

git_comments:

1. !/usr/bin/env bash
 2. add any rocks required for ci_tests to this list lua-curl depends on a libcurl development package (i.e. libcurl4-openssl-dev)
 3. !/usr/bin/env bash
 4. !/usr/bin/env bash
 5. fetch and unpack lua src
 6. civetweb base dir
 7. -L because it's a 302 redirect
 8. this script installs a lua / luarocks environment in .travis/lua this is necessary because travis docker architecture (the fast way) does not permit sudo, and does not contain a useful lua installation
 9. build luarocks
 10. After this script is finished, you can configure your environment to use it by sourcing lua_env.sh
 11. The current versions when this script was written
 12. !/usr/bin/env /bash
 13. fetch and unpack luarocks
 14. add to path required by luarocks installer
 15. directory where this script is located
 16. mv built lua install to target Lua dir
 17. build lua
 18. **comment:** cleanup source dirs
label: code-design
 19. Allocate new message. Caller must hold the lock.
 20. If client is too far behind, return all messages.
 21. We have a message to store. Write-lock the ringbuffer, grab the next message and copy data into it.
 22. A handler for the /ajax/send_message endpoint.
 23. Initialize random number generator. It will be used later on for the session identifier creation.
 24. vim:ts=2:sw=2:
 25. Protects messages, sessions, last_message_id
 26. Get session object for the connection. Caller must hold the lock.
 27. This file is part of the Civetweb project, <http://code.google.com/p/civetweb> It implements an online chat server. For more details, see the documentation on the project web site. To test the application, 1. type "make" in the directory where this file lives 2. point your browser to <http://127.0.0.1:8081>
 28. Redirect user to the login form. In the cookie, store the original URL we came from, so that after the authorization we could redirect back.
 29. In production environment we should ask an authentication system to authenticate the user. Here however we do trivial check that user and password are not empty
 30. Authentication failure, redirect to login.
 31. No suitable handler found, mark as not processed. Civetweb will try to serve the request.
 32. A handler for the /authorize endpoint. Login page form sends user name and password to this endpoint.
 33. Generate session ID. buf must be 33 bytes in size. Note that it is easy to steal session cookies by sniffing traffic. This is why all communication must be SSL-ed.
 34. buf is allocated on stack and hopefully is large enough to hold all messages (it may be too small if the ringbuffer is full and all messages are large. in this case asserts will trigger).
 35. **comment:** TODO(lsm): JSON-encode all text strings
label: code-design
 36. Setup and start Civetweb
 37. Allocate new session object
 38. If "callback" param is present in query string, this is JSONP call. Return 1 in this case, or 0 if "callback" is not specified. Wrap an output in Javascript function call.
 39. Fetch user name and password.
 40. Describes single message sent to a chat. If user is empty (0 length), the message is then originated from the server itself.
 41. Session ID Set user, needed by Javascript code Delete original_url
 42. Return 1 if request is authorized, 0 otherwise.
 43. Get a get of messages with IDs greater than last_id and transform them into a JSON string. Return that string to the caller. The string is dynamically allocated, caller must free it. If there are no messages, NULL is returned.
 44. Message ID User that have sent the message Message text Message timestamp, UTC
 45. Large enough to hold all messages
 46. Authentication success: 1. create new session 2. set session ID token in the cookie 3. remove original_url from the cookie - not needed anymore 4. redirect client back to the original URL The most secure way is to stay HTTPS all the time. However, just to show the technique, we redirect to HTTP after the successful authentication. The danger of doing this is that session cookie can be stolen and an attacker may impersonate the user. Secure application must use HTTPS all the time.
 47. Ringbuffer for messages Current sessions
 48. Empty user indicates server message
 49. Session ID, must be unique Random data used for extra user validation Authenticated user Expiration timestamp, UTC
 50. Always authorize accesses to login page and to authorize URI
 51. Read-lock the ringbuffer. Loop over all messages, making a JSON string.
 52. A handler for the /ajax/get_messages endpoint. Return a list of messages with ID greater than requested.
 53. Wait until enter is pressed, then exit
 54. Return 1 if username/password is allowed, 0 otherwise.
 55. Describes web session.
 56. This file is part of the Civetweb project, <http://sourceforge.net/projects/civetweb/>
 57. <http://sourceforge.net/projects/civetweb/>-->

60. This file is part of the Civetweb project, http://sourceforge.net/projects/civetweb/

61. sourceforge.net/projects/civetweb/ -->

62. Set correct action for the login form. We assume that the SSL port is the next one to insecure one.

63. Note that this page is self-sufficient, it does not load any other CSS or Javascript file. This is done so because only this page is allowed for non-authorized users. If we want to load other files from the frontend, we need to change backend code to allow those for non-authorized users. See chat.c :: must_authorize() function.

64. Keep only chat.maxVisibleMessages, delete older ones.

65. This file is part of Civetweb project, http://sourceforge.net/projects/civetweb/

66. Backend URL, string. 'http://backend.address.com' or " if backend is the same as frontend

67. vim:ts=2:sw=2:et

68. Deselect menu buttons Select clicked button Hide all main windows Show main window

69. input.disabled = true;

70. Stop the server.

71. Always set Content-Length

72. Wait until user hits "enter". Server is running in separate thread. Navigating to http://localhost:8080 will invoke begin_request_handler().

73. Send HTTP reply to the client

74. Start the web server.

75. List of options. Last element must be NULL.

76. Returning non-zero tells civetweb that our function has replied to the client, and civetweb should not send client any more data.

77. Prepare the message we're going to send

78. This function will be called by civetweb on every new request.

79. Prepare callbacks structure. We have only one callback, the rest are NULL.

80. **comment:** Unused
label: code-design

81. User has submitted a form, show submitted data and a variable value

82. Parse form data. input1 and input2 are guaranteed to be NUL-terminated

83. Show HTML form.

84. Mark request as processed

85. Wait until user hits "enter"

86. Send reply to the client, showing submitted form values.

87. Copyright (c) 2014 The Civetweb developers * Copyright (c) 2004-2012 Sergey Lyubka * This file is a part of civetweb project, http://github.com/bel2125/civetweb

88. callback: called after uploading a file is completed

89. Startup options for the server

90. Test server will use this port

91. Display a welcome message

92. Start the server

93. This example is deprecated and no longer maintained. * All relevant parts have been merged into the embedded_c example.

94. ! _WIN32

95. See http://www.w3.org/TR/html401/interact/forms.html#h-17.13.4.1

96. Mark request as processed

97. Wait until the user hits "enter", then stop the server

98. Main program: Set callbacks and start the server.

99. callback: used to generate all content

100. enctype="multipart/form-data"

101. Show HTML form.

102. close websock

103. chat message

104. init command

105. This example uses deprecated interfaces: global websocket callbacks. They have been superseeded by URI specific callbacks. See examples/embedded_c for an up to date example.

106. **comment:** todo: use mg_start_thread_id instead of mg_start_thread
label: code-design

107. **comment:** todo: wait for the thread instead of a timeout
label: requirement

108. keep alive

109. var connection; var keepAlive = false; function webSockKeepAlive() { if (keepAlive) { connection.send('ping'); // Send the message 'ping' to the server setTimeout("webSockKeepAlive()", 10000); } } function load() { connection = new WebSocket("ws://127.0.0.1/MyWebSock"); connection.onopen = function () { var send = "init " + Math.round(Math.random()*4294967294+1); console.log('Client: ' + send); connection.send(send); keepAlive = true; webSockKeepAlive(); }; connection.onerror = function (error) { keepAlive = false; connection.close(); console.log("WebSocket error: " + error); alert("WebSocket error"); }; connection.onmessage = function (e) { console.log('Server: ' + e.data); if (e.data.substring(0,5) == "title") {window.document.title = e.data.substring(6);} else if (e.data.substring(0,3) == "msg") { var msgStr = document.getElementById('msg'); msgStr.innerHTML = msgStr.innerHTML + e.data.substring(4); } }; } //

110. document_root: The path to the test function websock.htm

111. if the port is changed here, it needs to be changed in websock.htm as well

112. This example uses deprecated interfaces: global websocket callbacks. They have been superseeded by URI specific callbacks. See examples/embedded_c for an up to date example.

113. port: use http standard to match websocket url in websock.htm: ws://127.0.0.1/MyWebSock

114. return 0 to accept every connection

115. WEBSOCKET SERVER

116. Should get the acknowledge message

117. strlen(websocket_acknowledge_msg)

118. Connect client 3

119. * Copyright (c) 2014-2016 the Civetweb developers * Copyright (c) 2014 Jordan Shelley * https://github.com/jshelley * License http://opensource.org/licenses/mit-license.php MIT License

120. First set up a websocket server

121. Won't get any message

122. Simple example program on how to use websocket client embedded C interface.

123. Send websocket welcome message

124. Client 3 should get the websocket welcome message

125. New interface:

126. Obsolete:

127. Send websocket acknowledge message

128. Can not send a websocket goodbye message here - the connection is already * closed

129. return 1 to keep the connection open

130. strlen(websocket_goodbye_msg)

131. Should get the websocket welcome message

132. ****
133. This example is superseeded by other examples, and no longer * actively maintained. * See examples/embedded_c for an up to date example.
134. Now connect a second client
135. Should get the goodbye message
136. WEBSOCKET CLIENT
137. Then connect a first client
138. strlen(websocket_welcome_msg)
139. Client 2 should get the websocket welcome message
140. check for websocket support for Internet Explorer < 10 there are options for websocket support that could be integrated into production code, but for now, we are expecting browser support to be present for this demo
141. websocket connection
142. user connect/disconnect
143. **comment:** Version 0.1 Contributed by William Greathouse 9-Sep-2013 Simple demo of WebSocket connection use. Not a great example of web coding, but it is functional. The meter displays are adapted from CSS-TRICKS Progress Bars by Chris Coyier at <http://css-tricks.com/css3-progress-bars/>
label: code-design
144. Can be anything
145. user turn updates on/off
146. css-tricks.com/css3-progress-bars/
147. time to close the connection
148. simple structure for keeping track of websocket connection
149. second meter 0 to 500, by 10 every 0.5 second
150. Wait until user hits "enter"
151. echo back
152. get simple greeting for the web server
153. we should not send additional messages when close requested/acknowledged
154. websocket_ready_handler() Once websocket negotiation is complete, start a server for the connection
155. websocket_close_handler() When websocket is closed, tell the associated server to shut down
156. Arguments: flags: first byte of websocket frame, see websocket RFC, <http://tools.ietf.org/html/rfc6455>, section 5.2 data, data_len: payload data. Mask, if any, is already applied.
157. end of list
158. third meter 0 to 100, by 10 every 1.0 second
159. up to 16 independent client connections
160. turn on updates
161. client sent PING, respond with PONG
162. first meter 0 to 1000, by 5 every 0.1 second
163. keep connection open
164. ** interpret data as commands here **
165. 0.1 seconds
166. fprintf(stderr, "close handler\n"); /* called for every close, not just websockets */
167. Send initial meter updates
168. time base and structure periodic updates to client for demo
169. received PONG to our PING, no action
170. show the greeting and some basic information
171. if we are closing, server should not send new data
172. Send meter updates
173. **comment:** reset connection information to allow reuse by new client
label: code-design
174. ws_server_thread() Simple demo server thread. Sends periodic updates to connected clients
175. Copyright (c) 2004-2012 Sergey Lyubka This file is a part of civetweb project, <http://github.com/bel2125/civetweb> v 0.1 Contributed by William Greathouse 9-Sep-2013
176. 0.1 second
177. Send periodic PING to assure websocket remains connected, except if we are closing
178. While the connection is open, send periodic updates
179. websocket_connect_handler() On new client connection, find next available server connection and store new connection information. If no more server connections are available tell civetweb to not accept the client request.
180. If client initiated close, respond with close message in acknowledgement
181. turn off updates
182. Add handler for all files with .foo extention
183. Add handler for /close extention
184. Call the form handler
185. Handler may access the request info using mg_get_request_info
186. Add handler for /A* and special handler for /A/B
187. Add HTTP site to open a websocket connection
188. Add handler for /form (serve a file outside the document root)
189. We know the content length in advance
190. * Copyright (c) 2013-2017 the CivetWeb developers * Copyright (c) 2013 No Face Press, LLC * License <http://opensource.org/licenses/mit-license.php> MIT License
191. example from <https://github.com/civetweb/civetweb/issues/347>
192. mg_printf(conn, "<script type='text/javascript'><![CDATA[\n]; ... * xhtml style
193. Check return value:
194. Stop the server
195. We must read until we find the end (chunked encoding * or connection close), indicated my mg_read returning 0
196. Add HTTP site with auth
197. **comment:** MAX_WS_CLIENTS defines how many clients can connect to a websocket at the * same time. The value 5 is very small and used here only for demonstration; * it can be easily tested to connect more than MAX_WS_CLIENTS clients. * A real server should use a much higher number, or better use a dynamic list * of currently connected websocket clients.
label: code-design
198. Set a random password (4 digit number - bad idea from a security * point of view, but this is an API demo, not a security tutorial), * and store it in some directory within the document root (extremely * bad idea, but this is still not a security tutorial). * The reason we create a new password every time the server starts * is just for demonstration - we don't want the browser to store the * password, so when we repeat the test we start with a new password.
199. No valid authorization
200. **comment:** mg_printf(conn, "]]></script>\n"); ... xhtml style
label: code-design
201. Visual Studio 2010+ support llu
202. Add handler for /postresponse example
203. Simple example program on how to use CivetWeb embedded into a C program.
204. List all listening ports
205. Start CivetWeb web server

206. Add application specific SSL initialization
207. Add handler EXAMPLE_URI, to explain the example
208. Add handler for form data
209. IPv4
210. Wait until the server should be closed
211. Send error
212. Add handler for /B, /B/A, /B/B but not for /B*
213. WS site for the websocket connection
214. In this handler, we ignore the req_info and send the file "fileName".
215. Check if libcivetweb has been built with all required features.
216. Add a file upload handler for parsing files on the fly
217. It would be possible to check the request info here before calling * mg_handle_form_request.
218. IPv6
219. Add handler for /cookie example
220. Just tell the user the new password generated for this test.
221. Windows will not work with path > 260 (MAX_PATH), unless we use * the unicode API. However, this is just an example code: A real * code will probably never store anything to D:\\somewhere and * must be adapted to the specific needs anyhow.
222. Handler may access the request info using mg_get_request_info
223. Simple example program on how to use Embedded C++ interface.
224. This handler will handle "everything else", including * requests to files. If this handler is installed, * NO_FILES should be set.
225. Copyright (c) 2013-2017 the Civetweb developers * Copyright (c) 2013 No Face Press, LLC * License http://opensource.org/licenses/mit-license.php MIT License
226. mg_printf(conn, "<script type=\"text/javascript\"><![CDATA[\n]; ... * xhttp style
227. **comment:** mg_printf(conn, "])></script>\n"); ... xhttp style
 label: code-design
228. CivetServer server(options); // <-- C style start <-- C++ style start
229. **comment:** The string is too long and probably truncated. Make sure an * UTF-8 string is never truncated between the UTF-8 code bytes. * This example code must be adapted to the specific needs.
 label: code-design
230. * * getParam(const char *, size_t, const char *, std::string &, size_t) * * Returns a query parameter contained in the supplied buffer. 251. * * Callback method for HEAD request. * * @param server - the calling server * @param conn - the connection information * @returns true if implemented, false otherwise
252. * * Callback method for POST request. * * @param server - the calling server * @param conn - the connection information * @returns true if implemented, false otherwise
253. _CIVETWEB_SERVER_H
254. * * Callback method for when a data frame has been received from the client. * * @param server - the calling server * @param conn - the connection information * @bits: first byte of the websocket frame, see websocket RFC at *http://tools.ietf.org/html/rfc6455, section 5.2 * @data, data_len: payload, with mask (if any) already applied. * @returns true to keep socket open, false to close it
255. * * Callback method for when the connection is closed. * * @param server - the calling server * @param conn - the connection information
256. * * removeAuthHandler(const std::string &) * * Removes an authorization handler. * * @param uri - the exact URL used in addAuthHandler().
257. * * getHeader(struct mg_connection *conn, const std::string &headerName) * @param conn - the connection information * @param headerName - header name to get the value from * @returns a char array which contains the header value as string
258. Copyright (c) 2013-2017 the Civetweb developers * Copyright (c) 2013 No Face Press, LLC * * License http://opensource.org/licenses/mit-license.php MIT License

259. `** addHandler(const std::string &, CivetHandler *)` * Adds a URI handler. If there is existing URI handler, it will * be replaced with this one. * * URI's are ordered and prefix (REST) URI's are supported. * * @param uri - URI to match. * @param handler - handler instance to use.

260. generic user context which can be set/read, the server does nothing with this apart from keep it.

261. `** Callback method for PATCH request.` * * @param server - the calling server * @param conn - the connection information * @returns true if implemented, false otherwise

262. `** addAuthHandler(const std::string &, CivetAuthHandler *)` * Adds a URI authorization handler. If there is existing URI authorization * handler, it will be replaced with this one. * * URI's are ordered and prefix (REST) URI's are supported. * * @param uri - URI to match. * @param handler - authorization handler instance to use.

263. `** Basic interface for a websocket handler.` Handlers implementations * must be reentrant.

264. `** Callback method for PUT request.` * * @param server - the calling server * @param conn - the connection information * @returns true if implemented, false otherwise

265. `** Callback method for DELETE request.` * * @param server - the calling server * @param conn - the connection information * @returns true if implemented, false otherwise

266. `** getCookie(struct mg_connection *conn, const std::string &cookieName, *std::string &cookieValue)` * Puts the cookie value string that matches the cookie name in the *cookieValue destination string. * * @param conn - the connection information * @param cookieName - cookie name to get the value from * @param cookieValue - cookie value is returned using this reference * @returns the size of the cookie value string read.

267. `** Exception class for thrown exceptions within the CivetHandler object.`

268. `** removeHandler(const std::string &)` * Removes a handler. * * @param uri - the exact URL used in addHandler().

269. `** Callback method for when the client intends to establish a websocket *connection, before websocket handshake.` * * @param server - the calling server * * @param conn - the connection information * @returns true to keep socket open, false to close it

270. `** requestHandler(struct mg_connection *, void *cbdata)` * Handles the incoming request. * * @param conn - the connection information * @param cbdata - pointer to the CivetHandler instance. * @returns 0 if implemented, false otherwise

271. `** Destructor`

272. `** Basic interface for a URI authorization handler.` Handler implementations * must be reentrant.

273. `** close()` * * Stops server and frees resources.

274. `** Constructor` * This automatically starts the sever. * It is good practice to call getContext() after this in case there * were errors starting the server. * * Note: CivetServer should not be used as a static instance in a Windows * DLL, since the constructor creates threads and the destructor joins * them again (creating/joining threads should not be done in static * constructors). * * @param options - the web server options. * @param callbacks - optional web server callback methods. * * @throws CivetException

275. `__cplusplus`

276. `** Callback method for OPTIONS request.` * * @param server - the calling server * @param conn - the connection information * @returns true if implemented, false otherwise

277. `** addWebSocketHandler` * Adds a WebSocket handler for a specific URI. If there is existing URI *handler, it will * be replaced with this one. * * URI's are ordered and prefix (REST) URI's are supported. * * @param uri - URI to match. * @param handler - handler instance to use.

278. `** CivetCallbacks` * * wrapper for mg_callbacks

279. This structure may be extended in future versions.

280. Called when civetweb is about to log a message. If callback returns non-zero, civetweb does not log anything.

281. port number

282. Blocks until unique access is obtained to this connection. Intended for use with websockets only. Invoke this before mg_write or mg_printf when communicating with a websocket if your code has server-initiated communication as well as communication in direct response to a message.

283. Send contents of the entire file together with HTTP headers. Parameters: conn: Current connection information. path: Full path to the file to send. mime_type: Content-Type for file. NULL will cause the type to be looked up by the file extension. additional_headers: Additional custom header fields appended to the header. Each header should start with an X-, to ensure it is not included twice. NULL does not append anything.

284. URL-decoded URI (relative). Can be NULL * if the request_uri does not address a * resource at the server host.

285. Called when civetweb initializes SSL library. Parameters: user_data: parameter user_data passed when starting the server. Return value: 0: civetweb will set up the SSL certificate. 1: civetweb assumes the callback already set up the certificate. -1: initializing ssl fails.

286. Skip this field (neither get nor store it). Continue with the * next field.

287. Get the value of particular HTTP header. This is a helper function. It traverses request_info->http_headers array, and if the header is present in the array, returns its value. If it is not present, NULL is returned.

288. redirect all requests: 0 = no, 1 = yes

289. Called when websocket request is received, before websocket handshake. Return value: 0: civetweb proceeds with websocket handshake. 1: connection is closed immediately. This callback is deprecated: Use mg_set_websocket_handler instead.

290. Return information associated with the request. * Use this function to implement a server and get data about a request * from a HTTP/HTTPS client. * Note: Before CivetWeb 1.10, this function could be used to read * a response from a server, when implementing a client, although the * values were never returned in appropriate mg_request_info elements. * It is strongly advised to use mg_get_response_info for clients.

291. Fetch value of certain cookie variable into the destination buffer. Destination buffer is guaranteed to be '\0' - terminated. In case of failure, dst[0] == '\0'. Note that RFC allows many occurrences of the same parameter. This function returns only first occurrence. Return: On success, value length. On error: -1 (either "Cookie:" header is not present at all or the requested parameter is not found). -2 (destination buffer is NULL, zero length or too small to hold the value).

292. User data pointer passed to mg_start()

293. Macros for enabling compiler-specific checks for printf-like arguments.

294. Read data from the remote end, return number of bytes read. Return: 0 connection has been closed by peer. No more data could be read. < 0 read error. No more data could be read from the connection. > 0 number of bytes read into the buffer.

295. URL-decode input buffer into destination buffer. 0-terminate the destination buffer. form-url-encoded data differs from URI encoding in a way that it uses '+' as character for space, see RFC 1866 section 8.2.1 http://ftp.ics.uci.edu/pub/ietf/html/rfc1866.txt Return: length of the decoded data, or -1 if dst buffer is too small.

296. Client's port

297. Stop parsing this request. Skip the remaining fields.

298. Stop the web server. Must be called last, when an application wants to stop the web server and release all associated resources. This function blocks until all Civetweb threads are stopped. Context pointer becomes invalid.

299. utility methods to compare two buffers, case insensitive.

300. Old nomenclature.

301. Store body data into a file.

302. Return values definition for the "field_found" callback in * mg_form_data_handler.

303. Note: The "file in memory" feature is a deletion candidate, since * it complicates the code, and does not add any value compared to * "mg_add_request_handler". * See this discussion thread: * <https://groups.google.com/forum/#!topic/civetweb/h9HT4CmeYqI> * If you disagree, if there is any situation this is indeed useful * and cannot trivially be replaced by another existing feature, * please contribute to this discussion during the next 3 month * (till end of April 2017), otherwise this feature might be dropped * in future releases.

304. Get the value of particular configuration parameter. The value returned is read-only. Civetweb does not allow changing configuration at run time. If given parameter name is not valid, NULL is returned. For valid names, return value is guaranteed to be non-NUL. If parameter is not set, zero-length string is returned.

305. Old nomenclature

306. Called when initializing a new connection object. * Can be used to initialize the connection specific user data * (mg_request_info->conn_data, mg_get_user_connection_data). * When the callback is called, it is not yet known if a * valid HTTP(S) request will be made. * Parameters: * conn: not yet fully initialized connection object * conn_data: output parameter, set to initialize the * connection specific user data * Return value: * must be 0 * Otherwise, the result is undefined

307. Called when civetweb tries to open a file. Used to intercept file open calls, and serve file data from memory instead. Parameters: path: Full path to the file to open. data_len: Placeholder for the file size, if file is served from memory. Return value: NULL: do not serve file from memory, proceed with normal file open. non-NUL: pointer to the file contents in memory. data_len must be initialized with the size of the memory block.

308. Check which features were set when the civetweb library has been compiled. The function explicitly addresses compile time defines used when building the library - it does not mean, the feature has been initialized using a mg_init_library call. mg_check_feature can be called anytime, even before mg_init_library has

been called. Parameters: feature: specifies which feature should be checked The value is a bit mask. The individual bits are defined as: 1 serve files (NO_FILES not set) 2 support HTTPS (NO_SSL not set) 4 support CGI (NO_CGI not set) 8 support IPv6 (USE_IPV6 set) 16 support WebSocket (USE_WEBSOCKET set) 32 support Lua scripts and Lua server pages (USE LUA is set) 64 support server side JavaScript (USE_DUKTAPE is set) 128 support caching (NO_CACHING not set) 256 support server statistics (USE_SERVER_STATS is set) The result is undefined, if bits are set that do not represent a defined feature (currently: feature >= 512). The result is undefined, if no bit is set (feature == 0). Return: If feature is available, the corresponding bit is set If feature is not available, the bit is 0

309. Get a value of particular form variable. Parameters: data: pointer to form-uri-encoded buffer. This could be either POST data, or request_info.query_string. data_len: length of the encoded data. var_name: variable name to decode from the buffer dst: destination buffer for the decoded variable dst_len: length of the destination buffer Return: On success, length of the decoded variable. On error: -1 (variable not found). -2 (destination buffer is NULL, zero length or too small to hold the decoded variable). Destination buffer is guaranteed to be '\0' - terminated if it is not NULL or zero length.

310. Return builtin mime type for the given file name. For unrecognized extensions, "text/plain" is returned.

311. mg_set_websocket_handler Set or remove handler functions for websocket connections. This function works similar to mg_set_request_handler - see there.

312. **comment:** Called when websocket handshake is successfully completed, and connection is ready for data exchange. This callback is deprecated: Use mg_set_websocket_handler instead.

label: code-design

313. **comment:** Send data to the client using printf() semantics. Works exactly like mg_write(), but allows to do message formatting.

label: code-design

314. Handle for the individual connection

315. This structure contains callback functions for handling form fields. It is used as an argument to mg_handle_form_request.

316. Called when civetweb is about to log access. If callback returns non-zero, civetweb does not log anything.

317. Connect to a websocket as a client Parameters: host: host to connect to, i.e. "echo.websocket.org" or "192.168.1.1" or "localhost" port: server port use_ssl: make a secure connection to server error_buffer, error_buffer_size: buffer for an error message path: server path you are trying to connect to, i.e. if connection to localhost/app, path should be "/app" origin: value of the Origin HTTP header data_func: callback that should be used when data is received from the server user_data: user supplied argument Return: On success, valid mg_connection object. On error, NULL. See error_buffer for details.

318. struct mg_websocket_subprotocols * * List of accepted subprotocols

319. Called when civetweb is about to serve Lua server page, if Lua support is enabled. Parameters: lua_context: "lua_State **" pointer.

320. https port: 0 = no, 1 = yes

321. **comment:** TODO: add more data

label: requirement

322. Return array of struct mg_option, representing all valid configuration options of civetweb.c. The array is terminated by a NULL name option.

323. Maximum number of headers

324. Store the field value into a file.

325. Download data from the remote web server. host: host name to connect to, e.g. "foo.com", or "10.12.40.1". port: port number, e.g. 80. use_ssl: whether to use SSL connection. error_buffer, error_buffer_size: error message placeholder. request_fmt,...: HTTP request. Return: On success, valid pointer to the new connection, suitable for mg_read(). On error, NULL. error_buffer contains error message. Example: char ebuf[100]; struct mg_connection *conn; conn = mg_download("google.com", 80, 0, ebuf, sizeof(ebuf), "%s", "GET / HTTP/1.0\r\nHost: google.com\r\n\r\n");

326. Called when data frame has been received from the client. Parameters: bits: first byte of the websocket frame, see websocket RFC at http://tools.ietf.org/html/rfc6455, section 5.2 data, data_len: payload, with mask (if any) already applied. Return value: 1: keep this websocket connection open. 0: close this websocket connection. This callback is deprecated: Use mg_set_websocket_handler instead.

327. Number of HTTP headers

328. Get user data passed to mg_start from context.

329. **comment:** If the "field_found" callback returned FORM_FIELD_STORAGE_GET, * this callback will receive the field data. * * Parameters: * key: Name of the field ("name" property of the HTML input field). * value: Value of the input field. * user_data: Value of the member user_data of mg_form_data_handler * * Return value: * TODO: Needs to be defined.

label: code-design

330. This structure needs to be passed to mg_start(), to let civetweb know which callbacks to invoke. For a detailed description, see <https://github.com/civetweb/civetweb/blob/master/docs/UserManual.md>

331. Deprecated: Use mg_get_valid_options instead.

332. Send data to a websocket server wrapped in a masked websocket frame. Uses mg_lock_connection to ensure that the transmission is not interrupted, i.e., when the application is proactively communicating and responding to a request simultaneously. Send data to a websocket server wrapped in a masked websocket frame. This function is available when civetweb is compiled with -DUSE_WEBSOCKET Return: 0 when the connection has been closed -1 on error >0 number of bytes written on success

333. CIVETWEB_HEADER_INCLUDED

334. Called when civetweb has received new HTTP request. If the callback returns one, it must process the request by sending valid HTTP headers and a body. Civetweb will not do any further processing. Otherwise it must return zero. Note that since V1.7 the "begin_request" function is called before an authorization check. If an authorization check is required, use a request_handler instead. Return value: 0: civetweb will process the request itself. In this case, the callback must not send any data to the client. 1-999: callback already processed the request. Civetweb will not send any data after the callback returned. The return code is stored as a HTTP status code for the access log.

335. Get a formatted link corresponding to the current request Parameters: conn: current connection information. buf: string buffer (out) buflen: length of the string buffer Returns: <0: error >=0: ok

336. Called when civetweb has uploaded a file to a temporary directory as a result of mg_upload() call. Note that mg_upload is deprecated. Use mg_handle_form_request instead. Parameters: file_name: full path name to the uploaded file.

337. Send contents of the entire file together with HTTP headers. * Parameters: * conn: Current connection handle. * path: Full path to the file to send. * mime_type: Content-Type for file. NULL will cause the type to be * looked up by the file extension.

338. HTTP header value

339. Called when civetweb is closing a connection. The per-context mutex is locked when this is invoked. Websockets: Before mg_set_websocket_handler has been added, it was primarily useful for noting when a websocket is closing, and used to remove it from any application-maintained list of clients. Using this callback for websocket connections is deprecated: Use mg_set_websocket_handler instead. Connection specific data: If memory has been allocated for the connection specific user data (mg_request_info->conn_data, mg_get_user_connection_data), this is the last chance to free it.

340. 1 if SSL-ed, 0 if not

341. Allocate maximum headers

342. websocket subprotocol, * accepted during handshake

343. Deprecated: use local_uri instead

344. Convenience function -- create detached thread. Return: 0 on success, non-0 on error.

345. MG_LEGACY_INTERFACE

346. Callback types for websocket handlers in C/C++. mg_websocket_connect_handler Is called when the client intends to establish a websocket connection, before websocket handshake. Return value: 0: civetweb proceeds with websocket handshake. 1: connection is closed immediately. mg_websocket_ready_handler Is called when websocket handshake is successfully completed, and connection is ready for data exchange. mg_websocket_data_handler Is called when a data frame has been received from the client. Parameters: bits: first byte of the websocket frame, see websocket RFC at http://tools.ietf.org/html/rfc6455, section 5.2 data, data_len: payload, with mask (if any) already applied. Return value: 1: keep this websocket connection open. 0: close this websocket connection. mg_connection_close_handler Is called, when the connection is closed.

