
50148. is normalized
50149. Variant for writing duk_tvals so that any heap allocated values are * written out as tagged heap pointers.
50150. Coerce like boolean
50151. mark-and-sweep marking reached a recursion limit and must use multi-pass marking
50152. [(builtin objects)]
50153. **comment:** XXX: tv_func is not actually needed
 label: requirement
50154. * Source filename (or equivalent), for identifying thrown errors.
50155. '_proto_'
50156. **comment:** XXX: this is probably a useful shared helper: for a * duk_hbufferobject, get a validated buffer pointer/length.
 label: code-design
50157. parent env is the prototype
50158. get varenv for varname (callee's declarative lexical environment)
50159. Use a new environment and there's an 'arguments' object. * We need to initialize it right now.
50160. The timevalue must be in valid Ecmascript range, but since a local * time offset can be applied, we need to allow a +/- 24h leeway to * the value. In other words, although the UTC time is within the * Ecmascript range, the local part values can be just outside of it.
50161. Note: can be safely scanned as bytes (undecoded)
50162. ======
50163. No activation matches, use undefined for both .fileName and * .lineNumber (matches what we do with a _Tracedata based * no-match lookup).
50164. also goes into flags
50165. UnaryExpression
50166. **comment:** XXX: return something more useful, so that caller can throw?
 label: code-design
50167. Tailcalls are handled by back-patching the TAILCALL flag to the * already emitted instruction later (in return statement parser). * Since A and C have a special meaning here, they cannot be "shuffled".
50168. all virtual properties are non-configurable and non-writable
50169. [obj trap_result res_arr]
50170. **comment:** * The string conversion here incorporates all the necessary Ecmascript * semantics without attempting to be generic. nc_ctx->digits contains * nc_ctx->count digits (>= 1), with the topmost digit's 'position' * indicated by nc_ctx->k as follows: * * digits="123" count=3 k=0 --> 0.123 * digits="123" count=3 k=1 --> 1.23 * digits="123" count=3 k=5 --> 12300 * digits="123" count=3 k=-1 --> 0.0123 * * Note that the identifier names used for format selection are different * in Burger-Dybvig paper and Ecmascript specification (quite confusingly * so, because e.g. 'k' has a totally different meaning in each). See * documentation for discussion. * * Ecmascript doesn't specify any specific behavior for format selection * (e.g. when to use exponent notation) for non-base-10 numbers. * * The bigint space in the context is reused for string output, as there * is more than enough space for that (>1kB at the moment), and we avoid * allocating even more stack.
 label: code-design
50171. depth check is done when printing an actual type
50172. Preinc/predec for object properties.
50173. * duk_re_range_callback for generating character class ranges. * * When ignoreCase is false, the range is simply emitted as is. * We don't, for instance, eliminate duplicates or overlapping * ranges in a character class. * * When ignoreCase is true, the range needs to be normalized through * canonicalization. Unfortunately a canonicalized version of a * continuous range is not necessarily continuous (e.g. [x-{}] is * continuous but [X-{}] is not). The current algorithm creates the * canonicalized range(s) space efficiently at the cost of compile * time execution time (see doc/regexp.rst for discussion). * * Note that the ctx->nranges is a context-wide temporary value * (this is OK because there cannot be multiple character classes * being parsed simultaneously).
50174. init function state: init valstack allocations
50175. **comment:** Currently about 7*152 = 1064 bytes. The space for these * duk_bigsints is used also as a temporary buffer for generating * the final string. This is a bit awkward; a union would be * more correct.
 label: code-design
50176. Check statement type based on the first token type. * * Note: expression parsing helpers expect 'curr_tok' to * contain the first token of the expression upon entry.
50177. **comment:** * The 'in' operator requires an object as its right hand side, * throwing a TypeError unconditionally if this is not the case. * * However, lightfuncs need to behave like fully fledged objects * here to be maximally transparent, so we need to handle them * here.
 label: code-design
50178. * Number-to-string conversion. The semantics of these is very tightly * bound with the Ecmascript semantics required for call sites.
50179. **comment:** XXX: inject test
 label: code-design
50180. **comment:** SCANBUILD: with suitable dmin/dmax limits 'd' is unused
 label: code-design

50258. __proto__ setter returns 'undefined' on success unlike the * setPrototypeOf() call which returns the target object.
50259. 0x00-0x0f
50260. * String comparison (E5 Section 11.8.5, step 4), which * needs to compare codepoint by codepoint. * * However, UTF-8 allows us to use strcmp directly: the shared * prefix will be encoded identically (UTF-8 has unique encoding) * and the first differing character can be compared with a simple * unsigned byte comparison (which strcmp does). * * This will not work properly for non-xutf-8 strings, but this * is not an issue for compliance.
50261. DUK_TOK_BOR_EQ
50262. Argument must be a string, e.g. a buffer is not allowed.
50263. Note: val is a stable duk_tval pointer. The caller makes * a value copy into its stack frame, so 'tv_val' is not subject * to side effects here.
50264. number of formal arguments
50265. register, constant, or value
50266. Note: intentionally allow leading zeroes here, as the * actual parser will check for them.
50267. Impose a maximum buffer length for now. Restricted artificially to * ensure resize computations or adding a heap header length won't * overflow size_t and that a signed duk_int_t can hold a buffer * length. The limit should be synchronized with DUK_HSTRING_MAX_BYTELEN.
50268. h_code: held in bw_code

50269. * Forward declarations.
50270. heap pointer comparison suffices
50271. Note: 'count' is currently not adjusted by rounding (i.e. the * digits are not "chopped off". That shouldn't matter because * the digit position (absolute or relative) is passed on to the * convert-and-push function.
50272. **comment:** The variable environment for magic variable bindings needs to be * given by the caller and recorded in the arguments object. * * See E5 Section 10.6, the creation of setters/getters. * * The variable environment also provides access to the callee, so * an explicit (internal) callee property is not needed.
label: code-design
50273. All components default to 0 except day-of-month which defaults * to 1. However, because our internal day-of-month is zero-based, * it also defaults to zero here.
50274. Backtrack.
50275. **comment:** XXX: code duplication
label: code-design
50276. arg count
50277. **comment:** Switch to caller's setjmp() catcher so that if an error occurs * during error handling, it is always propagated outwards instead * of causing an infinite loop in our own handler.
label: code-design
50278. [... number] -> [... string]
50279. 'data' (and everything in it) is reachable through h_res now
50280. Fast path.
50281. called as a normal function: return new Date().toString()
50282. -----XX
50283. must be computed after realloc
50284. 'join'
50285. Get the value represented by an duk_ispec to a register or constant. * The caller can control the result by indicating whether or not: * * (1) a constant is allowed (sometimes the caller needs the result to * be in a register) * * (2) a temporary register is required (usually when caller requires * the register to be safely mutable; normally either a bound * register or a temporary register are both OK) * * (3) a forced register target needs to be used * * Bytecode may be emitted to generate the necessary value. The return * value is either a register or a constant.
50286. **comment:** XXX: FP_ZERO check can be removed, the else clause handles it * correctly (preserving sign).
label: code-design
50287. **comment:** XXX: the string shouldn't appear twice, but we now loop to the * end anyway; if fixed, add a looping assertion to ensure there * is no duplicate.
label: code-design
50288. re-lookup first char on first loop
50289. [... buf loop (proplist)]
50290. DUK_BUFOBJ_INT16ARRAY
50291. No net refcount changes.
50292. DUK_USE_DATE_FMT_STRFTIME
50293. eat the right paren
50294. **comment:** A straightforward 64-byte lookup would be faster * and cleaner, but this is shorter.
label: code-design
50295. For this to work, DATEMSK must be set, so this is not very * convenient for an embeddable interpreter.
50296. Fixed buffer; data follows struct, with proper alignment guaranteed by * struct size.
50297. **comment:** * Call handling. * * Main functions are: * * - duk_handle_call_unprotected(): unprotected call to Ecmascript or * Duktape/C function * - duk_handle_call_protected(): protected call to Ecmascript or * Duktape/C function * - duk_handle_safe_call(): make a protected C call within current * activation * - duk_handle_ecma_call_setup(): Ecmascript-to-Ecmascript calls * (not always possible), including tail calls and coroutine resume * * See 'execution.rst'. * * Note: setjmp() and local variables have a nasty interaction, * see execution.rst; non-volatile locals modified after setjmp() * call are not guaranteed to keep their value.
label: code-design
50298. -1 if disjunction is complex, char length if simple
50299. noblame_fileline
50300. Backtrack to previous slash or start of buffer.
50301. func limits
50302. This is a rare property helper; it sets the global thrower (E5 Section 13.2.3) * setter/getter into an object property. This is needed by the 'arguments' * object creation code, function instance creation code, and Function.prototype.bind().
50303. **comment:** Workaround for some exotic platforms where NAN is missing * and the expression (0.0 / 0.0) does NOT result in a NaN. * Such platforms use the global 'duk_computed_nan' which must * be initialized at runtime. Use 'volatile' to ensure that * the compiler will actually do the computation and not try * to do constant folding which might result in the original * problem.
label: code-design
50304. A -> target register (A, A+1) for call setup * (for DUK_OP_CSREGI, 'a' is indirect) * B -> register containing target function (not type checked here)
50305. Return the Buffer to allow chaining: b.fill(0x11).fill(0x22, 3, 5).toString()
50306. **comment:** code_idx: not needed
label: requirement
50307. keep func->h_funcs; inner functions are not reparsed to avoid O(depth^2) parsing
50308. load factor min 25%
50309. 1111 0xxx 10xx xxxx 10xx xxxx 10xx xxxx
50310. Note: peek cannot currently trigger a detach * so the dbg_detaching == 0 assert outside the * loop is correct.
50311. Assume interrupt init/counter are properly initialized here.
50312. * Parse a case or default clause.
50313. **comment:** XXX: when this error is caused by a nonexistent * file given to duk_peval_file() or similar, the * error message is not the best possible.
label: code-design
50314. impose a reasonable exponent limit, so that exp * doesn't need to get tracked using a bigint.
50315. marker value; in E5 2^32-1 is not a valid array index (2^32-2 is highest valid)
50316. maxval
50317. valstack space allocated especially for proxy lookup which does a * recursive property lookup
50318. Accept ASCII strings which conform to identifier requirements * as being emitted without key quotes. Since we only accept ASCII * there's no need for actual decoding: 'p' is intentionally signed * so that bytes >= 0x80 extend to negative values and are rejected * as invalid identifier codepoints.
50319. Careful overflow handling. When multiplying by 10: * - 0x19999998 x 10 = 0xfffffff0: no overflow, and adding * 0..9 is safe. * - 0x19999999 x 10 = 0xffffffff: no overflow, adding * 0..5 is safe, 6...9 overflows. * - 0x1999999a x 10 = 0x10000004: always overflow.
50320. The Str(key, holder) operation. * * Stack policy: [... key] -> [...]
50321. * Bitstream encoder
50322. -> [sep ToObject(this) len str sep]
50323. Decrement PC if that was requested, this requires a PC sync.
50324. Array properties have exotic behavior but they are concrete, * so no special handling here. * * Arguments exotic behavior (E5 Section 10.6, [[GetOwnProperty]]) * is only relevant as a post-check implemented below; hence no * check here.
50325. XXX: request a "last statement is terminal" from duk_parse_stmt() and duk_parse_stmts(); * we could avoid the last RETURN if we could ensure there is no way to get here * (directly or via a jump)
50326. [... key_obj key key flags]
50327. no side effects
50328. INACTIVE: no activation, single function value on valstack
50329. Equality may be OK but >length not. Checking * this explicitly avoids some overflow cases * below.

50330. this cannot initiate a detach
50331. done so that duk_mark_heaphdr() works correctly
50332. if highest bit of a register number is set, it refers to a constant instead
50333. **comment:** Slow variants, call to a helper to reduce code size. * Can be used explicitly when size is always more important than speed.
label: code-design
50334. DUK_USE_REFERENCE_COUNTING
50335. Caller ensures space for at least DUK_JSON_MAX_ESC_LEN.
50336. byte offset to buf
50337. * The catch variable must be updated to reflect the new allocated * register for the duration of the catch clause. We need to store * and restore the original value for the varmap entry (if any).
50338. **comment:** unused now
label: code-design
50339. **comment:** stack[0] = callback * stack[1] = thisArg * stack[2] = object * stack[3] = ToUInt32(length) (unused, but avoid unnecessary pop) * stack[4] = result array (or undefined)

50409. non-standard
50410. may be safe, or non-safe depending on flags
50411. activation prevents yield (native call or "new")
50412. **comment:** XXX: expensive, but numconv now expects to see a string
 label: code-design
50413. DUK_FLD_VARINT; not relevant here
50414. **comment:** * Note: use indirect realloc variant just in case mark-and-sweep * (finalizers) might resize this same buffer during garbage * collection.
 label: code-design
50415. eat 'try'
50416. 1110 xxxx 10xx xxxx 10xx xxxx
50417. Note: it's nice if size is 2^N (at least for 32-bit platforms).
50418. Quite heavy assert: check valstack policy. Improper * shuffle instructions can write beyond valstack_top/end * so this check catches them in the act.
50419. Expects 'this' at top of stack on entry.
50420. The token in the switch has already been eaten here
50421. currently all labels accept a break, so no explicit check for it now
50422. [arg result]
50423. got lineterm preceding non-whitespace, non-lineterm token
50424. intentional overlap with earlier memzero
50425. Allow exponent
50426. '\xffSource'
50427. read-only object, in code section
50428. **comment:** Slice and accessor information. * * Because the underlying buffer may be dynamic, these may be * invalidated by the buffer being modified so that both offset * and length should be validated before every access. Behavior * when the underlying buffer has changed doesn't need to be clean: * virtual 'length' doesn't need to be affected, reads can return * zero/NaN, and writes can be ignored. * * Note that a data pointer cannot be precomputed because 'buf' may * be dynamic and its pointer unstable.
 label: code-design
50429. Shared object part.
50430. **comment:** XXX: there are language sensitive rules for the ASCII range. * If/when language/locale support is implemented, they need to * be implemented here for the fast path. There are no context * sensitive rules for ASCII range.
 label: code-design
50431. DUK_OP_RETURN flags in A
50432. DUK_TOK_ADD
50433. allocate to reg only (not const)
50434. **comment:** not strictly necessary, but avoids "uninitialized variable" warnings
 label: code-design
50435. * Augment an error at throw time; allow a user error handler (if defined) * to process/replace the error. The error to be augmented is at the * stack top.
50436. **comment:** This macro works when a regconst field is 9 bits, [0,0x1ff]. Adding * DUK_LIKELY/DUK_UNLIKELY increases code footprint and doesn't seem to * improve performance on x64 (and actually harms performance in some tests).
 label: code-design
50437. requested number of output digits; 0 = free-format
50438. * Shared readfield and writefield methods * * The readfield/writefield methods need support for endianness and field * types. All offsets are byte based so no offset shifting is needed.
50439. Gap in array; check for inherited property, * bail out if one exists. This should be enough * to support gappy arrays for all practical code.
50440. **comment:** XXX: could improve bufwriter handling to write multiple codepoints * with one ensure call but the relative benefit would be quite small.
 label: code-design
50441. **comment:** * Delete references to given hstring from the heap string cache. * * String cache references are 'weak': they are not counted towards * reference counts, nor serve as roots for mark-and-sweep. When an * object is about to be freed, such references need to be removed.
 label: code-design
50442. DUK_TOK_EOF
50443. **comment:** XXX: signalling the need to shrink check (only if unwound)
 label: code-design
50444. XXX: duk_dup_unvalidated(ctx, -2) etc.
50445. fill new entries with -unused- (required, gc reachable)
50446. -> [O toString O]
50447. accept anything, expect first value (EOF will be * caught by key parsing below.)
50448. unknown, ignore
50449. * Note: fmax() does not match the E5 semantics. E5 requires * that if -any- input to Math.max() is a NaN, the result is a * NaN. fmax() will return a NaN only if - both- inputs are NaN. * Same applies to fmin(). * * Note: every input value must be coerced with ToNumber(), even * if we know the result will be a NaN anyway: ToNumber() may have * side effects for which even order of evaluation matters.
50450. [... v1 v2 name filename]
50451. !DUK_USE_PANIC_HANDLER
50452. **comment:** XXX: inlined DECREF macro would be nice here: no NULL check, * refzero queueing but no refzero algorithm run (= no pointer * instability), inline code.
 label: code-design
50453. expected ival
50454. **comment:** A 16-bit listlen makes sense with 16-bit heap pointers: there * won't be space for 64k strings anyway.
 label: code-design
50455. * Finalize refcounts for heap elements just about to be freed. * This must be done for all objects before freeing to avoid any * stale pointer dereferences. * * Note that this must deduce the set of objects to be freed * identically to duk_sweep_heap().
50456. no sce, or sce scan not best

50457. caller must have decref'd values above new_a_size (if that is necessary)
50458. [... buf loop (proplist) (gap)]
50459. **comment:** XXX: duk_hobject_hasprop() would be correct for * non-Proxy objects too, but it is about ~20-25% * slower at present so separate code paths for * Proxy and non-Proxy now.
label: code-design
50460. Coercion may be needed, the helper handles that by pushing the * tagged values to the stack.
50461. checked by caller
50462. 'Int16Array'
50463. res->strs16[] is zeroed and zero decodes to NULL, so no NULL inits.
50464. entry part must not contain any configurable properties, or * writable properties (if is_frozen).
50465. thread; minimizes argument passing
50466. step 4.d
50467. **comment:** * The Number constructor uses ToNumber(arg) for number coercion * (coercing an undefined argument to NaN). However, if the * argument is not given at all, +0 must be used instead. To do * this, a vararg function is used.
label: code-design
50468. one operator (= assign)

50470. string objects must not created without internal value
50471. eat backslash on entry
50472. * Cached module check. * * If module has been loaded or its loading has already begun without * finishing, return the same cached value ('exports'). The value is * registered when module load starts so that circular references can * be supported to some extent.
50473. * Setup a preliminary activation and figure out nargs/nregs. * * Don't touch valstack_bottom or valstack_top yet so that Duktape API * calls work normally.
50474. **comment:** XXX: Rework to use an always-inline function?
label: code-design
50475. **comment:** * Common heap header * * All heap objects share the same flags and refcount fields. Objects other * than strings also need to have a single or double linked list pointers * for insertion into the "heap allocated" list. Strings are held in the * heap-wide string table so they don't need link pointers. * * Technically, 'h_refcount' must be wide enough to guarantee that it cannot * wrap (otherwise objects might be freed incorrectly after wrapping). This * means essentially that the refcount field must be as wide as data pointers. * On 64-bit platforms this means that the refcount needs to be 64 bits even * if an 'int' is 32 bits. This is a bit unfortunate, and compromising on * this might be reasonable in the future. * * Heap header size on 32-bit platforms: 8 bytes without reference counting, * 16 bytes with reference counting.
label: code-design
50476. We're a varargs function because we need to detect whether * initialValue was given or not.
50477. cannot be strict (never mapped variables)
50478. Avoid recursive re-enter; enter when we're attached or * detaching (to finish off the pending detach).
50479. DUK_DEBUGGER_H_INCLUDED
50480. Maximum length of CommonJS module identifier to resolve. Length includes * both current module ID, requested (possibly relative) module ID, and a * slash in between.
50481. **comment:** * Property count check. This is the only point where we ensure that * we don't get more (allocated) property space that we can handle. * There aren't hard limits as such, but some algorithms fail (e.g. * finding next higher prime, selecting hash part size) if we get too * close to the 4G property limit. * * Since this works based on allocation size (not actually used size), * the limit is a bit approximate but good enough in practice.
label: code-design
50482. This loop intentionally does not ensure characters are valid * ([0-9a-fA-F]) because the hex decode call below will do that.
50483. 0 if no used entries
50484. * Basic double / byte union memory layout.
50485. copy values (no overlap even if to_ctx == from_ctx; that's not * allowed now anyway)
50486. Use match charlen instead of bytelen, just in case the input and * match codepoint encodings would have different lengths.
50487. **comment:** Count actually used array part entries and array minimum size. * NOTE: 'out_min_size' can be computed much faster by starting from the * end and breaking out early when finding first used entry, but this is * not needed now.
label: code-design
50488. if new_p == NULL, all of these pointers are NULL
50489. -> [... obj retval/error]
50490. [... holder key] -> [... holder]
50491. 'this' binding is just before current activation's bottom
50492. **comment:** * Error handling macros, assertion macro, error codes. * * There are three level of 'errors': * * 1. Ordinary errors, relative to a thread, cause a longjmp, catchable. * 2. Fatal errors, relative to a heap, cause fatal handler to be called. * 3. Panic errors, unrelated to a heap and cause a process exit. * * Panics are used by the default fatal error handler and by debug code * such as assertions. By providing a proper fatal error handler, user * code can avoid panics in non-debug builds.
label: code-design
50493. Arguments can be: [source? filename? &comp_args] so that * nargs is 1 to 3. Call site encodes the correct nargs count * directly into flags.
50494. a
50495. Allow leading zeroes (e.g. "0123" -> "123")
50496. * Default clause.
50497. d <- (quotient (* r B) s) (in range 0...B-1)
50498. **comment:** XXX: There used to be a shared log buffer here, but it was removed * when dynamic buffer spare was removed. The problem with using * bufwriter is that, without the spare, the buffer gets passed on * as an argument to the raw() call so it'd need to be resized * (reallocated) anyway. If raw() call convention is changed, this * could be made more efficient.

50842. * Intern the temporary byte buffer into a valstack slot * (in practice, slot1 or slot2).
50843. special RegExp literal handling after IdentifierName
50844. XXX: byte offset?
50845. 'switch'
50846. * The 'duktape.h' header provides the public API, but also handles all * compiler and platform specific feature detection, Duktape feature * resolution, inclusion of system headers, etc. These have been merged * because the public API is also dependent on e.g. detecting appropriate * C types which is quite platform/compiler

specific especially for a non-C99 * build. The public API is also dependent on the resolved feature set. * * Some actions taken by the merged header (such as including system headers) * are not appropriate for building a user application. The define * DUK_COMPILING_DUKTAPE allows the merged header to skip/include some * sections depending on what is being built.

50847. * Check the function type, handle bound function chains, and prepare * parameters for the rest of the call handling. Also figure out the * effective 'this' binding, which replaces the current value at * idx_func + 1. * * If the target function is a 'bound' one, follow the chain of 'bound' * functions until a non-bound function is found. During this process, * bound arguments are 'prepended' to existing ones, and the "this" * binding is overridden. See E5 Section 15.3.4.5.1. * * Lightfunc detection happens here too. Note that lightweight functions * can be wrapped by (non-lightweight) bound functions so we must resolve * the bound function chain first.

50848. avoid side effects

50849. result in csreg

50850. * Other heap related defines

50851. * Start doing property attributes updates. Steps 12-13. * * Start by computing new attribute flags without writing yet. * Property type conversion is done above if necessary.

50852. strict: non-deletable, non-writable

50853. * Assuming a register binds to a variable declared within this * function (a declarative binding), the 'this' for the call * setup is always 'undefined'. E5 Section 10.2.1.1.6.

50854. This may happen when forward and backward scanning disagree * (possible for non-extended-UTF-8 strings).

50855. use fallback as 'this' value

50856. Caller has already eaten the first character '(' which we don't need.

50857. r <- (* r B) * s <- s * m+ <- (* m+ B) * m- <- (* m- B) * k <- (- k 1)

50858. A -> object reg * B -> key reg/const * C -> value reg/const * * Note: intentional difference to register arrangement * of e.g. GETPROP; 'A' must contain a register-only value.

50859. C recursion check.

50860. b

50861. Misc

50867. approximation, close enough

50868. marker for detecting internal "double faults", see duk_error_throw.c

50869. three flags

50870. No difference between raw/ensure because the buffer shrinks.

50871. * Determining which datetime components to overwrite based on * stack arguments is a bit complicated, but important to factor * out from setters themselves for compactness. * * If DUK_DATE_FLAG_TIMESETTER, maxnargs indicates setter type: * * 1 -> millisecond * 2 -> second, [millisecond] * 3 -> minute, [second], [millisecond] * 4 -> hour, [minute], [second], [millisecond] * * Else: * * 1 -> date * 2 -> month, [date] * 3 -> year, [month], [date] * * By comparing nargs and maxnargs (and flags) we know which * components to override. We rely on part index ordering.

50872. False if the object is NULL or the prototype 'p' is NULL. * In particular, false if both are NULL (don't compare equal).

50873. Start filling in the activation

50874. SCANBUILD: complains about use of uninitialized values. * The complaint is correct, but operating in undefined * values here is intentional in some cases and the caller * ignores the results.

50875. prevent duk_expr_led() by using a binding power less than anything valid

50876. borrowed reference; although 'tv1' comes from a register, * its value was loaded using LDCONST so the constant will * also exist and be reachable.

50877. [... proplist enum_obj key val]

50878. * Unix-like Date providers * * Generally useful Unix / POSIX / ANSI Date providers.

50879. Push the current 'this' binding; throw TypeError if binding is not object * coercible (CheckObjectCoercible).

50880. All strings beginning with 0xff are treated as "internal", * even strings interned by the user. This allows user code to * create internal properties too, and makes behavior consistent * in case user code happens to use a string also used by Duktape * (such as string has already been interned and has the 'internal' * flag set).

50881. 1111 110x 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx [31 bits]

50882. shrink failure is not fatal

50883. !(l < p)

50884. valstack index of loop detection object

50885. limit is quite low: one array entry is 8 bytes, one normal entry is 4+1+8+4 = 17 bytes (with hash entry)

50886. yes -> move back to heap allocated

50887. strict flag for putvar comes from our caller (currently: fixed)

50888. catchstack limits

50889. * Manually optimized number-to-double conversion

50890. [ToObject(this) ToUint32(length) lowerValue upperValue]

50891. if a tail call: * - an Ecmascript activation must be on top of the callstack * - there cannot be any active catchstack entries

50892. [... enum_target res trap_result val true]

50893. Helper for component getter calls: check 'this' binding, get the * internal time value, split it into parts (either as UTC time or * local time), push a specified component as a return value to the * value stack and return 1 (caller can then tail call us).

50894. important for callers

50895. fail

50896. [sep ToObject(this) len]

50897. DUK_TOK_PERIOD

50898. Enumeration keys are checked against the enumeration target (to see * that they still exist). In the proxy enumeration case _Target will * be the proxy, and checking key existence against the proxy is not * required (or sensible, as the keys may be fully virtual).

50899. Easiest way to implement the search required by the specification * is to do a RegExp test() with lastIndex forced to zero. To avoid * side effects on the argument, "clone" the RegExp if a RegExp was * given as input. * * The global flag of the RegExp should be ignored; setting lastIndex * to zero (which happens when "cloning" the RegExp) should have an * equivalent effect.

50900. idx_reviver

50901. **comment:** Require a lot of stack to force a value stack grow/shrink. * Recursive mark-and-sweep is prevented by allocation macros * so this won't trigger another mark-and-sweep.
label: code-design

50902. signed shift

50903. Impose a string maximum length, need to handle overflow * correctly.

51171. not minimum exponent
51172. * Avoid nested calls. Concretely this happens during debugging, e.g. * when we eval() an expression. * * Also don't interrupt if we're currently doing debug processing * (which can be initiated outside the bytecode executor) as this * may cause the debugger to be called recursively. Check required * for correct operation of throw intercept and other "exotic" halting * scenarios.
51173. Because new_size > duk_count_used_probe(heap), guaranteed to work
51174. bump refcount to prevent refzero during finalizer processing
51175. * Pointers to function data area for faster access. Function * data is a buffer shared between all closures of the same * "template" function. The data buffer is always fixed (non- * dynamic, hence stable), with a layout as follows: * * constants (duk_tval) * inner functions (duk_hobject *) * bytecode (duk_instr_t) * * Note: bytecode end address can be computed from 'data' buffer * size. It is not strictly necessary functionally, assuming * bytecode never jumps outside its allocated area. However, * it's a safety/robustness feature for avoiding the chance of * executing random data as bytecode due to a compiler error. * * Note: values in the data buffer must be incref'd (they will * be decref'd on release) for every compiledfunction referring * to the 'data' element.
51176. **comment:** * Advance lookup window by N characters, filling in new characters as * necessary. After returning caller is guaranteed a character window of * at least DUK_LEXER_WINDOW_SIZE characters. * * The main function duk_advance_bytes() is called at least once per every * token so it has a major lexer/compiler performance impact. There are two * variants for the main duk_advance_bytes() algorithm: a sliding window * approach which is slightly faster at the cost of larger code footprint, * and a simple copying one. * * Decoding directly from the source string would be another lexing option. * But the lookup window based approach has the advantage of hiding the * source string and its encoding effectively which gives more flexibility * going forward to e.g. support chunked streaming of source from flash. * * Decodes UTF-8/CESU-8 leniently with support for code points from U+0000 to * U+10FFFF, causing an error if the input is unparseable. Leniency means: * * * Unicode code point validation is intentionally not performed, * except to check that the codepoint does not exceed 0x10ffff. * * * In particular, surrogate pairs are allowed and not combined, which * allows source files to represent all SourceCharacters with CESU-8. * Broken surrogate pairs are allowed, as Ecmascript does not mandate * their validation. * * * Allows non-shortest UTF-8 encodings. * * Leniency here causes few security concerns because all character data is * decoded into Unicode codepoints before lexer processing, and is then * re-encoded into CESU-8. The source can be parsed as strict UTF-8 with * a compiler option. However, Ecmascript source characters include -all- * 16-bit unsigned integer codepoints, so leniency seems to be appropriate. * * Note that codepoints above the BMP are not strictly SourceCharacters, * but the lexer still accepts them as such. Before ending up in a string * or an identifier name, codepoints above BMP are converted into surrogate * pairs and then CESU-8 encoded, resulting in 16-bit Unicode data as * expected by Ecmascript. * * An alternative approach to dealing with invalid or partial sequences * would be to skip them and replace them with e.g. the Unicode replacement * character U+FFFD. This has limited utility because a replacement character * will most likely cause a parse error, unless it occurs inside a string. * Further, Ecmascript source is typically pure ASCII. * * See: * * <http://en.wikipedia.org/wiki=UTF-8> * <http://en.wikipedia.org/wiki/CESU-8> * <http://tools.ietf.org/html/rfc3629> * http://en.wikipedia.org/wiki/UTF-8#Invalid_byte_sequences * * Future work: * * * Reject other invalid Unicode sequences (see Wikipedia entry for examples) * in strict UTF-8 mode. * * * Size optimize. An attempt to use a 16-byte lookup table for the first * byte resulted in a code increase though. * * * Is checking against maximum 0x10ffff really useful? 4-byte encoding * imposes a certain limit anyway. * * * Support chunked streaming of source code. Can be implemented either * by streaming chunks of bytes or chunks of codepoints.

51247. k > 0 -> k was too low, and cannot be too high

51248. 'func' in the algorithm

51249. **comment:** * Note: zero works as a "no update" marker because the new length * can never be zero after a new property is written. * * Note: must re-lookup because calls above (e.g. duk_alloc_entry_checked()) * may realloc and compact properties and hence change e_idx.
label: code-design

51250. Outside any activation -> look up from global.

51251. Decrease by 25% every round

51252. For manual testing only.

51253. **comment:** Execute the fast path in a protected call. If any error is thrown, * fall back to the slow path. This includes e.g. recursion limit * because the fast path has a smaller recursion limit (and simpler, * limited loop detection).
label: code-design

51254. * Main heap structure

51255. * Argument exotic [[Delete]] behavior (E5 Section 10.6) is * a post-check, keeping arguments internal 'map' in sync with * any successful deletes (note that property does not need to * exist for delete to 'succeed'). * * Delete key from 'map'. Since 'map' only contains array index * keys, we can use arr_idx for a fast skip.

51256. E5 Section 9.2

51257. Backtrack utf-8 input and return a (possibly canonicalized) input character.

51258. Cause an interrupt after executing one instruction.

51259. Compiler

51260. at least errobj must be on stack

51261. 16 bits

51262. * Default panic handler

51263. thr->heap->dbg_detaching may be != 0 if a debugger write outside * the message loop caused a transport error and detach1() to run.

51264. 'modSearch'

51265. **comment:** The condition could be more narrow and check for the * copy area only, but there's no need for fine grained * behavior when the underlying buffer is misconfigured.
label: code-design

51266. **comment:** XXX: for a memory-code tradeoff, remove 'func' and make it's access either a function * or a macro. This would make the activation 32 bytes long on 32-bit platforms again.
label: code-design

51267. Function name is an Identifier (not IdentifierName), but we get * the raw name (not recognizing keywords) here and perform the name * checks only after pass 1.

51268. does not fit into 16 bits

51269. ensures no overflow

51270. [... input buffer]

51271. execution resumes in bytecode executor

51272. Standard JSON omits functions

51273. 7 bits

51274. * Value stack resizing. ** This resizing happens above the current "top": the value stack can be * grown or shrunk, but the "top" is not affected. The value stack cannot * be resized to a size below the current "top". ** The low level reallocation primitive must carefully recompute all value * stack pointers, and must also work if ALL pointers are NULL. The resize * is quite tricky because the valstack realloc may cause a mark-and-sweep, * which may run finalizers. Running finalizers may resize the valstack * recursively (the same value stack we're working on). So, after realloc * returns, we know that the valstack "top" should still be the same (there * should not be live values above the "top"), but its underlying size and * pointer may have changed.

51275. * Objects have internal references. Must finalize through * the "refzero" work list.

51276. different thread

51277. number of values in current MPUTARR set

51278. steps 13-14

51279. Compute result length and validate argument buffers.

51280. DUK_BUILTINS_H_INCLUDED

51281. copy bytecode instructions one at a time

51282. **comment:** E5.1 Section 15.2.4.6, step 3.a, lookup proto once before compare. * Prototype loops should cause an error to be thrown.
label: code-design

51283. [... RegExp val] -> [... res]

51284. load factor max 75%

51285. [value offset noAssert], when ftype != DUK_FLD_VARINT

51286. * Resizing

51287. token closes expression, e.g. ')', ']'

51288. fileName

51289. * Get prototype object for an integer error code.