347. mg_request_handler Called when a new request comes in. This callback is URI based and configured with mg_set_request_handler(). Parameters: conn: current connection information. cbdata: the callback data configured with mg_set_request_handler(). Returns: 0: the handler could not handle the request, so fall through. 1 - 999: the handler processed the request. The return code is stored as a HTTP status code for the access log.

348. **comment:** Print error message to the opened error log stream. This utilizes the provided logging configuration. conn: connection (not used for sending data, but to get parameters) fmt: format string without the line return ...: variable argument list Example: mg_cry(conn, "i like %s", "logging");

label: code-design

349. Get context information. Useful for server diagnosis. Parameters: ctx: Context handle buffer: Store context information here. buflen: Length of buffer (including a byte required for a terminating 0). Return: Available size of system information, excluding a terminating 0. The information is complete, if the return value is

smaller than buflen. The result is a JSON formatted string, the exact content may vary. Note: It is possible to determine the required buflen, by first calling this function with buffer = NULL and buflen = NULL. The required buflen is one byte more than the returned value. However, since the available context information changes, you should allocate a few bytes more.

- 350. Get the field value.
- 351. Check if the current request has a valid authentication token set. * A file is used to provide a list of valid user names, realms and * password hashes. The file can be created and modified using the * mg_modify_passwords_file API function. * Parameters: * conn: Current connection handle. * realm: Authentication realm. If NULL is supplied, the sever domain * set in the authentication_domain configuration is used. * filename: Path and name of a file storing multiple password hashes. * Return: * > 0 Valid authentication * 0 Invalid authentication * < 0 Error (all values < 0 should be considered as invalid * authentication, future error codes will have negative * numbers) * -1 Parameter error * -2 File not found
- 352. Send contents of the entire file together with HTTP headers.
- 353. URL part after '?', not including '?', or NULL
- 354. Start web server. Parameters: callbacks: mg_callbacks structure with user-defined callbacks. options: NULL terminated list of option_name, option_value pairs that specify Civetweb configuration parameters. Side-effects: on UNIX, ignores SIGCHLD and SIGPIPE signals. If custom processing is required for these, signal handlers must be set up after calling mg_start(). Example: const char *options[] = { "document_root", "/var/www", "listening_ports", "80,443s", NULL }; struct mg_context *ctx = mg_start(&my_func, NULL, options); Refer to <https://github.com/civetweb/civetweb/blob/master/docs/UserManual.md> for the list of valid option and their possible values. Return: web server context, or NULL on error.
- 355. mg_set_request_handler Sets or removes a URI mapping for a request handler. This function uses mg_lock_context internally. URI's are ordered and prefixed URI's are supported. For example, consider two URIs: /a/b and /a /a matches /a /a/b matches /a/b /a/c matches /a Parameters: ctx: server context uri: the URI (exact or pattern) for the handler handler: the callback handler to use when the URI is requested. If NULL, an already registered handler for this URI will be removed. The URI used to remove a handler must match exactly the one used to register it (not only a pattern match). cbdata: the callback data to give to the handler when it is called.
- 356. Get user data set for the current connection.
- 357. Send data to the client. Return: 0 when the connection has been closed -1 on error >0 number of bytes written on success
- 358. Client's IP address. Deprecated: use remote_addr instead
- 359. Send a part of the message body, if chunked transfer encoding is set. * Only use this function after sending a complete HTTP request or response * header with "Transfer-Encoding: chunked" set.
- 360. E.g. "1.0", "1.1"
- 361. "GET", "POST", etc
- 362. Close the connection opened by mg_download().
- 363. HTTP header name
- 364. Send HTTP error reply.
- 365. User supplied argument, passed to all callback functions.
- 366. Client certificate information
- 367. **comment:** Initialize this library. This should be called once before any other * function from this library. This function is not guaranteed to be * thread safe. * Parameters: * features: bit mask for features to be initialized. * Return value: * initialized features * 0: error
label: requirement
- 368. Client certificate information (part of mg_request_info)
- 369. Process form data. * Returns the number of fields handled, or < 0 in case of an error. * Note: It is possible that several fields are already handled successfully * (e.g., stored into files), before the request handling is stopped with an * error. In this case a number < 0 is returned as well. * In any case, it is the duty of the caller to remove files once they are * no longer required.
- 370. New nomenclature
- 371. Return array of strings that represent valid configuration options. For each option, option name and default value is returned, i.e. the number of entries in the array equals to number_of_options x 2. Array is NULL terminated.
- 372. Get context from connection.
- 373. Return information associated with a HTTP/HTTPS response. * Use this function in a client, to check the response from * the server.
- 374. Connect to a TCP server as a client (can be used to connect to a HTTP server) Parameters: host: host to connect to, i.e. "www.wikipedia.org" or "192.168.1.1" or "localhost" port: server port use_ssl: make a secure connection to server error_buffer, error_buffer_size: buffer for an error message Return: On success, valid mg_connection object. On error, NULL. See error_buffer for details.
- 375. Opcodes, from <http://tools.ietf.org/html/rfc6455>
- 376. URL-decoded URI (absolute or relative, * as in the request)
- 377. mg_set_auth_handler Sets or removes a URI mapping for an authorization handler. This function works similar to mg_set_request_handler - see there.
- 378. URL-encode input buffer into destination buffer. returns the length of the resulting buffer or -1 is the buffer is too small.
- 379. Return CivetWeb version.
- 380. Authenticated user, or NULL if no auth used
- 381. This callback function is called, if a new field has been found. * The return value of this callback is used to define how the field * should be processed. * * Parameters: * key: Name of the field ("name" property of the HTML input field). * filename: Name of a file to upload, at the client computer. * Only set for input fields of type "file", otherwise NULL. * path: Output parameter: File name (incl. path) to store the file * at the server computer. Only used if FORM_FIELD_STORAGE_STORE * is returned by this callback. Existing files will be * overwritten. * pathlen: Length of the buffer for path. * user_data: Value of the member user_data of mg_form_data_handler * * Return value: * The callback must return the intended storage for this field * (See FORM_FIELD_STORAGE_*)
- 382. Called when a new worker thread is initialized. Parameters: ctx: context handle thread_type: 0 indicates the master thread 1 indicates a worker thread handling client connections 2 indicates an internal helper thread (timer thread)
- 383. New nomenclature.
- 384. E.g. "OK"
- 385. __cplusplus
- 386. **comment:** MD5 hash given strings. Buffer 'buf' must be 33 bytes long. Varargs is a NULL terminated list of ASCIIz strings. When function returns, buf will contain human-readable MD5 hash. Example: char buf[33]; mg_md5(buf, "aa", "bb", NULL);
label: code-design
- 387. Send data to a websocket client wrapped in a websocket frame. Uses mg_lock_connection to ensure that the transmission is not interrupted, i.e., when the application is proactively communicating and responding to a request simultaneously. Send data to a websocket client wrapped in a websocket frame. This function is available when civetweb is compiled with -DUSE_WEBSOCKET Return: 0 when the connection has been closed -1 on error >0 number of bytes written on success
- 388. Called when civetweb is about to send HTTP error to the client. Implementing this callback allows to create custom error pages. Parameters: status: HTTP error status code. Return value: 1: run civetweb error handler. 0: callback already handled the error.
- 389. Copyright (c) 2013-2017 The Civetweb Developers * Copyright (c) 2004-2013 Sergey Lyubka * * Permission is hereby granted, free of charge, to any person obtaining a copy * of this software and associated documentation files (the "Software"), to deal * in the Software without restriction, including without limitation the rights * to use, copy, modify, merge, publish, distribute, sublicense, and/or sell * copies of the Software, and to permit persons to whom the Software is * furnished to do so, subject to the following conditions: * * The above copyright notice and this permission notice shall be included in * all copies or substantial portions of the Software. * * THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR * IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, * FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE * AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER * LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, * OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN * THE SOFTWARE.
- 390. Get information on the system. Useful for support requests. Parameters: buffer: Store system information as string here. buflen: Length of buffer (including a byte required for a terminating 0). Return: Available size of system information, excluding a terminating 0. The information is complete, if the return value is smaller than buflen. The result is a JSON formatted string, the exact content may vary. Note: It is possible to determine the required buflen, by first calling this function with buffer = NULL and buflen = NULL. The required buflen is one byte more than the returned value.

391. **comment:** If the "field_found" callback returned FORM_FIELD_STORAGE_STORE, * the data will be stored into a file. If the file has been written * successfully, this callback will be called. This callback will * not be called for only partially uploaded files. The * mg_handle_form_request function will either store the file completely * and call this callback, or it will remove any partial content and * not call this callback function. * * Parameters: * path: Path of the file stored at the server. * file_size: Size of the stored file in bytes. * user_data: Value of the member user_data of mg_form_data_handler * * Return value: * TODO: Needs to be defined.
label: code-design
392. Handle for the HTTP service itself
393. Read entire request body and store it in a file "path". Return: < 0 Error >= 0 Number of bytes stored in file "path".
394. Get a value of particular form variable. Parameters: data: pointer to form-uri-encoded buffer. This could be either POST data, or request_info.query_string. data_len: length of the encoded data. var_name: variable name to decode from the buffer dst: destination buffer for the decoded variable dst_len: length of the destination buffer occurrence: which occurrence of the variable, 0 is the first, 1 the second... this makes it possible to parse a query like b=x&a=y&a=z which will have occurrence values b:0, a:0 and a:1 Return: On success, length of the decoded variable. On error: -1 (variable not found). -2 (destination buffer is NULL, zero length or too small to hold the decoded variable). Destination buffer is guaranteed to be '\0' - terminated if it is not NULL or zero length.
395. Length (in bytes) of the request body, can be -1 if no length was given.
396. mg_authorization_handler Callback function definition for mg_set_auth_handler Parameters: conn: current connection information. cbdata: the callback data configured with mg_set_request_handler(). Returns: 0: access denied 1: access granted
397. Called when civetweb context is deleted. Parameters: ctx: context handle
398. Deprecated: Use mg_get_server_ports instead.
399. Lock server context. This lock may be used to protect resources that are shared between different connection/worker threads.
400. This structure contains information about the HTTP request.
401. Connection-specific user data
402. E.g. 200
403. Wait for a response from the server Parameters: conn: connection ebuf, ebuf_len: error message placeholder. timeout: time to wait for a response in milliseconds (if < 0 then wait forever) Return: On success, >= 0 On error/timeout, < 0
404. 1 = IPv4, 2 = IPv6, 3 = both
405. Called when civetweb has finished processing request.
406. Called after civetweb context has been created, before requests are processed. Parameters: ctx: context handle
407. File upload functionality. Each uploaded file gets saved into a temporary file and MG_UPLOAD event is sent. Return number of uploaded files. Deprecated: Use mg_handle_form_request instead.
408. **comment:** Get connection information. Useful for server diagnosis. Parameters: ctx: Context handle idx: Connection index buffer: Store context information here. buflen: Length of buffer (including a byte required for a terminating 0). Return: Available size of system information, excluding a terminating 0. The information is complete, if the return value is smaller than buflen. The result is a JSON formatted string, the exact content may vary. Note: It is possible to determine the required buflen, by first calling this function with buffer = NULL and buflen = NULL. The required buflen is one byte more than the returned value. However, since the available context information changes, you should allocate a few bytes more.
label: code-design
409. Send HTTP digest access authentication request. * Browsers will send a user name and password in their next request, showing * an authentication dialog if the password is not stored. * Parameters: * conn: Current connection handle. * realm: Authentication realm. If NULL is supplied, the sever domain * set in the authentication_domain configuration is used. * Return: * < 0 Error
410. Client's IP address as a string.
411. Set user data for the current connection.
412. Get text representation of HTTP status code.
413. Add, edit or delete the entry in the passwords file. * * This function allows an application to manipulate .htpasswd files on the * fly by adding, deleting and changing user records. This is one of the * several ways of implementing authentication on the server side. For another, * cookie-based way please refer to the examples/chat in the source tree. * * Parameter: * passwords_file_name: Path and name of a file storing multiple passwords * realm: HTTP authentication realm (authentication domain) name * user: User name * password: * If password is not NULL, entry modified or added. * If password is NULL, entry is deleted. * * Return: * 1 on success, 0 on error.
414. Get the list of ports that civetweb is listening on. The parameter size is the size of the ports array in elements. The caller is responsibility to allocate the required memory. This function returns the number of struct mg_server_ports elements filled in, or <0 in case of an error.
415. Un-initialize this library. * Return value: * 0: error
416. !/bin/sh using "pass" for every password
417. remove last build
418. check if the build was successful
419. ! /bin/sh
420. new scan build
421. pack build results for upload
422. check if we use the correct directory
423. copy files to build folder
424. return "ok"
425. data is "var1=val1&var2=val2...". Find variable first
426. Point s to the end of the value
427. No handler found, close connection
428. Add one extra character: in case the post-data is a text, it is required as 0-termination. Do not increment con_len, since the 0 terminating is not part of the content (text or binary).
429. **comment:** malloc may fail for huge requests
label: code-design
430. Happens when a request hits the server before the context is saved
431. No handler found
432. Maximum cookie length as per microsoft is 4096. <http://msdn.microsoft.com/en-us/library/ms178194.aspx>
433. Decode variable into destination buffer
434. get requests do store html <form> field values in the http query_string
435. Point p to variable value
436. Copyright (c) 2013-2017 the Civetweb developers * Copyright (c) 2013 No Face Press, LLC * * License <http://opensource.org/licenses/mit-license.php> MIT License
437. Now update the variable index
438. **comment:** TODO: print error
label: code-design
439. 3. call a "handle everything" callback, if registered
440. Asterisk
441. Get a random number (independent of C rand function)
442. **comment:** Function should never be called
label: code-design
443. range buffer is big enough
444. **comment:** TODO (low): If some data has been sent, a correct error * reply can no longer be sent, so just close the connection
label: code-design
445. Step 1.2: Check websocket protocol version.
446. TODO (mid): Check the mg_send_http_error situations in this function
447. Calculate an estimate for the required space
448. assert(handler == NULL);

449. "Cache-Control: private\r\n" (= default)
450. File name is relative to the webserver working directory * or it is absolute system path
451. Timeout: should retry
452. RFC2616 Section 10.1.2
453. REPORT method only allowed for CGI/Lua/LSP and callbacks.
454. Handler for error group, e.g., 5xx error * handler * for all server errors (500-599)
455. RFC 6585, Section 4
456. Set close flag, so the server thread can exit.
457. Initialize port and len as invalid.
458. File already exists
459. Do not show current dir (but show hidden files as they will * also be removed)
460. Cannot get host from the Host: header. * Fallback to our IP address.
461. <http://en.wikipedia.org/wiki/WebM>
462. File is read only
463. Here we can either generate and send a directory listing, * or send an "access denied" error.
464. RFC2616 Section 10.2.3
465. Pointer to the beginning of the portion of the incoming websocket * message queue. * The original websocket upgrade request is never removed, so the queue * begins after it.
466. Loop over multiple requests sent using the same connection * (while "keep alive").
467. assert(s >= p);
468. Traverse index files list. For each entry, append it to the given * path and see if the file exists. If it exists, break the loop
469. Gobble initial spaces
470. Redirect error code from -1 to -2 (destination buffer too * small).
471. SSL descriptor
472. We are using non-blocking sockets. Thus, the * set_sock_timeout(so.sock, timeout); * call is no longer required.
473. Depending on the SDK, this function uses either * (volatile unsigned int *) or (volatile LONG *), * so whatever you use, the other SDK is likely to raise a warning.
474. This value is the last one
475. Bind to a specific IPv4 address, e.g. 192.168.1.5:8080
476. We need an additional wait loop around this, because in some cases * with TLSwe may get data from the socket but not from SSL_read. * In this case we need to repeat at least once.
477. queue is full
478. 123
479. !NO_CGI
480. AUTH_HANDLER
481. 0 = nowhere, 1 = on disk, 2 = in memory
482. Important: on new connection, reset the receiving buffer. Credit * goes to crule42.
483. success
484. RFC2616 Section 10.4.16
485. ignore leading whitespaces
486. Use "Cache-Control: max-age" instead of "Expires" header. * Reason: see https://www.mnot.net/blog/2007/05/15/expires_max-age
487. Error
488. 100 nsecs
489. Request is directed to another server: The server name is * longer * than * the request name. Drop this case here to avoid overflows * in * the * following checks.
490. Data block
491. If a file should not be cached, do not only send * max-age=0, but also pragmas and Expires headers.
492. 1 is CRYPTO_LOCK
493. keep legacy behavior
494. difftime for struct timespec. Return value is in seconds.
495. OK
496. **comment:** TODO: 1) uri is deprecated; * 2) here, ri.uri is the http response code
 label: code-design
497. Compiler information
498. If CGI file is a script, try to read the interpreter line
499. Is path itself a directory?
500. Read from the socket into the next available location in the * message queue.
501. process HTTP connection
502. 12. Directory uris should end with a slash
503. return 0 on success, just like fclose
504. And disabling them does not work either: * #pragma clang diagnostic ignored "-Wno-error=date-time" * #pragma clang diagnostic ignored "-Wdate-time" * So we just have to disable ALL warnings for some lines * of code.
505. Server did not recv anything -> just close the connection
506. Start master (listening) thread
507. RFC2616 Section 10.2.1
508. EBUSY
509. out of memory
510. Debug: * printf("Missing function: %s\n", fp->name);
511. is still not MIT) and use dynamic binding like
512. body_len is the length of the entire queue in bytes * len is the length of the current message * data_len is the length of the current message's data payload * header_len is the length of the current message's header
513. Get some operating system independent thread id
514. **comment:** File is bad and will be removed anyway.
 label: code-design
515. Note: mg_snprintf will not cause a buffer overflow above. * So, string truncation checks are not required here.
516. open a connection
517. so->sa.sin6.sin6_family = AF_INET6; already set by mg_inet_pton
518. Add 1 to len for the + character we skipped before
519. RFC2616 Section 10.4.18
520. If the path is not complete, skip processing.
521. Access granted
522. Port is specified with a +, bind to IPv6 and IPv4, INADDR_ANY
523. IANA registered MIME types * (<http://www.iana.org/assignments/media-types>) * application types
524. This is the problematic case for CRYPTO_set_id_callback: * The OS pthread_t can not be cast to unsigned long.
525. Server starts *now*
526. SSL context
527. defined(_WIN32) && !defined(__SYMBIAN32__) - \ WINDOWS / UNIX include block
528. PATCH method (RFC 5789)
529. Free Lua state of lua background task
530. chunksize not set correctly

531. Pointer to name (in user addr space).
532. Overflow case
533. Try to read until it succeeds, fails, times out, or the server * shuts down.
534. padding added after data member
535. data is "var1=val1&var2=val2...". Find variable first
536. Wait until everything has stopped.
537. RFC2616 Section 10.5.4
538. Send a chunk, if "Transfer-Encoding: chunked" is used
539. copy from the remainder of the last received chunk
540. Total bytes sent to client
541. Receive error
542. Transfer-Encoding is chunked: * 0 = not chunked, * 1 = chunked, do data read yet, * 2 = chunked, some data read, * 3 = chunked, all data read
543. Public function to check http digest authentication header
544. processed
545. Parameter error
546. next try for a partial match, we will accept uri/something
547. defined(__GNUC__) || defined(__MINGW32__)
548. 11. Handle put/delete/mkcol requests
549. RFC2616 Section 10.2 - Successful 2xx
550. model
551. 6.2.2. Check if put authorization for static files is * available.
552. may be NULL
553. sscanf() is safe here, since send_ssi_file() also uses buffer * of size MG_BUF_LEN to get the tag. So strlen(tag) is * always < MG_BUF_LEN.
554. Publish the content length back to the response info.
555. Parent
556. File properties filled by mg_fopen:
557. CGI error handler should show the status code
558. Fatal error - abort start. However, this situation should never * occur in practice.
559. Size of the accepted socket queue
560. **comment:** This function is deprecated. Use mg_get_valid_options instead.
 label: code-design
561. IPv6
562. **comment:** This is an "in-memory" file, that can not be replaced
 label: code-design
563. RFC 6585, Section 5
564. finally try for pattern match
565. If file name is fishy, reset the file structure and return * error. * Note it is important to reset, not just return the error, cause * functions like is_file_opened() check the struct.
566. **comment:** Appear "unused parameter" warnings
 label: code-design
567. Put the temp file in place of real file
568. Compile-time option to control stack size, * e.g. -DUSE_STACK_SIZE=16384
569. Return True if we should reply 304 Not Modified.
570. Do not compress ranges.
571. 11.1. PUT method
572. !_WIN32 && !_SYMBIAN32_
573. IPv6 address, examples: see above
574. Add user-specified variables
575. Delete is not successful: Return 500 (Server error).
576. On Windows, the file creation time can be higher than the * modification time, e.g. when a file is copied. * Since the Last-Modified timestamp is used for caching * it should be based on the most recent timestamp.
577. Buffer allocation successful. Store the string there.
578. or timeout occurred * => the code must stay in the while loop
579. lock while cert is reloading
580. thread was not created
581. strcat with additional NULL check to avoid clang scan-build warning.
582. Return buffered data
583. MINGW typedefs pid_t to int. Using #define here.
584. If PEM file is not specified and the init_ssl callback * is not specified, skip SSL initialization.
585. closed
586. Each error code path in this function must send an error
587. Forward declaration for Windows
588. Feature check API function
589. Start a thread storing the thread context.
590. RFC2616 Section 10.3 - Redirection 3xx
591. Reallocate the buffer
592. Always put directories on top
593. REPORT method (RFC 3253)
594. Will only work for RFC 952 compliant hostnames, * starting with a letter, containing only letters, * digits and hyphen ('-'). Newer specs may allow * more, but this is not guaranteed here, since it * may interfere with rules for port option lists.
595. ext now points to the path suffix
596. defined(USE_STACK_SIZE) && (USE_STACK_SIZE > 1)
597. assert(conn->data_len <= conn->buf_size);
598. Deprecated: Use mg_get_server_ports instead.
599. Content length is not specified by the client.
600. RFC2616 Section 10.3.1
601. Two \r\n - standard compliant
602. assert(is_delete_request || connect_handler!=NULL || * ready_handler!=NULL || data_handler!=NULL || * close_handler!=NULL);
603. End of civetweb.c
604. We sent an "upgrade" request. For a correct websocket * protocol handshake, we expect a "101 Continue" response. * Otherwise it is a protocol violation. Maybe the HTTP * Server does not know websockets.
605. 14. directories
606. Don't wait if the server is going to be stopped.
607. Values from errno.h in Windows SDK (Visual Studio).
608. Decode variable into destination buffer
609. !EWOULDBLOCK
610. The second word is the URI
611. 1.2. do a https redirect, if required. Do not decode URIs yet.

612. File exists (precondition for calling this function), * but can not be opened by the server.
613. out: file found (directly)
614. mg_stat returns 0 if the file does not exist
615. POST or PUT request without content length set
616. Get Subject and issuer
617. set_ssl_option() function updates this array. * It loads SSL library dynamically and changes NULLs to the actual addresses * of respective functions. The macros above (like SSL_connect()) are really * just calling these functions indirectly via the pointer.
618. No Tag
619. out: websocket connection?
620. Calculate how much to read from the file in the buffer
621. ok = FALSE; already set by init
622. RFC2324 Section 2.3.2
623. file stored on disk
624. If we don't memset stat structure to zero, mtime will have * garbage and strftime() will segfault later on in * print_dir_entry(). memset is required only if mg_stat() * fails. For more details, see * <http://code.google.com/p/mongoose/issues/detail?id=79>
625. Thread local storage index
626. See https://www.chilkatsoft.com/p/p_299.asp
627. For given directory path, substitute it to valid index file. * Return 1 if index file has been found, 0 if not found. * If the file is found, its stats is returned in stp.
628. isgraph or isspace = isprint
629. Read from IO channel - opened file descriptor, socket, or SSL descriptor. * Return value: * >=0 .. number of bytes successfully read * -1 .. timeout * -2 .. error
630. Add data bytes in the current chunk have been read, * so we are expecting \r\n now.
631. 9a. In case the server uses only callbacks, this uri is * unknown. * Then, all request handling ends here.
632. last_modified = now ... assumes the file may change during * runtime, * so every mg_fopen call may return different data
633. HTTP reply status code, e.g. 200
634. Master thread adds accepted socket to a queue
635. shutdown of the socket at client side
636. BEGIN: CLOCK_MONOTONIC = stopwatch (time differences)
637. # is a comment
638. This server does not have any real files, thus the * PUT/DELETE methods are not valid.
639. The headers "Host", "Sec-WebSocket-Key", "Sec-WebSocket-Protocol" and * "Sec-WebSocket-Version" are also required. * Don't check them here, since even an unsupported websocket protocol * request still IS a websocket request (in contrast to a standard HTTP * request). It will fail later in handle_websocket_request.
640. While the delimiter is quoted, look for the next delimiter.
641. Create a temporary file name. Length has been checked before.
642. Size of structures, aligned to 8 bytes
643. Ignore errors for readonly files
644. Process a connection - may handle multiple requests * using the same connection. * Must be called with a valid connection (conn and * conn->ctx must be valid).
645. in: filename (must be valid)
646. PATCH method only allowed for CGI/Lua/LSP and callbacks.
647. Skip over '=' character
648. Avoid CRYPTO_cleanup_all_ex_data(); See discussion: * https://wiki.openssl.org/index.php/Talk:Library_Initialization
649. The first word is the HTTP version
650. Dynamically load SSL library. Set up ctx->ssl_ctx pointer.
651. Mark required libraries
652. Keep reading the input (either opened file descriptor fd, or socket sock, * or SSL descriptor ssl) into buffer buf, until \r\n\r\n appears in the * buffer (which marks the end of HTTP request). Buffer buf may already * have some data. The length of the data is stored in nread. * Upon every read operation, increase nread by the number of bytes read.
653. Send len bytes from the opened file to the client.
654. Message is a valid request
655. !fileno MINGW #defines fileno
656. PROPPATCH, COPY, MOVE, LOCK, UNLOCK (RFC 2518)
657. Set linger option to avoid socket hanging out after close. This * prevent ephemeral port exhaust problem under high QPS.
658. GCC seems to have a flaw with its own socket macros: * <http://www.linuxquestions.org/questions/programming-9/impossible-to-use-gcc-with-wconversion-and-standard-socket-macros-841935/>
659. C++ wants that for INT64_MAX
660. Some of the parameters may be NULL
661. Lua Script
662. not required anyway
663. This is a POST/PUT request, or another request with body data.
664. **comment:** user names may not contain a ':' and may not be empty, * so lines starting with ':' may be used for a special purpose
 label: code-design
665. Copy the data payload into the data pointer for the * callback. Cast to 31 bit is OK, since we * limited data_len
666. !USE_WEBSOCKET
667. Default: don't configure any linger
668. Content-Length header value
669. NO_CACHING
670. Send headers
671. Deallocate context itself
672. Sleep quantum in ms
673. CORS request is asking for additional headers
674. Last time throttled data was sent
675. p must correspond to end_word - 1
676. the ready handler returned false
677. Send 304 "Not Modified" - this must not send any body data
678. last_modified = conn->ctx.start_time; * May be used if the data does not change during runtime. This * allows * browser caching. Since we do not know, we have to assume the file * in memory may change.
679. File exists and is not a directory.
680. Terminate string
681. Print error message to the opened error log stream.
682. **comment:** clock_gettime is not implemented on OSX prior to 10.12
 label: requirement
683. worst case
684. According to RFC 2616, Section 14.21, caching times should not exceed * one year. A year with 365 days corresponds to 31536000 seconds, a * leap * year to 31622400 seconds. For the moment, we just send whatever has * been configured, still the behavior for >1 year should be considered * as undefined.
685. The pre-allocated buffer not large enough.
686. Can it be replaced?
687. HTTP (RFC 2616)
688. Tag is opening
689. draft-tbray-http-legally-restricted-status-05, * Section 3

690. path does not exist and can not be created
691. Propagate the error
692. USE_SERVER_STATS
693. Step 2: If a callback is responsible, call it.
694. **comment:** Alternative alloc_vprintf() for non-compliant C runtimes
 label: code-design
695. **comment:** TODO: Check ssl_verify_peer and ssl_ca_path here. * SSL_CTX_set_verify call is needed to switch off server * certificate checking, which is off by default in OpenSSL and * on in yaSSL.

736. RFC2518 Section 10.2, RFC4918 Section 11.1
737. Set bits for available features according to API documentation. * This bit mask is created at compile time, according to the active * preprocessor defines. It is a single const value at runtime.
738. RFC says that all initial whitespaces should be ingored
739. Add this thread to cv's waiting list
740. must be a end of line
741. Memory information
742. pollres = 0 means timeout
743. Copy VARIABLE=VALUE\0 string into the free space
744. video
745. CGI scripts may support all HTTP methods
746. All calls to construct_etag use 64 byte buffer
747. POSIX dirent interface
748. Prepare the environment block
749. Size of the request + headers in a buffer
750. Initialize elements.
751. **comment:** TODO (mid): error handling depending on the error code. * These codes are different between Windows and Linux. * Currently there is no problem with failing send calls, * if there is a reproducible situation, it should be * investigated in detail.
 label: code-design
752. Used by mg_(un)lock_connection to ensure * atomic transmissions for websockets
753. see errno
754. File name is relative to the webserver root
755. Timeout occurred, but no data available.
756. If there is anything beyond end_word, copy it.
757. Websocket Lua script
758. NO_SOCKETLEN_T
759. Note: set_sock_timeout is not required for non-blocking sockets. * Leave this function here (commented out) for reference until * CivetWeb 1.9 is tested, and the tests confirm this function is * no longer required.
760. timeout
761. Valid URIs according to RFC 3986 * (<https://www.ietf.org/rfc/rfc3986.txt>) * must only contain reserved characters :?#[@!\$&()'*=; and unreserved characters A-Z a-z 0-9 and -_~ * and % encoded symbols.
762. RFC2616 Section 10.2.5
763. IE uses commas, FF uses * spaces
764. if an error occurred, close the connection

765. Stringify binary data. Output buffer must be twice as big as input, * because each byte takes 2 bytes in string representation
766. Point p to variable value
767. This is the hixie version
768. error
769. set an error, if not yet set
770. HTTP 1.1 default is keep alive
771. Convert in 32 bit words, if data is 4 byte aligned
772. RFC2518 Section 10.1
773. 1 if gzip encoding is accepted
774. Check if the script file is in a path, allowed for script files. * This can be used if uploading files is possible not only for the server * admin, and the upload mechanism does not check the file extension.
775. update existing handler
776. nanoseconds
777. Return HTTP header value, or NULL if not found.
778. Then send length information, chunk and terminating \r\n.
779. Allocate new buffer
780. Initialize thread local storage
781. 1.3. decode url (if config says so)
782. Child
783. Skip over leading LWS
784. timeout: return 0
785. **comment:** TODO: 1) uri is deprecated; * 2) here, ri.uri is the http response code
label: code-design
786. Now read CGI reply into a buffer. We need to set correct * status code, thus we need to see all HTTP headers first. * Do not send anything back to client, until we buffer in all * HTTP headers.
787. Parsing failure.
788. RFC2616 Section 10.4.15
789. See table: <http://wwwcplusplus.com/reference/cctype/>
790. See IANA HTTP status code assignment: * <http://www.iana.org/assignments/http-status-codes/http-status-codes.xhtml>
791. Ok
792. seconds
793. Start a thread to read the websocket client connection * This thread will automatically stop when mg_disconnect is * called on the client connection
794. Describes listening socket, or socket which was accept()ed by the master * thread and queued for future handling by the worker thread.
795. BEGIN: unknown clock
796. Should get data, but got EOL
797. socket error - check errno
798. !defined(NO_SSL)
799. RFC2616 Section 10.4.2
800. Protocol violation
801. Allocate a new buffer.
802. Interface function. Parameters are provided by the user, so do * at least some basic checks.
803. _WIN32_WCE
804. Flush current buffer
805. Check config, if index scripts may have sub-resources
806. defined(USE_WEBSOCKET)
807. Step 2.1 check and select subprotocol
808. Step 8: Check if the file exists at the server
809. Is port supposed to redirect everything to SSL * port
810. Step 9: Check for zipped files:
811. Need to retry the function call "later". * See https://linux.die.net/man/3/ssl_get_error * This is typical for non-blocking sockets.
812. **comment:** TODO: for 1.10: restructure how files in memory are handled
label: code-design
813. Return 0 means, path itself is a directory.
814. RFC2616 Section 10.4.5
815. 1. get the request url
816. Not chunked: content length is known
817. This is an SSL specific error
818. Send a response to CORS preflights only if * access_control_allow_methods is not NULL and not an empty string. * In this case, scripts can still handle CORS.
819. RFC2518 Section 10.3, RFC4918 * Section 11.2
820. Environment buffer
821. call init_thread for a worker thread (type 1)
822. Message is a valid response
823. **comment:** __attribute__((unused))
label: code-design
824. **comment:** request not yet handled by a handler or redirect, so the request * is processed here
label: requirement
825. Step 4: Check if gzip encoded response is allowed
826. Flush if buffer is full
827. Copy socket to the queue and increment head
828. could use atomic compare exchange, but this * seems overkill for statistics data
829. Throttling, bytes/sec. <= 0 means no * throttle
830. Stop signal received: somebody called mg_stop. Quit.
831. Client
832. **comment:** TODO: set some error message
label: requirement
833. **comment:** NOTE: If SO_EXCLUSIVEADDRUSE is used, * Windows might need a few seconds before * the same port can be used again in the * same process, so a short Sleep may be * required between mg_stop and mg_start.
label: code-design
834. O_BINARY
835. HCP24: some changes to compare hole var_name
836. This version uses 8 byte body data in a GET request
837. ALTERNATIVE_QUEUE
838. could use SSL_CTX_set_default_passwd_cb_userdata
839. Since we know all sockets, we can shutdown the connections.
840. hope nobody uses this
841. Requests information
842. Mark memory as dead
843. Get system information. It can be printed or stored by the caller. * Return the size of available information.

844. Delete is successful: Return 204 without content.
845. File should be created
846. Allow only if access_control_allow_headers is * not NULL and not an empty string. If this * configuration is set to *, allow everything. * Otherwise this configuration must be a list * of allowed HTTP header names.
847. accepted subprotocols for ws/wss requests.
848. Shut down signal
849. SSL is not supported
850. First satisfy needs of the server
851. <http://msdn.microsoft.com/en-us/library/1w06ktidy.aspx>
852. EINTR can be generated on a socket with a timeout set even * when SA_RESTART is effective for all relevant signals * (see signal(7)). * => stay in the while loop
853. **comment:** Shutdown according to * https://wiki.openssl.org/index.php/Library_Initialization#Cleanup * <http://stackoverflow.com/questions/29845527/how-to-properly-uninitialize-openssl>
label: code-design
854. Darwin prior to 7.0 and Win32 do not have socklen_t
855. Using the given file format, user name and domain must not contain * ':'
856. Flush buffer
857. Perform case-insensitive match of string against pattern
858. Make modifiable copy of the auth header
859. Only accept a full file path, not a Windows short (8.3) path.
860. timeout is handled by the while loop
861. mask flag and opcode
862. Implement the deprecated mg_upload function by calling the new * mg_handle_form_request function. While mg_upload could only handle * HTML forms sent as POST request in multipart/form-data format * containing only file input elements, mg_handle_form_request can * handle all form input elements and all standard request methods.
863. NOTE(lsm): order is important here. should_keep_alive() call * is using parsed request, which will be invalid after * memmove's below. * Therefore, memorize should_keep_alive() result now for later * use in loop exit condition.
864. Run SSL_shutdown twice to ensure completely close SSL connection
865. Step 1.3: Could check for "Host", but we do not really need this * value for anything, so just ignore it.
866. processing
867. A websocket protocol has the following HTTP headers: * * Connection: Upgrade * Upgrade: Websocket
868. Make sure the port is valid and vector ends with 's', 'r' or '
869. Null-terminate the destination
870. assert(connect_handler==NULL && ready_handler==NULL && * data_handler==NULL && close_handler==NULL);
871. Deallocate request handlers
872. Request too long
873. Unknown server error code
874. Set to 1 if the content is gzipped, in which * case we need a "Content-Encoding: gzip" header
875. character is ok
876. destructor not supported for Windows
877. Length of the message being read at the front of the * queue. Cast to 31 bit is OK, since we limited * data_len before.
878. remove existing handler
879. **comment:** Set some extra bits not defined in the API documentation. * These bits may change without further notice.
label: documentation
880. Get a unique thread ID as unsigned long, independent from the data type * of thread IDs defined by the operating system API. * If two calls to mg_current_thread_id return the same value, they calls * are done from the same thread. If they return different values, they are * done from different threads. (Provided this function is used in the same * process context and threads are not repeatedly created and deleted, but * CivetWeb does not do that). * This function must match the signature required for SSL id callbacks: * CRYPTO_set_id_callback
881. **comment:** TODO: check if it is still used in response_info
label: code-design
882. **comment:** TODO: handle non-local request (PROXY)
label: code-design
883. Convert the nonce from the client to a number.
884. Linear congruential generator
885. ASN1_digest is deprecated. Do the calculation manually, * using EVP_Digest.
886. Open failed
887. if clock_gettime is declared, then __CLOCK_AVAILABILITY will be defined
888. Regard empty password as no password - remove user record.
889. data points to the place where the message is stored when passed to * the * websocket_data callback. This is either mem on the stack, or a * dynamically allocated buffer if it is too large.
890. This function only checks if the uri is valid, not if it is * addressing the current server. So civetweb can also be used * as a proxy server.
891. Check if the request is directed to a different server.
892. URI: /path_to_script/ ... using index.cgi
893. This file can not be sent using sendfile. * This might be the case for pseudo-files in the * /sys/ and /proc/ file system. * Use the regular user mode copy code instead.
894. Send chunk of data that may have been read after the headers
895. The body data is completed when the connection * is closed.
896. Allocate a mutex for this connection to allow communication both * within the request handler and from elsewhere in the application
897. Ignore SIGPIPE signal, so if browser cancels the request, it * won't kill the whole process.
898. Do not delete anything shorter
899. Check for quotechar
900. **comment:** Avoid warnings for Xcode 7. It seems it does no longer exist in Xcode 8
label: code-design
901. Step 5: The websocket connection has been accepted
902. BEGIN: CLOCK_PROCESS = CPU usage of process
903. Assume the data may change during runtime by setting * last_modified = now
904. END: unknown clock
905. **comment:** TODO: get timeout def
label: code-design
906. The converted number corresponds to the time the nounce has been * created. This should not be earlier than the server start.
907. Parse HTTP request, fill in mg_request_info structure. * This function modifies the buffer by NUL-terminating * HTTP request components, header names and header values. * Parameters: * buf (in/out): pointer to the HTTP header to parse and split * len (in): length of HTTP header buffer * re (out): parsed header as mg_request_info * buf and ri must be valid pointers (not NULL), len>0. * Returns <0 on error.
908. !NO_SSL
909. Check for a valid HTTP version key
910. Step 10: Script resources may handle sub-resources
911. Find end of HTTP header
912. Return stringified MD5 hash for list of strings. Buffer must be 33 bytes.
913. standard case if called from close_socket_gracefully

914. Look at the "path" extension and figure what mime type it has. * Store mime type in the vector.
915. Step 1: Set all initially unknown outputs to zero
916. RFC7238 Section 3
917. Name/Pattern of the URI.
918. **comment:** TODO: specific error message
 label: code-design
919. Request is directed to another server: It could be a * substring * like notmyserver.com
920. Next would be the HTTP version
921. Get SSL client certificate information (if set)
922. If any ACL is set, deny by default
923. For every system, "(sizeof(int) == sizeof(void *))" is either always * true or always false. One of the two branches is unreachable in any case. * Unfortunately the C standard does not define a way to check this at * compile time, since the #if preprocessor conditions can not use the sizeof * operator as an argument.
924. USE_LUA
925. **comment:** TODO: check for openSSL 1.1
 label: requirement
926. For sockets, wait for the socket using select
927. Script was in an illegal path
928. Make up and send the status line
929. Check end of word
930. RFC 2774, Section 7
931. Check if the nonce is too high, so it has not (yet) been used by the * server.
932. Reset buffer, so we can always use strcat.
933. Connection structure has been pre-allocated
934. Convert to Unicode and back. If doubly-converted string does not * match the original, something is fishy, reject.
935. Wrap pointers if needed
936. SSL context for client connections
937. deallocate system name string
938. Fatal error - abort start. However, this situation should * never occur in practice.
939. **comment:** Enable unused function warning again
 label: code-design
940. Store the ssl library handle.
941. RFC2616 Section 10.4.13
942. Get context information. It can be printed or stored by the caller. * Return the size of available information.
943. mg_stat must fill all fields, also for files in memory
944. Put so socket structure into the queue
945. **comment:** FIXME(lsm): fix this.
 label: code-design
946. pthread cond not available
947. SCRIPT_NAME
948. Start the server
949. none found
950. RFC2616 Section 10.1.1
951. NOTE(lsm): due to a bug in MSIE, we do not compare the URI
952. sf_sent<0 means error, thus fall back to the classic way
953. **comment:** not defined as a preprocessor macro, replacing with '0' for '#if/#elif'
 label: code-design
954. Now we know that our FIN is ACK-ed, safe to close
955. End of initial operating system specific define block.
956. If truncated, add "..."
957. Helper function for deprecated mg_upload.
958. Request to create a directory has been fulfilled successfully. * No need to put a file.
959. add mask
960. **comment:** TODO: (void)mg_snprintf(NULL, dst, dst_size, "implement strftime() * for WinCE");
 label: code-design
961. Step 5: If there is no root directory, don't look for files.
962. put_dir returns -1 if the path is too long
963. **comment:** Signal mg_stop() that we're done. * WARNING: This must be the very last thing this * thread does, as ctx becomes invalid after this line.
 label: code-design
964. Both read and write were successful, adjust counters
965. Try to delete it.
966. Compile-time option to control stack size, e.g. * -DUSE_STACK_SIZE=16384
967. Windows SO_REUSEADDR lets many procs binds to a * socket, SO_EXCLUSIVEADDRUSE makes the bind fail * if someone already has the socket -- DTL
968. ORDERPATCH (RFC 3648)
969. 1 if connection must be closed
970. !NO_POPEN
971. linked list of uri handlers
972. Mark handles that should not be inherited. See * <https://msdn.microsoft.com/en-us/library/windows/desktop/ms682499%28v=vs.85%29.aspx>
973. Request/response has content length set
974. **comment:** We should subtract the time used in select from remaining * "milliseconds", in particular if called from mg_poll with a * timeout quantum. *
 Unfortunately, the remaining time is not stored in "tv" in all * implementations, so the result in "tv" must be considered undefined. * See
 <http://man7.org/linux/man-pages/man2/select.2.html>
 label: code-design
975. Could be a hostname
976. asterisk
977. GCC does not realize one branch is unreachable, so it raises some * pointer cast warning within the unreachable branch.
978. The first word has to be the HTTP method
979. Send host, port, uri and (if it exists) ?query_string
980. 8.3: If the request target is a directory, there could be * a substitute file (index.html, index.cgi, ...).
981. Tag to long for buffer
982. This is an IO error. Look at errno.
983. RFC2616 Section 10.4.6
984. Context has been created - init user libraries
985. error callint poll
986. According to <https://en.wikipedia.org/wiki/Symbian#History>, * Symbian is no longer maintained since 2014-01-01. * Recent versions of CivetWeb are no longer tested for Symbian. * It makes no sense, to support an abandoned operating system. * All remaining "#ifdef __SYMBIAN__" cases will be dropped from * the code sooner or later.
987. Note that root == NULL is a regular use case here. This occurs, * if all requests are handled by callbacks, so the WEBSOCKET_ROOT * config is not required.
988. Currently gz files can not be scripts.

989. A file should be created or overwritten.
990. Some ANSI #includes are not available on Windows CE
991. assert(fp != NULL);
992. Update lsa port in case of random free ports
993. If Range: header specified, act accordingly
994. Deallocate config parameters
995. EAGAIN/EWOULDBLOCK: * standard case if called from close_socket_gracefully * => should return -1
996. IPv4
997. Strings returned from bn_bn2hex must be freed using OPENSSL_free, * see https://linux.die.net/man/3/bn_bn2hex
998. call the init_connection callback if assigned
999. Create substitutes for POSIX functions in Win32.
1000. Unified socket address. For IPv6 support, add IPv6 address structure in * the * union u.
1001. Step 4: Check if there is a responsible websocket handler.
1002. For every compiler, either "sizeof(pthread_t) > sizeof(unsigned long)" * or not, so one of the two conditions will be unreachable by construction. * Unfortunately the C standard does not define a way to check this at * compile time, since the #if preprocessor conditions can not use the sizeof * operator as an argument.
1003. Check if the method is known to the server. The list of all known * HTTP methods can be found here at * <http://www.iana.org/assignments/http-methods/http-methods.xhtml>
1004. RFC2616 Section 10.4 - Client Error 4xx
1005. Step 6: Call the ready handler
1006. See CONTEXT_* above
1007. Store the <
1008. Set default value if needed
1009. There should be already an error message
1010. Timeout in s:
1011. **comment:** Print message to buffer. If buffer is large enough to hold the message, * return buffer. If buffer is to small, allocate large enough buffer on * heap, * and return allocated buffer.
label: code-design
1012. Adjust length for trailing LWS
1013. 1.1.1970 in filedate
1014. put_dir returns 0 if path is a directory
1015. Point s to the end of the value
1016. **comment:** This standard handler is only used for real files. * Scripts should support the OPTIONS method themselves, to allow a * maximum flexibility. * Lua and CGI scripts may fully support CORS this way (including * preflights).
label: code-design
1017. Could not parse the CGI response. Check if some error message on * stderr.
1018. Log is written to a file and/or a callback. If both are not set, * executing the rest of the function is pointless.
1019. Buffer size
1020. Yes it does, break the loop
1021. **comment:** va_copy should always be a macro, C99 and C++11 - DTL
label: code-design
1022. Send all current and obsolete cache opt-out directives.
1023. Return 1 on success. Always initializes the ah structure.

1423. Handler for all errors
1424. Reject wrong versions
1425. Include '\n'
1426. A relative uri starts with a / character
1427. Find end of status text
1428. No error, but 0 bytes sent. May be EOF?
1429. File does not exist. This is not always a problem here.
1430. On the fly compression allowed
1431. RFC2616 Section 10.5.6
1432. If we compiled with Mac OSX 10.12 or later, then clock_gettime will be * declared but it may be NULL at runtime. So we need to check before using * it.
1433. **comment:** not registered types * (<http://reference.sitepoint.com/html/mime-types-full>, * http://www.hansenb.pdx.edu/DMKB/dict/tutorials/mime_typ.php, ..)
label: documentation
1434. Open file for writing, create and overwrite
1435. RFC2616 Section 10.4.4
1436. Read the server config to check how long a file may be cached. * The configuration is in seconds.
1437. file is on disk
1438. Server is to be stopped.
1439. Listening socket
1440. This is an unknown version
1441. Delete not successful (file locked).
1442. find a free worker slot and signal it
1443. WinCE does not support CGI pipes

1444. **comment:** TODO (low): Replace "membuf" implementation by a "file in memory" * support library. Use some struct mg_file_in_memory *mf; instead of * membuf char pointer.
label: code-design

1445. File is already compressed. No "on the fly" compression.

1446. Copy remaining data

1447. Not an SSI tag

1448. some data has been read, or no data was requested

1449. This structure helps to create an environment for the spawned CGI * program. * Environment is an array of "VARIABLE=VALUE\0" ASCIIZ strings, * last element must be NULL. * However, on Windows there is a requirement that all these * VARIABLE=VALUE\0 * strings must reside in a contiguous buffer. The end of the buffer is * marked by two '\0' characters. * We satisfy both worlds: we create an envp array (which is vars), all * entries are actually pointers inside buf.

1450. handle request to local server

1451. This thread has been removed from cv's waiting list

1452. Step 7: URI rewriting

1453. one worker thread will be created

1454. Space available in buf

1455. dlsym() on UNIX returns void *. ISO C forbids casts of data * pointers to function pointers. We need to use a union to make a * cast.

1456. Disable deprecation warning in VS2005

1457. Use the global passwords file, if specified by auth_gpass option, * or search for .htpasswd in the requested directory.

1458. RFC2616 Section 10.4.3

1459. 16 = Max. thread length in Linux/OSX/..

1460. Check license (zlib has a permissive license, but

1461. __SYMBIAN32__

1462. 6.2.1. thus, the server must have real files

1463. Request is directed to another server: * The server name is different.

1464. Call ductape to generate the page

1465. The chain of threads

1466. Bind to IPv4 only, since IPv6 is not built in.

1467. Return at least a category according to RFC 2616 Section 10.

1468. Accepted sockets

1469. defined for tdm-gcc so we can use getnameinfo

1470. The max request size

1471. RFC2518 Section 10.4, RFC4918 Section 11.3

1472. assert(conn->consumed_content == 0);

1473. The request sent by the client could not be understood by * the server, or it was incomplete or a timeout. Send an * error message and close the connection.

1474. Implementation of POSIX opendir/closedir/readdir for Windows.

1475. Do not lock when getting the callback value, here and below. * I suppose this is fine, since function cannot disappear in the * same way string option can.

1476. The pre-allocated buffer is large enough. * Use it to store the string and return the address.

1477. Initialize output string

1478. 6.2. this request is a PUT/DELETE to a real file

1479. WinCE has no popen

1480. Poll returned either success (1) or error (-1). * Forward both to the caller.

1481. output: socket, must not be NULL

1482. The number of configured worker threads.

1483. RFC2616 Section 10.4.10

1484. Full request not yet received

1485. 6.1. a custom authorization handler is installed

1486. Deallocate SSL context

1487. Cannot determine if socket is already closed. This should * not occur and never did in a test. Log an error message * and continue.

1488. Is valid

1489. function has been selected for automatic inline expansion

1490. Initialize locking callbacks, needed for thread safety. * <http://www.openssl.org/support/faq.html#PROG1>

1491. file does not exist and will not be created

1492. 3 indicates a websocket client thread

1493. GCC_VERSION >= 40500

1494. This will fail file is the file is in memory

1495. Make sure child closes all pipe descriptors. It must dup them to 0,1

1496. Using fmt as a non-literal is intended here, since it is mostly called * indirectly by mg_snprintf

1497. Note that POSIX/Winsock's send() is threadsafe * <http://stackoverflow.com/questions/1981372/are-parallel-calls-to-send-recv-on-the-same-socket-valid> * but mongoose's mg_printf/mg_write is not (because of the loop in * push(), although that is only a problem if the packet is large or * outgoing buffer is full).

1498. C callback has returned non-zero, do not proceed with * handshake.

1499. Apple OSX section

1500. **comment:** Convert variable name into uppercase, and change - to _
label: code-design

1501. Reset ip_version to 0 of there is an error

1502. on linux we can use the old prctl function

1503. **comment:** Todo: check if cors_origin is in cors_orig_cfg. * Or, let the client check this.
label: requirement

1504. TCP_USER_TIMEOUT/RFC5482 (<http://tools.ietf.org/html/rfc5482>): * max. time waiting for the acknowledged of TCP data before the connection * will be forcefully closed and ETIMEDOUT is returned to the application. * If this option is not set, the default timeout of 20-30 minutes is used.

1505. Default is "no".

1506. Since we use a sleep quantum of some seconds to check for recv * timeouts, we will just wait a few seconds in mg_join_thread.

1507. Free existing block

1508. conditional expression is constant: introduced by FD_SET(..)

1509. Verify given socket address against the ACL. * Return -1 if ACL is malformed, 0 if address is disallowed, 1 if allowed.

1510. 10. Request is handled by a script

1511. Handle SSI tag

1512. Not yet a valid request/response

1513. This legacy interface only works for the IPv4 case

1514. **comment:** Join all worker threads to avoid leaking threads.
label: code-design

1515. Cross-origin resource sharing (CORS), see * <http://www.html5rocks.com/en/tutorials/cors/>, * http://www.html5rocks.com/static/images/cors_server_flowchart.png * - * preflight is not supported for files.

1516. RFC7540 Section 9.1.2

1517. Incomplete request

1518. We need to get the client thread out of the select/recv call * here.

1519. Get connection information. It can be printed or stored by the caller. * Return the size of available information.

1520. !_WIN32_WCE

1521. File did not exist before fopen was called. * Maybe it has been created now. Get stat info * like creation time now.

1522. if this file is in fact a pre-gzipped file, rewrite its filename * it's important to rewrite the filename after resolving * the mime type from it, to preserve the actual file's type
1523. convert 1-3 remaining bytes if ((dataLen % 4) != 0)
1524. Initialize SSL library
1525. TODO: SSL_CTX_set_verify(conn->client_ssl_ctx, * SSL_VERIFY_PEER, verify_ssl_server);
1526. Response code not even within reasonable range
1527. Terminate and forward to the next word
1528. absolute uri (with/without port)
1529. There is no callback, and Lua is not responsible either.
1530. 11.2. DELETE method
1531. _MSC_VER
1532. For files, just wait a fixed time, * maybe an average disk seek time.
1533. Unsupported WEBDAV Methods:
1534. 4. Check for CORS preflight requests and handle them (if configured). * https://developer.mozilla.org/en-US/docs/Web/HTTP/Access_control_CORS
1535. Valid request
1536. Forward until a space is found - use isgraph here
1537. If callback returns 0, civetweb sets up the SSL certificate. * If it returns 1, civetweb assumes the callback already did this. * If it returns -1, initializing ssl fails.
1538. forward_body_data failed. * The error code has already been sent to the client, * and conn->status_code is already set.
1539. Return null terminated string of given maximum length. * Report errors if length is exceeded.
1540. Data information
1541. assert(discard_len >= 0);
1542. Should we support client certificates?
1543. Create the file if does not exist
1544. Buffer for received data
1545. Read and discard pending incoming data. If we do not do that and * close * the socket, the data in the send buffer may be discarded. This * behaviour is seen on Windows, when client keeps sending data * when server decides to close the connection; then when client * does recv() it gets no data back.
1546. Terminate string and forward buf to next line
1547. **comment:** TODO: not thread safe
label: requirement
1548. **comment:** TODO: add interface to compression module
label: code-design
1549. Send the rest of buffered data
1550. Currently CivetWeb does not need read+write access.
1551. closing
1552. assert(buffered_len >= 0);
1553. **comment:** TODO: Check if this lock should be moved to user land. * Currently the server sets this lock for websockets, but * not for any other connection. It must be set for every * conn read/written by more than one thread, no matter if * it is a websocket or regular connection.
label: code-design
1554. 0 means "do not cache". All values <0 are reserved * and may be used differently in the future.
1555. If we're stopping, sq_head may be equal to sq_tail.
1556. Reply with a 404 Not Found. We are still at a standard * HTTP request here, before the websocket handshake, so * we can still send standard HTTP error replies.
1557. <inttypes.h> wants this for C++
1558. Check whether full request is buffered. Return: * -1 if request or response is malformed * 0 if request or response is not yet fully buffered * >0 actual request length, including last \r\n\r\n
1559. Use global passwords file
1560. Close write end fdin and read end fdout and fderr
1561. output: socket address, must not be NULL
1562. **comment:** TODO: POSIX returns either EAGAIN or EWOULDBLOCK in both cases, * if the timeout is reached and if the socket was set to non- * blocking in close_socket_gracefully, so we can not distinguish * here. We have to wait for the timeout in both cases for now.

1769. RFC2616 Section 10.3.3
1770. No need to continue processing files once we have a * match, since nothing will reset it back * to 0.
1771. The "file in memory" feature is a candidate for deletion. * Please join the discussion at * <https://groups.google.com/forum/#topic/civetweb/h9HT4CmeYql>
1772. unknown content length
1773. CGI needs it as REMOTE_USER
1774. RFC2616 Section 10.2.2
1775. Valid response
1776. Next character after the port number
1777. State as string
1778. Tail of the socket queue
1779. Calculate how much space is left in the buffer
1780. We already know there is no more data buffered in conn->buf * but there is more available in the SSL layer. So don't poll * conn->client.sock yet.
1781. NOTE(lsm): on QNX, poll() returns POLLRDNORM after the * successful poll, and POLLIN is defined as * (POLLRDNORM | POLLRDBAND) * Therefore, we're checking pfd[i].revents & POLLIN, not * pfd[i].revents == POLLIN.
1782. HPUX defines socklen_t incorrectly as size_t which is 64bit on * Itanium. Without defining _XOPEN_SOURCE or _XOPEN_SOURCE_EXTENDED * the prototypes use int* rather than socklen_t* which matches the * actual library expectation. When called with the wrong size arg * accept() returns a zero client inet addr and check_acl() always * fails. Since socklen_t is widely used below, just force replace * their typedef with int. - DTL
1783. No conn
1784. It was defined for WEBDAV in RFC 3253, Sec. 3.6 * (<https://tools.ietf.org/html/rfc3253#section-3.6>), but seems * to be useful for REST in case a "GET request with body" is * required.
1785. WEBDAV (RFC 2518)
1786. !defined(NO_CGI) || defined(USE_LUA) || defined(USE_DUKTAPE)
1787. Retrieve requested HTTP header multiple values, and return the number of * found occurrences
1788. stderr write
1789. Build date
1790. Should we stop event loop
1791. process HTTPS connection
1792. filep is initialized in mg_stat: all fields with memset to, * some fields like size and modification date with values
1793. Destroy other context global data structures mutex
1794. 8. handle websocket requests
1795. 5.2.1. A callback will handle this request. All requests * handled * by a callback have to be considered as requests to a script * resource.
1796. no can do
1797. **comment:** Depending on USE_WEBSOCKET and NO_SSL, some of the protocols might be * not supported. Clang raises an "unreachable code" warning for parts of ?: * unreachable, but splitting into four different #ifdef clauses here is more * complicated.
 label: code-design
1798. Loop over passwords file
1799. 13.1. Handle PROPFIND
1800. !defined(NO_THREAD_NAME)
1801. **comment:** GCC unused function attribute seems fundamentally broken. * Several attempts to tell the compiler "THIS FUNCTION MAY BE USED * OR UNUSED" for individual functions failed. * Either the compiler creates an "unused-function" warning if a * function is not marked with __attribute__((unused)). * On the other hand, if the function is marked with this attribute, * but is used, the compiler raises a completely idiotic * "used-but-marked-unused" warning - and * #pragma GCC diagnostic ignored "-Wused-but-marked-unused" * raises error: unknown option after #pragma GCC diagnostic*. * Disable this warning completely, until the GCC guys sober up * again.