51290. '\xffNext'

51291. PC/line semantics here are: * - For callstack top we're conceptually between two * opcodes and current PC indicates next line to * execute, so report that (matches Status). * - For other activations we're conceptually still * executing the instruction at PC-1, so report that * (matches error stacktrace behavior). * - See: <https://github.com/svaaraal/duktape/issues/281>

51292. Don't allow negative zero as it will cause trouble with * LDINT+LDINTX. But positive zero is OK.

51293. borrow literal Infinity from builtin string

51294. **comment:** XXX: This now coerces an identifier into a GETVAR to a temp, which * causes an extra LDREG in call setup. It's sufficient to coerce to a * unary ivalue?
label: code-design

51295. prefer direct execution

51296. **comment:** Longjmp state is cleaned up by error handling
label: code-design

51297. **comment:** spaces[] must be static to allow initializer with old compilers like BCC
label: code-design

51298. * Object.prototype.hasOwnProperty() and Object.prototype.propertyIsEnumerable().

51299. Ordinary gap, undefined encodes to 'null' in * standard JSON (and no JX/JC support here now).

51300. fall-through jump to next code of next case (backpatched)

51301. already one-based

51302. **comment:** XXX: could use at least one fewer loop counters
label: code-design

51303. Wrap checked above.

51304. Create function 'data' buffer but don't attach it yet.

51305. * Function built-ins

51306. * No match, E5 Section 15.10.6.2, step 9.a.i - 9.a.ii apply, regardless * of 'global' flag of the RegExp. In particular, if lastIndex is invalid * initially, it is reset to zero.

51307. **comment:** hacky helper for String.prototype.split()
label: code-design

51308. [(builtin objects) name func]

51309. We request a tail call, but in some corner cases * call handling can decide that a tail call is * actually not possible. * See: test-bug-tailcall-preventyield-assert.c.

51310. toString() conditions

51311. Write bytecode executor's curr_pc back to topmost activation (if any).

51312. [] -> [val]

51313. **comment:** XXX: Extensibility check for target uses IsExtensible(). If we * implemented the isExtensible trap and didn't reject proxies as * proxy targets, it should be respected here.
label: code-design

51314. **comment:** Technically return value is not needed because INVLHS will * unconditionally throw a ReferenceError. Coercion is necessary * for proper semantics (consider ToNumber() called for an object). * Use DUK_EXTRAOP_UNP with a dummy register to get ToNumber().
label: code-design

51315. decl type

51316. -> [sep TObject(this) len sep str]

51317. Shared lenient buffer length clamping helper. Indices are treated as * element indices (though output values are byte offsets) which only * really matters for TypedArray views as other buffer object have a zero * shift. Negative indices are counted from end of input slice; crossed * indices are clamped to zero length; and final indices are clamped * against input slice. Used for e.g. ArrayBuffer slice().

51318. XXX: perhaps refactor this to allow caller to specify some parameters, or * at least a 'compact' flag which skips any spare or round-up .. useful for * emergency gc.

51319. [... enum_target res handler trap]

51320. XXX: Decrementing and restoring act->curr_pc works now, but if the * debugger message loop gains the ability to adjust the current PC * (e.g. a forced jump) restoring the PC here will break. Another * approach would be to use a state flag for the "decrement 1 from * topmost activation's PC" and take it into account whenever dealing * with PC values.

51321. Create a fresh object environment for the global scope. This is * needed so that the global scope points to the newly created RAM-based * global object.

51322. x <- (1<<y)

51323. * HASPROP: Ecmascript property existence check ("in" operator). ** Interestingly, the 'in' operator does not do any coercion of * the target object.

51324. Any 'res' will do.

51325. If neutered must return 0; length is zeroed during * neutering.

51326. XXX: assert idx_base

51327. **comment:** XXX: refactor into internal helper, duk_clone_hobject()
label: code-design

51328. * Get starting character offset for match, and initialize 'sp' based on it. ** Note: lastIndex is non-configurable so it must be present (we check the * internal class of the object above, so we know it is). User code can set * its value to an arbitrary (garbage) value though; E5 requires that lastIndex * be coerced to a number before using. The code below works even if the * property is missing: the value will then be coerced to zero. ** Note: lastIndex may be outside Uint32 range even after ToInteger() coercion. * For instance, ToInteger(+Infinity) = +Infinity. We track the match offset * as an integer, but pre-check it to be inside the 32-bit range before the loop. * If not, the check in E5 Section 15.10.6.2, step 9.a applies.

51329. avoid side effect issues

51330. * Setup call: target and 'this' binding. Three cases: * * 1. Identifier base (e.g. "foo()") * 2. Property base (e.g. "foo.bar()") * 3. Register base (e.g. "foo()"); i.e. when a return value is a function

51331. SHIFT EXPRESSION

51332. overflow, fall through

51333. restored if ecma-to-ecma setup fails

51334. Match labels starting from latest label because there can be duplicate empty * labels in the label set.
51335. If debugger is paused, garbage collection is disabled by default.
51336. DUK_ERR_REFERENCE_ERROR: no macros needed
51337. XXX: shared helper for duk_push_hobject_or_undefined()
51338. * Strings have no internal references but do have "weak" * references in the string cache. Also note that strings * are not on the heap_allocated list like other heap * elements.
51339. unconditionally
51340. **comment:** XXX: At the moment Duktape accesses internal keys like _Finalizer using a * normal property set/get which would allow a proxy handler to interfere with * such behavior and to get access to internal key strings. This is not a problem * as such because internal key strings can be created in other ways too (e.g. * through buffers). The best fix is to change Duktape internal lookups to * skip proxy behavior. Until that, internal property accesses bypass the * proxy and are applied to the target (as if the handler did not exist). * This has some side effects, see test-bi-proxy-internal-keys.js.
label: code-design
51341. Get local time offset (in seconds) for a certain (UTC) instant 'd'.
51342. **comment:** Can be called multiple times with no harm. Mark the transport * bad (dbg_read_cb == NULL) and clear state except for the detached * callback and the udata field. The detached callback is delayed * to the message loop so that it can be called between messages; * this avoids corner cases related to immediate debugger reattach * inside the detached callback.

51493. currently running thread
51494. temproots
51495. Tail call check: if last opcode emitted was CALL(I), and * the context allows it, change the CALL(I) to a tail call. * This doesn't guarantee that a tail call will be allowed at * runtime, so the RETURN must still be emitted. (Duktape * 0.10.0 avoided this and simulated a RETURN if a tail call * couldn't be used at runtime; but this didn't work * correctly with a thread yield/resume, see * test-bug-tailcall-thread-yield-resume.js for discussion.) * * In addition to the last opcode being CALL, we also need to * be sure that 'rc_val' is the result register of the CALL(I). * For instance, for the expression 'return 0, (function () { return 1; })', 2' the last opcode emitted is CALL (no * bytecode is emitted for '2') but 'rc_val' indicates * constant '2'. Similarly if '2' is replaced by a register * bound variable, no opcodes are emitted but tail call would * be incorrect. * * This is tricky and easy to get wrong. It would be best to * track enough expression metadata to check that 'rc_val' came * from that last CALL instruction. We don't have that metadata * now, so we check that 'rc_val' is a temporary register result * (not a constant or a register bound variable). There should * be no way currently for 'rc_val' to be a temporary for an * expression following the CALL instruction without emitting * some opcodes following the CALL. This proxy check is used * below. * * See: test-bug-comma-expr-gh131.js. * * The non-standard 'caller' property disables tail calls * because they pose some special cases which haven't been * fixed yet.
51496. * Helper: handle Array object 'length' write which automatically * deletes properties, see E5 Section 15.4.5.1, step 3. This is * quite tricky to get right. * * Used by duk_hobject_putprop().

51698. Duktape debug protocol version used by this build.

51699. **comment:** DUK_COMPILE_xxx bits 0-2 are reserved for an internal 'nargs' argument * (the nargs value passed is direct stack arguments + 1 to account for an * internal extra argument).

label: code-design

51700. fixed or dynamic, garbage collected byte buffer

51701. * Thread management

51702. * Double NaN manipulation macros related to NaN normalization needed when * using the packed duk_tval representation. NaN normalization is necessary * to keep double values compatible with the duk_tval format. * * When packed duk_tval is used, the NaN space is used to store pointers * and other tagged values in addition to NaNs. Actual NaNs are normalized * to a specific quiet NaN. The macros below are used by the implementation * to check and normalize NaN values when they might be created. The macros * are essentially NOPs when the non-packed duk_tval representation is used. * * A FULL check is exact and checks all bits. A NOTFULL check is used by * the packed duk_tval and works correctly for all NaNs except those that * begin with 0x7ff0. Since the 'normalized NaN' values used with packed * duk_tval begin with 0x7ff8, the partial check is reliable when packed * duk_tval is used. The 0x7ff8 prefix means the normalized NaN will be a * quiet NaN regardless of its remaining lower bits. * * The ME variant below is specifically for ARM byte order, which has the * feature that while doubles have a mixed byte order (32107654), unsigned * long long values has a little endian byte order (76543210). When writing * a logical double value through a ULL pointer, the 32-bit words need to be * swapped; hence the #ifdefs below for ULL writes with DUK_USE_DOUBLE_ME. * This is not full ARM support but suffices for some environments.

51703. either not a NaN

51704. convert time value to local time

51705. not directly applicable, byte order differs from a double

51706. end 'extern "C"' wrapper

51707. * Object operations

51708. set writable (effective if DUK_DEFPROP_HAVE_WRITABLE set)

51709. UnsupportedError

51710. **comment:** Internal API call flags, used for various functions in this file. * Certain flags are used by only certain functions, but since the flags * don't overlap, a single flags value can be passed around to multiple * functions. * * The unused top bits of the flags field are also used to pass values * to helpers (duk_get_part_helper() and duk_set_part_helper()). * * (Must be in-sync with genbuiltins.py)

label: code-design

51711. There are currently no native functions to yield/resume, due to the internal * limitations on coroutine handling. These will be added later.

51712. Concrete macros for NaN handling used by the implementation internals. * Chosen so that they match the duk_tval representation: with a packed * duk_tval, ensure NaNs are properly normalized; with a non-packed duk_tval * these are essentially NOPs.

51713. (internal) no source string on stack

51714. * Function (method) calls

51715. plain

51716. ECMAScript string: CESU-8 / extended UTF-8 encoded

51717. internal flag: don't zero allocated buffer

51718. use strict (outer) context for global, eval, or function code

51719. in non-packed representation we don't care about which NaN is used

51720. * Union for accessing double parts, also serves as packed duk_tval

51721. include date part in string conversion result

51722. internal flag: dynamic buffer

51723. ECMAScript null

51724. enumerate non-enumerable properties in addition to enumerable

51725. **comment:** XXX: replace with RangeError?

label: code-design

51726. * Push operations * * Push functions return the absolute (relative to bottom of frame) * position of the pushed value for convenience. * * Note: duk_dup() is technically a push.

51727. string
51728. * ROM pointer compression
51729. * Union to access IEEE double memory representation, indexes for double * memory representation, and some macros for double manipulation. ** Also used by packed duk_tval. Use a union for bit manipulation to minimize aliasing issues in practice. The C99 standard does not guarantee that this should work, but it's a very widely supported * practice for low level manipulation. ** IEEE double format summary: ** seeeeeeee eeeeffff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H *'s sign bit * eee... exponent field * fff... fraction ** See http://en.wikipedia.org/wiki/Double_precision_floating-point_format. ** NaNs are represented as exponent 0x7ff and mantissa != 0. The NaN is a * signaling NaN when the highest bit of the mantissa is zero, and a quiet * NaN when the highest bit is set. ** At least three memory layouts are relevant here: ** A B C D E F G H Big endian (e.g. 68k) DUK_USE_DOUBLE_BE * H G F E D C B A Little endian (e.g. x86) DUK_USE_DOUBLE_LE * D C B A H G F E Mixed/cross endian (e.g. ARM) DUK_USE_DOUBLE_ME ** ARM is a special case: ARM double values are in mixed/cross endian * format while ARM duk_uint64_t values are in standard little endian * format (H G F E D C B A). When a double is read as a duk_uint64_t * from memory, the register will contain the (logical) value * E F G H A B C D. This requires some special handling below. ** Indexes of various types (8-bit, 16-bit, 32-bit) in memory relative to * the logical (big endian) order: ** byte order duk_uint8_t duk_uint16_t duk_uint32_t * BE 01234567 0123 01 * LE 76543210 3210 10 * ME (ARM) 32107654 1032 01 ** Some processors may alter NaN values in a floating point load+store. ** For instance, on X86 a FLD + FSTP may convert a signaling NaN to a * quiet one. This is catastrophic when NaN space is used in packed * duk_tval values. See: misc/clang_aliasing.c.

51730. * Helper macros for reading/writing memory representation parts, used * by duk_numconv.c and duk_tval.h.
51731. string conversion: use 'T' instead of '' as a separator
51732. Ecmascript number: double
51733. TypeError
51734. Support array for ROM pointer compression. Only declared when ROM * pointer compression is active.
51735. **comment:** Although extra/top could be an unsigned type here, using a signed type * makes the API more robust to calling code calculation errors or corner * cases (where caller might occasionally come up with negative values). * Negative values are treated as zero, which is better than casting them * to a large unsigned number. (This principle is used elsewhere in the * API too.)
label: code-design
51736. * Misc conversion
51737. Ecmascript object: includes objects, arrays, functions, threads
51738. URIError
51739. all doubles are considered normalized
51740. AUTHORS.rst
51741. day within month: 0 to 30
51742. setter: call is a time setter (affects hour, min, sec, ms); otherwise date setter (affects year, month, day-in-month)
51743. (internal) no filename on stack
51744. compile eval code (instead of global code)
51745. One problem with this macro is that expressions like the following fail * to compile: "(void) duk_error(...)". But because duk_error() is noreturn, * they make little sense anyway.
51746. set setter (given on value stack)
51747. prefer number, unless input is a Date, in which * case prefer string (E5 Section 8.12.8)
51748. Part indices for internal breakdowns. Part order from DUK_DATE_IDX_YEAR * to DUK_DATE_IDX_MILLISECOND matches argument ordering of Ecmascript API * calls (like Date constructor call). Some functions in duk_bi_date.c * depend on the specific ordering, so change with care. 16 bits are not * enough for all parts (year, specifically). * * (Must be in-sync with genbuiltins.py.)
51749. E == 0x7ff, F == 8 => normalized NaN
51750. Enumeration flags for duk_enum()
51751. year
51752. * Other state related functions
51753. user-id of owner
51754. time of last data modification
51755. file size, in bytes
51756. device type, for special file inode
51757. ** Factory of directory iterators
51758. ** Get symbolic link information using lstat.
51759. blocks allocated for file
51760. **
51761. push member value and return
51762. next entry
51763. lkmode valid values are: LK_LOCK Locks the specified bytes. If the bytes cannot be locked, the program immediately tries again after 1 second. If, after 10 attempts, the bytes cannot be locked, the constant returns an error. LK_NBLCK Locks the specified bytes. If the bytes cannot be locked, the constant returns an error. LK_NBRLCK Same as _LK_NBLCK. LK_RLCK Same as _LK_LOCK. LK_UNLCK Unlocks the specified bytes, which must have been previously locked. Regions should be locked only briefly and should be unlocked before closing a file or exiting the program. http://msdn.microsoft.com/library/default.asp?url=/library/en-us/vclib/html/_crt_locking.asp

53554. hash part is empty?
53555. **comment:** ** Implementation of tables (aka arrays, objects, or hash tables). ** Tables keep its elements in two parts: an array part and a hash part. ** Non-negative integer keys are all candidates to be kept in the array ** part. The actual size of the array is the largest `n` such that at ** least half the slots between 0 and n are in use. ** Hash uses a mix of chained scatter table with Brent's variation. ** A main invariant of these tables is that, if an element is not ** in its main position (i.e. the 'original' position that its hash gives ** to it), then the colliding element is in its own main position. ** Hence even when the load factor reaches 100%, performance remains good.

53817. @@ LUA_DL_* define which dynamic-library system Lua should use. ** CHANGE here if Lua has problems choosing the appropriate ** dynamic-library system for your platform (either Windows' DLL, Mac's ** dyld, or Unix's dlopen). If your system is some kind of Unix, there ** is a good chance that it has dlopen, so LUA_DL_DLOPEN will work for ** it. To use dlopen you also need to adapt the src/Makefile (probably ** adding -ldl to the linker options), so Lua does not select it ** automatically. (When you change the makefile to add -lldl, you must ** also add -DLUA_USE_DLOPEN.) ** If you do not want any kind of dynamic library, undefine all these ** options. ** By default, _WIN32 gets LUA_DL_DLL and MAC OS X gets LUA_DL_DYLD.