1851. + 11 methods from RFC 3253
1852. **comment:** goto spawn_cleanup;
 label: code-design
1853. 7. check if there are request handlers for this uri
1854. **comment:** TODO(Feature): this is no longer a boolean, but yes/no/optional
 label: code-design
1855. END: CLOCK_THREAD
1856. **comment:** TODO (mid): Define proper return values - maybe return length? * For the first test use <0 for error and >0 for OK
 label: code-design
1857. Set the thread name for debugging purposes in Visual Studio * <http://msdn.microsoft.com/en-us/library/xcb2z8hs.aspx>
1858. Set TCP keep-alive. This is needed because if HTTP-level * keep-alive * is enabled, and client resets the connection, server won't get * TCP FIN or RST and will keep the connection open forever. With * TCP keep-alive, next keep-alive handshake will figure out that * the client is down and will close the server end.
 Thanks to Igor Klopov who suggested the patch.
1859. Substitute file is a regular file
1860. **comment:** Disable TCP Nagle's algorithm. Normally TCP packets are coalesced * to effectively fill up the underlying IP packet payload and * reduce the overhead of sending lots of small buffers. However * this hurts the server's throughput (ie. operations per second) * when HTTP 1.1 persistent connections are used and the responses * are relatively small (eg. less than 1400 bytes).
 label: code-design
1861. out: put/delete a file?
1862. Check for a valid http method
1863. The server must only return one value from this list.
1864. Windows happily opens files with some garbage at the end of file name. * For example, fopen("a.cgi ", "r") on Windows successfully opens * "a.cgi", despite one would expect an error back. * This function returns non-0 if path ends with some garbage.
1865. If name=" is found, search for the closing "
1866. Read new data
1867. There are three ways to encode data from a HTML form: * 1) method: GET (default) * The form data is in the HTTP query string. * 2) method: POST, enctype: "application/x-www-form-urlencoded" * The form data is in the request body. * The body is url encoded (the default encoding for POST). * 3) method: POST, enctype: "multipart/form-data". * The form data is in the request body of a multipart message. * This is the typical way to handle file upload from a form.
1868. If the boundary is already in the buffer, get the address, * otherwise next will be NULL.
1869. GET request: form data is in the query string.
1870. Get the mandatory name="..." part of the Content-Disposition * header.
1871. **comment:** TODO: check Content-Type
 label: requirement
1872. No query string.
1873. Copy boundary string to variable "boundary"
1874. **comment:** Sanity check: The algorithm can not work if bl >= sizeof(buf), * and it will not work effectively, if the buf is only a few byte * larger than bl, or if buf can not hold the multipart header * plus the boundary. * Check some reasonable number here, that should be fulfilled by * any reasonable request from every browser. If it is not * fulfilled, it might be a hand-made request, intended to * interfere with the algorithm.
 label: code-design
1875. No body data, but not a GET request. * This is not a valid form request.
1876. **comment:** Sanity check: A boundary string of less than 4 bytes makes * no sense either.
 label: code-design
1877. Store the content of the buffer.
1878. Read body data and split it in keys and values. * The encoding is like in the "GET" case above: a=1&b=c=3&c=4. * Here we use "POST", and read the data from the request body. * The data read on the fly, so it is not required to buffer the * entire request in memory before processing it.
1879. **comment:** The initial sanity check * (bl + 800 > sizeof(buf)) * is no longer required, since sizeof(buf) == 1024 * * Original comment:
 label: code-design
1880. Malformed request (the filename field is optional, but if * it exists, it needs to be terminated correctly).
1881. Malformed request
1882. Unknown Content-Type
1883. Call callback
1884. }

1885. **comment:** And others complain, the result is unused.
label: code-design
1886. All parts handled
1887. We must do a binary search here, not a string search, since the buffer * may contain '\x00' bytes, if binary data is transferred.
1888. Copyright (c) 2016-2017 the Civetweb developers * * Permission is hereby granted, free of charge, to any person obtaining a copy * of this software and associated documentation files (the "Software"), to deal * in the Software without restriction, including without limitation the rights * to use, copy, modify, merge, publish, distribute, sublicense, and/or sell * copies of the Software, and to permit persons to whom the Software is * furnished to do so, subject to the following conditions: * * The above copyright notice and this permission notice shall be included in * all copies or substantial portions of the Software. * * THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR * IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, * FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE * AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER * LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, * OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN * THE SOFTWARE.
1889. RFC 2616 Sec. 2.2 defines a list of allowed * separators, but many of them make no sense * here, e.g. various brackets or slashes. * If they are used, probably someone is * trying to attack with curious hand made * requests. Only ; , space and tab seem to be * reasonable here. Ignore everything else.
1890. End of handle_form.inl
1891. If the boundary is quoted, trim the quotes
1892. Next, we need to get the part header: Read until \r\n\r\n
1893. TODO: Create a function to get "all_data_read" from * the conn object. All data is read if the Content-Length * has been reached, or if chunked encoding is used and * the end marker has been read, or if the connection has * been closed.
1894. RFC 2046 permits the boundary string to be quoted.
1895. Store the content to a file
1896. if (field_storage == FORM_FIELD_STORAGE_READ) {
1897. In theory, it could be possible that someone crafts * a request like name=filename=xyz. Check if name and * filename do not overlap.
1898. Log error message and stop parsing the form data.
1899. Skip \r\n\r\n
1900. There has to be a BOUNDARY definition in the Content-Type header
1901. No data
1902. name= without quotes is also allowed
1903. Try the same without quotes
1904. Out of memory
1905. In every "field_found" callback we ask what to do with the * data ("field_storage"). This could be: * FORM_FIELD_STORAGE_SKIP (0) ... ignore the value of this field * FORM_FIELD_STORAGE_GET (1) ... read the data and call the get * callback function * FORM_FIELD_STORAGE_STORE (2) ... store the data in a file * FORM_FIELD_STORAGE_READ (3) ... let the user read the data * (for parsing long data on the fly) * (currently not implemented) * FORM_FIELD_STORAGE_ABORT (flag) ... stop parsing
1906. Split data in a=1&b=xy&c=3&c=4 ...
1907. The form data is in the request body data, encoded in key/value * pairs.
1908. avoid warning
1909. Must not be smaller than ~900 - see sanity check
1910. read error
1911. **comment:** The idea of "field_storage=read" is to let the API user read * data chunk by chunk and to some data processing on the fly. * This should avoid the need to store data in the server: * It should neither be stored in memory, like * "field_storage=get" does, nor in a file like * "field_storage=store". * However, for a "GET" request this does not make any much * sense, since the data is already stored in memory, as it is * part of the query string.
label: code-design
1912. Loop to read values larger than sizeof(buf)-keylen-2
1913. Log error message and skip this field.
1914. Remove from the buffer
1915. The entire data has already been loaded, so there is no need to * call mg_read. We just need to split the query string into key-value * pairs.
1916. init here, to a avoid a false positive "uninitialized variable used" warning
1917. Equivalent to "upload" callback of "mg_upload".
1918. Every part must end with \r\n, if there is another part. * The end of the request has an extra --
1919. End of the request
1920. According to the RFC, every part has to have a header field like: * Content-Disposition: form-data; name="..."
1921. It could be somethingname= instead of name=
1922. Stop parsing the request
1923. Proceed to next entry
1924. Skip all spaces between MULTIPART/FORM-DATA; and BOUNDARY=
1925. Find boundary
1926. Content-Type: application/octet-stream
1927. Get the optional filename="..." part of the Content-Disposition * header.
1928. **comment:** This line is not required, but otherwise some compilers * generate spurious warnings.
label: code-design
1929. Set "towrite" to the number of bytes available * in the buffer
1930. TODO: Create a function to get "all_data_read" * from the conn object. All data is read if the * Content-Length has been reached, or if chunked * encoding is used and the end marker has been * read, or if the connection has been closed.
1931. **comment:** we do not need mg_cry here, so conn is currently unused
label: code-design
1932. This callback will deliver partial contents
1933. **comment:** Do some sanity checks for boundary lengths
label: code-design
1934. It could be somethingfilename= instead of filename=
1935. stored successfully
1936. The form data is in the request body data, encoded as multipart * content (see <https://www.ietf.org/rfc/rfc1867.txt>, * <https://www.ietf.org/rfc/rfc2388.txt>).
1937. Call callback for new field
1938. From RFC 2046: * Boundary delimiters must not appear within the * encapsulated material, and must be no longer * than 70 characters, not counting the two * leading hyphens.
1939. Subtract the boundary length, to deal with * cases the boundary is only partially stored * in the buffer.
1940. If filename=" is found, search for the closing "
1941. Should we use a config file ?
1942. Initialize the dialog elements
1943. **comment:** Unused code from "string duplicate with escape"
label: code-design
1944. Errno will still hold the error from fopen.
1945. invalid number
1946. Show usage if -h or --help options are specified
1947. option set correctly
1948. Trim additional spaces between option name and value - then * (line+j) contains the option value
1949. Set by init_system_info()

2320. mg.get_option

2321. Add padding and return the message digest.

2322. SHA-1 in C By Steve Reid <sreid@sea-to-sky.net> 100% Public Domain ----- Modified 7/98 By James H. Brown <jbrown@burgoyne.com> Still 100% Public Domain Corrected a problem which generated improper hash values on 16 bit machines Routine SHA1Update changed from void SHA1Update(SHA_CTX* context, unsigned char* data, unsigned int len) to void SHA1Update(SHA_CTX* context, unsigned char* data, unsigned long len) The 'len' parameter was declared an int which works fine on 32 bit machines. However, on 16 bit machines an int is too small for the shifts being done against it. This

caused the hash function to generate incorrect values if len was greater than 8191 (8K - 1) due to the 'len << 3' on line 3 of SHA1Update(). Since the file IO in main() reads 16K at a time, any file 8K or larger would be guaranteed to generate the wrong hash (e.g. Test Vector #3, a million "a"s). I also changed the declaration of variables i & j in SHA1Update to unsigned long from unsigned int for the same reason. These changes should make no difference to any 32 bit implementations since an int and a long are the same size in those environments. -- I also corrected a few compiler warnings generated by Borland C. 1. Added #include <process.h> for exit() prototype 2. Removed unused variable 'j' in SHA1Final 3. Changed exit(0) to return(0) at end of main. ALL changes I made can be located by searching for comments containing 'JHB' ----- Modified 8/98 By Steve Reid <sreid@sea-to-sky.net> Still 100% public domain 1- Removed #include <process.h> and used return() instead of exit() 2- Fixed overwriting of finalcount in SHA1Final() (discovered by Chris Hall) 3- Changed email address from steve@edmweb.com to sreid@sea-to-sky.net ----- Modified 4/01 By Saul Kravitz <Saul.Kravitz@celera.com> Still 100% PD Modified to run on Compaq Alpha hardware. ----- Modified 07/2002 By Ralph Giles <giles@ghostscript.com> Still 100% public domain modified for use with stdint types, autoconf code cleanup, removed attribution comments switched SHA1Final() argument order for consistency use SHA1_ prefix for public api move public api to sha1.h

2379. #fnfdef CIVETWEB LUA_H

2380. Lua 5.3 detected

2381. Shared helper to generate DUK_OPT_xxx and DUK_USE_xxx documentation. XXX: unfinished placeholder

2382. Add a header snippet for detecting presence of DUK_OPT_xxx feature options which will be removed in Duktape 2.x.

2383. Add a header snippet for providing a __OVERRIDE_DEFINES__ section.

2384. XXX: unsigned constants?

2385. Globals holding scanned metadata, helper snippets, etc

2386. verbatim text for the entire line

2387. **comment:** Derived defines (DUK_USE_INTEGER_LE, etc) from DUK_USE_BYTEORDER. Duktape internals currently rely on the derived defines. This is after sanity checks because the derived defines are marked removed.

label: code-design

2388. Add original snippets. This fills in the required nodes recursively.

2389. **comment:** DUK_OPT_xxx always come from outside

label: code-design

2390. print('#snippet ' + sub_fn)

2391. already present

2392. **comment:** XXX: more checks

label: code-design

2393. Assume these provides come from outside.

2394. Feature selection, system include, Date provider Most #include statements are here

2395. Remaining tags in alphabetic order

2396. Automatic DUK_OPT_xxx feature option handling

2397. key is known

2398. Byte order and alignment defines are allowed to be missing, a fill-in will handle them. This is necessary because for some architecture byte order and/or alignment may vary between targets and may be software configurable.

2399. integer value

2400. Figure out fill-ins by looking for snippets not in original list and without any unserialized dependent nodes.

2401. **comment:** Autogeneration of option documentation

label: documentation

2402. duk_config.h generation

2403. print(repr(graph)) print(repr(snlist)) print('Resolved helper defines: %r' % resolved)

2404. Detect and reject 'fast math'

2405. **comment:** XXX: conditional warning, happens in some normal cases print('WARNING: define %r required, not provided so far' % k)

label: code-design

2406. Helper for building a text file from individual lines, injected files, etc. Inserted values are converted to Snippets so that their provides/requires information can be tracked. When non-C outputs are created, these will be bogus but ignored.

2407. Don't allow e.g. DUK_USE_ which results from matching DUK_USE_xxx

2408. NOTE: careful with Python equality, e.g. "0 == False" is true.

2409. Metadata to scan from config files.

2410. Generate a duk_config.h where platform, architecture, and compiler are all either autodetected or specified by user. Autodetection is based on a configured list of supported platforms, architectures, and compilers. For example, platforms.yaml defines the supported platforms and provides a helper define (DUK_F_xxx) to use for detecting that platform, and names the header snippet to provide the platform-specific definitions. Necessary dependencies (DUK_F_xxx) are automatically pulled in. Automatic "fill ins" are used for mandatory platform, architecture, and compiler defines which have a reasonable portable default. This reduces e.g. compiler-specific define count because there are a lot compiler macros which have a good default.

2411. **comment:** XXX: require automatic detection to be signaled? e.g. define DUK_USE_ALIGN_BY -1 define DUK_USE_BYTE_ORDER -1

label: code-design

2412. Development time helper: add DUK_ACTIVE which provides a runtime C string indicating what DUK_USE_xxx config options are active at run time. This is useful in genconfig development so that one can e.g. diff the active run time options of two headers. This is intended just for genconfig development and is not available in normal headers.

2413. Default value is false, and caller has emitted an unconditional #undef, so don't emit a duplicate

2414. Platform, architecture, compiler fillins. These are after all detection so that e.g. DUK_SPRINTF() can be provided by platform or compiler before trying a fill-in.

2415. Main

2416. **comment:** XXX: indicate feature option support, sanity checks enabled, etc in general summary of options, perhaps genconfig command line?

label: code-design

2417. sort under primary tag

2418. **comment:** for line in stripped_lines: print(line)

label: code-design

2419. **comment:** XXX: better to lookup compilers metadata

label: code-design

2420. Compiler files must provide at least these (additional checks in validate_compiler_file()). Fill-ins provide missing optionals.

2421. Header snippet representation: lines, provides defines, requires defines.

2422. **comment:** Find a header snippet which provides the missing define. Some DUK_F_xxx files provide multiple defines, so we don't necessarily know the snippet filename here.

label: code-design

2423. signal to fillin

2424. print('Tags: %r' % use_tags_list)

2425. must be #define'd

2426. Compatibility with Duktape 1.3

2427. compiling Duktape from a single source file (duktape.c) version compiling Duktape (not user application) artifact, include guard

2428. Forced options from multiple sources are gathered into a shared list so that the override order remains the same as on the command line.

2429. Avoid ambiguous hex escapes

2430. Snippet provides its own require; omit

2431. print('config option %s not covered by manual snippets, emitting default automatically' % k)

2432. **comment:** XXX: rst or other format

label: code-design

2433. C string value

2434. Platform files must provide at least these (additional checks in validate_platform_file()). Fill-ins provide missing optionals.

2435. shallow copy

2436. Architecture files must provide at least these (additional checks in validate_architecture_file()). Fill-ins provide missing optionals.

2437. Generate a duk_config.h header with platform, compiler, and architecture either autodetected (default) or specified by user. Support for autogenerated DUK_OPT_xxx flags is also selected by user.

2438. **comment:** XXX: aware of target version

label: code-design

2439. Preferred tags first

2440. snippet list

2441. **comment:** XXX: better to lookup architectures metadata

label: code-design

2442. graph[A] = [B, ...] <-> B, ... provide something A requires.

2443. x is a Snippet

2444. Helper headers snippets.

2445. lines of text and/or snippets map from define to 'True' for now map from define to 'True' for now

2446. **comment:** Insert missing define dependencies into index 'idx_deps' repeatedly until no unsatisfied dependencies exist. This is used to pull in the required DUK_F_xxx helper defines without pulling them all in. The resolution mechanism also ensures dependencies are pulled in the correct order, i.e. DUK_F_xxx helpers may depend on each other (as long as there are no circular dependencies). XXX: this can be simplified a lot

label: code-design

2447. strip last newline to avoid empty line

2448. **comment:** DUK_USE_xxx are internal and they should not be 'requirements'

label: code-design

2449. This is a fallback in case config option metadata is wrong.

2450. byteorder provided by all architecture files alignment provided by all architecture files packed tval provided by all architecture files

2451. print('Autoscanning snippet: %s' % fn)

2452. for printing only

2453. **comment:** XXX: detect and handle loops cleanly

label: code-design

2454. Emit a default #define / #undef for an option based on a config option metadata node (parsed YAML doc).

2455. Object layout

2456. Careful with order, snippet may self-reference its own defines in which case there's no outward dependency. (This is not 100% because the order of require/provide matters and this is not handled now.) Also, some snippets may #undef/#define another define but they don't "provide" the define as such. Such redefinitions are marked /* redefine */ in the snippets. They're best avoided (and not currently needed in Duktape 1.4.0).

2457. **comment:** Add a header snippet for checking consistency of DUK_USE_xxx config options, e.g. inconsistent options, invalid option values.

label: code-design

2458. Helpers for duk_config.h generation

2459. must be #define'd may be #undef'd, as long as provided may be #undef'd, as long as provided may be #undef'd, as long as provided

2460. Snippet may have further unresolved provides; add recursively

2461. For some options like DUK_OPT_PACKED_TVAL the default comes from platform definition.

2462. **comment:** XXX: assume no newlines etc

label: code-design

2463. Date provider snippet is after custom header and overrides, so that the user may define e.g. DUK_USE_DATE_NOW_GETTIMEofday in their custom header.

2464. **comment:** /usr/bin/env python2 Process Duktape option metadata and produce various useful outputs: - duk_config.h with specific or autodetected platform, compiler, and architecture; forced options; sanity checks; etc - option documentation for Duktape 1.x feature options (DUK_OPT_xxx) - option documentation for Duktape 1.x/2.x config options (DUK_USE_xxx) Genconfig tries to build all outputs based on modular metadata, so that managing a large number of config options (which is hard to avoid given the wide range of targets Duktape supports) remains maintainable. Genconfig does *not* try to support all exotic platforms out there. Instead, the goal is to allow the metadata to be extended, or to provide a reasonable starting point for manual duk_config.h tweaking. For Duktape 1.3 release the main goal was to autogenerate a Duktape 1.2 compatible "autodetect" header from legacy snippets, with other outputs being experimental. For Duktape 1.4 duk_config.h is always created from modular sources.

label: code-design

2465. **comment:** Not exact but close enough. Doesn't handle string literals etc, but these are not a concrete issue for scanning preprocessor #define references. Comment contents are stripped of any DUK_ prefixed text to avoid incorrect requires/provides detection. Other comment text is kept; in particular a /* redefine */ comment must remain intact here. (The 'redefine' hack is not actively needed now.) Avoid Python 2.6 vs. Python 2.7 argument differences.

label: code-design

2466. If manually-edited snippets don't #define or #undef a certain config option, emit a default value here. This is useful to fill-in for new config options not covered by manual snippets (which is intentional).

2467. position where to emit DUK_F_xxx dependencies

2468. **comment:** XXX: platform/compiler could provide types; if so, need some signaling defines like DUK_F_TYPEDEFS_DEFINED

label: code-design

2469. **comment:** Compilers need a lot of defines; missing defines are automatically filled in with defaults (which are mostly compiler independent), so the requires define list is not very large.

label: code-design

2470. **comment:** C preprocessor '#warning' is often supported

label: code-design

2471. print('Resolving %r' % k)

2472. Miscellaneous helpers

2473. If a related feature option exists, it can be used to force enable/disable the target feature. If neither feature option (DUK_OPT_xxx or DUK_OPT_NO_xxx) is given, revert to default.

2474. print('Deleting temporary directory: %r' % dirname)

2475. at least one other node provides 'k'

2476. Preferred tag order for generated C header files.

2477. **comment:** XXX: better plumbing for lookup path

label: code-design

2478. Add automatic DUK_OPT_XXX and DUK_OPT_NO_XXX handling for backwards compatibility with Duktape 1.2 and before.

2479. DUK_SETJMP, DUK_LONGJMP, DUK JMPBUF_TYPE are optional, fill-in provides if none defined.

2480. for trailing newline

2481. Forced options, last occurrence wins (allows a base config file to be overridden by a more specific one).

2482. DUK_F_xxx snippets

2483. emit tag heading only if there are subsections

2484. **comment:** XXX: placeholder, need to decide on markup conventions for YAML files

label: code-design

2485. Number types

2486. print('REQUIRES: %r' % m)

2487. **comment:** XXX: better to lookup platforms metadata

label: code-design

2488. verbatim value

2489. **comment:** uppercase only, don't match DUK_USE_xxx for example

label: code-design

2490. **comment:** XXX: assume no newlines etc XXX: support compiler specific warning mechanisms

label: code-design

2491. print('Effective tag order: %r' % tags)

2492. **comment:** Don't allow e.g. DUK_USE_ which results from matching DUK_USE_xxx print('PROVIDES: %r' % m.group(1))

label: code-design

2493. DUK_F_UCLIBC is special because __UCLIBC__ is provided by an #include file, so the check must happen after platform includes. It'd be nice for this to be automatic (e.g. DUK_F_UCLIBC.h.in could indicate the dependency somehow).

2494. Emit forced options. If a corresponding option is already defined by a snippet above, #undef it first.

2495. DLL build affects visibility attributes on Windows but unfortunately cannot be detected automatically from preprocessor defines or such. DLL build status is hidden behind DUK_F_DLL_BUILD and there are two ways for that to be set: - Duktape 1.3 backwards compatible DUK_OPT_DLL_BUILD - Genconfig --dll

option

2496. Preferred tag order for option documentation.

2497. XXX: check that YAML parses

2498. Pretty print a debugger command.

2499. Duktape internal class numbers, must match C headers

2500. Write a string into a buffer interpreting codepoints U+0000...U+00FF * as bytes. Drop higher bits.

2501. **comment:** XXX: add constants inline to preformatted output (e.g. for strings, add a short escaped snippet as a comment on the line after the compact argument list).

label: code-design

2502. absFn -> true

2503. Errors

2504. true

2505. We shouldn't come here, but if we do, JSON is a reasonable default.

2506. Could emit a 'debug-value' event here, but that's not necessary because the receiver will just collect statistics which can also be done using the finished message.

2507. **comment:** XXX: move this to the web UI so that the UI can control what locals are listed (or perhaps show locals for all levels with an expandable tree view).

label: code-design

2508. There is no close() or destroy() for a passthrough stream, so just close the outputParser which will cancel timers etc.

2509. Raw bytes Unicode string

2510. Still waiting for version identification to complete.

2511. **comment:** Pending flags are used to avoid requesting the same thing twice while a previous request is pending. The flag-based approach is quite awkward. Rework to use promises.

label: code-design

2512. 2-byte string

2513. undefined

2514. * JSON debug proxy

2515. msg.varname is a proper Unicode strings here, and needs to be converted into a protocol string (U+0000...U+00FF).

2516. new object, old may be in circulation for a while

2517. list of command names, merged client/target

2518. XXX: normalize last newline (i.e. force a newline if contents don't end with a newline)?

2519. accumulate data accumulated message until EOM

2520. A PutVar call quite possibly changes the local variables so always re-read locals afterwards. We don't need to wait for PutVar to complete here; the requests will pipeline automatically and be executed in order.

2521. 2-byte buffer

2522. ./foo/bar.js' -> 'foo/bar.js'

2523. whole

2524. Commands initiated by Duktape

2525. Not all streams will emit this.

2526. Pretty print a dvalue. Useful for dumping etc.

2527. Could also check for an empty request queue, but that's probably too strict?

2528. Technically we should wait for each delbreak reply but because target processes the requests in order, it doesn't matter.

2529. Protocol version handling. When dumping an output stream, the caller gives a non-null protocolVersion so we don't read one here.

2530. **comment:** Check if 'msg' would encode to the same JSON which was previously sent to the web client. The caller then avoid resending unnecessary stuff.

label: code-design

2531. Up-to-date list of breakpoints on target

2532. **comment:** XXX: do pretty printing in debug client for now

label: code-design

2533. console.log(JSON.stringify(msg));

2534. Duktape heapHdr type constants, must match C headers

2535. * Debugger implementation * * A debugger instance communicates with the debug target and maintains * persistent debug state so that the current state can be resent to the * socket.io client (web UI) if it reconnects. Whenever the debugger state * is changed an event is generated. The socket.io handler will listen to * state change events and push the necessary updates to the web UI, often * in a rate limited fashion or using a client pull to ensure the web UI * is not overloaded. * * The debugger instance assumes that if the debug protocol connection is * re-established, it is always to the same target. There is no separate * abstraction for a debugger session.

2536. error

2537. Decode and normalize source file contents: UTF-8, tabs to 8, * CR LF to LF.

2538. **comment:** unused/none

label: code-design

2539. * Command line parsing and initialization

2540. "notify" can be a string or "true"

2541. Shouldn't come here.

2542. 4-byte signed integer

2543. For the unquoted version we don't need to escape single or double quotes.

2544. unsigned

2545. msg.input is a proper Unicode strings here, and needs to be converted into a protocol string (U+0000...U+00FF).

2546. nop: no callback

2547. https://github.com/ryanmcgrath/wrench.js

2548. varvalue is JSON parsed by the web UI for now, need special string encoding here.

2549. Command line options (defaults here, overwritten if necessary)

2550. truncate higher bits

2551. No actual requests sent by the target right now (just notifies).

2552. Encode an ordinary Unicode string into a dvalue compatible format, i.e. * into a byte array represented as codepoints U+0000...U+00FF. Concretely, * encode with UTF-8 and then represent the bytes with U+0000...U+00FF.

2553. console.log('Received json proxy input line: ' + line.toString('utf8'));

2554. * Miscellaneous helpers

2555. indicate 'v' is actually set

2556. Dump effective options. Also provides a list of option names.

2557. Although the underlying transport may not have a close() or destroy() method or even a 'close' event, this method is always available and will generate a 'transport-close'. The caller is responsible for closing the underlying stream if that is necessary.

2558. A byline-parser is simple and good enough for now (assume compact JSON with no newlines).

2559. override

2560. update run state now that we're paused

2561. duk_tval number, any IEEE double decode into hex big endian ieee double

2562. just trigger a sync, gets rate limited

2563. **comment:** Convert a buffer into a string using Unicode codepoints U+0000...U+00FF. * This is the NodeJS 'binary' encoding, but since it's being deprecated, * reimplement it here. We need to avoid parsing strings as e.g. UTF-8: * although Duktape strings are usually UTF-8/CESU-8 that's not always the * case, e.g. for internal strings. Buffer values are also represented as * strings in the debug protocol, so we must deal accurately with arbitrary * byte arrays.

label: code-design

2564. Marker objects for special protocol values

2565. Fetch basic info right away

2566. **comment:** Pretty print a dvalue for UI usage. Everything comes out as a ready-to-use * string. * * XXX: Currently the debug client formats all values for UI use. A better * solution would be to pass values in typed form and let the UI format them, * so that styling etc. could take typing into account.

label: code-design

2567. An eval call quite possibly changes the local variables so always re-read locals afterwards. We don't need to wait for Eval to complete here; the requests will pipeline automatically and be executed in order.

2568. Commands initiated by the debug client (= us)

2569. res.status(200).json(val);

2570. raw identification string

2571. Create debugger and web UI singletons, tie them together and start them.

2572. * Debug protocol parser * * The debug protocol parser is an EventEmitter which parses debug messages * from an input stream and emits 'debug-message' events for completed * messages ending in an EOM. The parser also provides debug dumping, stream * logging functionality, and statistics gathering functionality. * * This parser is used to parse both incoming and outgoing messages. For * outgoing messages the only function is to validate and debug dump the * messages we're about to send. The downside of dumping at this low level * is that we can't match request and reply/error messages here. * * <http://www.sitepoint.com/nodejs-events-and-eventemitter/>

2573. Pretty print a dvalue string (bytes represented as U+0000...U+00FF) * for UI usage without quotes.

2574. Loose matching is tempting but counterproductive: filenames must match 1:1 between the debug client and the debug target for e.g. breakpoints to work as expected. Note that a breakpoint may be assigned by selecting a file from a dropdown populated by scanning the filesystem for available sources and there's no way of knowing if the debug target uses the exact same name.

2575. web UI singleton transport connection to target dummy passthrough for message dumping parser for incoming debug messages parser for outgoing debug messages (stats, dumping)

2576. **comment:** XXX: make the client do this?

label: code-design

2577. // This fails with "RangeError: Maximum call stack size exceeded" for some // reason, so use a much slower variant. for (i = 0, n = buf.length; i < n; i++) { cp[i] = buf[i]; } return String.fromCharCode.apply(String, cp);

2578. We require a destroy() method from the actual target stream

2579. Debug protocol integer

2580. shift forces unsigned

2581. Send a status request to trigger a status notify, result is ignored: target sends a status notify instead of a meaningful reply

2582. See doc/debugger.rst for format description.

2583. Pretty print a dvalue string (bytes represented as U+0000...U+00FF) * for UI usage. Try UTF-8 decoding to get a nice Unicode string (JSON * encoded) but if that fails, ensure that bytes are encoded transparently. * The result is a quoted string with a special quote marker for a "raw" * string when UTF-8 decoding fails. Very long strings are optionally * clipped.

2584. console.dir(argv);

2585. Intentional invalid command

2586. When we fall back to representing bytes, indicate that the string is "raw" with a 'r"' prefix (a somewhat arbitrary convention). U+0022 = ", U+0027 = '

2587. number (IEEE double), big endian

2588. We want the fileMap to contain the filename relative to the search dir root.

2589. Initial debugger connection

2590. Represented signed 32-bit integers as plain integers. Debugger code expects this for all fields that are not duk_tval representations (e.g. command numbers and such).

2591. Right now bytecode is a string containing a direct dump of the bytecode in target endianness. Decode here so that the web UI doesn't need to.

2592. **comment:** The value key should not be used programmatically, it is just there to make the dumps more readable.

label: code-design

2593. msg.varname and msg.varvalue are proper Unicode strings here, they need to be converted into protocol strings (U+0000...U+00FF).

2594. Note: typeof null === 'object', so null special case explicitly

2595. Parse complete dvalues (quite inefficient now) by trial parsing. Consume a value only when it's fully present in 'buf'. See doc/debugger.rst for format description.

2596. 0x80...0xbf: integers 0-63

2597. pointer

2598. * Source file manager * * Scan the list of search directories for Ecmascript source files and * build an index of them. Provides a mechanism to find a source file * based on a raw 'fileName' property provided by the debug target, and * to provide a file list for the web UI. * * NOTE: it's tempting to do loose matching for filenames, but this does * not work in practice. Filenames must match 1:1 with the debug target * so that e.g. breakpoints assigned based on filenames found from the * search paths will match 1:1 on the debug target. If this is not the * case, breakpoints won't work as expected.

2599. not cached, send (cache already updated)

2600. CUSTOMTRANSPORT: to use a custom transport, change this.targetStream to use your custom transport.

2601. Resend all debugger state for new client clear client state cache

2602. Parse arguments.

2603. not negative zero

2604. stats and dumping

2605. map from (merged) command name to number

2606. stats for current debug connection

2607. "request" can be a string or "true"

2608. Use a PassThrough stream to debug dump and get stats for output messages. Simply write outgoing data to both the targetStream and this passthrough separately.

2609. object

2610. * Debugger output formatting

2611. Read final, effective breakpoints from the target

2612. cached

2613. null

2614. **comment:** XXX: unprintable characters etc? In some UI cases we'd want to e.g. escape newlines and in others not.

label: code-design

2615. 4-byte string

2616. String map for commands (debug dumping). A single map works (instead of separate maps for each direction) because command numbers don't currently overlap. So merge the YAML metadata.