57289. ** returns current 'pc' and marks it as a jump target (to avoid wrong ** optimizations with consecutive instructions not in the same basic block).
57290. ** Emit a "load constant" instruction, using either 'OP_LOADK' ** (if constant index 'k' fits in 18 bits) or an 'OP_LOADKX' ** instruction with "extra argument".
57291. ** Fix an expression to return the number of results 'nresults'. ** Either 'e' is a multi-ret expression (function call or vararg) ** or 'nresults' is LUA_MULTRET (as any expression can satisfy that).
57292. ** Ensures final expression result is in a valid R/K index ** (that is, it is either in a register or in 'k' with an index ** in the range of R/K indices). ** Returns R/K index.
57293. point to itself represents end of list
57294. use boolean itself as key
57295. result is already in a register
57296. already returns 1 value
57297. ** Create a jump instruction and return its position, so its destination ** can be fixed later (with 'fixjump'). If there are jumps to ** this position (kept in 'jpc'), link them all together so that ** 'patchlistaux' will fix all them directly to the final destination.
57298. ** Add an integer to list of constants and return its index. ** Integers use userdata as keys to avoid collision with floats with ** same value; conversion to 'void*' is used only for hashing, so there ** are no "precision" problems.
57299. position of an eventual LOAD false
57300. no original list?
57301. no jumps?
57302. can relocate its simple result
57303. mark "here" as a jump target
57304. ** Ensures final expression result (including results from its jump ** lists) is in register 'reg'. ** If expression has jumps, need to patch these jumps either to ** its final position or to "load" instructions (for those tests ** that do not produce values).
57305. ** Emit a SETLIST instruction. ** 'base' is register that keeps table; ** 'nelems' is #table plus those to be stored now; ** 'tostore' is number of values (in registers 'base + 1',...) to add to ** table (or LUA_MULTRET to add up to stack top).
57306. ** Traverse a list of tests ensuring no one produces a value
57307. ** Add elements in 'list' to list of pending jumps to "here" ** (current position)
57308. ** Emit code to go through if 'e' is true, jump otherwise.
57309. jump to default target
57310. base register for op_self
57311. already jump if true
57312. ** Free register used by expression 'e' (if any)
57313. turn offset into absolute position
57314. ** Return false if folding can raise an error. ** Bitwise operations need operands convertible to integers; division ** operations cannot have 0 as divisor.
57315. else keep numeral, which may be folded with 2nd operand
57316. always false; do nothing
57317. does operation
57318. '(a > b)' ==> '(b < a)'; '(a >= b)' ==> '(b <= a)'
57319. get previous range
57320. index scanner table
57321. ** Gets the destination address of a jump instruction. Used to traverse ** a list of jumps.
57322. use string itself as key
57323. jump when it is false
57324. 'target' is current position?
57325. constant not found; create a new entry
57326. those instructions may be jump targets
57327. Maximum number of registers in a Lua function (must fit in 8 bits)
57328. there is one value available (somewhere)
57329. insert new jump in false list
57330. ** Add a string to list of constants and return its index.
57331. ** check whether list has any jump that do not produce a value ** or produce an inverted value
57332. ** Add a boolean to list of constants and return its index.
57333. reg. is not a local?
57334. pc of new jump
57335. true list jumps to here (to go through)
57336. invert operands
57337. fake 2nd operand
57338. get a register
57339. not a constant in the right range: put it in a register
57340. save list of jumps to here
57341. add list to pending jumps
57342. register where 'e' was placed
57343. function and 'self' produced by op_self
57344. can connect both?
57345. move constants to 'k'
57346. FALLTHROUGH
57347. ** Add nil to list of constants and return its index.
57348. self expression has a fixed register
57349. free registers with list values
57350. ** Code a 'return' instruction
57351. ** Code a "conditional jump", that is, a test or comparison opcode ** followed by a jump. Return jump position.
57352. ** Ensure all pending jumps to current position are fixed (jumping ** to current position with no values) and reset list of pending ** jumps
57353. operand must be on the 'stack'
57354. ** Finalize code for binary operation, after reading 2nd operand. ** For '(a .. b .. c)' (which is '(a .. (b .. c))', because ** concatenation is right associative), merge second CONCAT into first ** one.
57355. ** Ensures expression value is in any register.
57356. ** Returns the position of the instruction "controlling" a given ** jump (that is, its condition), or the jump itself if it is ** unconditional.
57357. argument is +1 to reserve 0 as non-op
57358. ** Negate condition 'e' (where 'e' is a comparison).
57359. else go through
57360. ** Format and emit an 'iABC' instruction. (Assertions check consistency ** of parameters versus opcode.)
57361. is there an index there?
57362. conversion errors

57363. ** Ensures expression value is in register 'reg' (and therefore ** 'e' will become a non-relocatable expression).
57364. ** Ensures final expression result (including results from its jump ** lists) is in some (any) register and return that register.
57365. ** Ensures final expression result (including results from its jump ** lists) is in next available register.
57366. 'pc' will change
57367. use number itself as key
57368. '==', '<', '<=' use their own opcodes
57369. expression already has a register?
57370. ** Create a OP_LOADNIL instruction, but try to optimize: if the previous ** instruction is also OP_LOADNIL and ranges are compatible, adjust ** range of previous instruction instead of emitting a new one. (For ** instance, 'local a; local b' will generate a single opcode.)
57371. list closed by 'luK_infix'
57372. go ahead only if 'v' is true
57373. move value to some (pending) register
57374. position of an eventual LOAD true
57375. otherwise, use next available register
57376. put value there
57377. put final result in it
57378. ** Fix an expression to return one result. ** If expression is not a multi-ret expression (function call or ** vararg), it already returns one result, so nothing needs to be done. ** Function calls become VNONRELOC expressions (as its result comes ** fixed in the base register of the call), while vararg expressions ** become VRELOCABLE (as OP_VARARG puts its results where it wants). ** (Calls are created returning one result, so that does not need ** to be fixed.)
57379. is 't' in a register?
57380. last register to set nil
57381. save jump position
57382. ** Emit code for unary expressions that "produce values" ** (everything but 'not'). ** Expression to produce final result will be encoded in 'e'.
57383. no jumps to current position?
57384. save corresponding line information
57385. '(a ~= b)' ==> 'not (a == b)'
57386. reuse index
57387. jump if true
57388. ** Apply prefix operation 'op' to expression 'e'.
57389. expression is an open function call?
57390. ** \$Id: lcode.c,v 2.109 2016/05/13 19:09:21 roberto Exp \$ ** Code generator for Lua ** See Copyright Notice in lua.h
57391. else no optimization
57392. ** Try to "constant-fold" an operation; return 1 iff successful. ** (In this case, 'e1' has the final result.)
57393. expression itself is a test?
57394. keep them on hold
57395. ** Free registers used by expressions 'e1' and 'e2' (if any) in proper ** order.
57396. ** Create expression 't[k]'. 't' must have its final result already in a ** register or upvalue.
57397. ** Ensures final expression result is either in a register or in an ** upvalue.
57398. register or upvalue index
57399. ** Emit code for comparisons. ** 'e1' was already put in R/K form by 'luaK_infix'.
57400. ** Reserve 'n' registers in register stack
57401. go ahead only if 'v' is false
57402. no fixed register yet?
57403. not a numeral
57404. true == not nil == not false
57405. ** Format and emit an 'iABx' instruction.
57406. ** Emit instruction to jump if 'e' is 'cond' (that is, if 'cond' ** is true, code will jump if 'e' is true.) Return jump position. ** Optimize when 'e' is 'not' something, inverting the condition ** and removing the 'not'.
57407. ** Code 'not e', doing constant folding.
57408. constant fits in 'argC'?
57409. find last element
57410. compute 'ex' into proper place
57411. invalid var kind to store
57412. opcodes operate only on registers
57413. ** Patch destination register for a TESTSET instruction. ** If instruction in position 'node' is not a TESTSET, return 0 ("fails"). ** Otherwise, if 'reg' is not 'NO_REG', set it as the destination ** register. Otherwise, change instruction to a simple 'TEST' (produces ** no register value)
57414. ** Change line information associated with current position.
57415. end of list
57416. ** Emit code to go through if 'e' is false, jump otherwise.
57417. last element links to 'l2'
57418. ** Path all jumps in 'list' to close upvalues up to given 'level' ** (The assertion checks that jumps either were closing nothing ** or were closing higher levels, from inner blocks.)
57419. ** Emit instruction 'i', checking for array sizes and saving also its ** line information. Return 'i' position.
57420. cannot happen
57421. values are useless when negated
57422. generate opcode
57423. already in a register
57424. condition?
57425. interchange true and false lists
57426. ** Free register 'reg', if it is neither a constant index nor ** a local variable.)
57427. ** Add a float to list of constants and return its index.
57428. becomes a non-relocatable value
57429. nothing to do...
57430. ** Check register-stack level, keeping track of its maximum size ** in field 'maxstacksize'
57431. previous is LOADNIL
57432. cannot patch other instructions
57433. ** Ensure that expression 'e' is not a variable.
57434. false == not "x" == not 0.5 == not 1 == not true
57435. cannot use nil as key; instead use table itself to represent nil
57436. numerical value does not need GC barrier; table has no metatable, so it does not need to invalidate cache
57437. **comment:** ** Emit an "extra argument" instruction (format 'iAx')

59824. is 'key' an appropriate array index?
59825. **comment:** ** Implementation of tables (aka arrays, objects, or hash tables). ** Tables keep its elements in two parts: an array part and a hash part. ** Non-negative integer keys are all candidates to be kept in the array ** part. The actual size of the array is the largest 'n' such that ** more than half the slots between 1 and n are in use. ** Hash uses a mix of chained scatter table with Brent's variation. ** A main invariant of these tables is that, if an element is not ** in its main position (i.e. the 'original' position that its hash gives ** to it), then the colliding element is in its own main position. ** Hence even when the load factor reaches 100%, performance remains good.
label: code-design
59826. loop while keys can fill more than half of total size
59827. could not find a free place
59828. find previous
59829. ** Try to find a boundary in table 't'. A 'boundary' is an integer index ** such that t[i] is non-nil and t[i+1] is nil (and 0 if t[1] is nil).

***** This file contains the implementation of a write-ahead log (WAL) used in ** "journal_mode=WAL" mode. ** ** WRITE-AHEAD LOG (WAL) FILE FORMAT ** ** A WAL file consists of a header followed by zero or more "frames". ** Each frame records the revised content of a single page from the ** database file. All changes to the database are recorded by writing ** frames into the WAL. Transactions commit when a frame is written that ** contains a commit marker. A single WAL can and usually does record ** multiple transactions. Periodically, the content of the WAL is ** transferred back into the database file in an operation called a ** "checkpoint". ** ** A single WAL file can be used multiple times. In other words, the ** WAL can fill up with frames and then be checkpointed and then new ** frames can overwrite the old ones. A WAL always grows from beginning ** toward the end. Checksums and counters attached to each frame are ** used to determine which frames within the WAL are valid and which ** are leftovers from prior checkpoints. ** ** The WAL header is 32 bytes in size and consists of the following eight ** big-endian 32-bit unsigned integer values: ** ** 0: Magic number. 0x377f0682 or 0x377f0683 ** 4: File format version. Currently 3007000 ** 8: Database page size. Example: 1024 ** 12: Checkpoint sequence number ** 16: Salt-1, random integer incremented with each checkpoint ** 20: Salt-2, a different random integer changing with each ckpt ** 24: Checksum-1 (first part of checksum for first 24 bytes of header). ** 28: Checksum-2 (second part of checksum for first 24 bytes of header). ** ** Immediately following the wal-header are zero or more frames. Each ** frame consists of a 24-byte frame-header followed by a <page-size> bytes ** of page data. The frame-header is six big-endian 32-bit unsigned ** integer values, as follows: ** ** 0: Page number. ** 4: For commit records, the size of the database image in pages ** after the commit. For all other records, zero. ** 8: Salt-1 (copied from the header) ** 12: Salt-2 (copied from the header) ** 16: Checksum-1. ** 20: Checksum-2. ** ** A frame is considered valid if and only if the following conditions are ** true: ** ** (1) The salt-1 and salt-2 values in the frame-header match ** salt values in the wal-header ** ** (2) The checksum values in the final 8 bytes of the frame-header ** exactly match the checksum computed consecutively on the ** WAL header and the first 8 bytes and the content of all frames ** up to and including the current frame. ** ** The checksum is computed using 32-bit big-endian integers if the ** magic number in the first 4 bytes of the WAL is 0x377f0683 and it ** is computed using little-endian if the magic number is 0x377f0682. ** The checksum values are always stored in the frame header in a ** big-endian format regardless of which byte order is used to compute ** the checksum. The checksum is computed by interpreting the input as ** an even number of unsigned 32-bit integers: x[0] through x[N]. The ** algorithm used for the checksum is as follows: ** ** for i from 0 to n-1 step 2: ** s0 += x[i] + s1; ** s1 += x[i+1] + s0; ** endfor ** ** Note that s0 and s1 are both weighted checksums using fibonacci weights ** in reverse order (the largest fibonacci weight occurs on the first element ** of the sequence being summed.) The s1 value spans all 32-bit ** terms of the sequence whereas s0 omits the final term. ** ** On a checkpoint, the WAL is first VFS.xSync-ed, then valid content of the ** WAL is transferred into the database, then the database is VFS.xSync-ed. ** The VFS.xSync operations serve as write barriers - all writes launched ** before the xSync must complete before any write that launches after the ** xSync begins. ** ** After each checkpoint, the salt-1 value is incremented and the salt-2 ** value is randomized. This prevents old and new frames in the WAL from ** being considered valid at the same time and being checkpointing together ** following a crash. ** ** READER ALGORITHM ** ** To read a page from the database (call it page number P), a reader ** first checks the WAL to see if it contains page P. If so, then the ** last valid instance of page P that is followed by a commit frame ** or is a commit frame itself becomes the value read. If the WAL ** contains no copies of page P that are valid and which are a commit ** frame or are followed by a commit frame, then page P is read from ** the database file. ** ** To start a read transaction, the reader records the index of the last ** valid frame in the WAL. The reader uses this recorded "mxFrame" value ** for all subsequent read operations. New transactions can be appended ** to the WAL, but as long as the reader uses its original mxFrame value ** and ignores the newly appended content, it will see a consistent snapshot ** of the database from a single point in time. This technique allows ** multiple concurrent readers to view different versions of the database ** content simultaneously. ** ** The reader algorithm in the previous paragraphs works correctly, but ** because frames for page P can appear anywhere within the WAL, the ** reader has to scan the entire WAL looking for page P frames. If the ** WAL is large (multiple megabytes is typical) that scan can be slow, ** and read performance suffers. To overcome this problem, a separate ** data structure called the wal-index is maintained to expedite the ** search for frames of a particular page. ** ** WAL-INDEX FORMAT ** ** Conceptually, the wal-index is shared memory, though VFS implementations ** might choose to implement the wal-index using a mmapped file. Because ** the wal-index is shared memory, SQLite does not support journal_mode=WAL ** on a network filesystem. All users of the database must be able to ** share memory. ** ** The wal-index is transient. After a crash, the wal-index can (and should ** be) reconstructed from the original WAL file. In fact, the VFS is required ** to either truncate or zero the header of the wal-index when the last ** connection to it closes. Because the wal-index is transient, it can ** use an architecture-specific format; it does not have to be cross-platform. ** Hence, unlike the database and WAL file formats which store all values ** as big endian, the wal-index can store multi-byte values in the native ** byte order of the host computer. ** ** The purpose of the wal-index is to answer this question quickly: Given ** a page number P and a maximum frame index M, return the index of the ** last frame in the wal before frame M for page P in the WAL, or return ** NULL if there are no frames for page P in the WAL prior to M. ** ** The wal-index consists of a header region, followed by an

one or ** more index blocks. *** The wal-index header contains the total number of frames within the WAL ** in the mxFrame field. *** Each index block except for the first contains information on ** HASHTABLE_NPAGE frames. The first index block contains information on ** HASHTABLE_NPAGE_ONE frames. The values of HASHTABLE_NPAGE_ONE and ** HASHTABLE_NPAGE are selected so that together the wal-index header and ** first index block are the same size as all other index blocks in the ** wal-index. *** Each index block contains two sections, a page-mapping that contains the ** database page number associated with each wal frame, and a hash-table ** that allows readers to query an index block for a specific page number. ** The page-mapping is an array of HASHTABLE_NPAGE (or HASHTABLE_NPAGE_ONE ** for the first index block) 32-bit page numbers. The first entry in the **first index-block contains the database page number corresponding to the ** first frame in the WAL file. The first entry in the second index block ** in the WAL file corresponds to the (HASHTABLE_NPAGE_ONE+1)th frame in ** the log, and so on. *** The last index block in a wal-index usually contains less than the full ** complement of HASHTABLE_NPAGE (or HASHTABLE_NPAGE_ONE) page-numbers, ** depending on the contents of the WAL file. This does not change the ** allocated size of the page-mapping array - the page-mapping array merely ** contains unused entries. *** Even without using the hash table, the last frame for page P ** can be found by scanning the page-mapping sections of each index block ** starting with the last index block and moving toward the first, and ** within each index block, starting at the end and moving toward the ** beginning. The first entry that equals P corresponds to the frame ** holding the content for that page. ** ** The hash table consists of HASHTABLE_NSLOT 16-bit unsigned integers. ** HASHTABLE_NSLOT = 2*HASHTABLE_NPAGE, and there is one entry in the ** hash table for each page number in the mapping section, so the hash ** table is never more than half full. The expected number of collisions ** prior to finding a match is 1. Each entry of the hash table is an ** 1-based index of an entry in the mapping section of the same ** index block. Let K be the 1-based index of the largest entry in ** the mapping section. (For index blocks other than the last, K will ** always be exactly HASHTABLE_NPAGE (4096) and for the last index block ** K will be (mxFrame%HASHTABLE_NPAGE).) Unused slots of the hash table ** contain a value of 0. ** ** To look for page P in the hash table, first compute a hash iKey on ** P as follows: *** iKey = (P * 383) % HASHTABLE_NSLOT ** ** Then start scanning entries of the hash table, starting with iKey ** (wrapping around to the beginning when the end of the hash table is ** reached) until an unused hash slot is found. Let the first unused slot ** be at index iUnused. (iUnused might be less than iKey if there was ** wrap-around.) Because the hash table is never more than half full, ** the search is guaranteed to eventually hit an unused entry. Let ** iMax be the value between iKey and iUnused, closest to iUnused, ** where aHash[iMax]==P. If there is no iMax entry (if there exists ** no hash slot such that aHash[i]==p) then page P is not in the ** current index block. Otherwise the iMax-th mapping entry of the ** current index block corresponds to the last entry that references ** page P. ** ** A hash search begins with the last index block and moves toward the ** first index block, looking for entries corresponding to page P. On ** average, only two or three slots in each index block need to be ** examined in order to either find the last entry for page P, or to ** establish that no such entry exists in the block. Each index block ** holds over 4000 entries. So two or three index blocks are sufficient ** to cover a typical 10 megabyte WAL file, assuming 1K pages. 8 or 10 ** comparisons (on average) suffice to either locate a frame in the ** WAL or to establish that the frame does not exist in the WAL. This ** is much faster than scanning the entire 10MB WAL. ** ** Note that entries are added in order of increasing K. Hence, one ** reader might be using some value K0 and a second reader that started ** at a later time (after additional transactions were added to the WAL ** and to the wal-index) might be using a different value K1, where K1>K0. ** Both readers can use the same hash table and mapping section to get ** the correct result. There may be entries in the hash table with ** K>K0 but to the first reader, those entries will appear to be unused ** slots in the hash table and so the first reader will get an answer as ** if no values greater than K0 had ever been inserted into the hash table ** in the first place - which is what reader one wants. Meanwhile, the ** second reader using K1 will see additional values that were inserted ** later, which is exactly what reader two wants. ** ** When a rollback occurs, the value of K is decreased. Hash table entries ** that correspond to frames greater than the new K value are removed ** from the hash table at this point.

60944. Return the unixInodeInfo object here

60945. ** The maximum depth of an expression tree. This is limited to ** some extent by SQLITE_MAX_SQL_LENGTH. But sometime you might ** want to place more severe limits on the complexity of an ** expression. *** A value of 0 used to mean that the limit was not enforced. ** But that is no longer true. The limit is now strictly enforced ** at all times.

60946. **comment:** Read the first three 32-bit fields of the journal header: The nRec ** field, the checksum-initializer and the database size at the start ** of the transaction. Return an error code if anything goes wrong.

label: code-design

60947. **comment:** ** Change the size of an existing memory allocation. *** For this debugging implementation, we *always* make a copy of the ** allocation into a new place in memory. In this way, if the ** higher level code is using pointer to the old allocation, it is ** much more likely to break and we are much more likng to find ** the error.

label: code-design

60948. READWRITE

60949. Guaranteed by the code generator

60950. ** The smallest possible node-size is (512-64)==448 bytes. And the largest ** supported cell size is 48 bytes (8 byte rowid + ten 4 byte coordinates). ** Therefore all non-root nodes must contain at least 3 entries. Since ** 2^40 is greater than 2^64, an r-tree structure always has a depth of ** 40 or less.

60951. x.pSelect is valid (otherwise x.pList is)

60952. ** Allocate an Fts3MultiSegReader for each token in the expression headed ** by pExpr. *** An Fts3SegReader object is a cursor that can seek or scan a range of ** entries within a single segment b-tree. An Fts3MultiSegReader uses multiple ** Fts3SegReader objects internally to provide an interface to seek or scan ** within the union of all segments of a b-tree. Hence the name. *** If the allocated Fts3MultiSegReader just seeks to a single entry in a ** segment b-tree (if the term is not a prefix or it is a prefix for which ** there exists prefix b-tree of the right length) then it may be traversed ** and merged incrementally. Otherwise, it has to be merged into an in-memory ** doclist and then traversed.

60953. ** 2001 September 15 *** The author disclaims copyright to this source code. In place of ** a legal notice, here is a blessing: *** May you do good and not evil. ** May you find forgiveness for yourself and forgive others. ** May you share freely, never taking more than you give. **
***** An tokenizer for SQL *** This file contains C code that splits an SQL input string up into ** individual tokens and sends those tokens one-by-one over to the ** parser for analysis.

60954. Name of left-most parent key column

60955. ** This routine prepares a memory cell for modification by breaking ** its link to a shallow copy and by marking any current shallow ** copies of this cell as invalid. *** This is used for testing and debugging only - to make sure shallow ** copies are not misused.

60956. Opcode: Param P1 P2 * * * * * This opcode is only ever present in sub-programs called via the ** OP_Program instruction. Copy a value currently stored in a memory ** cell of the calling (parent) frame to cell P2 in the current frames ** address space. This is used by trigger programs to access the new.* ** and old.* values. *** The address of the cell in the parent frame is determined by adding ** the value of the P1 argument to the value of the P1 argument to the ** calling OP_Program instruction.

60957. ** CAPI3REF: Close A BLOB Handle ** DESTRUCTOR: sqlite3_blob *** ^This function closes an open [BLOB handle]. ^The BLOB handle is closed ** unconditionally. Even if this routine returns an error code, the ** handle is still closed.^ ** ^If the blob handle being closed was opened for read-write access, and if ** the database is in auto-commit mode and there are no other open read-write ** blob handles or active write statements, the current transaction is ** committed. ^If an error occurs while committing the transaction, an error ** code is returned and the transaction rolled back. *** Calling this function with an argument that is not a NULL pointer or an ** open blob handle results in undefined behaviour. ^Calling this routine ** with a null pointer (such as would be returned by a failed call to ** [sqlite3_blob_open()]) is a harmless no-op. ^Otherwise, if this function ** is passed a valid open blob handle, the values returned by the ** sqlite3_errcode() and sqlite3errmsg() functions are set before returning.

60958. ** Write value iVal encoded as a varint to the PMA. Return ** SQLITE_OK if successful, or an SQLite error code if an error occurs.

60959. ** Declare that a function has been overloaded by a virtual table. *** If the function already exists as a regular global function, then ** this routine is a no-op. If the function does not exist, then create ** a new one that always throws a run-time error. *** When virtual tables intend to provide an overloaded function, they ** should call this routine to make sure the global function exists. ** A global function must exist in order for name resolution to work ** properly.

60960. Reader marks

60961. **comment:** Failure to set the bits in the InJournal bit-vectors is benign. ** It merely means that we might do some extra work to journal a ** page that does not need to be journaled. Nevertheless, be sure ** to test the case where a malloc error occurs while trying to set ** a bit in a bit vector.

label: code-design

60962. Size of read buffer in bytes

60963. ** This function is used to set the schema of a virtual table. It is only ** valid to call this function from within the xCreate() or xConnect() of a ** virtual table module.

60964. Table that change applies to

60965. ** Create the %_stat table if it does not already exist.

60966. Initialize the count of rows to be inserted

60967. ** Register a new tokenizer. This is the implementation of the ** fts5_api.xCreateTokenizer() method.

60968. Move level -1 to level iAbsLevel

60969. Allocate a page. The page that currently resides at pgnoRoot will ** be moved to the allocated page (unless the allocated page happens ** to reside at pgnoRoot).

60970. Write current value here

60971. ** A bitmap is an instance of the following structure. *** This bitmap records the existence of zero or more bits ** with values between 1 and iSize, inclusive. ** ** There are three possible representations of the bitmap. ** If iSize<=BITVEC_NBIT, then Bitvec.u.aBitmap[] is a straight ** bitmap. The least significant bit is bit 1. *** If iSize>BITVEC_NBIT and iDivisor==0 then Bitvec.u.aHash[] is ** a hash table that will hold up to BITVEC_MXHASH distinct values. *** Otherwise, the value i is redirected into one of BITVEC_NPTR ** sub-bitmaps pointed to by Bitvec.u.apSub[]. Each subbitmap ** handles up to iDivisor separate values of i. apSub[0] holds ** values between 1 and iDivisor. apSub[1] holds values between ** iDivisor+1 and 2*iDivisor. apSub[N] holds values between ** N*iDivisor+1 and (N+1)*iDivisor. Each subbitmap is normalized ** to hold deal with values between 1 and iDivisor.

60972. .u =

60973. ** Convert an SQL-style quoted string into a normal string by removing ** the quote characters. The conversion is done in-place. If the ** input does not begin with a quote character, then this routine ** is a no-op. *** The input string must be zero-terminated. A new zero-terminator ** is added to the dequoted string. ** ** The return value is -1 if no dequoting occurs or the length of the ** dequoted string, exclusive of the zero terminator, if dequoting does ** occur. *** 2002-Feb-14: This routine is extended to remove MS-Access style ** brackets from around identifiers. For example: "[a-b-c]" becomes ** "a-b-c".

60974. ** Return the current time as a Julian Day number in *pTimeOut.

60975. Doclist-index flag (1 bit)

60976. ** This routine processes the join information for a SELECT statement. ** ON and USING clauses are converted into extra terms of the WHERE clause. **

NATURAL joins also create extra WHERE clause terms. *** The terms of a FROM clause are contained in the Select.pSrc structure. ** The left most table is the first entry in Select.pSrc. The right-most ** table is the last entry. The join operator is held in the entry to ** the left. Thus entry 0 contains the join operator for the join between ** entries 0 and 1. Any ON or USING clauses associated with the join are ** also attached to the left entry. *** This routine returns the number of errors encountered.

60977. This routine should not be called if a prior error has occurred. ** But if (due to a coding error elsewhere in the system) it does get ** called, just return the same error code without doing anything.

60978. ONEPASS_OFF, or _SINGLE, or _MULTI

60979. ** Release any memory resources held by the Mem. Both the memory that is ** free by Mem.xDel and the Mem.zMalloc allocation are freed. *** Use this routine prior to clean up prior to abandoning a Mem, or to ** reset a Mem back to its minimum memory utilization. *** Use sqlite3VdbeMemSetNull() to release just the Mem.xDel space ** prior to inserting new content into the Mem.

60980. List for thread to write to a PMA

60981. ** Check to see if virtual table module pMod can be have an eponymous ** virtual table instance. If it can, create one if one does not already ** exist. Return non-zero if the eponymous virtual table instance exists ** when this routine returns, and return zero if it does not exist. *** An eponymous virtual table instance is one that is named after its ** module, and more importantly, does not require a CREATE VIRTUAL TABLE ** statement in order to come into existance.

Eponymous virtual table ** instances always exist. They cannot be DROP-ed. *** Any virtual table module for which xConnect and xCreate are the same ** method can have an eponymous virtual table instance.

60982. Allocate and populate the array of LcsIterator objects. The array ** contains one element for each matchable phrase in the query. *

60983. IN/OUT: Pointer to string buffer

60984. min/max aggregates seen. See note above

60985. Character set tests (like isspace(), isalpha() etc.)

60986. **comment:** ** The query generator uses an array of instances of this structure to ** help it analyze the subexpressions of the WHERE clause. Each WHERE ** clause subexpression is separated from the others by AND operators, ** usually, or sometimes subexpressions separated by OR. *** All WhereTerms are collected into a single WhereClause structure. ** The following identity holds: *** WhereTerm.pWC->a[WhereTerm.idx] == WhereTerm *** When a term is of the form: ** X <op> <expr> ** where X is a column name and <op> is one of certain operators, ** then WhereTerm.leftCursor and WhereTerm.u.leftColumn record the ** cursor number and column number for X. WhereTerm.eOperator records ** the <op> using a bitmask encoding defined by WO_xxx below. The ** use of a bitmask encoding for the operator allows us to search ** quickly for terms that match any of several different operators. *** A WhereTerm might also be two or more subterms connected by OR: *** (t1.X <op> <expr>) OR (t1.Y <op> <expr>) OR *** In this second case, wtFlag has the TERM_ORINFO bit set and eOperator==WO_OR ** and the WhereTerm.u.pOrInfo field points to auxiliary information that ** is collected about the OR clause. *** If a term in the WHERE clause does not match either of the two previous ** categories, then eOperator==0. The WhereTerm.pExpr field is still set ** to the original subexpression content and wtFlags is set up appropriately ** but no other fields in the WhereTerm object are meaningful. *** When eOperator!=0, prereqRight and prereqAll record sets of cursor numbers, ** but they do so indirectly. A single WhereMaskSet structure translates ** cursor number into bits and the translated bit is stored in the prereq ** fields. The translation is used in order to maximize the number of ** bits that will fit in a Bitmask. The VDBE cursor numbers might be ** spread out over the non-negative integers. For example, the cursor ** numbers might be 3, 8, 9, 10, 20, 23, 41, and 45. The WhereMaskSet ** translates these sparse cursor numbers into consecutive integers ** beginning with 0 in order to make the best possible use of the available ** bits in the Bitmask. So, in the example above, the cursor numbers ** would be mapped into integers 0 through 7. *** The number of terms in a join is limited by the number of bits ** in prereqRight and prereqAll. The default is 64 bits, hence SQLite ** is only able to process joins with 64 or fewer tables.

label: code-design

60987. **comment:** ** This function is called when the PmaReader corresponding to pIncr has ** finished reading the contents of aFile[0]. Its purpose is to "refill" ** aFile[0] such that the PmaReader should start rereading it from the ** beginning. *** For single-threaded objects, this is accomplished by literally reading ** keys from pIncr->pMerger and repopulating aFile[0]. ** For multi-threaded objects, all that is required is to wait until the ** background thread is finished (if it is not already) and then swap ** aFile[0] and aFile[1] in place. If the contents of pMerger have not ** been exhausted, this function also launches a new background thread ** to populate the new aFile[1]. *** SQLITE_OK is returned on success, or an SQLite error code otherwise.

61087. ** A read or write transaction may or may not be active on database handle ** db. If a transaction is active, commit it. If there is a ** write-transaction spanning more than one database file, this routine ** takes care of the master journal trickery.

61088. ** Bits for the mask used as the idxNum value by xBestIndex/xFilter.

61089. Set the VdbeCursor.isTable variable. Previous versions of ** SQLite used to check if the root-page flags were sane at this point ** and report database corruption if they were not, but this check has ** since moved into the btree layer.

61090. Locate the cursor number of the Current table

61091. IMP: R-65497-44594

61092. Iterate through all segments, from oldest to newest. Add them to ** the new Fts5Level object so that pLvl->aSeg[0] is the oldest ** segment in the data structure.

61093. Flags for OsSync() (or 0)

61094. Array of size pConfig->nCol

61095. If there is not a recovery running in another thread or process ** then convert BUSY errors to WAL_RETRY. If recovery is known to ** be running, convert BUSY to BUSY_RECOVERY. There is a race here ** which might cause WAL_RETRY to be returned even if BUSY_RECOVERY ** would be technically correct. But the race is benign since with ** WAL_RETRY this routine will be called again and will probably be ** right on the second iteration.

61096. Currently executing extension function

61097. xClose - close a cursor

61098. The loop to adjust downward

61099. A rowid/docid conflict.

61100. ** Remove from the column cache any entries that were added since the ** the previous sqlite3ExprCachePush operation. In other words, restore ** the cache to the state it was in prior the most recent Push.

61101. Child node (or 0 if this is a leaf)

61102. ** Flush all data associated with the SegmentWriter object pWriter to the ** database. This function must be called after all terms have been added ** to the segment using fts3SegWriterAdd(). If successful, SQLITE_OK is ** returned. Otherwise, an SQLite error code.

61103. EVIDENCE-OF: R-24089-57979 If a page contains no cells (which is only ** possible for a root page of a table that contains no rows) then the ** offset to the cell content area will equal the page size minus the ** bytes of reserved space.

61104. First in list of all tokenizer modules

61105. ** Attempt to add, subtract, or multiply the 64-bit signed value iB against ** the other 64-bit signed integer at *pA and store the result in *pA. ** Return 0 on success. Or if the operation would have resulted in an ** overflow, leave *pA unchanged and return 1.