2617. nop

2618. lightfunc

2619. false

2620. stream is closed/broken, don't parse anymore

2621. trailing "" intentionally missing

2622. heappt

2623. Explicit rate limiter because this is a source of a lot of traffic.

2624. * Minimal debug web console for Duktape command line tool * * See debugger/README.rst. * * The web UI socket.io communication can easily become a bottleneck and * it's important to ensure that the web UI remains responsive. Basic rate * limiting mechanisms (token buckets, suppressing identical messages, etc) * are used here now. Ideally the web UI would pull data on its own terms * which would provide natural rate limiting. * * Promises are used to structure callback chains. * * <https://github.com/petkaantonov/bluebird> * <https://github.com/petkaantonov/bluebird/blob/master/API.md> *

<https://github.com/petkaantonov/bluebird/wiki/Promise-anti-patterns>

2625. Pretty print a debugger message given as an array of parsed dvalues. * Result should be a pure ASCII one-liner.

2626. Constants

2627. Not possible in practice.

2628. * Express setup and socket.io
2629. Represent non-integers as IEEE double dvalues
2630. UTF-8
2631. **comment:** console logging is done at a higher level to match request/response
 label: code-design
2632. Ignore unknown notify messages
2633. console.log(msg);
2634. 0x60...0x7f: strings with length 0-31
2635. Delete matching breakpoints in reverse order so that indices remain valid. We do this for all operations so that duplicates are eliminated if present.
2636. 0xc0...0xff: integers 0-16383
2637. close previous target connection
2638. 4-byte buffer
2639. inform web UI
2640. XXX: signal success to UI?
2641. Bytecode opcode/extraop metadata
2642. Token bucket rate limiter for a given callback. Calling code calls * trigger() to request 'cb' to be called, and the rate limiter ensures * that 'cb' is not called too often.
2643. Poll various state items when running
2644. pc is preincremented before adding
2645. cache to avoid resending identical data
2646. Here utf8.decode() is better than decoding using NodeJS buffer operations because we want strict UTF-8 interpretation.
2647. Right now the implementation is setInterval-based, but could also be made timerless. There are so few rate limited resources that this doesn't matter in practice.
2648. Value could be a Node.js buffer directly, but we prefer all dvalues to be JSON compatible
2649. this.targetStream.destroy();
2650. nop
2651. Don't add a 'value' key to numbers.
2652. preformatted dvalues
2653. used to flag special values like undefined
2654. **comment:** Pretty print a number for UI usage. Types and values should be easy to * read and typing should be obvious. For numbers, support Infinity, NaN, * and signed zeroes properly.
 label: code-design
2655. no bias in LDINTX
2656. debugger singleton current socket (or null)
2657. Try to detach cleanly, timeout if no response
2658. 4-byte signed integer
2659. heapptr
2660. plain buffer
2661. * Target binary connection handler
2662. number (IEEE double), big endian
2663. Encode arguments into dvalues.
2664. **comment:** XXX: write a notify to target?
 label: code-design
2665. disconnect JSON client too (if not already disconnected)
2666. * JSON proxy server * * Accepts an incoming JSON proxy client and connects to a debug target, * tying the two connections together. Supports both a single connection * and a persistent mode.
2667. true
2668. truncate higher bits
2669. * JSON connection handler
2670. Represented signed 32-bit integers as plain integers. Debugger code expects this for all fields that are not duk_tval representations (e.g. command numbers and such).
2671. Not possible in practice.
2672. * Main
2673. indicate 'v' is actually set
2674. **comment:** The value key should not be used programmatically, it is just there to make the dumps more readable.
 label: code-design
2675. 2-byte string
2676. Once we're connected to the target, start read both binary and JSON input. We don't want to read JSON input before this so that we can always translate incoming messages to dvalues and write them out without queueing. Any pending JSON messages will be queued by the OS instead.
2677. Generic handshake format: only relies on initial version field.
2678. undefined
2679. 0x80...0xbff: integers 0-63
2680. pointer
2681. 0x60...0x7f: strings with length 0-31
2682. Represent non-integers as IEEE double dvalues.
2683. 0xc0...0xff: integers 0-16383
2684. Trial parse dvalue(s) and debug messages.
2685. default logger log.l = 0; // enable debug and trace logging
2686. 4-byte buffer
2687. **comment:** for manual testing of binary/json parsing robustness
 label: code-design
2688. 2-byte buffer
2689. Parse message type, determine initial marker for binary message.
2690. Note that typeof null === 'object'.
2691. * Config
2692. * Misc helpers
2693. **comment:** * JSON debug proxy written in DukLuv * * This single file JSON debug proxy implementation is an alternative to the * Node.js-based proxy in duk_debug.js. DukLuv is a much smaller dependency * than Node.js so embedding DukLuv in a debug client is easier.
 label: code-design
2694. Feed the data one byte at a time when torture testing.
2695. When this is invoked the proxy connection and the target connection have both been closed.
2696. Add an EOM, and write out the dvalues to the debug target.
2697. * Detect missing 'var' declarations
2698. whole
2699. not negative zero
2700. Receive data into 'incoming', resizing as necessary.
2701. explicit flag for e.g. v === undefined
2702. disconnect target too (if not already disconnected)
2703. **comment:** XXX: it'd be nice to log remote peer host:port
 label: code-design

2704. make a copy, ensuring there's no slice offset get underlying plain buffer
2705. Trial parse JSON message(s).
2706. This is still pretty awkward in Duktape 1.4.x. Argument may be a "slice" and we want a copy of the slice (not the full underlying buffer).
2707. **comment:** XXX: Code assumes uv.write() will write fully. This is not necessarily true; should add support for partial writes (or at least failing when a partial write occurs).
label: code-design
2708. Prevent new bindings on global object. This detects missing 'var' declarations, e.g. "x = 123;" in a function without declaring it.
2709. object
2710. lightfunc
2711. skip dukluv and script name
2712. null
2713. More detailed v1 handshake line.
2714. **comment:** unnecessary but just in case
label: code-design
2715. 4-byte string
2716. **comment:** unused/none
label: code-design
2717. don't register any sockets/timers etc to exit
2718. **comment:** In lenient mode if JSON parse fails just send back an _Error and ignore the line (useful for initial development). In non-lenient mode drop the connection here; if the failed line was a request the client is expecting a reply/error message back (otherwise it may go out of sync) but we can't send a synthetic one (as we can't parse the request).
label: code-design
2719. Trial parse handshake unless done.
2720. false

2731. #right-area
2732. **comment:** XXX: how to minimize the chance we'll further communicate with the server or reconnect to it? socket.reconnection()
label: code-design
2733. **comment:** XXX: prevent retry of no-such-file by negative caching?
label: code-design
2734. Eval may take seconds to complete so indicate it is pending.
2735. Bytecode dialog highlight
2736. If previous update is pending, abort and start a new one.
2737. http://diveintohtml5.info/storage.html
2738. Note: loadedFileName can be either from target or from server, but they must match exactly. We could do a loose match here, but exact matches are needed for proper breakpoint handling anyway.
2739. Remove eval button "pulsating" glow when we get a result
2740. may be null
2741. Remove pending highlight once we're no longer running.
2742. Update the "console" output based on lines sent by the server. The server rate limits these updates to keep the browser load under control. Even better would be for the client to pull this (and other stuff) on its own.
2743. * Duktape debugger web client * * Talks to the NodeJS server using socket.io. * * http://unixpapa.com/js/key.html
2744. If we just became paused, check for eval watch
2745. Make copies of the requested file/line so that we have the proper values in case they've changed.
2746. * UI update handling when exec-status update arrives
2747. Active breakpoints follow
2748. Exact match is required.
2749. **comment:** XXX: any faster way; elems doesn't have e.g. indexOf()
label: code-design
2750. **comment:** XXX: ignore issue with last empty line for now
label: code-design
2751. returns a Manager
2752. Update interval for custom source highlighting.
2753. Duktape now restricts execution status updates quite effectively so there's no need to rate limit UI updates now.
2754. **comment:** XXX: hacky transition, make source change visible
label: code-design
2755. puff slide, puff
2756. onclick handler for exec status text
2757. Source is updated periodically. Other code can also call doSourceUpdate() directly if an immediate update is needed.
2758. * AJAX request handling to fetch source files
2759. **comment:** XXX: error transition here
label: requirement
2760. If we're executing the file shown, highlight current line
2761. **comment:** Scroll to requested line. This is not very clean, so a better solution should be found: https://developer.mozilla.org/en-US/docs/Web/API/Element.scrollIntoView http://erraticdev.blogspot.fi/2011/02/jquery-scroll-into-view-plugin-with.html
http://flesler.blogspot.fi/2007/10/jqueryscrollto.html
label: code-design
2762. Make source window grey when running for a longer time, use a small delay to avoid flashing grey when stepping.
2763. **comment:** Source view file that we want to be loaded in source view scroll to line once file has been loaded line that we want to highlight (if any) currently loaded (shown) file currently loaded file line count true if currFileName (loosely) matches loadedFileName if set, scroll loaded file to requested line highlight line line numbers which have been modified (added classes etc, tracked for removing) timer for updating source view current AJAX request for fetching a source file (if any) hack to reset button states bytecode dialog active index of currently highlighted line (or null) index to first line of bytecode instructions
label: code-design
2764. Remove previously added custom classes
2765. Not really interesting in the UI \$(#server-info').text(new Date() + ': ' + JSON.stringify(msg));
2766. Not 100% reliable if callstack has several functions of the same name
2767. If no-one requested us to scroll to a specific line, finish.
2768. Update buttons

2769. <http://stackoverflow.com/questions/14918787/jquery-scroll-to-bottom-of-div-even-after-it-updates> Stop queued animations so that we always scroll quickly to bottom
2770. First line is special
2771. AJAX request for the source.
2772. * Initialization
2773. About dialog, shown automatically on first startup.
2774. Enter handling for eval input <https://forum.jquery.com/topic/bind-html-input-to-enter-key-keypress>
2775. Eval watch handling
2776. We'd like to window.close() here but can't (not allowed from scripts). Alert is the next best thing.
2777. float
2778. Bytecode dialog
2779. Force source view to match currFileName only when running or when just became paused (from running or detached).
2780. nop
2781. Force line update (scrollTop) only when running or just became paused. Otherwise let user browse and scroll source files freely.
2782. Not worth alerting about because source fetch errors happen all the time, e.g. for dynamically evaluated code.
2783. Execution state previous execution state ('paused', 'running', etc) previous debugger attached state (true, false, null) current filename being executed current function name being executed current line being executed current bytecode PC being executed current execution state ('paused', 'running', 'detached', etc) current debugger attached state (true or false) current local variables current callstack (from top to bottom) current breakpoints timestamp when last started running (if running) (used to grey out the source file if running for long enough)
2784. * Source view periodic update handling
2785. If we just started running, store a timestamp so we can grey out the source view only if we execute long enough (i.e. we're not just stepping).
2786. **comment:** The variable value is parsed as JSON right now, but it'd be better to also be able to parse buffer values etc.
 label: code-design
2787. * Init socket.io and add handlers
2788. don't clear eval input
2789. * AJAX request for fetching the source list
2790. This is worth alerting about as the UI is somewhat unusable if we don't get a source list.
2791. Update current execution state
2792. Add breakpoints
2793. * Helpers
2794. Pause may take seconds to complete so indicate it is pending.
2795. This must fit into the smallest pool entry.
2796. Define to enable some debug printfs.
2797. Use 'st' as udata.
2798. **comment:** #define DUK_ALLOC_HYBRID_DEBUG
 label: code-design
2799. **comment:** * Example memory allocator with pool allocation for small sizes and * fallback into malloc/realloc/free for larger sizes or when the pools * are exhausted. * * Useful to reduce memory churn or work around a platform allocator * that doesn't handle a lot of small allocations efficiently.
 label: code-design
2800. Still fits, no shrink support.
2801. 'ptr' cannot be NULL.
2802. DUK_ALLOC_HYBRID_H_INCLUDED
2803. **comment:** The double value in the union is there to ensure alignment is * good for IEEE doubles too. In many 32-bit environments 4 bytes * would be sufficiently aligned and the double value is unnecessary.
 label: code-design

2893. Bytecode.
2894. in interactive mode, write to stdout
2895. Try to use NODEFS to provide access to local files. Mount the * CWD as /working, and then prepend "/working/" to relative native * paths in file calls to get something that works reasonably for * relative paths. Emscripten doesn't support replacing virtual * "/" with host "/" (the default MEMFS at "/" can't be unmounted) * but we can mount "/tmp" as host "/tmp" to allow testcase runs. * * https://kripken.github.io/emscripten-site/docs/api_reference/Filesystem-API.html#filesystem-api-nodefs * https://github.com/kripken/emscripten/blob/master/tests/fs/test_nodefs_rw.c
2896. **comment:** Suppress warnings about plain fopen() etc.
 label: code-design
2897. suppress warning
2898. try { FS.mkdir("/tmp"); } catch (e) { console.log("Failed to create virtual /tmp: " + e); }
2899. Should never happen, just in case.
2900. * Execute any argument file(s)

2901. **comment:** duk_safe_call() cleans up
label: code-design

2902. * Parse options

2903. an error 'taints' the execution

2904. At the moment it's not possible to replace the default MEMFS mounted at '/': * <https://github.com/kripken/emscripten/issues/2040> *
https://github.com/kripken/emscripten/blob/incoming/src/library_fs.js#L1341-L1358

2905. **comment:** This is useful at the global level; libraries should avoid SIGPIPE though
label: code-design

2906. nargs

2907. Helper define to enable a feature set; can also use separate defines.

2908. Last component is partial, complete.

2909. **comment:** Workaround for snprintf() missing in older MSVC versions. * Note that _snprintf() may not NUL terminate the string, but * this difference does not matter here as a NUL terminator is * always explicitly added.
label: code-design

2910. Ignore array index keys: usually not desirable, and would * also require ['0'] quoting.

2911. Scan backwards for a maximal string which looks like a property * chain (e.g. foo.bar.quux).

2912. skip filename

2913. **comment:** * Heap initialization when using AllJoyn.js pool allocator (without any * other AllJoyn.js integration). This serves as an example of how to * integrate Duktape with a pool allocator and is useful for low memory * testing. * * The pool sizes are not optimized here. The sizes are chosen so that * you can look at the high water mark (hwm) and use counts (use) and see * how much allocations are needed for each pool size. To optimize pool * sizes more accurately, you can use -alloc-logging and inspect the memory * allocation log which provides exact byte counts etc. * * <https://git.allseenalliance.org/cgit/core/alljoyn-js.git> *
<https://git.allseenalliance.org/cgit/core/alljoyn-js.git/tree/ajs.c>
label: code-design

2914. This extern declaration is provided by duktape.h, array provided by duktape.c.

2915. heapConfig

2916. Enable heap dumps

2917. duk_heap, with heap ptr compression, ROM strings+objects

2918. ...

2919. Scan ROM pointer range for faster detection of "is 'p' a ROM pointer" * later on.

2920. heapSz

2921. **comment:** not needed
label: requirement

2922. numPools

2923. **comment:** * Simplified example of an external strings strategy where incoming strings * are written sequentially into a fixed, memory mapped flash area. * * The example first scans if the string is already in the flash (which may * happen if the same string is interned multiple times), then adds it to * flash if there is space. * * This example is too slow to be used in a real world application: there * should be e.g. a hash table to quickly check for strings that are already * present in the string data (similarly to how string interning works in * Duktape itself).
label: code-design

2924. * Not present yet, check if we have space. Again, be careful to * ensure there is space for a NUL following the input data.

2925. Linear scan. An actual implementation would need some acceleration * structure, e.g. select a sublist based on first character. * * NOTE: input string (behind 'ptr' with 'len' bytes) DOES NOT have a * trailing NUL character. Any strings returned from this function * MUST have a trailing NUL character.

2926. * 'ajduk' specific functionality, examples for low memory techniques

2927. Pointer compression with ROM strings/objects: * * For now, use DUK_USE_ROM_OBJECTS to signal the need for compressed ROM * pointers. DUK_USE_ROM_PTRCOMP_FIRST is provided for the ROM pointer * compression range minimum to avoid duplication in user code.

2928. to avoid empty source file

2929. Ensure that we always get the heap_udata given in heap creation. * (Useful for Duktape development, not needed for user programs.)

2930. AjsHeap.dump(), allows Ecmascript code to dump heap status at suitable * points.

2931. heapNum

2932. protected call not yet running

2933. **comment:** The if-condition should be the fastest possible check * for "is 'p' in ROM?". If pointer is in ROM, we'd like * to compress it quickly. Here we just scan a ~1K array * which is very bad for performance and for illustration * only.
label: code-design

2934. Ensure that we always get the heap_udata given in heap creation.

2935. heap

2936. * These strings are from util/duk_meta_to_strarray.py

2937. **comment:** * Check if we already have the string. Be careful to compare for * NUL terminator too, it is NOT present in 'ptr'. This algorithm * is too simplistic and way too slow for actual use.
label: code-design

2938. duk_heap, with heap ptr compression, RAM strings+objects

2939. This is a blind lookup, could check index validity. * Duktape should never decompress a pointer which would * be out-of-bounds here.

2940. **comment:** * External strings strategy intended for valgrind testing: external strings * are allocated using malloc()/free() so that valgrind can be used to ensure * that strings are e.g. freed exactly once.
label: code-design

2941. * These strings are manually added, and would be gathered in some * application specific manner.

2942. **comment:** It's not worth it to make very small strings external, as * they would take the same space anyway. Also avoids zero * length degenerate case.
label: code-design

2943. **comment:** Somewhat portable way of losing a const without warnings. * Another approach is to cast through intptr_t, but that * type is not always available.
label: code-design

2944. * Example pointer compression functions. * * 'base' is chosen so that no non-NULL pointer results in a zero result * which is reserved for NULL pointers.

2945. * There is space, add the string to our collection, being careful * to append the NUL.

2946. DUK_CMDLINE_AJSHEAP

2947. **comment:** * Wrapped ajs_heap.c alloc functions * * Used to write an alloc log.
label: code-design

2948. until_nul

2949. We should really never be here: Duktape should only be * compressing pointers which are in the ROM compressed * pointers list, which are known at 'make dist' time. * We go on, causing a pointer compression error.

2950. * Simplified example of an external strings strategy where a set of strings * is gathered during application compile time and baked into the application * binary. * * Duktape built-in strings are available from duk_build_meta.json, see * util/duk_meta_to_strarray.py. There may also be a lot of application * specific strings, e.g. those used by application specific APIs. These * must be gathered through some other means, see e.g. util/scan_strings.py.

2951. * Execution timeout example

2952. See userdata discussion in ajsheap_enc16().

2953. duk_hthread, with heap ptr compression, ROM strings+objects

2954. **comment:** potentially unused
label: code-design

2955. **comment:** Userdata is not needed in this case but would be useful if heap * pointer compression were used for multiple heaps. The userdata * allows the callback to distinguish between heaps and their base * pointers. * * If not needed, the userdata can be left out during compilation * by simply ignoring the userdata argument of the pointer encode * and decode macros. It is kept here so that any bugs in actually * providing the value inside Duktape are revealed during compilation.

3105. XXX: or t->target + t->delay?

3106. **comment:** Active timers. Dense list, terminates to end of list or first unused timer. * The list is sorted by 'target', with lowest 'target' (earliest expiry) last * in the list. When a timer's callback is being called, the timer is moved * to 'timer_expiring' as it needs special handling should the user callback * delete that particular timer.
label: code-design

3107. ignore errors for now -> [... stash eventTimers]

3108. not found, append to list

3109. Initialize global stash 'eventTimers'.

3110. Update timer_count.

3111. Misc

3112. -> [...]

3113. -> [... stash eventTimers retval]

3114. One-shot timer (always removed) or removed by user callback.

3115. Finally, register the callback to the global stash 'eventTimers' object.

3116. * Determine poll() timeout (as close to poll() as possible as * the wait is relative).

3117. Interval timer, not removed by user callback. Queue back to * timer list and bubble to its final sorted position.

3118. deleted, perhaps by previous callback

3119. Timer is now at the last position; use swaps to "bubble" it to its * correct sorted position.

3120. * If exit has been requested, exit without running further * callbacks.

3121. **comment:** mark to-be-deleted, cleaned up by next poll
label: code-design

3122. last timer at timer_count - 1

3123. Zero last element for clarity.

3124. Socket poll state.

3125. [... stash eventTimers]

3126. error

3127. * Compact poll list by removing pollfds with fd == 0.

3128. Set global 'EventLoop'.

3129. eventTimers[timer_id] = callback

3130. **comment:** zeroize unused entries for sanity
label: code-design

3131. Last timer expires first (list is always kept sorted).

3132. -> [... stash eventTimers func]

3133. delay/interval

3134. oneshot=1 (setTimeout), repeated=0 (setInterval)

3135. The callback associated with the timer is held in the "global stash", * in <stash>.eventTimers[String(id)]. The references must be deleted * when a timer struct is deleted.

3136. Get Javascript compatible 'now' timestamp (millisecs since 1970).

3137. events == 0 means stop listening to the FD

3138. -> [timer_id stash eventTimers]

3139. * Expire timers.

3140. Shift elements downwards to keep the timer list dense * (no need if last element).

3141. * If exit requested, bail out as fast as possible.

3142. 't' expires later than 't-1', so swap them and repeat.

3143. Timer to bubble is at index i, timer to compare to is * at i-1 (both guaranteed to exist).

3144. Return timer id.

3145. Bubble last timer on timer list backwards until it has been moved to * its proper sorted position (based on 'target' time).

3146. next target time

3147. i = input index * j = output index (initially same as i)

3148. The C state is now up-to-date, but we still need to delete * the timer callback state from the global 'stash'.

3149. 'rc' fds active

3150. clamping ensures that fits
3151. * Expired timer(s) still exist?
3152. timeout
3153. * Move the timer to 'expiring' for the duration of the callback. * Mark a one-shot timer deleted, compute a new target for an interval.
3154. * Call timer callback. The callback can operate on the timer list: * add new timers, remove timers. The callback can even remove the * expired timer whose callback we're calling. However, because the * timer being expired has been moved to 'timer_expiring', we don't * need to worry about the timer's offset changing on the timer list.
3155. **comment:** this is quite excessive for embedded use, but good for testing
label: code-design
3156. if timeout, no need to check pollfd
3157. The Ecmascript poll handler is passed through EventLoop.fdPollHandler * which c_eventloop.js sets before we come here.
3158. indexes: * 0 = function (callback) * 1 = delay * 2 = boolean: oneshot
3159. -> [func delay oneshot stash eventTimers]
3160. **comment:** * Unlike insertion, deletion needs a full scan of the timer list * and an expensive remove. If no match is found, nothing is deleted. * Caller gets a boolean return code indicating match. * * When a timer is being expired and its user callback is running, * the timer has been moved to 'timer_expiring' and its deletion * needs special handling: just mark it to-be-deleted and let the * expiry code remove it.
label: code-design
3161. nargs
3162. * Poll for activity or timeout.
3163. copy only if indices have diverged
3164. timer has been requested for removal
3165. -> [global EventLoop fdPollHandler]
3166. Because a user callback can mutate the timer list (by adding or deleting * a timer), we expire one timer and then rescan from the end again. There * is a sanity limit on how many times we do this per expiry round.
3167. keep output index the same
3168. **comment:** * Check socket activity, handle all sockets. Handling is offloaded to * Ecmascript code (fd + revents). * * If FDs are removed from the poll list while we're processing callbacks, * the entries are simply marked unused (fd set to 0) without actually * removing them from the poll list. This ensures indices are not * disturbed. The poll list is compacted before next poll().
label: code-design
3169. numeric ID (returned from e.g. setTimeout); zero if unused
3170. Should never happen, so return whatever.
3171. delete eventTimers[timer_id]
3172. 't' expires earlier than (or same time as) 't-1', so we're done.
3173. indexes: * 0 = timer id
3174. **comment:** * C eventloop example. * * Timer management is similar to eventloop.js but implemented in C. * In particular, timer insertion is an O(n) operation; in a real world * eventloop based on a heap insertion would be O(log N).
label: code-design
3175. print('unexpected revents, close fd');
3176. no size control now print('READ', Duktape.enc('jx', data));
3177. * C eventloop example (c_eventloop.c). * * Ecmascript code to initialize the exposed API (setTimeout() etc) when * using the C eventloop. * * <https://developer.mozilla.org/en-US/docs/Web/JavaScript/Timers>
3178. This simple example doesn't have support for write blocking / draining
3179. Connected
3180. print('ACCEPT:', Duktape.enc('jx', acc_res));
3181. Special case: callback arguments are provided. [arg1, arg2, ...] [global(this), arg1, arg2, ...]
3182. print('activity on fd', fd, 'revents', revents);
3183. * Timer API
3184. **comment:** * Socket handling * * Ideally this would be implemented more in C than here for more speed * and smaller footprint: C code would directly maintain the callback state * and such. * * Also for more optimal I/O, the buffer churn caused by allocating and * freeing a lot of buffer values could be eliminated by reusing buffers. * Socket reads would then go into a pre-allocated buffer, for instance.

3185. retval ignored
3186. print('UNKNOWN');
3187. Legacy case: callback is a string.
3188. oneshot
3189. Normal case: callback given as a function without arguments.
3190. Math.exp(0)...Math.exp(8) is an uneven distribution between 1...~2980.
3191. Here the inserts take a lot of time because the underlying timer manager * data structure has O(n) insertion performance.
3192. * Test using timers and intervals with curses.
3193. * Pure Ecmascript eventloop example. * * Timer state handling is inefficient in this trivial example. Timers are * kept in an array sorted by their expiry time which works well for expiring * timers, but has O(n) insertion performance. A better implementation would * use a heap or some other efficient structure for managing timers so that * all operations (insert, remove, get nearest timer) have good performance. * * <https://developer.mozilla.org/en-US/docs/Web/JavaScript/Timers>
3194. **comment:** If exit requested, don't call any more callbacks. This allows a callback to do cleanups and request exit, and can be sure that no more callbacks are processed.
label: code-design
3195. Remove the timer from the active list and process it. The user callback may add new timers which is not a problem. The callback may also delete timers which is not a problem unless the timer being deleted is the timer whose callback we're running; this is why the timer is recorded in this.expiring so that clearTimeout() and clearInterval() can detect this situation.
3196. sockets fd -> callback fd -> callback fd -> callback
3197. If the timer was one-shot, it's marked 'removed'. If the user callback requested deletion for the timer, it's also marked 'removed'. If the timer is an interval (and is not marked removed), insert it back into the timer list.
3198. this.dumpState();
3199. Timer has expired and we're processing its callback. User callback has requested timer deletion. Mark removed, so that the timer is not reinserted back into the active list. This is actually a common case because an interval may very well cancel itself.
3200. Special case: callback arguments are provided. [arg1, arg2, ...] [global(this), arg1, arg2, ...]
3201. This simple example doesn't have support for write blocking / draining
3202. no such ID, ignore
3203. print('zero read for fd ' + fd + ', closing forcibly'); ignore result
3204. print('UNKNOWN');
3205. Legacy case: callback is a string.
3206. timers active timers, sorted (nearest expiry last) set to timer being expired (needs special handling in clearTimeout/clearInterval)
3207. no size control now print('READ', Duktape.enc('jx', data));
3208. print('revents ' + t.revents + ' for fd ' + fd + ', closing forcibly'); ignore result
3209. misc
3210. print('ACCEPT:', Duktape.enc('jx', acc_res));
3211. * Create poll socket list. This is a very naive approach. * On Linux, one could use e.g. epoll() and manage socket lists * incrementally.
3212. start
3213. deleteCount

3214. * Find 'i' such that we want to insert *after* timers[i] at index i+1. * If no such timer, for-loop terminates with i-1, and we insert at -1+1=0.
3215. print('exit requested, exit');
3216. Remove timer/interval with a timer ID. The timer/interval can reside either on the active list or it may be an expired timer (this.expiring) whose user callback we're running when this function gets called.
3217. Get timer with lowest expiry time. Since the active timers list is sorted, it's always the last timer.
3218. * Wait timeout for timer closest to expiry. Since the poll * timeout is relative, get this as close to poll() as possible.
3219. print(new Date(), 'poll_set OUT:', Duktape.enc('jx', poll_set));
3220. * Do the actual poll.
3221. * Timer API * * These interface with the singleton EventLoop.
3222. print('UNKNOWN POLLOUT');
3223. Timers to expire?
3224. * Exit check (may be requested by a user callback)
3225. **comment:** Timer on active list: mark removed (not really necessary, but nice for dumping), and remove from active list.
label: code-design
3226. insert after 't', to index i+1
3227. * Event loop * * Timers are sorted by 'target' property which indicates expiry time of * the timer. The timer expiring next is last in the array, so that * removals happen at the end, and inserts for timers expiring in the * near future displace as few elements in the array as possible.
3228. print(new Date(), 'poll_set IN:', Duktape.enc('jx', poll_set));
3229. * Here we must be careful with mutations: user callback may add and * delete an arbitrary number of timers. * * Current solution is simple: check whether the timer at the end of * the list has expired. If not, we're done. If it has expired, * remove it from the active list, record it in this.expiring, and call * the user callback. If user code deletes the this.expiring timer, * there is special handling which just marks the timer deleted so * it won't get inserted back into the active list. * * This process is repeated at most maxExpirys times to ensure we don't * get stuck forever; user code could in principle add more and more * already expired timers.
3230. custom call
3231. * Process expired timers.
3232. * Process all sockets so that nothing is left unhandled for the * next round.
3233. flag for removal
3234. Timer has not expired, and no other timer could have expired either because the list is sorted.
3235. Reinsert interval timer to correct sorted position. The timer must be an interval timer because one-shot timers are marked 'removed' above.
3236. Eat errors silently. When resizing curses window an EINTR happens now.
3237. Normal case: callback given as a function without arguments.
3238. Set global 'FileIo'.
3239. * File I/O binding example.

3418. Complex condition broken into separate parts.
3419. POSIX
3420. If not provided, use safe default for alignment.
3421. * Date provider selection * * User may define DUK_USE_DATE_GET_NOW() etc directly, in which case we'll * rely on an external provider. If this is not done, revert to previous * behavior and use Unix/Windows built-in provider.
3422. Cannot determine byte order.
3423. --- Cygwin ---
3424. !defined(DUK_USE_BYTEORDER) && defined(`__BYTE_ORDER__`)
3425. More or less standard endianness predefines provided by header files. * The ARM hybrid case is detected by assuming that `__FLOAT_WORD_ORDER__` will be big endian, see: <http://lists.mysql.com/internals/443>. * On some platforms some defines may be present with an empty value which * causes comparisons to fail: <https://github.com/svaarala/duktape/issues/453>.
3426. !defined(DUK_USE_BYTEORDER)
3427. **comment:** For custom platforms allow user to define byteorder explicitly. * Since endianness headers are not standardized, this is a useful * workaround for custom platforms for which endianness detection * is not directly supported. Perhaps custom hardware is used and * user cannot submit upstream patches.
 label: code-design

3428. **comment:** Don't know how to declare unreachable point, so don't do it; this * may cause some spurious compilation warnings (e.g. "variable used * uninitialized").
 label: code-design

3429. Good default is a bit arbitrary because alignment requirements * depend on target. See <https://github.com/svaarala/duktape/issues/102>.

3430. --- Windows ---

3431. User provided InitJS.
3432. These have been tested from VS2008 onwards; may work in older VS versions * too but not enabled by default.
3433. Error codes are represented with platform int. High bits are used * for flags and such, so 32 bits are needed.
3434. Intermediate define for 'have inttypes.h'
3435. build is not C99 or C++11, play it safe
3436. GCC: test not very accurate; enable only in relatively recent builds * because of bugs in gcc-4.4 (<http://lists.debian.org/debian-gcc/2010/04/msg00000.html>)
3437. Intel x86 (32-bit), x64 (64-bit) or x32 (64-bit but 32-bit pointers), * define only one of DUK_F_X86, DUK_F_X64, DUK_F_X32. *
- <https://sites.google.com/site/x32abi/>
3438. Enabled with debug/assertions just so that any issues can be caught.
3439. C99 or compatible
3440. --- Mac OSX, iPhone, Darwin ---
3441. C99 or above
3442. MinGW. Also GCC flags (DUK_F_GCC) are enabled now.
3443. This detection is not very reliable.
3444. Support for 48-bit signed integer duk_tval with transparent semantics.
3445. GCC and Clang provide endianness defines as built-in predefines, with * leading and trailing double underscores (e.g. __BYTE_ORDER__). See * output of "make gcpredefs" and "make clangpredefs". Clang doesn't * seem to provide __FLOAT_WORD_ORDER__; assume not mixed endian for clang. *
- <http://gcc.gnu.org/onlinedocs/cpp/Common-Predefined-Macros.html>
3446. 64-bit type detection is a bit tricky. ** ULLONG_MAX is a standard define. __LONG_LONG_MAX__ and __ULONGLONG_MAX__ * are used by at least GCC (even if system headers don't provide ULLONG_MAX). * Some GCC variants may provide __LONG_LONG_MAX__ but not __ULONGLONG_MAX__. * * ULL / LL constants are rejected / warned about by some compilers, even if * the compiler has a 64-bit type and the compiler/system headers provide an * unsupported constant (ULL/LL)! Try to avoid using ULL / LL constants. * As a side effect we can only check that e.g. ULONG_MAX is larger than 32 * bits but can't be sure it is exactly 64 bits. Self tests will catch such * cases.
3447. Convert any input pointer into a "void **", losing a const qualifier. * This is not fully portable because casting through duk_uintptr_t may * not work on all architectures (e.g. those with long, segmented pointers).
3448. Small integers (16 bits or more) can fall back to the 'int' type, but * have a typedef so they are marked "small" explicitly.
3449. **comment:** Most portable, potentially wastes space

3480. VBCC
3481. sigsetjmp() alternative
3482. GCC. Clang also defines __GNUC__ so don't detect GCC if using Clang.
3483. --- SuperH ---
3484. Pre-C99: va_list type is implementation dependent. This replacement * assumes it is a plain value so that a simple assignment will work. * This is not the case on all platforms (it may be a single-array element, * for instance).
3485. **comment:** The best type for an "all around int" in Duktape internals is "at least * 32 bit signed integer" which is most convenient. Same for unsigned type. * Prefer 'int' when large enough, as it is almost always a convenient type.
- label:** code-design
3486. uclibc
3487. Explicit marker needed; may be 'defined', 'undefined', 'or 'not provided'.