61106. Free idxStr using sqlite3_free() if true

61107. plus_num ::= PLUS INTEGER|FLOAT

61108. True for first term on the node

61109. Load the initial configuration

61110. Another SELECT immediately to our left

61111. Statement cursor is currently pointing at

61112. Size of pSorter in bytes

61113. **comment:** ** CAPI3REF: Standard File Control Opcodes ** KEYWORDS: {file control opcodes} {file control opcode} *** These integer constants are opcodes for the xFileControl method ** of the [sqlite3_io_methods] object and for the [sqlite3_file_control()] ** interface. *** ** [[SQLITE_FCNTL_LOCKSTATE]] ** The [SQLITE_FCNTL_LOCKSTATE] opcode is used for debugging. This ** opcode causes the xFileControl method to write the current state of ** the lock (one of [SQLITE_LOCK_NONE], [SQLITE_LOCK_SHARED], ** [SQLITE_LOCK_RESERVED], [SQLITE_LOCK_PENDING], or [SQLITE_LOCK_EXCLUSIVE]) ** into an integer that the pArg argument points to. This capability ** is used during testing and is only available when the SQLITE_TEST ** compile-time option is used. *** [[SQLITE_FCNTL_SIZE_HINT]] ** The [SQLITE_FCNTL_SIZE_HINT] opcode is used by SQLite to give the VFS ** layer a hint of how large the database file will grow to be during the ** current transaction. This hint is not guaranteed to be accurate but it ** is often close. The underlying VFS might choose to preallocate database ** file space based on this hint in order to help writes to the database ** file run faster. *** [[SQLITE_FCNTL_CHUNK_SIZE]] ** The [SQLITE_FCNTL_CHUNK_SIZE] opcode is used to request that the VFS ** extends and truncates the database file in chunks of a size specified ** by the user. The fourth argument to [sqlite3_file_control()] should ** point to an integer (type int) containing the new chunk-size to use ** for the nominated database. Allocating database file space in large ** chunks (say 1MB at a time), may reduce file-system fragmentation and ** improve performance on some systems. *** [[SQLITE_FCNTL_FILE_POINTER]] ** The [SQLITE_FCNTL_FILE_POINTER] opcode is used to obtain a pointer ** to the [sqlite3_file] object associated with a particular database ** connection. See also [SQLITE_FCNTL_JOURNAL_POINTER]. *** [[SQLITE_FCNTL_JOURNAL_POINTER]] ** The [SQLITE_FCNTL_JOURNAL_POINTER] opcode is used to obtain a pointer ** to the [sqlite3_file] object associated with the journal file (either ** the [rollback journal] or the [write-ahead log]) for a particular database ** connection. See also [SQLITE_FCNTL_FILE_POINTER]. *** [[SQLITE_FCNTL_SYNC OMITTED]] ** No longer in use. *** [[SQLITE_FCNTL_SYNC]] ** The [SQLITE_FCNTL_SYNC] opcode is generated internally by SQLite and ** sent to the VFS immediately before the xSync method is invoked on a ** database file descriptor. Or, if the xSync method is not invoked ** because the user has configured SQLite with ** [PRAGMA synchronous | PRAGMA synchronous=OFF] it is invoked in place ** of the xSync method. In most cases, the pointer argument passed with ** this file-control is NULL. However, if the database file is being synced ** as part of a multi-database commit, the argument points to a nul-terminated ** string containing the transactions master-journal file name. VFSes that ** do not need this signal should silently ignore this opcode. Applications ** should not call [sqlite3_file_control()] with this opcode as doing so may ** disrupt the operation of the specialized VFSes that do require it. *** [[SQLITE_FCNTL_COMMIT_PHASETWO]] ** The [SQLITE_FCNTL_COMMIT_PHASETWO] opcode is generated internally by SQLite ** and sent to the VFS after a transaction has been committed immediately ** but before the database is unlocked. VFSes that do not need this signal ** should silently ignore this opcode. Applications should not call ** [sqlite3_file_control()] with this opcode as doing so may disrupt the ** operation of the specialized VFSes that do require it. *** [[SQLITE_FCNTL_WIN32_AV_RETRY]] ** ^The [SQLITE_FCNTL_WIN32_AV_RETRY] opcode is used to configure automatic ** retry counts and intervals for certain disk I/O operations for the ** windows [VFS] in order to provide robustness in the presence of ** anti-virus programs. By default, the windows VFS will retry file read, ** file write, and file delete operations up to 10 times, with a delay ** of 25 milliseconds before the first retry and with the delay increasing ** by an additional 25 milliseconds with each subsequent retry. This ** opcode allows these two values (10 retries and 25 milliseconds of delay) ** to be adjusted. The values are changed for all database connections ** within the same process. The argument is a pointer to an array of two ** integers where the first integer is the new retry count and the second ** integer is the delay. If either integer is negative, then the setting ** is not changed but instead the prior value of that setting is written ** into the array entry, allowing the current retry settings to be ** interrogated. The zDbName parameter is ignored. *** [[SQLITE_FCNTL_PERSIST_WAL]] ** ^The [SQLITE_FCNTL_PERSIST_WAL] opcode is used to set or query the ** persistent [WAL | Write Ahead Log] setting. By default, the auxiliary ** write ahead log and shared memory files used for transaction control ** are automatically deleted when the latest connection to the database ** closes. Setting persistent WAL mode causes those files to persist after ** close. Persisting the files is useful when other processes that do not ** have write permission on the directory containing the database file want ** to read the database file, as the WAL and shared memory files must exist ** in order for the database to be readable. The fourth parameter to ** [sqlite3_file_control()] for this opcode should be a pointer to an integer. ** That integer is 0 to disable persistent WAL mode or 1 to enable persistent ** WAL mode. If the integer is -1, then it is overwritten with the current ** WAL persistence setting. *** [[SQLITE_FCNTL_POWERSAFE_OVERWRITE]] ** ^The [SQLITE_FCNTL_POWERSAFE_OVERWRITE] opcode is used to set or query the ** persistent "powersafe-overwrite" or "PSOW" setting. The PSOW setting ** determines the [SQLITE_IOCAP_POWERSAFE_OVERWRITE] bit of the ** xDeviceCharacteristics methods. The fourth parameter to ** [sqlite3_file_control()] for this opcode should be a pointer to an integer. ** That integer is 0 to disable zero-damage mode or 1 to enable zero-damage ** mode. If the integer is -1, then it is overwritten with the current ** zero-damage mode setting. *** [[SQLITE_FCNTL_OVERWRITE]] ** ^The [SQLITE_FCNTL_OVERWRITE] opcode is invoked by SQLite after opening ** a write transaction to indicate that, unless it is rolled back for some ** reason, the entire database file will be overwritten by the current ** transaction. This is used by VACUUM operations. *** [[SQLITE_FCNTL_VFSNAME]] ** ^The [SQLITE_FCNTL_VFSNAME] opcode can be used to obtain the names of ** all [VFSes] in the VFS stack. The names are of all VFS shims and the ** final bottom-level VFS are written into memory obtained from ** [sqlite3_malloc()] and the result is stored in the char* variable ** that the fourth parameter of [sqlite3_file_control()] points to. ** The caller is responsible for freeing the memory when done. As with ** all file-control

actions, there is no guarantee that this will actually do anything. Callers should initialize the char* variable to a NULL pointer in case this file-control is not implemented. This file-control is intended for diagnostic use only.

[SQLITE_FCNTL_VFS_POINTER] opcode finds a pointer to the top-level [VFSes] currently in use. The argument X in [SQLITE_FCNTL_VFS_POINTER] must be of type "[sqlite3_vfs]". This opcodes will set *X to a pointer to the top-level VFS. When there are multiple VFS shims in the stack, this opcode finds the upper-most shim only.

Whenever a [PRAGMA] statement is parsed, an [SQLITE_FCNTL_PRAGMA] file control is sent to the open [sqlite3_file] object corresponding to the database file to which the pragma statement refers. The argument to the [SQLITE_FCNTL_PRAGMA] file control is an array of pointers to strings (char**) in which the second element of the array is the name of the pragma and the third element is the argument to the pragma or NULL if the pragma has no argument. The handler for an [SQLITE_FCNTL_PRAGMA] file control can optionally make the first element of the char** argument point to a string obtained from [sqlite3_mprintf()] or the equivalent and that string will become the result of the pragma or the error message if the pragma fails. If the [SQLITE_FCNTL_PRAGMA] file control returns [SQLITE_NOTFOUND], then normal [PRAGMA] processing continues. If the [SQLITE_FCNTL_PRAGMA] file control returns [SQLITE_OK], then the parser assumes that the VFS has handled the PRAGMA itself and the parser generates a no-op prepared statement if result string is NULL, or that returns a copy of the result string if the string is non-NULL. If the [SQLITE_FCNTL_PRAGMA] file control returns any result code other than [SQLITE_OK] or [SQLITE_NOTFOUND], that means that the VFS encountered an error while handling the [PRAGMA] and the compilation of the PRAGMA fails with an error. The [SQLITE_FCNTL_PRAGMA] file control occurs at the beginning of pragma statement analysis and so it is able to override built-in [PRAGMA] statements.

[SQLITE_FCNTL_BUSYHANDLER] file-control may be invoked by SQLite on the database file handle shortly after it is opened in order to provide a custom VFS with access to the connections busy-handler callback. The argument is of type (void**) - an array of two (void *) values. The first (void *) actually points to a function of type (int (*) (void *)). In order to invoke the connections busy-handler, this function should be invoked with the second (void *) in the array as the only argument. If it returns non-zero, then the operation should be retried. If it returns zero, the custom VFS should abandon the current operation.

[SQLITE_FCNTL_TEMPFILENAME] Application can invoke the [SQLITE_FCNTL_TEMPFILENAME] file-control to have SQLite generate a temporary filename using the same algorithm that is followed to generate temporary filenames for TEMP tables and other internal uses. The argument should be a char** which will be filled with the filename written into memory obtained from [sqlite3_malloc0]. The caller should invoke [sqlite3_free0] on the result to avoid a memory leak.

[SQLITE_FCNTL_MMAP_SIZE] The [SQLITE_FCNTL_MMAP_SIZE] file control is used to query or set the maximum number of bytes that will be used for memory-mapped I/O. The argument is a pointer to a value of type sqlite3_int64 that is an advisory maximum number of bytes in the file to memory map. The pointer is overwritten with the old value. The limit is not changed if the value originally pointed to is negative, and so the current limit can be queried by passing in a pointer to a negative number. This file-control is used internally to implement [PRAGMA mmap_size].

[SQLITE_FCNTL_TRACE] The [SQLITE_FCNTL_TRACE] file control provides advisory information to the VFS about what the higher layers of the SQLite stack are doing. This file control is used by some VFS activity tracing [shims]. The argument is a zero-terminated string. Higher layers in the SQLite stack may generate instances of this file control if the [SQLITE_USE_FCNTL_TRACE] compile-time option is enabled.

[SQLITE_FCNTL_HAS_MOVED] The [SQLITE_FCNTL_HAS_MOVED] file control interprets its argument as a pointer to an integer and it writes a boolean into that integer depending on whether or not the file has been renamed, moved, or deleted since it was first opened.

[SQLITE_FCNTL_WIN32_GET_HANDLE] The [SQLITE_FCNTL_WIN32_GET_HANDLE] opcode can be used to obtain the underlying native file handle associated with a file handle. This file control interprets its argument as a pointer to a native file handle and writes the resulting value there.

[SQLITE_FCNTL_WIN32_SET_HANDLE] The [SQLITE_FCNTL_WIN32_SET_HANDLE] opcode is used for debugging. This opcode causes the xFileControl method to swap the file handle with the one pointed to by the pArg argument. This capability is used during testing and only needs to be supported when SQLITE_TEST is defined.

[SQLITE_FCNTL_WAL_BLOCK] The [SQLITE_FCNTL_WAL_BLOCK] is a signal to the VFS layer that it might be advantageous to block on the next WAL lock if the lock is not immediately available. The WAL subsystem issues this signal during rare circumstances in order to fix a problem with priority inversion. Applications should use this file-control.

[SQLITE_FCNTL_ZIPVFS] The [SQLITE_FCNTL_ZIPVFS] opcode is implemented by zipvfs only. All other VFS should return SQLITE_NOTFOUND for this opcode.

[SQLITE_FCNTL_RBU] The [SQLITE_FCNTL_RBU] opcode is implemented by the special VFS used by the RBU extension only. All other VFS should return SQLITE_NOTFOUND for this opcode.

label: code-design

61114. ** This is the implementation of a scalar SQL function used to test the expression parser. It should be called as follows:
- ```
<expr>, <column 1>, ...);
```
- The first argument, <tokenizer>, is the name of the fts3 tokenizer used to parse the query expression (see README.tokenizers). The second argument is the query expression to parse. Each subsequent argument is the name of a column of the fts3 table that the query expression may refer to. For example:
- ```
SELECT fts3_exprtest('simple', 'Bill col2:Bloggs', 'col1', 'col2');
```
61115. Checksum of string zMaster
61116. OUT: True if plan uses an IN(...) op
61117. Initial size of write buffer
61118. Data is coming from a SELECT or from a multi-row VALUES clause. Generate a co-routine to run the SELECT.

If bPreserve is false, any prior content in pMem->z is discarded.
61144. If we reach this point it means that the new candidate path needs to be added to the set of best-so-far paths.
61145. **comment:** ** CAPI3REF: Compiling An SQL Statement ** KEYWORDS: {SQL statement compiler} ** METHOD: sqlite3 ** CONSTRUCTOR: sqlite3_stmt ** To execute an SQL statement, it must first be compiled into a byte-code program using one of these routines. Or, in other words, these routines are constructors for the [prepared statement] object. ** The preferred routine to use is [sqlite3_prepare_v20]. The [sqlite3_prepare0] interface is legacy and

should be avoided. ** [sqlite3_prepare_v3()] has an extra "prepFlags" option that is used ** for special purposes. *** The use of the UTF-8 interfaces is preferred, as SQLite currently ** does all parsing using UTF-8. The UTF-16 interfaces are provided ** as a convenience. The UTF-16 interfaces work by converting the ** input text into UTF-8, then invoking the corresponding UTF-8 interface. *** The first argument, "db", is a [database connection] obtained from a ** prior successful call to [sqlite3_open()], [sqlite3_open_v2()] or ** [sqlite3_open16()]. The database connection must not have been closed. *** The second argument, "zSql", is the statement to be compiled, encoded ** as either UTF-8 or UTF-16. The sqlite3_prepare(), sqlite3_prepare_v2(), ** and sqlite3_prepare_v3() ** interfaces use UTF-8, and sqlite3_prepare16(), sqlite3_prepare16_v2(), ** and sqlite3_prepare16_v3() use UTF-16. *** ^If the nByte argument is negative, then zSql is read up to the ** first zero terminator. ^If nByte is positive, then it is the ** number of bytes read from zSql. ^If nByte is zero, then no prepared ** statement is generated. ** If the caller knows that the supplied string is nul-terminated, then ** there is a small performance advantage to passing an nByte parameter that ** is the number of bytes in the input string <i>including</i> ** the nul-terminator. *** ^If pzTail is not NULL then *pzTail is made to point to the first byte ** past the end of the first SQL statement in zSql. These routines only ** compile the first statement in zSql, so *pzTail is left pointing to ** what remains uncompiled. *** ^ppStmt is left pointing to a compiled [prepared statement] that can be ** executed using [sqlite3_step()]. ^If there is an error, *ppStmt is set ** to NULL. ^If the input text contains no SQL (if the input is an empty ** string or a comment) then *ppStmt is set to NULL. ** The calling procedure is responsible for deleting the compiled ** SQL statement using [sqlite3_finalize()] after it has finished with it. ** ppStmt may not be NULL. *** ^On success, the sqlite3_prepare() family of routines return [SQLITE_OK]; ** otherwise an [error code] is returned. *** The sqlite3_prepare_v2(), sqlite3_prepare_v3(), sqlite3_prepare16_v2(), ** and sqlite3_prepare16_v3() interfaces are recommended for all new programs. ** The older interfaces (sqlite3_prepare() and sqlite3_prepare16()) ** are retained for backwards compatibility, but their use is discouraged. *** ^In the "vX" interfaces, the prepared statement ** that is returned (the [sqlite3_stmt] object) contains a copy of the ** original SQL text. This causes the [sqlite3_step()] interface to ** behave differently in three ways: *** ** ** ^If the database schema changes, instead of returning [SQLITE_SCHEMA] as it ** always used to do, [sqlite3_step()] will automatically recompile the SQL ** statement and try to run it again. As many as [SQLITE_MAX_SCHEMA_RETRY] ** retries will occur before sqlite3_step() gives up and returns an error. ** ** ** ^When an error occurs, [sqlite3_step()] will return one of the detailed ** [error codes] or [extended error codes]. ^The legacy behavior was that ** [sqlite3_step()] would only return a generic [SQLITE_ERROR] result code ** and the application would have to make a second call to [sqlite3_reset()] ** in order to find the underlying cause of the problem. With the "v2" prepare ** interfaces, the underlying reason for the error is returned immediately. ** ** ** ^If the specific value bound to [parameter | host parameter] in the ** WHERE clause might influence the choice of query plan for a statement, ** then the statement will be automatically recompiled, as if there had been ** a schema change, on the first [sqlite3_step()] call following any change ** to the [sqlite3_bind_text | bindings] of that [parameter]. ** ^The specific value of WHERE-clause [parameter] might influence the ** choice of query plan if the parameter is the left-hand side of a [LIKE] ** or [GLOB] operator or if the parameter is compared to an indexed column ** and the [SQLITE_ENABLE_STAT3] compile-time option is enabled. ** ** <p>sqlite3_prepare_v3() differs from sqlite3_prepare_v2() only in having ** the extra prepFlags parameter, which is a bit array consisting of zero or ** more of the [SQLITE_PERSISTENT|SQLITE_PREPARE_*] flags. ^The ** sqlite3_prepare_v2() interface works exactly the same as ** sqlite3_prepare_v3() with a zero prepFlags parameter. **

61171. True if range start uses ==, >= or <=

61172. **comment:** ** The Pager.eLock variable is almost always set to one of the ** following locking-states, according to the lock currently held on ** the database file: NO_LOCK, SHARED_LOCK, RESERVED_LOCK or EXCLUSIVE_LOCK. ** This variable is kept up to date as locks are taken and released by ** the pagerLockDb() and pagerUnlockDb() wrappers. ** ** If the VFS xLock() or xUnlock() returns an error other than SQLITE_BUSY ** (i.e. one of the SQLITE_IOERR subtypes), it is not clear whether or not ** the operation was successful. In these circumstances pagerLockDb() and ** pagerUnlockDb() take a conservative approach - eLock is always updated ** when unlocking the file, and only updated when locking the file if the ** VFS call is successful. This way, the Pager.eLock variable may be set ** to a less exclusive (lower) value than the lock that is actually held ** at the system level, but it is never set to a more exclusive value. ** ** This is usually safe. If an xUnlock fails or appears to fail, there may ** be a few redundant xLock() calls or a lock may be held for longer than ** required, but nothing really goes wrong. ** ** The exception is when the database file is unlocked as the pager moves ** from ERROR to OPEN state. At this point there may be a hot-journal file ** in the file-system that needs to be rolled back (as part of an OPEN->SHARED ** transition, by the same pager or any other). If the call to xUnlock() ** fails at this point and the pager is left holding an EXCLUSIVE lock, this ** can confuse the call to xCheckReservedLock() call made later as part ** of hot-journal detection. ** ** xCheckReservedLock() is defined as returning true "if there is a RESERVED ** lock held by this process or any others". So xCheckReservedLock may ** return true because the caller itself is holding an EXCLUSIVE lock (but ** doesn't know it because of a previous error in xUnlock). If this happens ** a hot-journal may be mistaken for a journal being created by an active ** transaction in another process, causing SQLite to read from the database ** without rolling it back. ** ** To work around this, if a call to xUnlock() fails when unlocking the ** database in the ERROR state, Pager.eLock is set to UNKNOWN_LOCK. It ** is only changed back to a real locking state after a successful call ** to xLock(EXCLUSIVE). Also, the code to do the OPEN->SHARED state transition ** omits the check for a hot-journal if Pager.eLock is set to UNKNOWN_LOCK ** lock. Instead, it assumes a hot-journal exists and obtains an EXCLUSIVE ** lock on the database file before attempting to roll it back. See function ** PagerSharedLock() for more detail. ** ** Pager.eLock may only be set to UNKNOWN_LOCK when the pager is in ** PAGER_OPEN state.