3488. No provider for DUK_USE_DATE_FORMAT_STRING(), fall back to ISO 8601 only.

3489. **comment:** Many platforms are missing fpclassify() and friends, so use replacements * if necessary. The replacement constants (FP_NAN etc) can be anything but * match Linux constants now.
label: code-design

3490. * Checks for config option consistency (DUK_USE_xxx)

3491. autodetect compiler

3492. Rely on C89 headers only; time.h must be here.

3493. These functions don't currently need replacement but are wrapped for * completeness. Because these are used as function pointers, they need * to be defined as concrete C functions (not macros).

3494. --- TI-Nspire ---

3495. **comment:** We need va_copy() which is defined in C99 / C++11, so an awkward * replacement is needed for pre-C99 / pre-C++11 environments. This * will quite likely need portability hacks for some non-C99 * environments.
label: code-design

3496. AmigaOS on M68K or PPC is always big endian.

3497. Feature option forcing.

3498. --- ARM 64-bit ---

3499. * Feature option handling

3500. **comment:** * Wrapper typedefs and constants for integer types, also sanity check types. ** C99 typedefs are quite good but not always available, and we want to avoid * forcibly redefining the C99 typedefs. So, there are Duktape wrappers for * all C99 typedefs and Duktape code should only use these typedefs. Type * detection when C99 is not supported is best effort and may end up detecting * some types incorrectly. ** Pointer sizes are a portability problem: pointers to different types may * have a different size and function pointers are very difficult to manage * portably. ** http://en.wikipedia.org/wiki/C_data_types#Fixed-width_integer_types ** Note: there's an interesting corner case when trying to define minimum * signed integer value constants which leads to the current workaround of * defining e.g. -0x80000000 as (-0x7fffffffL - 1L). See doc/code-issues.txt * for a longer discussion. ** Note: avoid typecasts and computations in macro integer constants as they * can then no longer be used in macro relational expressions (such as * #if DUK_SIZE_MAX < 0xffffffffUL). There is internal code which relies on * being able to compare DUK_SIZE_MAX against a limit.
label: code-design

3501. Not standard but common enough

3502. --- QNX ---

3503. **comment:** Object property allocation layout has implications for memory and code * footprint and generated code size/speed. The best layout also depends * on whether the platform has alignment requirements or benefits from * having mostly aligned accesses.
label: code-design

3504. (v)snprintf() is missing before MSVC 2015. Note that _(v)snprintf() does * NOT NUL terminate on truncation, but Duktape code never assumes that. * http://stackoverflow.com/questions/2915672/snprintf-and-visual-studio-2010

3505. Motorola 68K. Not defined by VBCC, so user must define one of these * manually when using VBCC.

3506. http://msdn.microsoft.com/en-us/library/aa235362(VS.60).aspx

3507. Non-C99 case, still relying on DUK_UINTPTR_MAX, as long as it is not a computed value

3508. http://bellard.org/tcc/tcc-doc.html#SEC7

3509. * Intermediate helper defines

3510. **comment:** Macro hackery to convert e.g. __LINE__ to a string without formatting, * see: http://stackoverflow.com/questions/240353/convert-a-preprocessor-token-to-a-string
label: code-design

3511. Flash player (e.g. Crossbridge)

3512. no endian.h

3513. Shared includes: C89

3514. integer byte order

3515. float word order

3516. * Convert DUK_USE_BYTEORDER, from whatever source, into currently used * internal defines. If detection failed, #error out.

3517. e.g. ptrdiff_t

3518. **comment:** XXX: DUK_NOINLINE, DUK_INLINE, DUK_ALWAYS_INLINE for msvc?
label: code-design

3519. SPARC

3520. VBCC supports C99 so check only for C99 for union initializer support. * Designated union initializers would possibly work even without a C99 check.

3521. C++11 apparently ratified stdint.h

3522. QNX gcc cross compiler seems to define e.g. __LITTLEENDIAN__ or __BIGENDIAN__: * \$ /opt/qnx650/host/linux/x86/usr/bin/i486-pc-nto-qnx6.5.0-gcc -dM -E -</dev/null | grep -ni endian * 67:#define __LITTLEENDIAN__ 1 * \$ /opt/qnx650/host/linux/x86/usr/bin/mips-unknown-nto-qnx6.5.0-gcc -dM -E -</dev/null | grep -ni endian * 81:#define __BIGENDIAN__ 1 * \$ /opt/qnx650/host/linux/x86/usr/bin/arm-unknown-nto-qnx6.5.0-gcc -dM -E -</dev/null | grep -ni endian * 70:#define __LITTLEENDIAN__ 1

3523. At least some uclibc versions have broken floating point math. For * example, fpclassify() can incorrectly classify certain NaN formats. * To be safe, use replacements.

3524. Placeholder fix for (detection is wider than necessary): * http://llvm.org/bugs/show_bug.cgi?id=17788

3525. snprintf() is technically not part of C89 but usually available.

3526. --- x32 ---

3527. Basic integer typedefs and limits, preferably from inttypes.h, otherwise * through automatic detection.

3528. **comment:** Only include when compiling Duktape to avoid polluting application build * with a lot of unnecessary defines.
label: code-design

3529. --- VBCC ---

3530. On some systems SIZE_MAX can be smaller than max unsigned 32-bit value * which seems incorrect if size_t is (at least) an unsigned 32-bit type. * However, it doesn't seem useful to error out compilation if this is the * case.

3531. **comment:** On other platforms use layout 2, which requires some padding but * is a bit more natural than layout 3 in ordering the entries. Layout * 3 is currently not used.
label: code-design

3532. VS2005+ should have variadic macros even when they're not C99.

3533. illumos / Solaris

3534. DUK_COMPILING_DUKTAPE

3535. DUK_OPT_FORCE_BYTORDER

3536. QNX

3537. since gcc-4.5

3538. **comment:** Windows 32-bit and 64-bit are currently the same.
label: code-design

3539. This is optionally used by panic handling to cause the program to segfault * (instead of e.g. abort()) on panic. Valgrind will then indicate the C * call stack leading to the panic.

3540. IEEE float/double typedef.

3541. --- ARM 32-bit ---

3542. **comment:** XXX: This is technically not guaranteed because it's possible to configure * an x86 to require aligned accesses with Alignment Check (AC) flag.
label: code-design

3543. TinyC

3544. **comment:** Note: the funny looking computations for signed minimum 16-bit, 32-bit, and * 64-bit values are intentional as the obvious forms (e.g. -0x80000000L) are * -not- portable. See code-issues.txt for a detailed discussion.

label: code-design

3545. These are necessary wild guesses.

3546. Already provided above

3547. Atari ST TOS. `__TOS__` defined by PureC. No platform define in VBCC * apparently, so to use with VBCC user must define `__TOS__` manually.

3548. Byte order is big endian but cannot determine IEEE double word order.

3549. --- Flashplayer (Crossbridge) ---

3550. MIPS byte order varies so rely on autodetection.

3551. stdint.h not available

3552. **comment:** The most portable way to figure out local time offset is `gmtime()`, * but it's not thread safe so use with caution.

label: requirement

3553. Codepoint type. Must be 32 bits or more because it is used also for * internal codepoints. The type is signed because negative codepoints * are used as internal markers (e.g. to mark EOF or missing argument). * (X)UTF-8/CESU-8 encode/decode take and return an unsigned variant to * ensure `duk_uint32_t` casts back and forth nicely. Almost everything * else uses the signed one.

3554. DUK_USE_VARIADIC_MACROS: required from compilers, so no fill-in.

3555. TOS on M68K is always big endian.

3556. don't use `strftime()` for now

3557. **comment:** not sure, not needed with C99 anyway

label: requirement

3558. C++ doesn't have standard designated union initializers ({ .foo = 1 }).

3559. --- Emscripten ---

3560. nop

3561. DLL build detection

3562. **comment:** Avoid custom date parsing and formatting for portability.

label: code-design

3563. Workaround for older C++ compilers before including <inttypes.h>, * see e.g.: https://sourceware.org/bugzilla/show_bug.cgi?id=15366

3564. * Compiler autodetection

3565. --- SPARC 32-bit ---

3566. --- Clang ---

3567. On some platforms int is 16-bit but long is 32-bit (e.g. PureC)

3568. **comment:** * Byte order and double memory layout detection * * Endianness detection is a major portability hassle because the macros * and headers are not standardized. There's even variance across UNIX * platforms. Even with "standard" headers, details like underscore count * varies between platforms, e.g. both `_BYTE_ORDER` and `_BYT_E_ORDER` are used * (Crossbridge has a single underscore, for instance). * * The checks below are structured with this in mind: several approaches are * used, and at the end we check if any of them worked. This allows generic * approaches to be tried first, and platform/compiler specific hacks tried * last. As a last resort, the user can force a specific endianness, as it's * not likely that automatic detection will work on the most exotic platforms. * * Duktape supports little and big endian machines. There's also support * for a hybrid used by some ARM machines where integers are little endian * but IEEE double values use a mixed order (12345678 -> 43218765). This * byte order for doubles is referred to as "mixed endian".

label: code-design

3569. **comment:** Check whether we should use 64-bit integers or not. * * Quite incomplete now. Use 64-bit types if detected (C99 or other detection) * unless they are known to be unreliable. For instance, 64-bit types are * available on VBCC but seem to misbehave.

label: code-design

3570. VS2013+ supports union initializers but there's a bug involving union-inside-struct: * <https://connect.microsoft.com/VisualStudio/feedback/details/805981> * The bug was fixed (at least) in VS2015 so check for VS2015 for now: * <https://blogs.msdn.microsoft.com/vcblog/2015/07/01/c-compiler-front-end-fixes-in-vs2015/> * Manually tested using VS2013, CL reports 18.00.31101, so enable for VS2013 too.

3571. no user declarations

3572. DUK_CONFIG_H_INCLUDED

3573. BCC (Bruce's C compiler): this is a "torture target" for compilation

3574. Generic Unix (includes Cygwin)

3575. There was a curious bug where `test-bi-date-canceling.js` would fail e.g. * on 64-bit Ubuntu, gcc-4.8.1, -m32, and no -std=c99. Some date computations * using doubles would be optimized which then broke some corner case tests. * The problem goes away by adding 'volatile' to the datetime computations. * Not sure what the actual triggering conditions are, but using this on * non-C99 systems solves the known issues and has relatively little cost * on other platforms.

3576. C99 / C++11 and above: rely on `va_copy()` which is required. * Omit parenthesis on macro right side on purpose to minimize differences * to direct use.

3577. C99 types

3578. DUK_SIZE_MAX (= SIZE_MAX) is often reliable

3579. --- PowerPC 64-bit ---

3580. See: /opt/qnx650/target/qnx6/usr/include/sys/platform.h

3581. --- SPARC 64-bit ---

3582. On platforms without any alignment issues, layout 1 is preferable * because it compiles to slightly less code and provides direct access * to property keys.

3583. Strict C99 case: DUK_UINTPTR_MAX (= UINTPTR_MAX) should be very reliable

3584. autodetect platform

3585. **comment:** NetBSD 6.0 x86 (at least) has a few problems with `pow()` semantics, * see `test-bug-netbsd-math-pow.js`. Use NetBSD specific workaround. * (This might be a wider problem; if so, generalize the define name.)

label: code-design

3586. autodetect architecture

3587. In VBCC (0.0 / 0.0) results in a warning and 0.0 instead of NaN. * In MSVC (VS2010 Express) (0.0 / 0.0) results in a compile error. * Use a computed NaN (initialized when a heap is created at the * latest).

3588. Clang: assume we have `__va_copy()` in non-C99 mode.

3589. --- Bruce's C compiler ---

3590. Same as 'duk_int_t' but guaranteed to be a 'fast' variant if this * distinction matters for the CPU. These types are used mainly in the * executor where it might really matter.

3591. vbcc + AmigaOS may be missing these

3592. C99 or C++11, no known issues

3593. **comment:** XXX: DUK_LIKELY, DUK_UNLIKELY for msvc?

label: code-design

3594. Initial fix: disable secure CRT related warnings when compiling Duktape * itself (must be defined before including Windows headers). Don't define * for user code including `duktape.h`.

3595. varargs

3596. * Fill-ins for platform, architecture, and compiler

3597. e.g. `strftime`

3598. **comment:** Note: PRS and FMT are intentionally left undefined for now. This means * there is no platform specific date parsing/formatting but there is still * the ISO 8601 standard format.

label: code-design

3599. `vsnprintf()` is technically not part of C89 but usually available.

3600. Rely on autodetection for byte order, alignment, and packed tval.

3601. AmigaOS + M68K seems to have math issues even when using GCC cross * compilation. Use replacements for all AmigaOS versions on M68K * regardless of compiler.

3602. Byte order is little endian but cannot determine IEEE double word order.

3603. C++

3604. MIPS. Related defines: `__MIPSEB__`, `__MIPSEL__`, `__mips_isa_rev`, `__LP64__`

3605. VBCC is missing the built-ins even in C99 mode (perhaps a header issue).
3606. _MSC_VER
3607. **comment:** Macro for suppressing warnings for potentially unreferenced variables. * The variables can be actually unreferenced or unreferenced in some * specific cases only; for instance, if a variable is only debug printed, * it is unreferenced when debug printing is disabled.
label: code-design
3608. Byte order varies, rely on autodetection.
3609. Use _setjmp() on Apple by default, see GH-55.
3610. TI-Nspire (using Ndless)
3611. --- PowerPC 32-bit ---
3612. Some math functions are C99 only. This is also an issue with some * embedded environments using uclibc where uclibc has been configured * not to provide some functions. For now, use replacements whenever * using uclibc.
3613. Most portable
3614. Boolean values are represented with the platform 'int'.
3615. Shared includes: stdint.h is C99
3616. BSD variant
3617. Old uclibcs have a broken memcpy so use memmove instead (this is overly wide * now on purpose): <http://lists.uclibc.org/pipermail/uclibc-cvs/2008-October/025511.html>
3618. date.h is omitted, and included per platform
3619. * Architecture autodetection
3620. The most portable current time provider is time(), but it only has a * one second resolution.
3621. Convenience, e.g. gcc 4.5.1 == 40501; <http://stackoverflow.com/questions/6031819/emulating-gccs-built-in-unreachable>
3622. defined(DUK_USE_BYTEORDER)
3623. In VBCC (1.0 / 0.0) results in a warning and 0.0 instead of infinity. * Use a computed infinity (initialized when a heap is created at the * latest).
3624. For now, hash part is dropped if and only if 16-bit object fields are used.
3625. MSVC dllexport/dllimport: appropriate __declspec depends on whether we're * compiling Duktape or the application.
3626. **comment:** On Windows, assume we're little endian. Even Itanium which has a * configurable endianness runs little endian in Windows.
label: code-design
3627. **comment:** Compiler specific hackery needed to force struct size to match alignment, * see e.g. duk_hbuffer.h. * * <http://stackoverflow.com/questions/11130109/struct-size-alignment>
label: code-design
3628. Index values must have at least 32-bit signed range.
3629. **comment:** Workaround for GH-323: avoid inlining control when compiling from * multiple sources, as it causes compiler portability trouble.
label: code-design
3630. byte order
3631. Linux
3632. Based on 'make checkalign' there are no alignment requirements on * Linux SH4, but align by 4 is probably a good basic default.
3633. MSVC preprocessor defines: <http://msdn.microsoft.com/en-us/library/b0084kay.aspx> * _MSC_FULL_VER includes the build number, but it has at least two formats, see e.g. * BOOST_MSVC_FULL_VER in http://www.boost.org/doc/libs/1_52_0/boost/config/compiler/visualc.hpp
3634. ARM
3635. Fast variants of small integers, again for really fast paths like the * executor.
3636. **comment:** When C99 types are not available, we use heuristic detection to get * the basic 8, 16, 32, and (possibly) 64 bit types. The fast/least * types are then assumed to be exactly the same for now: these could * be improved per platform but C99 types are very often now available. * 64-bit types are not available on all platforms; this is OK at least * on 32-bit platforms. * * This detection code is necessarily a bit hacky and can provide typedefs * and defines that won't work correctly on some exotic platform.

3743. request to create catch binding

3744. for object-bound identifiers

3745. **comment:** XXX: compression (as an option)

label: code-design

3746. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. ** This handling is now identical for C and Ecmascript functions. * C functions always have the 'NEWENV' flag set, so their * environment record initialization is delayed (which is good). ** Delayed creation (on demand) is handled in duk_js_var.c.

3747. **comment:** * Declaration binding instantiation conceptually happens when calling a * function; for us it essentially means that function prologue. The * conceptual process is described in E5 Section 10.5. ** We need to keep track of all encountered identifiers to (1) create an * identifier-to-register map ("varmap"); and (2) detect duplicate * declarations. Identifiers which are not bound to registers still need * to be tracked for detecting duplicates. Currently such identifiers * are put into the varmap with a 'null' value, which is later cleaned up. ** To support functions with a large number of variable and function * declarations, registers are not allocated beyond a certain limit; * after that limit, variables and functions need slow path access. * Arguments are currently always register bound, which imposes a hard * (and relatively small) argument count limit. ** Some bindings in E5 are not configurable (= deletable) and almost all * are mutable (writable). Exceptions are: ** - The 'arguments' binding, established only if no shadowing argument * or function declaration exists. We handle 'arguments' creation * and binding through an explicit slow path environment record. ** - The "name" binding for a named function expression. This is also * handled through an explicit slow path environment record.

3880. **comment:** * Array built-ins * * Note that most Array built-ins are intentionally generic and work even * when the 'this' binding is not an Array instance. To ensure this, * Array algorithms do not assume "magical" Array behavior for the "length" * property, for instance. * * XXX: the "Throw" flag should be set for (almost?) all [[Put]] and * [[Delete]] operations, but it's currently false throughout. Go through * all put/delete cases and check throw flag use. Need a new API primitive * which allows throws flag to be specified. * * XXX: array lengths above 2G won't work reliably. There are many places * where one needs a full signed 32-bit range ([-0xffffffff, 0xffffffff], * i.e. -33- bits). Although array 'length' cannot be written to be outside * the unsigned 32-bit range (E5.1 Section 15.4.5.1 throws a RangeError if so) * some intermediate values may be above 0xffffffff and this may not be always * correctly handled now (duk_uint32_t is not enough for all algorithms). * * For instance, push() can legitimately write entries beyond length 0xffffffff * and cause a RangeError only at the end. To do this properly, the current * push() implementation tracks the array index using a 'double' instead of a * duk_uint32_t (which is somewhat awkward). See test-bi-array-push-maxlen.js. * * On using "put" vs. "def" prop * ===== * * Code below must be careful to use the appropriate primitive as it matters * for compliance. When using "put" there may be inherited properties in * Array.prototype which cause side effects when values are written. When * using "define" there are no such side effects, and many test262 test cases * check for this (for real world code, such side effects are very rare). * Both "put" and "define" are used in the E5.1 specification; as a rule, * "put" is used when modifying an existing array (or a non-array 'this' * binding) and "define" for setting values into a fresh result array. * * Also note that Array instance 'length' should be writable, but not * enumerable and definitely not configurable: even Duktape code internally * assumes that an Array instance will always have a 'length' property. * Preventing deletion of the property is critical.

 label: code-design
4233. lookup should prevent this

4234. * Preliminary activation record and valstack manipulation. * The concrete actions depend on whether we're dealing * with a tail call (reuse an existing activation), a resume, * or a normal call. * * The basic actions, in varying order, are: * * - Check stack size for call handling * - Grow call stack if necessary (non-tail-calls) * - Update current activation (idx_retval) if necessary * (non-tail, non-resume calls) * - Move start of args (idx_args) to valstack bottom * (tail calls) * * Don't touch valstack_bottom or valstack_top yet so that Duktape API * calls work normally.

4235. result index for filter()

4236. either nonzero value is ok

4237. bc

4238. * DELVAR * * See E5 Sections: * 11.4.1 The delete operator * 10.2.1.1.5 DeleteBinding (N) [declarative environment record] * 10.2.1.2.5 DeleteBinding (N) [object environment record] * * Variable bindings established inside eval() are deletable (configurable), * other bindings are not, including variables declared in global level. * Registers are always non-deletable, and the deletion of other bindings * is controlled by the configurable flag. * * For strict mode code, the 'delete' operator should fail with a compile * time SyntaxError if applied to identifiers. Hence, no strict mode * run-time deletion of identifiers should ever happen. This function * should never be called from strict mode code!

4239. * Mark refzero_list objects. * * Objects on the refzero_list have no inbound references. They might have * outbound references to objects that we might free, which would invalidate * any references held by the refzero objects. A refzero object might also * be rescued by refcount finalization. Refzero objects are treated as * reachability roots to ensure they (or anything they point to) are not * freed in mark-and-sweep.

4240. Negative zero needs special handling in JX/JC because * it would otherwise serialize to '0', not '-0'.

4241. can't resize below 'top'

4242. round up roughly to next 'grow step'

4243. **comment:** * E5 Section 7.6: * * IdentifierPart: * IdentifierStart * UnicodeCombiningMark * UnicodeDigit * UnicodeConnectorPunctuation * <ZWNJ> [U+200C] * <ZWJ> [U+200D] * * IdentifierPart production has one multi-character production * as part of its IdentifierStart alternative. The '\v' character * of an escape sequence is not matched here, see discussion in * duk_unicode_is_identifier_start(). * * To match non-ASCII characters (codepoints >= 0x80), a very slow * linear range-by-range scan is used. The codepoint is first compared * to the IdentifierStart ranges, and if it doesn't match, then to a * set consisting of code points in IdentifierPart but not in * IdentifierStart. This is done to keep the unicode range data small, * at the expense of speed. * * The ASCII fast path consists of: * * 0x0030 ... 0x0039 ['0' ... '9', UnicodeDigit] * 0x0041 ... 0x005a ['A' ... 'Z', IdentifierStart] * 0x0061 ... 0x007a ['a' ... 'z', IdentifierStart] * 0x0024 ['\$', IdentifierStart] * 0x005f['_', IdentifierStart and * UnicodeConnectorPunctuation] * * UnicodeCombiningMark has no code points <= 0x7f. * * The matching code reuses the "identifier start" tables, and then * consults a separate range set for characters in "identifier part" * but not in "identifier start". These can be extracted with the * "src/extract_chars.py" script. * * UnicodeCombiningMark -> categories Mn, Mc * UnicodeDigit -> categories Nd * UnicodeConnectorPunctuation -> categories Pc

4292. relookup (side effects)
4293. **comment:** XXX: make a common DUK_USE_ option, and allow custom fixed seed?
label: code-design
4294. x <- y * z
4295. * Note: assuming new_a_size == 0, and that entry part contains * no conflicting keys, refcounts do not need to be adjusted for * the values, as they remain exactly the same. * * The keys, however, need to be interned, incref'd, and be * reachable for GC. Any intern attempt may trigger a GC and * claim any non-reachable strings, so every key must be reachable * at all times. * * A longjmp must not occur here, as the new_p allocation would * be freed without these keys being decref'd, hence the messy * decref handling if intern fails.
4296. **comment:** * 'props' contains {key,value,flags} entries, optional array entries, and * an optional hash lookup table for non-array entries in a single 'sliced' * allocation. There are several layout options, which differ slightly in * generated code size/speed and alignment/padding; duk_features.h selects * the layout used. * * Layout 1 (DUK_USE_HOBJECT_LAYOUT_1): * * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * * Layout 2 (DUK_USE_HOBJECT_LAYOUT_2): * * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_uint8_t) + pad bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * * Layout 3 (DUK_USE_HOBJECT_LAYOUT_3): * * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * * In layout 1, the 'e_next' count is rounded to 4 or 8 on platforms * requiring 4 or 8 byte alignment. This ensures proper alignment * for the entries, at the cost of memory footprint. However, it's * probably preferable to use another layout on such platforms instead. * * In layout 2, the key and value parts are swapped to avoid padding * the key array on platforms requiring alignment by 8. The flags part * is padded to get alignment for array entries. The 'e_next' count does * not need to be rounded as in layout 1. * * In layout 3, entry values and array values are always aligned properly, * and assuming pointers are at most 8 bytes, so are the entry keys. Hash * indices will be properly aligned (assuming pointers are at least 4 bytes). * Finally, flags don't need additional alignment. This layout provides * compact allocations without padding (even on platforms with alignment * requirements) at the cost of a bit slower lookups. * * Objects with few keys don't have a hash index; keys are looked up linearly, * which is cache efficient because the keys are consecutive. Larger objects * have a hash index part which contains integer indexes to the entries part. * * A single allocation reduces memory allocation overhead but requires more * work when any part needs to be resized. A sliced allocation for entries * makes linear key matching faster on most platforms (more locality) and * skimps on flags size (which would be followed by 3 bytes of padding in * most architectures if entries were placed in a struct). * * 'props' also contains internal properties distinguished with a non-BMP * prefix. Often used properties should be placed early in 'props' whenever * possible to make accessing them as fast as possible.

4438. Equivalent year for DST calculations outside [1970,2038[range, see * E5 Section 15.9.1.8. Equivalent year has the same leap-year-ness and * starts with the same weekday on Jan 1. * https://bugzilla.mozilla.org/show_bug.cgi?id=351066

4439. empty expressions can be detected conveniently with nud/led counts

4440. There are at most 7 args, but we use 8 here so that also * DUK_DATE_IDX_WEEKDAY gets initialized (to zero) to avoid the potential * for any Valgrind gripes later.

4441. [... val callback thisArg val i obj]

4442. [... this tracedata sep this str1 ... strN]

4443. important chosen base types

4444. Digit count indicates number of fractions (i.e. an absolute * digit index instead of a relative one). Used together with * DUK_N2S_FLAG_FIXED_FORMAT for toFixed().

4445. must also check refzero_list

4446. MEMBER/NEW/CALL EXPRESSIONS

4447. **comment:** XXX: add flag to indicate whether caller cares about return value; this * affects e.g. handling of assignment expressions. This change needs API * changes elsewhere too.
label: code-design

4448. Fast jumps (which avoid longjmp) jump directly to the jump sites * which are always known even while the iteration/switch statement * is still being parsed. A final peephole pass "straightens out" * the jumps.

4449. [... func]

4450. * Function gets no new environment when called. This is the * case for global code, indirect eval code, and non-strict * direct eval code. There is no direct correspondence to the * E5 specification, as global/eval code is not exposed as a * function.

4451. Wrappers for calling standard math library methods. These may be required * on platforms where one or more of the math built-ins are defined as macros * or inline functions and are thus not suitable to be used as function pointers.

4452. **comment:** Throwing an error this deep makes the error rather vague, but * saves hundreds of bytes of code.
label: code-design

4453. This is not strictly necessary, but avoids compiler warnings; e.g. * gcc won't reliably detect that no uninitialized data is read below.

4454. Trigger at zero or below

4455. Custom coercion for API

4456. **comment:** Note: cannot read more than 24 bits without possibly shifting top bits out. * Fixable, but adds complexity.
label: code-design

4457. Almost all global level Function objects are constructable * but not all: Function.prototype is a non-constructable, * callable Function.

4458. source ends before dest starts

4459. * Statement terminator check, including automatic semicolon * handling. After this step, 'curr_tok' should be the first * token after a possible statement terminator.

4460. * Exposed string-to-number API * * Input: [string] * Output: [number] * * If number parsing fails, a NaN is pushed as the result. If number parsing * fails due to an internal error, an InternalError is thrown.

4461. 64-bit OK because always >= 0

4462. reg/const for switch value

4463. **comment:** When formatting an argument to a string, errors may happen from multiple * causes. In general we want to catch obvious errors like a toLogString() * throwing an error, but we don't currently try to catch every possible * error. In particular, internal errors (like out of memory or stack) are * not caught. Also, we expect Error.toString() to not throw an error.

label: code-design

4464. Each round of finalizer execution may spawn new finalizable objects * which is normal behavior for some applications. Allow multiple * rounds of finalization, but use a shrinking limit based on the * first round to detect the case where a runaway finalizer creates * an unbounded amount of new finalizable objects. Finalizer rescue * is not supported: the semantics are unclear because most of the * objects being finalized here are already reachable. The finalizer * is given a boolean to indicate that rescue is not possible. ** See discussion in: <https://github.com/svaarala/duktape/pull/473>

4465. no prototype, updated below

4466. unwind to 'resume' caller

4467. 0xf0-0xff

4468. **comment:** XXX: missing trap result validation for non-configurable target keys * (must be present), for non-extensible target all target keys must be * present and no extra keys can be present. * <http://www.ecma-international.org/ecma-262/6.0/#sec-proxy-object-internal-methods-and-internal-slots-ownpropertykeys>

label: code-design

4469. **comment:** NOTE: lightfuncs are coerced to full functions because * lightfuncs don't fit into a property value slot. This * has some side effects, see test-dev-lightfunc-accessor.js.

label: code-design

4470. IdentityEscape, with dollar added as a valid additional * non-standard escape (see test-regexp-identity-escape-dollar.js). * Careful not to match end-of-buffer (<0) here.

4471. 1st related value (type specific)

4472. The caller is responsible for being sure that bytecode being loaded * is valid and trusted. Invalid bytecode can cause memory unsafe * behavior directly during loading or later during bytecode execution * (instruction validation would be quite complex to implement). ** This signature check is the only sanity check for detecting * accidental invalid inputs. The initial 0xFF byte ensures no * ordinary string will be accepted by accident.