61193. Set the foreign key value to its default

61194. **comment:** ** SUMMARY ** ** Writing a transaction containing a large number of operations on ** b-tree indexes that are collectively larger than the available cache ** memory can be very inefficient. ** ** The problem is that in order to update a b-tree, the leaf page (at least) ** containing the entry being inserted or deleted must be modified. If the ** working set of leaves is larger than the available cache memory, then a ** single leaf that is modified more than once as part of the transaction ** may be loaded from or written to the persistent media multiple times. ** Additionally, because the index updates are likely to be applied in ** random order, access to pages within the database is also likely to be in ** random order, which is itself quite inefficient. ** ** One way to improve the situation is to sort the operations on each index ** by index key before applying them to the b-tree. This leads to an IO ** pattern that resembles a single linear scan through the index b-tree, ** and all but guarantees each modified leaf page is loaded and stored ** exactly once. SQLite uses this trick to improve the performance of ** CREATE INDEX commands. This extension allows it to be used to improve ** the performance of large transactions on existing databases. ** ** Additionally, this extension allows the work involved in writing the ** large transaction to be broken down into sub-transactions performed ** sequentially by separate processes. This is useful if the system cannot ** guarantee that a single update process will run for long enough to apply ** the entire update, for example because the update is being applied on a ** mobile device that is frequently rebooted. Even after the writer process ** has committed one or more sub-transactions, other

database clients continue ** to read from the original database snapshot. In other words, partially ** applied transactions are not visible to other clients. *** *** "RBU" stands for "Resumable Bulk Update". As in a large database update ** transmitted via a wireless network to a mobile device. A transaction ** applied using this extension is hence referred to as an "RBU update". *** *** LIMITATIONS *** An "RBU update" transaction is subject to the following limitations: *** *** The transaction must consist of INSERT, UPDATE and DELETE operations ** only. *** *** INSERT statements may not use any default values. *** *** * UPDATE and DELETE statements must identify their target rows by ** non-NULL PRIMARY KEY values. Rows with NULL values stored in PRIMARY KEY fields may not be updated or deleted. If the table being written ** has no PRIMARY KEY, affected rows must be identified by rowid. *** *** * UPDATE statements may not modify PRIMARY KEY columns. *** *** No triggers will be fired. *** *** No foreign key violations are detected or reported. *** *** CHECK constraints are not enforced. *** *** No constraint handling mode except for "OR ROLLBACK" is supported. *** *** PREPARATION *** An "RBU update" is stored as a separate SQLite database. A database ** containing an RBU update is an "RBU database". For each table in the ** target database to be updated, the RBU database should contain a table ** named "data_<target name>" containing the same set of columns as the ** target table, and one more - "rbu_control". The data_% table should ** have no PRIMARY KEY or UNIQUE constraints, but each column should have ** the same type as the corresponding column in the target database. ** The "rbu_control" column should have no type at all. For example, if ** the target database contains: *** *** CREATE TABLE t1(a INTEGER PRIMARY KEY, b TEXT, c UNIQUE); *** Then the RBU database should contain: *** *** CREATE TABLE data_t1(a INTEGER, b TEXT, c, rbu_control); *** The order of the columns in the data_% table does not matter. *** Instead of a regular table, the RBU database may also contain virtual ** tables or view named using the data_<target> naming scheme. *** Instead of the plain data_<target> naming scheme, RBU database tables ** may also be named data<integer>_<target>, where <integer> is any sequence ** of zero or more numeric characters (0-9). This can be significant because ** tables within the RBU database are always processed in order sorted by ** name. By judicious selection of the <integer> portion of the names ** of the RBU tables the user can therefore control the order in which they ** are processed. This can be useful, for example, to ensure that "external *** content" FTS4 tables are updated before their underlying content tables. *** If the target database table is a virtual table or a table that has no ** PRIMARY KEY declaration, the data_% table must also contain a column ** named "rbu_rowid". This column is mapped to the tables implicit primary ** key column - "rowid". Virtual tables for which the "rowid" column does ** not function like a primary key value cannot be updated using RBU. For ** example, if the target db contains either of the following: *** *** CREATE VIRTUAL TABLE x1 USING fts3(a, b); ** CREATE TABLE x1(a, b) ** ** then the RBU database should contain: *** *** CREATE TABLE data_x1(a, b, rbu_rowid, rbu_control); *** All non-hidden columns (i.e. all columns matched by "SELECT *") of the ** target table must be present in the input table. For virtual tables, ** hidden columns are optional - they are updated by RBU if present in ** the input table, or not otherwise. For example, to write to an fts4 ** table with a hidden languageid column such as: *** *** CREATE VIRTUAL TABLE ft1 USING fts4(a, b, languageid='langid'); *** Either of the following input table schemas may be used: *** *** CREATE TABLE data_ft1(a, b, langid, rbu_rowid, rbu_control); ** CREATE TABLE data_ft1(a, b, rbu_rowid, rbu_control); *** *** For each row to INSERT into the target database as part of the RBU ** update, the corresponding data_% table should contain a single record ** with the "rbu_control" column set to contain integer value 0. The ** other columns should be set to the values that make up the new record ** to insert. *** *** If the target database table has an INTEGER PRIMARY KEY, it is not ** possible to insert a NULL value into the IPK column. Attempting to ** do so results in an SQLITE_MISMATCH error. *** For each row to DELETE from the target database as part of the RBU ** update, the corresponding data_% table should contain a single record ** with the "rbu_control" column set to contain integer value 1. The ** real primary key values of the row to delete should be stored in the ** corresponding columns of the data_% table. The values stored in the ** other columns are not used. *** *** For each row to UPDATE from the target database as part of the RBU ** update, the corresponding data_% table should contain a single record ** with the "rbu_control" column set to contain a value of type text. ** The real primary key values identifying the row to update should be ** stored in the corresponding columns of the data_% table row, as should ** the new values of all columns being update. The text value in the ** "rbu_control" column must contain the same number of characters as ** there are columns in the target database table, and must consist entirely ** of 'x' and '.' characters (or in some special cases 'd' - see below). For ** each column that is being updated, the corresponding character is set to ** 'x'. For those that remain as they are, the corresponding character of the ** rbu_control value should be set to '..'. For example, given the tables ** above, the update statement: *** *** UPDATE t1 SET c = 'usa' WHERE a = 4; *** is represented by the data_t1 row created by: *** *** INSERT INTO data_t1(a, b, c, rbu_control) VALUES(4, NULL, 'usa', '.x'); *** Instead of an 'x' character, characters of the rbu_control value specified ** for UPDATES may also be set to 'd'. In this case, instead of updating the ** target table with the value stored in the corresponding data_% column, the ** user-defined SQL function "rbu_delta()" is invoked and the result stored in ** the target table column. rbu_delta() is invoked with two arguments - the ** original value currently stored in the target table column and the ** value specified in the data_xxx table. *** *** For example, this row: *** *** INSERT INTO data_t1(a, b, c, rbu_control) VALUES(4, NULL, 'usa', '..d'); *** is similar to an UPDATE statement such as: *** *** UPDATE t1 SET c = rbu_delta(c, 'usa') WHERE a = 4; *** *** Finally, if an 'f' character appears in place of a 'd' or 's' in an ** ota_control string, the contents of the data_xxx table column is assumed ** to be a "fossil delta" - a patch to be applied to a blob value in the ** format used by the fossil source-code management system. In this case ** the existing value within the target database table must be of type BLOB. ** It is replaced by the result of applying the specified fossil delta to ** itself. *** *** If the target database table is a virtual table or a table with no PRIMARY ** KEY, the rbu_control value should not include a character corresponding ** to the rbu_rowid value. For example, this: *** *** INSERT INTO data_ft1(a, b, rbu_rowid, rbu_control) ** VALUES(NULL, 'usa', 12, '.x'); *** causes a result similar to: *** *** UPDATE ft1 SET b = 'usa' WHERE rowid = 12; *** *** The data_xxx tables themselves should have no PRIMARY KEY declarations. ** However, RBU is more efficient if reading the rows in from each data_xxx ** table in "rowid" order is roughly the same as reading them sorted by ** the PRIMARY KEY of the corresponding target database table. In other ** words, rows should be sorted using the destination table PRIMARY KEY ** fields before they are inserted into the data_xxx tables. *** *** USAGE *** The API declared below allows an application to apply an RBU update ** stored on disk to an existing target database. Essentially, the ** application: *** *** 1) Opens an RBU handle using the sqlite3rbu_open() function. *** *** 2) Registers any required virtual table modules with the database ** handle returned by sqlite3rbu_db(). Also, if required, register ** the rbu_delta() implementation. *** *** 3) Calls the sqlite3rbu_step() function one or more times on ** the new handle. Each call to sqlite3rbu_step() performs a single ** b-tree operation, so thousands of calls may be required to apply ** a complete update. *** *** 4) Calls sqlite3rbu_close() to close the RBU update handle. If ** sqlite3rbu_step() has been called enough times to completely ** apply the update to the target database, then the RBU database ** is marked as fully applied. Otherwise, the state of the RBU ** update application is saved in the RBU database for later ** resumption. *** *** See comments below for more detail on APIs. *** *** If an update is only partially applied to the target database by the ** time sqlite3rbu_close() is called, various state information is saved ** within the RBU database. This allows subsequent processes to automatically ** resume the RBU update from where it left off. *** *** To remove all RBU extension state information, returning an RBU database ** to its original contents, it is sufficient to drop all tables that begin ** with the prefix "rbu_" *** *** DATABASE LOCKING *** *** An RBU update may not be applied to a database in WAL mode. Attempting ** to do so is an error (SQLITE_ERROR). *** *** While an RBU handle is open, a SHARED lock may be held on the target ** database file. This means it is possible for other clients to read the ** database, but not to write it. *** *** If an RBU update is started and then suspended before it is completed, ** then an external client writes to the database, then attempting to resume ** the suspended RBU update is also an error (SQLITE_BUSY).

Hence: ** ** WhereTerm.wsFlags |= TERM_ORINFO ** WhereTerm.u.pOrInfo = a dynamically allocated WhereOrTerm object ** ** The term being analyzed must have two or more of OR-connected subterms. ** A single subterm might be a set of AND-connected sub-subterms. ** Examples of terms under analysis: ** ** (A) t1.x=2,y OR t1.x=t2.z OR t1.y=15 OR t1.z=t3.a+5 ** (B) x=expr1 OR expr2=x OR x=expr3 ** (C) t1.x=t2,y OR (t1.x=t2.z AND t1.y=15) ** (D) x=expr1 OR (y>11 AND y<22 AND z LIKE "hello*") ** (E) (p.a=1 AND q.b=2 AND r.c=3) OR (p.x=4 AND q.y=5 AND r.z=6) ** (F) x>A OR (x=A AND y>B) ** ** CASE 1: ** ** If all subterms are of the form T.C=expr for some single column of C and ** a single table T (as shown in example B above) then create a new virtual ** term that is an equivalent IN expression. In other words, if the term ** being analyzed is: ** ** x = expr1 OR expr2 = x OR x = expr3 ** ** then create a new virtual term like this: ** ** x IN (expr1,expr2,expr3) ** ** CASE 2: ** ** If there are exactly two disjuncts and one side has x>A and the other side ** has x=A (for the same x and A) then add a new virtual conjunct term to the ** WHERE clause of the form "x>=A". Example: ** ** x>A OR (x=A AND y>B) adds: x>=A ** ** The added conjunct can sometimes be helpful in query planning. ** ** CASE 3: ** ** If all subterms are indexable by a single table T, then set ** ** WhereTerm.eOperator = WO_OR ** WhereTerm.u.pOrInfo->indexable |= the cursor number for table T ** ** A subterm is "indexable" if it is of the form ** "T.C <op> <expr>" where C is any column of table T and ** <op> is one of "=", "<", "<=", ">", ">=", "IS NULL", or "IN". ** A subterm is also indexable if it is an AND of two or more ** subsubterms at least one of which is indexable. Indexable AND ** subterms have their eOperator set to WO_AND and they have ** u.pAndInfo set to a dynamically allocated WhereAndTerm object. ** ** From another point of view, "indexable" means that the subterm could ** potentially be used with an index if an appropriate index exists. ** This analysis does not consider whether or not the index exists; that ** is decided elsewhere. This analysis only looks at whether subterms ** appropriate for indexing exist. ** ** All examples A through E above satisfy case 3. But if a term ** also satisfies case 1 (such as B) we know that the optimizer will ** always prefer case 1, so in that case we pretend that case 3 is not ** satisfied. ** ** It might be the case that multiple tables are indexable. For example, ** (E) above is indexable on tables P, Q, and R. ** ** Terms that satisfy case 3 are candidates for lookup by using ** separate indices to find rowids for each subterm and composing ** the union of all rowids using a RowSet object. This is similar ** to "bitmap indices" in other database engines. ** ** OTHERWISE: **** If none of cases 1, 2, or 3 apply, then leave the eOperator set to ** zero. This term is not useful for search.

61375. tcons ::= CHECK LP expr RP onconf
61376. 84
61377. ** Clear the content of node p (set all bytes to 0x00).
61378. Index of column in first table

61388. ** Free all memory allocations associated with the tree pTree.
61389. ** CAPI3REF: Error Codes And Messages ** METHOD: sqlite3 ** ** ^If the most recent sqlite3_* API call associated with ** [database connection] D failed, then the sqlite3_errcode(D) interface ** returns the numeric [result code] or [extended result code] for that ** API call. ** If the most recent API call was successful, ** then the return value from sqlite3_errcode() is undefined. ** ^The sqlite3_extended_errcode() ** interface is the same except that it always returns the ** [extended result code] even when extended result codes are ** disabled. *** ^The sqlite3_errmsg() and sqlite3_errmsg16() return English-language ** text that describes the error, as either UTF-8 or UTF-16 respectively. ** ^Memory to hold the error message string is managed internally. ** The application does not need to worry about freeing the result. ** However, the error string might be overwritten or deallocated by ** subsequent calls to other SQLite interface functions.** ^The sqlite3_errstr() interface returns the English-language text ** that describes the [result code], as UTF-8. ** ^Memory to hold the error message string is managed internally ** and must not be freed by the application).** ^When the serialized [threading mode] is in use, it might be the ** case that a second error occurs on a separate thread in between ** the time of the first error and the call to these interfaces. ** When that happens, the second error will be reported since these ** interfaces always report the most recent result. To avoid ** this, each thread can obtain exclusive use of the [database connection] D ** by invoking [sqlite3_mutex_enter][[sqlite3_db_mutex](D)]) before beginning ** to use D and invoking [sqlite3_mutex_leave][[sqlite3_db_mutex](D)) after ** all calls to the interfaces listed here are completed. *** If an interface fails with SQLITE_MISUSE, that means the interface ** was invoked incorrectly by the application. In that case, the ** error code and message may or may not be set.
61390. If the opcode is TK_TRIGGER, then the expression is a reference ** to a column in the new.* or old.* pseudo-tables available to ** trigger programs. In this case Expr.iTable is set to 1 for the ** new.* pseudo-table, or 0 for the old.* pseudo-table. Expr.iColumn ** is set to the column of the pseudo-table to read, or to -1 to ** read the rowid field. *** The expression is implemented using an OP_Param opcode. The p1 ** parameter is set to 0 for an old.rowid reference, or to (i+1) ** to reference another column of the old.* pseudo-table, where ** i is the index of the column. For a new.rowid reference, p1 is ** set to (n+1), where n is the number of columns in each pseudo-table. ** For a reference to any other column in the new.* pseudo-table, p1 ** is set to (n+2+i), where n and i are as defined previously. For ** example, if the table on which triggers are being fired is ** declared as: *** CREATE TABLE t1(a, b); ** ** Then p1 is interpreted as follows: *** ** p1==0 -> old.rowid p1==3 -> new.rowid ** p1==1 -> old.a p1==4 -> new.a ** p1==2 -> old.b p1==5 -> new.b
61391. This constraint creates the same index as a previous ** constraint specified somewhere in the CREATE TABLE statement. ** However the ON CONFLICT clauses are different. If both this ** constraint and the previous equivalent constraint have explicit ** ON CONFLICT clauses this is an error. Otherwise, use the ** explicitly specified behavior for the index.
61392. Pointers to the body of overflow cells
61393. ** Generate code that will increment the schema cookie. *** The schema cookie is used to determine when the schema for the ** database changes. After each schema change, the cookie value ** changes. When a process first reads the schema it records the ** cookie. Thereafter, whenever it goes to access the database, ** it checks the cookie to make sure the schema has not changed ** since it was last read. *** This plan is not completely bullet-proof. It is possible for ** the schema to change multiple times and for the cookie to be ** set back to prior value. But schema changes are infrequent ** and the probability of hitting the same cookie value is only ** 1 chance in 2^32. So we're safe enough. *** IMPLEMENTATION-OF: R-34230-56049 SQLite automatically increments ** the schema-version whenever the schema changes.

- 61435. **comment:** ** CAPI3REF: Apply A Changeset To A Database ** ** Apply a changeset to a database. This function attempts to update the ** "main" database attached to handle db with the changes found in the ** changeset passed via the second and third arguments. ** ** The fourth argument (xFilter) passed to this function is the "filter ** callback". If it is not NULL, then for each table affected by at least one ** change in the changeset, the filter callback is invoked with ** the table name as the second argument, and a copy of the context pointer ** passed as the sixth argument to this function as the first. If the "filter ** callback" returns zero, then no attempt is made to apply any changes to ** the table. Otherwise, if the return value is non-zero or the xFilter ** argument to this function is NULL, all changes related to the table are ** attempted. ** ** For each table that is not excluded by the filter callback, this function ** tests that the target database contains a compatible table. A table is ** considered compatible if all of the following are true: ** ** ** The table has the same name as the name recorded in the ** changeset, and ** The table has at least as many columns as recorded in the ** changeset, and ** The table has primary key columns in the same position as ** recorded in the changeset. ** ** ** If there is no compatible table, it is not an error, but none of the ** changes associated with the table are applied. A warning message is issued ** via the sqlite3_log() mechanism with the error code SQLITE_SCHEMA. At most ** one such warning is issued for each table in the changeset. ** ** For each change for which there is a compatible table, an attempt is made ** to modify the table contents according to the UPDATE, INSERT or DELETE ** change. If a change cannot be applied cleanly, the conflict handler ** function passed as the fifth argument to sqlite3changeset_apply() may be ** invoked. A description of exactly when the conflict handler is invoked for ** each type of change is below. ** ** Unlike the xFilter argument, xConflict may not be passed NULL. The results ** of passing anything other than a valid function pointer as the xConflict ** argument are undefined. ** ** Each time the conflict handler function is invoked, it must return one ** of [SQLITE_CHANGESET OMIT], [SQLITE_CHANGESET_ABORT] or ** [SQLITE_CHANGESET_REPLACE]. SQLITE_CHANGESET_REPLACE may only be returned ** if the second argument passed to the conflict handler is either ** SQLITE_CHANGESET_DATA or SQLITE_CHANGESET_CONFLICT. If the conflict-handler ** returns an illegal value, any changes already made are rolled back and ** the call to sqlite3changeset_apply() returns SQLITE_MISUSE. Different ** actions are taken by sqlite3changeset_apply() depending on the value ** returned by each invocation of the conflict-handler function. Refer to ** the documentation for the three ** [SQLITE_CHANGESET OMIT]available return values] for details. ** ** <dl> ** <dt>DELETE Changes<dd> ** For each DELETE change, this function checks if the target database ** contains a row with the same primary key value (or values) as the ** original row values stored in the changeset. If it does, and the values ** stored in all non-primary key columns also match the values stored in ** the changeset the row is deleted from the target database. ** ** If a row with matching primary key values is found, but one or more of ** the non-primary key fields contains a value different from the original ** row value stored in the changeset, the conflict-handler function is ** invoked with [SQLITE_CHANGESET DATA] as the second argument. If the ** database table has more columns than are recorded in the changeset, ** only the values of those non-primary key fields are compared against ** the current database contents - any trailing database table columns ** are ignored. ** ** If no row with matching primary key values is found in the database, ** the conflict-handler function is invoked with [SQLITE_CHANGESET NOTFOUND] ** passed as the second argument. ** ** If the DELETE operation is attempted, but SQLite returns SQLITE_CONSTRAINT ** (which can only happen if a foreign key constraint is violated), the ** conflict-handler function is invoked with [SQLITE_CHANGESET CONSTRAINT] ** passed as the second argument. This includes the case where the DELETE ** operation is attempted because an earlier call to the conflict handler ** function returned [SQLITE_CHANGESET_REPLACE]. ** ** <dt>INSERT Changes<dd> ** For each INSERT change, an attempt is made to insert the new row into ** the database. If the changeset row contains fewer fields than the ** database table, the trailing fields are populated with their default ** values. ** ** If the attempt to insert the row fails because the database already ** contains a row with the same primary key values, the conflict handler ** function is invoked with the second argument set to ** [SQLITE_CHANGESET CONFLICT]. ** ** If the attempt to insert the row fails because of some other constraint ** violation (e.g. NOT NULL or UNIQUE), the conflict handler function is ** invoked with the second argument set to [SQLITE_CHANGESET CONSTRAINT]. ** This includes the case where the INSERT operation is re-attempted because ** an earlier call to the conflict handler function returned ** [SQLITE_CHANGESET_REPLACE]. ** ** <dt>UPDATE Changes<dd> ** For each UPDATE change, this function checks if the target database ** contains a row with the same primary key value (or values) as the ** original row values stored in the changeset. If it does, and the values ** stored in all modified non-primary key columns also match the values ** stored in the changeset the row is updated within the target database. ** ** If a row with matching primary key values is found, but one or more of ** the modified non-primary key fields contains a value different from an ** original row value stored in the changeset, the conflict-handler function ** is invoked with [SQLITE_CHANGESET DATA] as the second argument. Since ** UPDATE changes only contain values for non-primary key fields that are ** to be modified, only those fields need to match the original values to ** avoid the SQLITE_CHANGESET DATA conflict-handler callback. ** ** If no row with matching primary key values is found in the database, ** the conflict-handler function is invoked with [SQLITE_CHANGESET NOTFOUND] ** passed as the second argument. ** ** If the UPDATE operation is attempted, but SQLite returns ** SQLITE_CONSTRAINT, the conflict-handler function is invoked with ** [SQLITE_CHANGESET CONSTRAINT] passed as the second argument. ** This includes the case where the UPDATE operation is attempted after ** an earlier call to the conflict handler function returned ** [SQLITE_CHANGESET_REPLACE]. ** </dl> ** ** It is safe to execute SQL statements, including those that write to the ** table that the callback related to, from within the xConflict callback. ** This can be used to further customize the applications conflict ** resolution strategy. ** ** All changes made by this

function are enclosed in a savepoint transaction. ** If any other error (aside from a constraint failure when attempting to ** write to the target database) occurs, then the savepoint transaction is ** rolled back, restoring the target database to its original state, and an ** SQLite error code returned.

61502. DETACH

61503. *** End of interface to code in fts5_varint.c. *****

61504. Index iterator

61505. ** Maximum size of any allocation is ((1<<LOGMAX)*mem5.szAtom). Since ** mem5.szAtom is always at least 8 and 32-bit integers are used, ** it is not actually possible to reach this limit.

61506. ** Windows will only let you create file view mappings ** on allocation size granularity boundaries. ** During sqlite3_os_init() we do a GetSystemInfo() ** to get the granularity size.

61507. Register a trace callback using the version-2 interface.

61508. ** Attempt to start a new transaction. A write-transaction ** is started if the second argument is nonzero, otherwise a read- ** transaction. If the second argument is 2 or more and exclusive ** transaction is started, meaning that no other process is allowed ** to access the database. A preexisting transaction may not be ** upgraded to exclusive by calling this routine a second time - the ** exclusivity flag only works for a new transaction. ** ** A write-transaction must be started before attempting any ** changes to the database. None of the following routines ** will work unless a transaction is started first: ** ** sqlite3BtreeCreateTable() ** sqlite3BtreeCreateIndex() ** sqlite3BtreeClearTable() ** sqlite3BtreeDropTable() ** sqlite3BtreeInsert() ** sqlite3BtreeDelete() ** sqlite3BtreeUpdateMeta() ** ** If an initial attempt to acquire the lock fails because of lock contention ** and the database was previously unlocked, then invoke the busy handler ** if there is one. But if there was previously a read-lock, do not ** invoke the busy handler - just return SQLITE_BUSY. SQLITE_BUSY is ** returned when there is already a read-lock in order to avoid a deadlock. ** ** Suppose there are two processes A and B. A has a read lock and B has ** a reserved lock. B tries to promote to exclusive but is blocked because ** of A's read lock. A tries to promote to reserved but is blocked by B. ** One or the other of the two processes must give way or there can be ** no progress. By returning SQLITE_BUSY and not invoking the busy callback ** when A already has a read lock, we encourage A to give up and let B ** proceed.

61509. ***** Interface to code in fts5_hash.c.

61510. ** GCC does not define the offsetof() macro so we'll have to do it ** ourselves.

61511. Column number of matching column on the right

61512. ** Constants for the largest and smallest possible 64-bit signed integers. ** These macros are designed to work correctly on both 32-bit and 64-bit ** compilers.

61513. Offset to the cell pointer array

61514. Bitmask of tables referenced by pExpr

61515. If we reach this point, it means the two subterms can be combined

61516. Open and close a connection to a write-ahead log.

61517. Size of one page

61518. Number of the page to get

61519. ** Used as an fts3ExprIterate() context when loading phrase doclists to ** Fts3Expr.aDoclist[]/nDoclist.

61520. Number of bytes of URI args at *zUri

61521. Boolean properties. See COLFLAG_ defines below

61522. Take a shared-cache advisory read-lock on the parent table. Allocate ** a cursor to use to search the unique index on the parent key columns ** in the parent table.

61523. plidx is a covering index. No need to access the main table.

61524. Overwrite deleted information with zeros when the secure_delete ** option is enabled

61525. Opcode: OpenDup P1 P2 * * * ** Open a new cursor P1 that points to the same ephemeral table as ** cursor P2. The P2 cursor must have been opened by a prior OP_OpenEphemeral ** opcode. Only ephemeral cursors may be duplicated. ** ** Duplicate ephemeral cursors are used for self-joins of materialized views.

61526. If true, store 0 for segment size

61527. Minimum amount of payload held locally

61528. Samples of the left-most key

61529. Find any inequality constraint terms for the start and end ** of the range.

61530. #include "os_win.h"

61531. Number of rows in the entire table

61532. List of triggers on pTab, if required

61533. ** True if we are evaluating an out-of-memory callback.

61534. Check for index coverage

61535. Store the value in this register

61536. EXCLUSIVE => ID

61537. Number of entries in aVar[]

61538. ** Add an entry to the array of counters managed by sqlite3_stmt_scanstatus().

61539. Size of term in bytes

61540. The content of the whole page

61541. ** PRAGMA table_info(<table>) ** ** Return a single row for each column of the named table. The columns of ** the returned data set are: ** ** cid: Column id (numbered from left to right, starting at 0) ** name: Column name ** type: Column declaration type. ** notnull: True if 'NOT NULL' is part of column declaration ** dflt_value: The default value for the column, if any.

61542. ***** Include vdbe.h in the middle of sqliteInt.h *****

61543. Initialize all iterators

61544. If there is anything other than a rowset object in memory cell P1, ** delete it now and initialize P1 with an empty rowset

61545. idx

61546. ** FTS4 virtual tables may maintain multiple indexes - one index of all terms ** in the document set and zero or more prefix indexes. All indexes are stored ** as one or more b+-trees in the %_segments and %_segdir tables. ** ** It is possible to determine which index a b+-tree belongs to based on the ** value stored in the "%_segdir.level" column. Given this value L, the index ** that the b+-tree belongs to is (L<<10). In other words, all b+-trees with ** level values between 0 and 1023 (inclusive) belong to index 0, all levels ** between 1024 and 2047 to index 1, and so on. ** ** It is considered impossible for an index to use more than 1024 levels. In ** theory though this may happen, but only after at least ** (FTS3_MERGE_COUNT^1024) separate flushes of the pending-terms tables.

61547. If pToRelease is not zero than pPrior points into the data area ** of pToRelease. Make sure pToRelease is still writeable.

61548. The virtual table to be modified

61549. ** Return the declared type of a column. Or return zDflt if the column ** has no declared type. ** ** The column type is an extra string stored after the zero-terminator on ** the column name if and only if the COLFLAG_HASTYPE flag is set.

61550. For each term in the FROM clause, do two things: ** (1) Authorized unreferenced tables ** (2) Generate code for all sub-queries

61551. sortlist ::= sortlist COMMA expr sortorder

61552. Page not on the PCache.pDirty list

61553. ***** General Implementation Functions *****

61554. Number of SHARED locks held

61555. Find out what action to take in case there is a uniqueness conflict

61556. Length of position list

61557. Generate code to remove the index and from the master table

61558. Opcode: Jump P1 P2 P3 * * * ** Jump to the instruction at address P1, P2, or P3 depending on whether ** in the most recent OP_Compare instruction the P1 vector was less than ** equal to, or greater than the P2 vector, respectively.

61559. The thread routine

61560. **comment:** By default use a full table scan. This is an expensive option, ** so search through the constraints to see if a more efficient ** strategy is possible.
label: code-design

61561. **comment:** Save the current term so that it can be used to prefix-compress the next. ** If the isCopyTerm parameter is true, then the buffer pointed to by ** zTerm is transient, so take a copy of the term data. Otherwise, just ** store a copy of the pointer.
label: code-design

61562. ** Mark term iChild as being a child of term iParent
61563. Enlarge the allocation
61564. Leaf pages in a "unit" of work
61565. The token codes above must all fit in 8 bits
61566. Allocated array
61567. Number of input segments on best level
61568. 3x
61569. ** 2008 May 27 ** ** The author disclaims copyright to this source code. In place of ** a legal notice, here is a blessing: *** ** May you do good and not evil. **

label: code-design

61644. Allocate registers for holding the rowid of the new row, ** the content of the new row, and the assembled row record.

61645. If the auto-commit flag is set to true, then any locks that were held ** by connection db have now been released. Call sqlite3ConnectionUnlocked() ** to invoke any required unlock-notify callbacks.

61646. ** Argument apSegment is an array of nSegment elements. It is known that ** the final (nSegment-nSuspect) members are already in sorted order ** (according to the comparison function provided). This function shuffles ** the array around until all entries are in sorted order.

61647. Cursor containing term and doclist

61648. Loop through all the foreign key constraints that refer to this table. ** (the "child" constraints)

61649. Tokenizer module methods object

61650. Pages from root to current page

61651. ** For LIKE and GLOB matching on EBCDIC machines, assume that every ** character is exactly one byte in size. Also, provide the Utf8Read() ** macro for fast reading of the next character in the common case where ** the next character is ASCII.

61652. **comment:** ** The page getter methods each try to acquire a reference to a ** page with page number pgno. If the requested reference is ** successfully obtained, it is copied to *ppPage and SQLITE_OK returned. ** ** There are different implementations of the getter method depending ** on the current state of the pager. *** ** getPageNormal() -- The normal getter ** getPageError() -- Used if the pager is in an error state ** getPageMmap() -- Used if memory-mapped I/O is enabled *** ** If the requested page is already in the cache, it is returned. ** Otherwise, a new page object is allocated and populated with data ** read from the database file. In some cases, the pcache module may ** choose not to allocate a new page object and may reuse an existing ** object with no outstanding references. ** ** The extra data appended to a page is always initialized to zeros the ** first time a page is loaded into memory. If the page requested is ** already in the cache when this function is called, then the extra ** data is left as it was when the page object was last used. ** ** If the database image is smaller than the requested page or if ** the flags parameter contains the PAGER_GET_NOCONTENT bit and the ** requested page is not already stored in the cache, then no ** actual disk read occurs. In this case the memory image of the ** page is initialized to all zeros. ** ** If PAGER_GET_NOCONTENT is true, it means that we do not care about ** the contents of the page. This occurs in two scenarios: ** ** a) When reading a free-list leaf page from the database, and ** ** b) When a savepoint is being rolled back and we need to load ** a new page into the cache to be filled with the data read ** from the savepoint journal. ** ** If PAGER_GET_NOCONTENT is true, then the data returned is zeroed instead ** of being read from the database. Additionally, the bits corresponding ** to pgno in Pager.pInJournal (bitvec of pages already written to the ** journal file) and the PagerSavepoint.pInSavepoint bitvecs of any open ** savepoints are set. This means if the page is made writable at any ** point in the future, using a call to sqlite3PagerWrite(), its contents ** will not be journaled. This saves IO. ** ** The acquisition might fail for several reasons. In all cases, ** an appropriate error code is returned and *ppPage is set to NULL. ** ** See also sqlite3PagerLookup(). Both this routine and Lookup() attempt ** to find a page in the in-memory cache first. If the page is not already ** in memory, this routine goes to disk to read it in whereas Lookup() ** just returns 0. This routine acquires a read-lock the first time it ** has to go to disk, and could also playback an old journal if necessary. ** Since Lookup() never goes to disk, it never has to deal with locks ** or journal files.