4473. Shared object part

4474. always throw ReferenceError for unresolved

4475. * Mark roots, hoping that recursion limit is not normally hit. * If recursion limit is hit, run additional reachability rounds * starting from "temproots" until marking is complete. ** Marking happens in two phases: first we mark actual reachability * roots (and run "temproots" to complete the process). Then we * check which objects are unreachable and are finalizable; such * objects are marked as FINALIZABLE and marked as reachability * (and "temproots" is run again to complete the process). ** The heap finalize_list must also be marked as a reachability root. * There may be objects on the list from a previous round if the * previous run had finalizer skip flag.

4476. Shift to sign extend.

4477. '^'

4478. required_desc_flags

4479. **comment:** Stack indices for better readability

label: code-design

4480. * Try registers

4481. no prototype or class yet

4482. shadowed; update value

4483. E5 Section 8.6.2 + custom classes

4484. **comment:** Lookup current thread; use the stable 'entry_thread' for this to * avoid clobber warnings. Any valid, reachable 'thr' value would be * fine for this, so using 'entry_thread' is just to silence warnings.

label: code-design

4485. RELATIONAL EXPRESSION

4486. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property existence check right now.

4487. These are just convenience "wiping" of state. Side effects should * not be an issue here: thr->heap and thr->heap->jl have a stable * pointer. Finalizer runs etc capture even out-of-memory errors so * nothing should throw here.

4488. Zero escape (also allowed in non-strict mode)

4489. roughly 64 bytes

4490. XXX: this doesn't actually work properly for tail calls, so * tail calls are disabled when DUK_USE_NONSTD_FUNC_CALLER_PROPERTY * is in use.

4491. * Dragon4 slow path (binary) digit generation. * An extra digit is generated for rounding.

4492. this is a bit approximate (errors out before max is reached); this is OK

4493. **comment:** * Parse a function-body-like expression (FunctionBody or Program * in E5 grammar) using a two-pass parse. The productions appear * in the following contexts: * - function expression * - function statement * - function declaration * - getter in object literal * - setter in object literal * - global code * - eval code * - Function constructor body * * This function only parses the statement list of the body; the argument * list and possible function name must be initialized by the caller. * For instance, for Function constructor, the argument names are originally * on the value stack. The parsing of statements ends either at an EOF or * a closing brace; this is controlled by an input flag. ** Note that there are many differences affecting parsing and even code * generation: * - Global and eval code have an implicit return value generated * by the last statement; function code does not * - Global code, eval code, and Function constructor body end in * an EOF, other bodies in a closing brace ('}') * * Upon entry, 'curr_tok' is ignored and the function will pull in the * first token on its own. Upon exit, 'curr_tok' is the terminating * token (EOF or closing brace).

label: code-design

4494. When torture not enabled, can just use the same helper because * 'reg' won't get spilled.

4495. Note: actual update happens once write has been completed * without error below. The write should always succeed * from a specification viewpoint, but we may e.g. run out * of memory. It's safer in this order.

4496. Convert buffer to result string.

4497. default prototype (Note: 'thr' must be reachable)

4498. we know these because enum objects are internally created

4499. **comment:** XXX: error message is a bit misleading: we reached a recursion * limit which is also essentially the same as a C callstack limit * (except perhaps with some relaxed threading assumptions).

label: code-design

4500. **comment:** Direct eval requires that there's a current * activation and it is an Ecmascript function. * When Eval is executed from e.g. cooperate API * call we'll need to do an indirect eval instead.

label: code-design

4501. 1 = num actual 'return values'

4502. should never happen

4503. '-' verbatim

4504. Regexp tokens

4505. avoid attempt to compact the current object

4506. DUK_TOK_TRUE

4507. idx_bottom and idx_retval are only used for book-keeping of * Ecmascript-initiated calls, to allow returning to an Ecmascript * function properly. They are duk_size_t to match the convention * that value stack sizes are duk_size_t and local frame indices * are duk_idx_t.

4508. **comment:** This loop is optimized for size. For speed, there should be * two separate loops, and we should ensure that memcmp() can be * used without an extra "will searchstring fit" check. Doing * the preconditioning for 'p' and 'p_end' is easy but cpos * must be updated if 'p' is wound back (backward scanning).

label: code-design

4509. min(incl)

4510. may be equal

4511. traceback depth ensures fits into 16 bits

4512. * Get the values onto the stack first. It would be possible to cover * some normal cases without resorting to the value stack. ** The right hand side could be a light function (as they generally * behave like objects). Light functions never have a 'prototype' * property so E5.1 Section 15.3.5.3 step 3 always throws a TypeError. * Using duk_require_hobject() is thus correct (except for error msg).

4513. DUK_TOK_GET

4514. * Various

4515. Module has now evaluated to a wrapped module function. Force its `* .name` to match `module.name` (defaults to last component of resolved `* ID`) so that it is shown in stack traces too. Note that we must not `*` introduce an actual name binding into the function scope (which is `*` usually the case with a named function) because it would affect the `*` scope seen by the module and shadow accesses to globals of the same name. `*` This is now done by compiling the function as anonymous and then forcing `* its .name` without setting a "has name binding" flag.

4516. Characters outside BMP cannot be escape()'d. We could `*` encode them as surrogate pairs (for codepoints inside `*` valid UTF-8 range, but not extended UTF-8). Because `* escape()` and `unescape()` are legacy functions, we don't.

4517. trailer

4518. `*` Check whether we need to abandon an array part (if it exists)

4519. [... env callee]

4520. **comment:** These is not 100% because format would need to be non-portable "long long". `*` Also print out as doubles to catch cases where the "long" type is not wide `*` enough; the limits will then not be printed accurately but the magnitude `*` will be correct.
label: code-design

4521. an Ecmascript function

4522. **comment:** avoid pressure to add/remove strings, invalidation of call data argument, etc.
label: code-design

4523. end of bytecode

4524. key is 'length', cannot match argument exotic behavior

4525. `*` First check whether property exists; if not, simple case. This covers `*` steps 1-4.

4526. `*` Do-while statement is mostly trivial, but there is special `*` handling for automatic semicolon handling (triggered by the `*` `DUK__ALLOW_AUTO_SEMI_ALWAYS` flag related to a bug filed at: `** https://bugs.ecmascript.org/show_bug.cgi?id=8 **` See doc/compiler.rst for details.

4527. must be found: was found earlier, and cannot be inherited

4528. Input value should be on stack top and will be coerced and `*` popped. Refuse to update an Array's 'length' to a value `*` outside the 32-bit range. Negative zero is accepted as zero.

4529. shift in zeroes

4530. free object and all auxiliary (non-heap) allocs

4531. Useful for internal call sites where we either expect an object (function) `*` or a lightfunc. Returns NULL for a lightfunc.

4532. bytes in dest

4533. `stack[0] = regexp * stack[1] = string`

4534. flags

4535. Check for maximum buffer length.

4536. 'Thread'

4537. **comment:** Pointer to bytecode executor's 'curr_pc' variable. Used to copy `*` the current PC back into the topmost activation when activation `*` state is about to change (or "syncing" is otherwise needed). This `*` is rather awkward but important for performance, see execution.rst.
label: code-design

4538. The `Quote(value)` operation: quote a string. `** Stack policy: [] -> [].`

4539. Output #2: last component name

4540. `tc1 = false, tc2 = false`

4541. 0

4542. Exponent without a sign or with a +/- sign is accepted `*` by all call sites (even `JSON.parse()`).

4543. `0x90-0x9f`

4544. **comment:** XXX: Shuffling support could be implemented here so that `LDINT+LDINTX` `*` would only shuffle once (instead of twice). The current code works `*` though, and has a smaller compiler footprint.
label: code-design

4545. `*` Write to entry part

4546. To use the shared helper need the virtual index.

4547. `*` Slow delete, but we don't care as we're already in a very slow path. `*` The delete always succeeds: key has no exotic behavior, property `*` is configurable, and no resize occurs.

4548. LAYOUT 1

4549. For `len == 0`, `i` is initialized to `len - 1` which underflows. `*` The condition (`i < len`) will then exit the for-loop on the `*` first round which is correct. Similarly, loop termination `*` happens by `i` underflowing.

4550. Raw internal valstack access macros: access is unsafe so call site `*` must have a guarantee that the index is valid. When that is the case, `*` using these macro results in faster and smaller code than `duk_get_tval()`. `*` Both 'ctx' and 'idx' are evaluated multiple times, but only for asserts.

4551. `*` Node.js Buffer.isEncoding()

4552. array entries are all plain values

4553. **comment:** Buffer values are encoded in (lowercase) hex to make the `*` binary data readable. Base64 or similar would be more `*` compact but less readable, and the point of JX/JC `*` variants is to be as useful to a programmer as possible.
label: code-design

4554. **comment:** XXX: the helper currently assumes stack top contains new `*` 'length' value and the whole calling convention is not very `*` compatible with what we need.
label: code-design

4555. Coerce to number before validating pointers etc so that the `*` number coercions in `duk_hbufferobject_validated_write()` are `*` guaranteed to be side effect free and not invalidate the `*` pointer checks we do here.

4556. Mark-and-sweep interval is relative to combined count of objects and `*` strings kept in the heap during the latest mark-and-sweep pass. `*` Fixed point .8 multiplier and .0 adder. Trigger count (interval) is `*` decreased by each (re)allocation attempt (regardless of size), and each `*` refzero processed object. `*` 'SKIP' indicates how many (re)allocations to wait until a retry if `*` GC is skipped because there is no thread do it with yet (happens `*` only during init phases).

4557. XXX: assert 'c' is an enumerator

4558. two special escapes: '\n' and "", other printables as is

4559. for `indexOf`, `ToInteger(undefined)` would be 0, i.e. correct, but `*` handle both `indexOf` and `lastIndexOf` specially here.

4560. `DUK_USE_AUGMENT_ERROR_THROW`

4561. `*` Exponent notation for non-base-10 numbers isn't specified in Ecmascript `*` specification, as it never explicitly turns up: non-decimal numbers can `*` only be formatted with `Number.prototype.toString([radix])` and for that, `*` behavior is not explicitly specified. `**` Logical choices include formatting the exponent as decimal (e.g. binary `* 100000` as `1e+5`) or in current radix (e.g. binary `100000` as `1e+101`). `*` The Dragon4 algorithm (in the original paper) prints the exponent value `*` in the target radix B. However, for radix values 15 and above, the `*` exponent separator 'e' is no longer easily parseable. Consider, for `*` instance, the number `"1.faecee+1c"`.

4562. Template functions are not strictly constructable (they don't `*` have a "prototype" property for instance), so leave the `*` `DUK_HOBJECT_FLAG_CONSTRUCTABLE` flag cleared here.

4563. **comment:** Most practical strings will go here.
label: code-design

4564. non-strict eval: env is caller's env or global env (direct vs. indirect call) `*` global code: env is is global env

4565. **comment:** XXX: use the exactly same arithmetic function here as in executor
label: code-design

4566. `-> [... lval new_rval]`

4567. sep (even before first one)

4568. **comment:** XXX: use advancing pointers instead of index macros `->` faster and smaller?
label: code-design

4569. `0x7F` is special

4570. IEEE requires that zeros compare the same regardless `*` of their signed, so if both x and y are zeroes, they `*` are caught above.

4571. Signed integers always map to 4 bytes now.

4572. Resolve Proxy targets until Proxy chain ends. No explicit check for * a Proxy loop: user code cannot create such a loop without tweaking * internal properties directly.

4573. estimate is valid

4574. Note: it's nice if size is 2^N (not $4 \times 4 = 16$ bytes on 32 bit)

4575. always true, arg is unsigned

4576. ArrayBuffer: unlike any other argument variant, create * a view into the existing buffer.

4577. DUK_TOK_DO

4578. * Slow path: potentially requires function calls for coercion

4579. 'ArrayBuffer'

4580. Initialize index so that we skip internal control keys.

4581. flags have been already cleared

4582. * ArrayBuffer, DataView, and TypedArray constructors

4583. **comment:** * XXX: for now, indicate that an expensive catch binding * declarative environment is always needed. If we don't * need it, we don't need the const_varname either.
label: code-design

4584. -> [... this timeval_new timeval_new]

4585. DUK_TOK_CONST

4586. **comment:** XXX: unnecessary copying of values? Just set 'top' to * b + c, and let the return handling fix up the stack frame?
label: code-design

4587. Slot C

4588. **comment:** Array is dense and contains only strings, but ASIZE may * be larger than used part and there are UNUSED entries.
label: code-design

4589. At least: ... [err]

4590. wrapped

4591. whole or fraction digit

4592. * Constructor calls

4593. only 'length'

4594. DUK_USE_DEBUGGER_DUMPHEAP

4595. 'toISOString'

4596. 'res' contains expression value

4597. No other escape beginning with a digit in strict mode

4598. **comment:** Use Murmurhash2 directly for short strings, and use "block skipping" * for long strings: hash an initial part and then sample the rest of * the string with reasonably sized chunks. An initial offset for the * sampling is computed based on a hash of the initial part of the string; * this is done to (usually) avoid the case where all long strings have * certain offset ranges which are never sampled. * * Skip should depend on length and bound the total time to roughly * logarithmic. With current values: * * 1M string => 256 * 241 = 61696 bytes (0.06M) of hashing * 1G string => 256 * 16321 = 4178176 bytes (3.98M) of hashing * * XXX: It would be better to compute the skip offset more "smoothly" * instead of having a few boundary values.
label: code-design

4710. [array totalLength bufres buf]

4711. When src_size == 0, src_data may be NULL (if source * buffer is dynamic), and dst_data may be NULL (if * target buffer is dynamic). Avoid zero-size memcpy() * with an invalid pointer.

4712. [r1,r2] is the range

4713. * NormalizePropertyDescriptor() related helper. ** Internal helper which validates and normalizes a property descriptor * represented as an Ecmascript object (e.g. argument to defineProperty()). * The output of this conversion is a set of defprop_flags and possibly * some values pushed on the value stack; some subset of: property value, * getter, setter. Caller must manage stack top carefully because the * number of values pushed depends on the input property descriptor. ** The original descriptor object must not be altered in the process.

4714. duk_handle_call / duk_handle_safe_call recursion depth limiting

4715. DUK_HOBJECT_FLAG_NEWENV: handled below

4716. A leading digit is not required in some cases, e.g. accept ".123". * In other cases (JSON.parse()) a leading digit is required. This * is checked for after the loop.

4717. common case, already closed, so skip

4718. ignore millisecond fractions after 3

4719. * unshift()

4720. E5 Section 10.4.3

4721. No built-in functions are constructable except the top * level ones (Number, etc).

4722. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed, * and we're in an infinite loop.

4723. Raw helper for getting a value from the stack, checking its tag. * The tag cannot be a number because numbers don't have an internal * tag in the packed representation.

4724. Bernstein hash init value is normally 5381

4725. * DECLVAR ** See E5 Sections: * 10.4.3 Entering Function Code * 10.5 Declaration Binding Instantiation * 12.2 Variable Statement * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution ** Variable declaration behavior is mainly discussed in Section 10.5, * and is not discussed in the execution semantics (Sections 11-13). ** Conceptually declarations happen when code (global, eval, function) * is entered, before any user code is executed. In practice, register- * bound identifiers are 'declared' automatically (by virtue of being * allocated to registers with the initial value 'undefined'). Other * identifiers are declared in the function prologue with this primitive. * * Since non-register bindings eventually back to an internal object's * properties, the 'prop_flags' argument is used to specify binding * type: * * - Immutable binding: set DUK_PROPDESC_FLAG_WRITABLE to false * - Non-deletable binding: set DUK_PROPDESC_FLAG_CONFIGURABLE to false * - The flag DUK_PROPDESC_FLAG_ENUMERABLE should be set, although it * doesn't really matter for internal objects * * All bindings are non-deletable mutable bindings except: * * - Declarations in eval code (mutable, deletable) * - 'arguments' binding in strict function code (immutable) * - Function name binding of a function expression (immutable) ** Declarations may go to declarative environment records (always * so for functions), but may also go to object environment records * (e.g. global code). The global object environment has special * behavior when re-declaring a function (but not a variable); see * E5.1 specification, Section 10.5, step 5.e. ** Declarations always go to the 'top-most' environment record, i.e. * we never check the record chain. It's not an error even if a * property (even an immutable or non-deletable one) of the same name * already exists. ** If a declared variable already exists, its value needs to be updated * (if possible). Returns 1 if a PUTVAR needs to be done by the caller; * otherwise returns 0.

4726. **comment:** duk_handle_call_xxx: call ignores C recursion limit (for errhandler calls)
label: code-design

4727. expt 0xffff is infinite/NaN

4728. Augment the error if called as a normal function. __FILE__ and __LINE__ * are not desirable in this case.

4729. %s

4730. e.g. "x" < "xx"

4731. **comment:** XXX: for fastints, could use a variant which assumes a double duk_tval * (and doesn't need to check for fastint again).
label: code-design

4732. SameValue

4733. How much stack to require on entry to object/array encode

4734. * Parse code after the clause. Possible terminators are * 'case', 'default', and '}'. ** Note that there may be no code at all, not even an empty statement, * between case clauses. This must be handled just like an empty statement * (omitting seemingly pointless JUMPs), to avoid situations like * test-bug-case-fallthrough.js.

4735. ... name ': ' message

4736. to exit

4737. parenthesis count, 0 = top level

4738. * Useful Unicode codepoints * * Integer constants must be signed to avoid unexpected coercions * in comparisons.

4739. input string (may be a user pointer)

4740. * round_idx points to the digit which is considered for rounding; the * digit to its left is the final digit of the rounded value. If round_idx * is zero, rounding will be performed; the result will either be an empty * rounded value or if carry happens a '1' digit is generated.

4741. Careful with carry condition: * - If carry not added: 0x12345678 + 0 + 0xffffffff = 0x12345678 (< 0x12345678) * - If carry added: 0x12345678 + 1 + 0xffffffff = 0x12345678 (== 0x12345678)

4742. shared helper

4743. * Fast buffer writer with spare management.

4744. success/error path both do this

4745. DUK_TOK_MUL

4746. attempt to change from accessor to data property

4747. allowed ascii whitespace

4748. [... source? filename?]

4749. continue jump

4750. -> [... key val]

4751. Prepare value stack for a method call through an object property. * May currently throw an error e.g. when getting the property.

4752. no need to create environment record now; leave as NULL

4753. * Thread state check and book-keeping.

4754. "/=" and not in regexp mode

4755. for lastIndexOf, result may be -1 (mark immediate termination)

4756. fatal_func should be noreturn, but noreturn declarations on function * pointers has a very spotty support apparently so it's not currently * done.

4757. requested identifier

4758. Function expression. Note that any statement beginning with 'function' * is handled by the statement parser as a function declaration, or a * non-standard function expression/statement (or a SyntaxError). We only * handle actual function expressions (occurring inside an expression) here. ** O(depth^2) parse count for inner functions is handled by recording a * lexer offset on the first compilation pass, so that the function can * be efficiently skipped on the second pass. This is encapsulated into * duk_parse_func_like_fnum().

4759. * JSON.stringify() fast path * * Otherwise supports full JSON, JX, and JC features, but bails out on any * possible side effect which might change the value being serialized. The * fast path can take advantage of the fact that the value being serialized * is unchanged so that we can walk directly through property tables etc.

4760. **comment:** XXX: helper
label: code-design

label: code-design

4889. at least one opcode emitted

4890. Slice offsets are element (not byte) offsets, which only matters * for TypedArray views, Node.js Buffer and ArrayBuffer have shift * zero so byte and element offsets are the same. Negative indices * are counted from end of slice, crossed indices are allowed (and * result in zero length result), and final values are clamped * against the current slice. There's intentionally no check * against the underlying buffer here.

4891. side effects, in theory (referenced by global env)

4892. * Object.seal() and Object.freeze() (E5 Sections 15.2.3.8 and 15.2.3.9) * * Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. * * Note: virtual (non-concrete) properties which are non-configurable but * writable would pose some problems, but such properties do not currently * exist (all virtual properties are non-configurable and non-writable). * If they did exist, the non-configurability does NOT prevent them from * becoming non-writable. However, this change should be recorded somehow * so that it would turn up (e.g. when getting the property descriptor), * requiring some additional flags in the object.

4893. additional flags which are passed in the same flags argument as property * flags but are not stored in object properties.

4894. **comment:** XXX: Is this INCREF necessary? 'func' is always a borrowed * reference reachable through the value stack? If changed, stack * unwind code also needs to be fixed to match.
label: code-design

4895. **comment:** XXX: shared decoding of 'b' and 'c'?
label: code-design

4896. **comment:** The fast path for array property put is not fully compliant: * If one places conflicting number-indexed properties into * Array.prototype (for example, a non-writable Array.prototype[7]) * the fast path will incorrectly ignore them. * * This fast path could be made compliant by falling through * to the slow path if the previous value was UNUSED. This would * also remove the need to check for extensibility. Right now a * non-extensible array is slower than an extensible one as far * as writes are concerned. * * The fast path behavior is documented in more detail here: * tests/ecmascript/test-misc-array-fast-write.js
label: code-design

4897. **comment:** XXX: because we unwind stacks above, thr->heap->curr_thread is at * risk of pointing to an already freed thread. This was indeed the * case in test-bug-multithread-valgrind.c, until duk_handle_call() * was fixed to restore thr->heap->curr_thread before rethrowing an * uncaught error.
label: code-design

4898. Allow naked fraction (e.g. ".123")

4899. * Rate limit check for sending status update or peeking into * the debug transport. Both can be expensive operations that * we don't want to do on every opcode. * * Making sure the interval remains reasonable on a wide variety * of targets and bytecode is difficult without a timestamp, so * we use a Date-provided timestamp for the rate limit check. * But since it's also expensive to get a timestamp, a bytecode * counter is used to rate limit getting timestamps.

4900. >>> struct.unpack('>d', '4000112233445566'.decode('hex')) * (2.008366013071895,)

4901. Other longjmp types are handled by executor before propagating * the error here.

4902. * E5 Section 11.8.6 describes the main algorithm, which uses * [[HasInstance]]. [[HasInstance]] is defined for only * function objects: * * - Normal functions: * E5 Section 15.3.5.3 * - Functions established with Function.prototype.bind(): * E5 Section 15.3.4.5.3 * * For other objects, a TypeError is thrown. * * Limited Proxy support: don't support 'getPrototypeOf' trap but * continue lookup in Proxy target if the value is a Proxy.

4903. * Ecmascript/native function call or lightfunc call

4904. Halt execution and enter a debugger message loop until execution is resumed * by the client. PC for the current activation may be temporarily decremented * so that the "current" instruction will be shown by the client. This helper * is callable from anywhere, also outside bytecode executor.

4905. computed live

4906. **comment:** Load a function from bytecode. The function object returned here must * match what is created by duk_js_push_closure() with respect to its flags, * properties, etc. * * NOTE: there are intentionally no input buffer length / bound checks. * Adding them would be easy but wouldn't ensure memory safety as untrusted * or broken bytecode is unsafe during execution unless the opcodes themselves * are validated (which is quite complex, especially for indirect opcodes).
label: code-design

4907. * For an external string, the NUL-terminated string data is stored * externally. The user must guarantee that data behind this pointer * doesn't change while it's used.

4908. Note: masking of 'x' is not necessary because of * range check and shifting -> no bits overlapping * the marker should be set.

4909. **comment:** * Object.defineProperty() related helper (E5 Section 15.2.3.6) * * Inlines all [[DefineOwnProperty]] exotic behaviors. * * Note: Ecmascript compliant [[DefineOwnProperty]](P, Desc, Throw) is not * implemented directly, but Object.defineProperty() serves its purpose. * We don't need the [[DefineOwnProperty]] internally and we don't have a * property descriptor with 'missing values' so it's easier to avoid it * entirely. * * Note: this is only called for actual objects, not primitive values. * This must support virtual properties for full objects (e.g. Strings) * but not for plain values (e.g. strings). Lightfuncs, even though * primitive in a sense, are treated like objects and accepted as target * values.
label: code-design

4910. callstack limits

4911. A...P

4912. Module table: * - module.exports: initial exports table (may be replaced by user) * - module.id is non-writable and non-configurable, as the CommonJS * spec suggests this if possible * - module.filename: not set, defaults to resolved ID if not explicitly * set by modSearch() (note capitalization, not .fileName, matches Node.js) * - module.name: not set, defaults to last component of resolved ID if * not explicitly set by modSearch()

4913. String constructor needs to distinguish between an argument not given at all * vs. given as 'undefined'. We're a vararg function to handle this properly.

4914. Explicit length is only needed if it differs from 'nargs'.

4915. Force restart caused by a function return; must recheck * debugger breakpoints before checking line transitions, * see GH-303. Restart and then handle interrupt_counter * zero again.

4916. Decode 'bits' bits from the input stream (bits must be 1...24). * When reading past bitstream end, zeroes are shifted in. The result * is signed to match duk_bd_decode_flagged.

4917. (?:

4918. Must be restored here to handle e.g. yields properly.

4919. The base ID of the current require() function, resolution base

4920. non-Reference deletion is always 'true', even in strict mode

4921. jump to next loop, using reg_v34_iter as iterated value

4922. Scan error: this shouldn't normally happen; it could happen if * string is not valid UTF-8 data, and clen/blen are not consistent * with the scanning algorithm.

4923. max possible

4924. punctuators (unlike the spec, also includes "/" and "=")

4925. DUK_BUFOBJ_FLOAT32ARRAY

4926. [... ptr]

4927. Note: copying tv_obj and tv_key to locals to shield against a valstack * resize is not necessary for a property delete right now.

4928. 12: getDate

4929. * Helper for valstack space * * Caller of DUK_ASSERT_VALSTACK_SPACE() estimates the number of free stack entries * required for its own use, and any child calls which are not (a) Duktape API calls * or (b) Duktape calls which involve extending the valstack (e.g. getter call).

4930. 'modLoaded'

4931. * Assertions before

4932. **comment:** * Buffer writer (dynamic buffer only) * * Helper for writing to a dynamic buffer with a concept of a "spare" area * to reduce resizes. You can ensure there is enough space beforehand and * then write for a while without further checks, relying on a stable data * pointer. Spare handling is automatic so call sites only indicate how * much data they need right now. * * There are several ways to write using bufwriter. The best approach * depends mainly on how much performance matters over code footprint. * The key issues are (1) ensuring there is space and (2) keeping the * pointers consistent. Fast code should ensure space

for multiple writes * with one ensure call. Fastest inner loop code can temporarily borrow * the 'p' pointer but must write it back eventually. ** Be careful to ensure all macro arguments (other than static pointers like * 'thr' and 'bw_ctx') are evaluated exactly once, using temporaries if * necessary (if that's not possible, there should be a note near the macro). * Buffer write arguments often contain arithmetic etc so this is * particularly important here.

label: code-design

4933. Ordering should not matter (E5 Section 11.8.5, step 3.a) but * preserve it just in case.

4934. for zero size, don't push anything on valstack

4935. Here we'd have the option of decoding unpadded base64 * (e.g. "xxxxyy" instead of "xxxxyy==". Currently not * accepted.

4936. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway

4937. * Conceptually, we look for the identifier binding by starting from * 'env' and following to chain of environment records (represented * by the prototype chain). ** If 'env' is NULL, the current activation does not yet have an * allocated declarative environment record; this should be treated * exactly as if the environment record existed but had no bindings * other than register bindings. ** Note: we assume that with the DUK_HOBJECT_FLAG_NEWENV cleared * the environment will always be initialized immediately; hence * a NULL 'env' should only happen with the flag set. This is the * case for: (1) function calls, and (2) strict, direct eval calls.

4938. heap level "stash" object (e.g., various reachability roots)

4939. * For global or eval code this is straightforward. For functions * created with the Function constructor we only get the source for * the body and must manufacture the "function ..." part. ** For instance, for constructed functions (v8): * * > a = new Function("foo", "bar", "print(foo)"); * [Function] * > a.toString() * 'function anonymous(foo,bar) {nprint(foo)n}' * * Similarly for e.g. getters (v8): * * > x = { get a(foo,bar) { print(foo); } } * { a: [Getter] } * > Object.getOwnPropertyDescriptor(x, 'a').get.toString() * 'function a(foo,bar) { print(foo); }'

4940. c recursion check

4941. XXX: optimize by adding the token numbers directly into the * always interned duk_hstring objects (there should be enough * flag bits free for that)?

4942. Continue parsing after padding, allows concatenated, * padded base64.

4943. Check that 'this' is a duk_hbufferobject and return a pointer to it * (NULL if not).

4944. idx_step is +1 for indexOf, -1 for lastIndexOf

4945. is a setter/getter

4946. env created above to stack top

4947. cannot be e.g. arguments exotic, since exotic 'traits' are mutually exclusive

4948. DUK_TOK_LNOT

4949. XXX: sufficient to check 'strict', assert for 'is function'

4950. check final character validity

4951. * Init lexer context

4952. * Incref and decref functions. ** Decref may trigger immediate refzero handling, which may free and finalize * an arbitrary number of objects. *

4953. Generate pc2line data for an instruction sequence, leaving a buffer on stack top.

4954. a dummy undefined value is pushed to make valstack * behavior uniform for caller

4955. idx_step is +1 for reduce, -1 for reduceRight

4956. PatternCharacter, all excluded characters are matched by cases above

4957. Note: -nargs alone would fail for nargs == 0, this is OK

4958. curr and desc are accessors

4959. * Throw the error in the resumed thread's context; the * error value is pushed onto the resumee valstack. ** Note: the callstack of the target may empty in this case * too (i.e. the target thread has never been resumed). The * value stack will contain the initial function in that case, * which we simply ignore.

4960. For string-to-number, pretend we never have the lowest mantissa as there * is no natural "precision" for inputs. Having lowest_mantissa == 0, we'll * fall into the base cases for both e >= 0 and e < 0.

4961. Number built-in accepts a plain number or a Number object (whose * internal value is operated on). Other types cause TypeError.

4962. Encode to extended UTF-8; 'out' must have space for at least * DUK_UNICODE_MAX_XUTF8_LENGTH bytes. Allows encoding of any * 32-bit (unsigned) codepoint.

4963. func.prototype.constructor = func

4964. Accept any pointer-like value; for 'object' dvalue, read * and ignore the class number.

4965. **comment:** Clone the properties of the ROM-based global object to create a * fully RAM-based global object. Uses more memory than the inherit * model but more compliant.

label: code-design

4966. prev value can be garbage, no decref

4967. **comment:** * For/for-in statement is complicated to parse because * determining the statement type (three-part for vs. a * for-in) requires potential backtracking. ** See the helper for the messy stuff.

label: code-design

4968. Stepped? Step out is handled by callstack unwind.

4969. Copy values, the copy method depends on the arguments. ** Copy mode decision may depend on the validity of the underlying * buffer of the source argument; there must be no harmful side effects * from there to here for copy_mode to still be valid.

4970. fills window

4971. Caller must check character offset to be inside the string.

4972. valstack will be unbalanced, which is OK

4973. conservative

4974. unconditional

4975. DUK_USE_FASTINT && DUK_USE_PACKED_TVAL

4976. * NEXTENUM checks whether the enumerator still has unenumerated * keys. If so, the next key is loaded to the target register * and the next instruction is skipped. Otherwise the next instruction * will be executed, jumping out of the enumeration loop.

4977. **comment:** Providing access to e.g. act->lex_env would be dangerous: these * internal structures must never be accessible to the application. * Duktape relies on them having consistent data, and this consistency * is only asserted for, not checked for.

label: code-design

4978. Duktape.modSearch

4979. Set .buffer to the argument ArrayBuffer.

4980. * Parse a function-like expression: * * - function expression * - function declaration * - function statement (non-standard) * - setter/getter ** Adds the function to comp_ctxt->curr_func function table and returns the * function number. ** On entry, curr_token points to: * * - the token after 'function' for function expression/declaration/statement * - the token after 'set' or 'get' for setter/getter

4981. * Match loop. ** Try matching at different offsets until match found or input exhausted.

4982. flags: ''

4983. -> [res_obj]

4984. nbytes * <-----> * [... | p | x | x | q] * => [... | q | p | x | x]

4985. eat '{' on entry

4986. This native function is also used for Date.prototype.getTime() * as their behavior is identical.

4987. resume write to target

4988. if new_size < L * old_size, resize without abandon check; L = 3-bit fixed point, e.g. 9 -> 9/8 = 112.5%

4989. Note: we could try to stuff a partial hash (e.g. 16 bits) into the * shared heap header. Good hashing needs more hash bits though.

4990. Else functionality is identical for function call and constructor * call.

4991. inclusive

4992. Check that 'this' is a duk_hbufferobject and return a pointer to it.

4993. utf-8 continuation bytes have the form 10xx xxxx

4994. This is based on V8 EquivalentYear() algorithm (see src/genequivyear.py): * http://code.google.com/p/v8/source/browse/trunk/src/date.h#146

4995. 'buf' contains the string to write, 'sz_buf' contains the length * (which may be zero).

4997. hobject management functions
4998. Convert day from one-based to zero-based (internal). This may * cause the day part to be negative, which is OK.
4999. 1111 10xx 10xx xxxx 10xx xxxx 10xx xxxx [26 bits]
5000. There is no need to check the first character specially here * (i.e. reject digits): the caller only accepts valid initial * characters and won't call us if the first character is a digit. * This also ensures that the plain string won't be empty.
5001. \xffBytecode'
5002. Catch a double-to-int64 cast issue encountered in practice.
5003. * DumpHeap command
5004. **comment:** * Lexer for source files, ToNumber() string conversions, RegExp expressions, * and JSON. * * Provides a stream of Ecmascript tokens from an UTF-8/CESU-8 buffer. The * caller can also rewind the token stream into a certain position which is * needed by the compiler part for multi-pass scanning. Tokens are * represented as duk_token structures, and contain line number information. * Token types are identified with DUK_TOK_*. * * Characters are decoded into a fixed size lookup window consisting of * decoded Unicode code points, with window positions past the end of the * input filled with an invalid codepoint (-1). The tokenizer can thus * perform multiple character lookups efficiently and with few sanity * checks (such as access outside the end of the input), which keeps the * tokenization code small at the cost of performance. * * Character data in tokens, such as identifier names and string literals, * is encoded into CESU-8 format on-the-fly while parsing the token in * question. The string data is made reachable to garbage collection by * placing the token-related values in value stack entries allocated for * this purpose by the caller. The characters exist in Unicode code point * form only in the fixed size lookup window, which keeps character data * expansion (of especially ASCII data) low. * * Token parsing supports the full range of Unicode characters as described * in the E5 specification. Parsing has been optimized for ASCII characters * because ordinary Ecmascript code consists almost entirely of ASCII * characters. Matching of complex Unicode codepoint sets (such as in the * IdentifierStart and IdentifierPart productions) is optimized for size, * and is done using a linear scan of a bit-packed list of ranges. This is * very slow, but should never be entered unless the source code actually * contains Unicode characters. * * Ecmascript tokenization is partially context sensitive. First, * additional future reserved words are recognized in strict mode (see E5 * Section 7.6.1.2). Second, a forward slash character ('/') can be * recognized either as starting a RegExp literal or as a division operator, * depending on context. The caller must provide necessary context flags * when requesting a new token. * * Future work: * * * Make line number tracking optional, as it consumes space. * * * Add a feature flag for disabling UTF-8 decoding of input, as most * source code is ASCII. Because of Unicode escapes written in ASCII, * this does not allow Unicode support to be removed from e.g. * duk_unicode_is_identifier_start() nor does it allow removal of CESU-8 * encoding of e.g. string literals. * * * Add a feature flag for disabling Unicode compliance of e.g. identifier * names. This allows for a build more than a kilobyte smaller, because * Unicode ranges needed by duk_unicode_is_identifier_start() and * duk_unicode_is_identifier_part() can be dropped. String literals * should still be allowed to contain escaped Unicode, so this still does * not allow removal of CESU-8 encoding of e.g. string literals. * * * Character lookup tables for codepoints above BMP could be stripped. * * * Strictly speaking, E5 specification requires that source code consists * of 16-bit code units, and if not, must be conceptually converted to * that format first. The current lexer processes Unicode code points * and allows characters outside the BMP. These should be converted to * surrogate pairs while reading the source characters into the window, * not after tokens have been formed (as is done now). However, the fix * is not trivial because two characters are decoded from one codepoint. * * * Optimize for speed as well as size. Large if-else ladders are (at * least potentially) slow.
label: code-design
5005. [... buf loop]
5006. **comment:** * Heap object representation. * * Heap objects are used for Ecmascript objects, arrays, and functions, * but also for internal control like declarative and object environment * records. Compiled functions, native functions, and threads are also * objects but with an extended C struct. * * Objects provide the required Ecmascript semantics and exotic behaviors * especially for property access. * * Properties are stored in three conceptual parts: * * 1. A linear 'entry part' contains ordered key-value-attributes triples * and is the main method of string properties. * * 2. An optional linear 'array part' is used for array objects to store a * (dense) range of [0,N[array indexed entries with default attributes * (writable, enumerable, configurable). If the array part would become * sparse or non-default attributes are required, the array part is * abandoned and moved to the 'entry part'. * * 3. An optional 'hash part' is used to optimize lookups of the entry * part; it is used only for objects with sufficiently many properties * and can be abandoned without loss of information. * * These three conceptual parts are stored in a single memory allocated area. * This minimizes memory allocation overhead but also means that all three * parts are resized together, and makes property access a bit complicated.

5040. Step 1 is not necessary because duk_call_method() will take * care of it.

5041. * Code emission helpers ** Some emission helpers understand the range of target and source reg/const * values and automatically emit shuffling code if necessary. This is the * case when the slot in question (A, B, C) is used in the standard way and * for opcodes the emission helpers explicitly understand (like DUK_OP_CALL). ** The standard way is that: * - slot A is a target register * - slot B is a source register/constant * - slot C is a source register/constant * * If a slot is used in a non-standard way the caller must indicate this * somehow. If a slot is used as a target instead of a source (or vice * versa), this can be indicated with a flag to trigger proper shuffling * (e.g. DUK_EMIT_FLAG_B_IS_TARGET). If the value in the slot is not * register/const related at all, the caller must ensure that the raw value * fits into the corresponding slot so as to not trigger shuffling. The * caller must set a "no shuffle" flag to ensure compilation fails if * shuffling were to be triggered because of an internal error. ** For slots B and C the raw slot size is 9 bits but one bit is reserved for * the reg/const indicator. To use the full 9-bit range for a raw value, * shuffling must be disabled with the DUK_EMIT_FLAG_NO_SHUFFLE_{B,C} flag. * Shuffling is only done for A, B, and C slots, not the larger BC or ABC slots. ** There is call handling specific understanding in the A-B-C emitter to * convert call setup and call instructions into indirect ones if necessary.

5421. (?=

5422. require to be safe

5423. Parser part count.

5424. for side effects, result ignored

5425. Now we can check offset validity.

5426. Milliseconds between status notify and transport peeks.

5427. Matching separator index is used in the control table

5428. rehash even if old and new sizes are the same to get rid of * DELETED entries.

5429. * Two pass approach to processing the property descriptors. * On first pass validate and normalize all descriptors before * any changes are made to the target object. On second pass * make the actual modifications to the target object. * * Right now we'll just use the same normalize/validate helper * on both passes, ignoring its outputs on the first pass.

5430. * Stringify implementation.

5431. ToNumber() for a double is a no-op.

5432. default: char escape (two chars)

5433. * Hobject allocation. * * Provides primitive allocation functions for all object types (plain object, * compiled function, native function, thread). The object return is not yet * in "heap allocated" list and has a refcount of zero, so caller must careful.

5434. Check actual underlying buffers for validity and that they * cover the copy. No side effects are allowed after the check * so that the validity status doesn't change.

5435. * Special parser for character classes; calls callback for every * range parsed and returns the number of ranges present.

5436. negate result

5437. * Lightfunc

5438. **comment:** * Refzero handling is skipped entirely if (1) mark-and-sweep is * running or (2) execution is paused in the debugger. The objects * are left in the heap, and will be freed by mark-and-sweep or * eventual heap destruction. * * This is necessary during mark-and-sweep because refcounts are also * updated during the sweep phase (otherwise objects referenced by a * swept object would have incorrect refcounts) which then calls here. * This could be avoided by using separate decref macros in * mark-and-sweep; however, mark-and-sweep also calls finalizers which * would use the ordinary decref macros anyway and still call this * function. * * This check must be enabled also when mark-and-sweep support has been * disabled: the flag is also used in heap destruction when running * finalizers for remaining objects, and the flag prevents objects from * being moved around in heap linked lists.
label: code-design

5439. XXX: len $\geq 0x80000000$ won't work below because a signed type * is needed by qsort.

5440. Special handling for year sign.

5441. [arg1 ... argN obj length new_length]

5442. The algorithm in E5.1 Section 15.9.1.12 normalizes month, but * does not normalize the day-of-month (nor check whether or not * it is finite) because it's not necessary for finding the day * number which matches the (year,month) pair. * * We assume that duk__day_from_year() is exact here. * * Without an explicit infinity / NaN check in the beginning, * day_num would be a bogus integer here. * * It's possible for 'year' to be out of integer range here. * If so, we need to return NaN without integer overflow. * This fixes test-bug-setyear-overflow.js.

5443. * Node.js Buffer.prototype.slice([start], [end]) * ArrayBuffer.prototype.slice(begin, [end]) * TypedArray.prototype.slice(begin, [end]) * * The API calls are almost identical; negative indices are counted from end * of buffer, and final indices are clamped (allowing crossed indices). Main * differences: * * - Copy/view behavior; Node.js .slice() and TypedArray .subarray() create * views, ArrayBuffer .slice() creates a copy * * - Resulting object has a different class and prototype depending on the * call (or 'this' argument) * * - TypedArray .subarray() arguments are element indices, not byte offsets

5444. **comment:** When alloc_size == 0 the second allocation may not * actually exist.

5690. preincrement and predecrement

5691. Value would normally be omitted, replace with 'null'.

5692. e.g. require('/foo'), empty terms not allowed

5693. string is internal

5694. * Parse regexp Disjunction. Most of regexp compilation happens here. * * Handles Disjunction, Alternative, and Term productions directly without * recursion. The only constructs requiring recursion are positive/negative * lookaheads, capturing parentheses, and non-capturing parentheses. * * The function determines whether the entire disjunction is a 'simple atom' * (see doc/regexp.rst discussion on 'simple quantifiers') and if so, * returns the atom character length which is needed by the caller to keep * track of its own atom character length. A disjunction with more than one * alternative is never considered a simple atom (although in some cases * that might be the case). * * Return value: simple atom character length or < 0 if not a simple atom. * Appends the bytecode for the disjunction matcher to the end of the temp * buffer. * * Regexp top level structure is: * * Disjunction = Term* * | Term* | Disjunction * * Term = Assertion * | Atom * | Atom Quantifier * * An empty Term sequence is a valid disjunction alternative (e.g. /|||c||/). * * Notes: * * * Tracking of the 'simple-ness' of the current atom vs. the entire * disjunction are separate matters. For instance, the disjunction * may be complex, but individual atoms may be simple. Furthermore, * simple quantifiers are used whenever possible, even if the * disjunction as a whole is complex. * * * The estimate of whether an atom is simple is conservative now, * and it would be possible to expand it. For instance, captures * cause the disjunction to be marked complex, even though captures * -can- be handled by simple quantifiers with some minor modifications. * * * Disjunction 'tainting' as 'complex' is handled at the end of the * main for loop collectively for atoms. Assertions, quantifiers, * and '| tokens need to taint the result manually if necessary. * Assertions cannot add to result char length, only atoms (and * quantifiers) can; currently quantifiers will taint the result * as complex though.

5695. Get a pointer to the current buffer contents (matching current allocation * size). May be NULL for zero size dynamic/external buffer.

5696. success: leave varname in stack

5697. safe

5793. DUK_USE_EXPLICIT_NULL_INIT

5794. valgrind whine without this

5795. **comment:** * Helper for calling a user error handler. * * 'thr' must be the currently active thread; the error handler is called * in its context. The valstack of 'thr' must have the error value on * top, and will be replaced by another error value based on the return * value of the error handler. * * The helper calls duk_handle_call() recursively in protected mode. * Before that call happens, no longjmps should happen; as a consequence, * we must assume that the valstack contains enough temporary space for * arguments and such. * * While the error handler runs, any errors thrown will not trigger a * recursive error handler call (this is implemented using a heap level * flag which will "follow" through any coroutines resumed inside the * error handler). If the error handler is not callable or throws an * error, the resulting error replaces the original error (for Duktape * internal errors, duk_error_throw.c further substitutes this error with * a DoubleError which is not ideal). This would be easy to change and * even signal to the caller. * * The user error handler is stored in 'Duktape.errCreate' or * 'Duktape.errThrow' depending on whether we're augmenting the error at * creation or throw time. There are several alternatives to this approach, * see doc/error-objects.rst for discussion. * * Note: since further longjmp(s) may occur while calling the error handler * (for many reasons, e.g. a labeled 'break' inside the handler), the * caller can make no assumptions on the thr->heap->lj state after the * call (this affects especially duk_error_throw.c). This is not an issue * as long as the caller writes to the lj state only after the error handler * finishes.**label:** code-design

5796. * Exposed calls

5797. key encountered as a setter

5798. Don't need to sync curr_pc here; duk_new() will do that * when it augments the created error.

5799. one i_step over

5800. Shared prefix for all buffer types.

5801. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. * * Delayed creation (on demand) is handled in duk_js_var.c.

5802. Reject a proxy object as the target because it would need * special handler in property lookups. (ES6 has no such restriction)

5803. must restore reliably before returning

5804. * Basic context initialization. * * Some init values are read from the bytecode header * whose format is (UTF-8 codepoints): * * uint flags * uint nsaved (even, 2n+2 where n = num captures)

5805. return 'res_arr' or 'null'

5806. **comment:** This would be nice, but parsing is faster without resetting the * value slots. The only side effect is that references to temporary * string values may linger until lexing is finished; they're then * freed normally.**label:** code-design

5807. break jump

5808. "123"

5809. Note: the only yield-preventing call is Duktape.Thread.yield(), hence check for 1, not 0

5810. range check not necessary because all 4-bit values are mapped

6104. make current token the previous; need to fiddle with valstack "backing store"

6105. '{_func:true}'

6106. prediction: portable variant using doubles if 64-bit values not available

6107. [... arr val]

6108. Casting convenience.

6109. The stack has a variable shape here, so force it to the * desired one explicitly.

6110. **comment:** XXX: does not work if thr->catchstack is NULL

label: code-design

6111. Object.getOwnPropertyNames

6112. 'undefined'

6113. **comment:** XXX: with 'caller' property the callstack would need * to be unwound to update the 'caller' properties of * functions in the callstack.

label: code-design

6114. Overestimate required size; debug code so not critical to be tight.

6115. **comment:** no special formatting

label: code-design

6116. proplist is very rare

6117. * Handling DUK_OP_ADD this way is more compact (experimentally) * than a separate case with separate argument decoding.

6118. currently processing messages or breakpoints: don't enter message processing recursively (e.g. no breakpoints when processing debugger eval)

6119. DUK_USE_JC

6120. function refers to 'arguments' identifier

6121. don't want an intermediate exposed state with invalid pc

6122. Use loop to minimize code size of relookup after bound function case

6123. 'Undefined'

6124. **comment:** * Variable already declared, ignore re-declaration. * The only exception is the updated behavior of E5.1 for * global function declarations, E5.1 Section 10.5, step 5.e. * This behavior does not apply to global variable declarations.

label: code-design

6125. **comment:** Avoid fake finalization for the duk__refcount_fake_finalizer function * itself, otherwise we're in infinite recursion.

label: code-design

6126. **comment:** Borrow is detected based on wrapping which relies on exact 32-bit * types.

label: code-design

6127. if abandon_array, new_a_size must be 0

6128. Parse enumeration target and initialize enumerator. For 'null' and 'undefined', * INITENUM will creates a 'null' enumerator which works like an empty enumerator * (E5 Section 12.6.4, step 3). Note that INITENUM requires the value to be in a * register (constant not allowed).

6129. pointer is aligned, guaranteed for fixed buffer

6130. See MPUTOBJ comments above.

6131. Pause on the next opcode executed. This is always safe to do even * inside the debugger message loop: the interrupt counter will be reset * to its proper value when the message loop exits.

6132. Ensure there is internal valstack spare before we exit; this may * throw an alloc error. The same guaranteed size must be available * as before the call. This is not optimal now: we store the valstack * allocated size during entry; this value may be higher than the * minimal guarantee for an application.

6133. '\xffPc2line'

6134. **comment:** XXX: better coercion

label: code-design

6135. guaranteed to finish, as hash is never full

6136. shared flags for a subset of types

6137. nothing to incref

6138. The short string/integer initial bytes starting from 0x60 don't have * defines now.

6139. **comment:** XXX: use a helper for prototype traversal; no loop check here

label: code-design

6140. FunctionDeclaration: not strictly a statement but handled as such. ** O(depth^2) parse count for inner functions is handled by recording a * lexer offset on the first compilation pass, so that the function can * be efficiently skipped on the second pass. This is encapsulated into * duk_parse_func_like_fnnum().

6141. unpack args

6142. hash lookup

6143. * Cleanup: restore original function, restore valstack state.

6144. don't touch property attributes or hash part

6145. Note: duk_uint8_t type yields larger code

6146. * The error object has been augmented with a traceback and other * info from its creation point -- usually another thread. The * error handler is called here right before throwing, but it also * runs in the resumer's thread. It might be nice to get a traceback * from the resumee but this is not the case now.

6147. Push function object, init flags etc. This must match * duk_js_push_closure() quite carefully.

6148. return arg as-is

6149. NULL accepted

6150. Lightfunc, not blamed now.

6151. 0 = no throw

6152. **comment:** XXX: macros

label: code-design

6153. Interrupt counter for triggering a slow path check for execution * timeout, debugger interaction such as breakpoints, etc. The value * is valid for the current running thread, and both the init and * counter values are copied whenever a thread switch occurs. It's * important for the counter to be conveniently accessible for

the * bytecode executor inner loop for performance reasons.

6154. start value for current countdown

6155. maximum recursion depth for loop detection stacks

6156. us

6157. [... holder name val]

6158. Allow automatic detection of hex base ("0x" or "0X" prefix), * overrides radix argument and forces integer mode.

6159. * Init arguments properties, map, etc.

6160. **comment:** NUL terminator handling doesn't matter here
label: code-design

6161. **comment:** XXX: error handling is incomplete. It would be cleanest if * there was a setjmp catchpoint, so that all init code could * freely throw errors. If that were the case, the return code * passing here could be removed.
label: code-design

6375. Bytecode instructions: endian conversion needed unless * platform is big endian.
6376. DUK_TOK_EXTENDS
6377. XXX: optimize reconfig valstack operations so that resize, clamp, and setting * top are combined into one pass.
6378. fastint downgrade check for return values
6379. **comment:** bytes of indent still needed
 label: code-design
6380. DUK_JS_COMPILER_H_INCLUDED
6381. nop
6382. Restore the previous setjmp catcher so that any error in * error handling will propagate outwards rather than re-enter * the same handler. However, the error handling path must be * designed to be error free so that sandboxing guarantees are * reliable, see e.g. <https://github.com/svaarala/duktape/issues/476>.
6383. Double error
6384. * Valstack spare check
6385. This would be pointless: unexpected type and lightfunc would both return NULL
6386. For internal use: get non-accessor entry value
6387. trailing comma followed by rcurly
6388. Prevent mark-and-sweep for the pending finalizers, also prevents * refzero handling from moving objects away from the heap_allocated * list. (The flag meaning is slightly abused here.)
6389. [...] value this_binding]
6390. DUK_TOK_INCREMENT
6391. * Shared handling of binary operations ** args = (is_extraop << 16) + (opcode << 8) + rbp
6392. insert code for matching the remainder - infinite or finite
6393. **comment:** XXX: shared api error strings, and perhaps even throw code for rare cases?
 label: code-design
6394. Although there are writable virtual properties (e.g. plain buffer * and buffer object number indices), they are handled before we come * here.
6395. * Fast paths
6396. **comment:** XXX: static alloc is OK until separate chaining stringtable * resizing is implemented.
 label: code-design
6397. truncate towards zero
6398. 37: setUTCFullYear
6399. **comment:** Function name: missing/undefined is mapped to empty string, * otherwise coerce to string.
 label: code-design
6400. * Assert helpers
6401. resume lookup from target
6402. **comment:** XXX: assume these?
 label: code-design
6403. When creating built-ins, some of the built-ins may not be set * and we want to tolerate that when throwing errors.
6404. standard prototype
6405. **comment:** XXX: consolidated algorithm step 15.f -> redundant?
 label: code-design

6471. Careful here: state must be wiped before the call * so that we can cleanly handle a re-attach from * inside the callback.
6472. assume 0 <=> NULL
6473. skip leading digit
6474. B -> object register * C -> C+0 contains key, C+1 closure (value)
6475. caller guarantees
6476. **comment:** array part must not contain any non-unused properties, as they would * be configurable and writable.
 label: code-design
6477. Note: '\b' in char class is different than outside (assertion), * '\B' is not allowed and is caught by the duk_unicode_is_identifier_part() * check below.
6478. Note: combining __FILE__, __LINE__, and __func__ into fmt would be * possible compile time, but waste some space with shared function names.
6479. at least this function exists
6480. hash part is a 'weak reference' and does not contribute
6481. 'pc'
6482. 'errThrow'
6483. DUK_TOK_SUPER
6484. This is guaranteed by debugger code.
6485. [... (sep) str1 str2 ... strN buf]
6486. 0: no change
6487. Bigint is 2^52. Used to detect normalized IEEE double mantissa values * which are at the lowest edge (next floating point value downwards has * a different exponent). The lowest mantissa has the form: * * 1000.....000 (52 zeroes; only "hidden bit" is set)
6488. reg(ignore)
6489. undefined coerces to zero which is correct
6490. overwrite any previous binding of the same name; the effect is * that last argument of a certain name wins.
6491. returned after EOF (infinite amount)
6492. **comment:** XXX: investigate whether write protect can be handled above, if we * just update length here while ignoring its protected status
 label: code-design
6493. **comment:** This is a bit clunky because it is ANSI C portable. Should perhaps * relocate to another file because this is potentially platform * dependent.
 label: code-design
6494. Unwind catchstack entries referring to the callstack entry we're reusing
6495. **comment:** XXX: many operations actually want toforcedtemp() -- brand new temp?
 label: code-design
6496. e.g. DUK_OP_POSTINCR
6497. 'Uint8ClampedArray'
6498. No copy, leave zero bytes in the buffer. There's no * ambiguity with Float32/Float64 because zero bytes also * represent 0.0.
6499. no typedef
6500. [... func_template]
6501. Note: any entries above the callstack top are garbage and not zeroed. * Also topmost activation idx_retval is garbage (not zeroed), and must * be ignored.
6502. [arg1 ... argN obj length]
6503. Previous value of 'func' caller, restored when unwound. Only in use * when 'func' is non-strict.
6504. When doing string-to-number, lowest_mantissa is always 0 so * the exponent check, while incorrect, won't matter.
6505. If the value has a prototype loop, it's critical not to * throw here. Instead, assume the value is not to be * augmented.
6506. **comment:** unused with some debug level combinations
 label: code-design
6507. Line number range for function. Needed during debugging to * determine active breakpoints.
6508. **comment:** slow init, do only for slow path cases
 label: code-design
6509. DUK_BUFOBJ_DUKTAPE_BUFFER
6510. positive
6511. **comment:** XXX: Here we have a nasty dependency: the need to manipulate * the callstack means that catchstack must always be unwound by * the caller before unwinding the callstack. This should be fixed * later.
 label: code-design
6512. e.g. DUK_OP_PREINCP
6513. DUK_JS_H_INCLUDED
6514. DUK_USE_DATE_NOW_WINDOWS
6515. !DUK_SINGLE_FILE
6516. this is added to checks to allow for Duktape * API calls in addition to function's own use
6517. [... key_obj key]
6518. - A is a source register (it's not a write target, but used * to identify the target object) but can be shuffled. * - B cannot be shuffled normally because it identifies a range * of registers, the emitter has special handling for this * (the "no shuffle" flag must not be set). * - C is a non-register number and cannot be shuffled, but * never needs to be.
6519. is_setget
6520. flags always encodes to 1 byte
6521. Ensure space for 1:1 output plus one escape.
6522. [... obj key value]
6523. * Byte-based matching would be possible for case-sensitive * matching but not for case-insensitive matching. So, we * match by decoding the input and bytecode character normally. * * Bytecode characters are assumed to be already canonicalized. * Input characters are canonicalized automatically by * duk_inp_get_cp0() if necessary. * * There is no opcode for matching multiple characters. The * regexp compiler has trouble joining strings efficiently * during compilation. See doc/regexec.rst for more discussion.
6524. C array of duk_labelinfo
6525. **comment:** XXX: double evaluation for 'tv' argument.
 label: code-design
6526. with stack depth (affects identifier lookups)
6527. [... Duktape.modSearch resolved_id last_comp fresh_require exports module]
6528. * Detect recursive invocation
6529. **comment:** known to be 32-bit
 label: code-design
6530. * Directive prologue tracking.
6531. Handle lightfuncs through object coercion for now.
6532. exponent 0
6533. Identifier found in registers (always non-deletable) * or declarative environment record and non-configurable.
6534. duk_handle_ecma_call_setup: setup for a tail call
6535. match: keep wiped/resaved values
6536. E5 Section 11.7.2, steps 7 and 8
6537. **comment:** * Since there are no references in the catcher structure, * unwinding is quite simple. The only thing we need to * look out for is popping a possible lexical environment * established for an active catch clause.
 label: code-design
6538. * String cache. * * Provides a cache to optimize indexed string lookups. The cache keeps * track of (byte offset, char offset) states for a fixed number of strings. * Otherwise we'd need to scan from either end of the string, as we store * strings in (extended) UTF-8.
6539. heap thread, used internally and for finalization

6540. Don't allow a constant for the object (even for a number etc), as * it goes into the 'A' field of the opcode.
6541. For now all calls except Ecma-to-Ecma calls prevent a yield.
6542. If tv1==tv2 this is a NOP, no check is needed
6543. Dispatch loop.
6544. DUK_TOK_SUB
6545. Shared Windows helpers.
6546. This is a pretty awkward control flow, but we need to recheck the * key coercion here.
6547. catches EOF and invalid digits
6548. If thr->ptr_curr_pc is set, sync curr_pc to act->pc. Then NULL * thr->ptr_curr_pc so that it's not accidentally used with an incorrect * activation when side effects occur. If we end up not making the * call we must restore the value.
6549. **comment:** XXX: better macro for DUK_TVAL_IS_UNDEFINED_OR_NULL(tv)
label: code-design
6550. * Call the constructor function (called in "constructor mode").
6551. minimum prime
6552. set by atom case clauses
6553. [... error func fileName]
6554. reset callstack limit
6555. right paren eaten
6556. '['
6557. idx_desc
6558. E5 Section 11.7.1, steps 7 and 8
6559. coerced value is updated to value stack even when RangeError thrown
6560. Note: special DUK__EMIT_FLAG_B_IS_TARGETSOURCE * used to indicate that B is both a source and a * target register. When shuffled, it needs to be * both input and output shuffled.
6561. * Number is special because it doesn't have a specific * tag in the 8-byte representation.
6562. TypedArray views need an automatic ArrayBuffer which must be * provided as .buffer property of the view. Just create a new * ArrayBuffer sharing the same underlying buffer.
6563. Align 'p' to 4; the input data may have arbitrary alignment. * End of string check not needed because blen >= 16.
6564. Expression_opt
6565. Exact halfway, round to even.
6566. * Arguments check
6567. **comment:** Very minimal inlining to handle common idioms '!0' and '!1', * and also boolean arguments like '!false' and '!true'.
label: code-design

6859. When LHS is not register bound, always go through a * temporary. No optimization for top level assignment.
6860. keep key reachable for GC etc; guaranteed not to fail
6861. generate mantissa with a single leading whole number digit
6862. * Complex case conversion helper which decodes a bit-packed conversion * control stream generated by unicode/extract_caseconv.py. The conversion * is very slow because it runs through the conversion data in a linear * fashion to save space (which is why ASCII characters have a special * fast path before arriving here). * * The particular bit counts etc have been determined experimentally to * be small but still sufficient, and must match the Python script *(src/extract_caseconv.py). * * The return value is the case converted codepoint or -1 if the conversion * results in multiple characters (this is useful for regexp Canonicalization * operation). If 'buf' is not NULL, the result codepoint(s) are also * appended to the hbuffer. * * Context and locale specific rules must be checked before consulting * this function.
6863. Stored in duk_heaphdr unused flags.
6864. comment: * Augmenting errors at their creation site and their throw site. * * When errors are created, traceback data is added by built-in code * and a user error handler (if defined) can process or replace the * error. Similarly, when errors are thrown, a user error handler * (if defined) can process or replace the error. * * Augmentation and other processing at error creation time is nice * because an error is only created once, but it may be thrown and * rethrown multiple times. User error handler registered for processing * an error at its throw site must be careful to handle rethrowing in * a useful manner. * * Error augmentation may throw an internal error (e.g. alloc error). * * Ecmascript allows throwing any values, so all values cannot be * augmented. Currently, the built-in augmentation at error creation * only augments error values which are Error instances (= have the * built-in Error.prototype in their prototype chain) and are also * extensible. User error handlers have no limitations in this respect.
 label: code-design
6865. comment: * Emit initializers in sets of maximum max_init_values. * Corner cases such as single value initializers do not have * special handling now. * * Elided elements must not be emitted as 'undefined' values, * because such values would be enumerable (which is incorrect). * Also note that trailing elisions must be reflected in the * length of the final array but cause no elements to be actually * inserted.

6871. may have side effects
6872. increases key refcount
6873. on first round, skip
6874. **comment:** * Ecmascript specification algorithm and conversion helpers. ** These helpers encapsulate the primitive Ecmascript operation * semantics, and are used by the bytecode executor and the API * (among other places). Note that some primitives are only * implemented as part of the API and have no "internal" helper. * (This is the case when an internal helper would not really be * useful; e.g. the operation is rare, uses value stack heavily, * etc.) ** The operation arguments depend on what is required to implement * the operation: ** - If an operation is simple and stateless, and has no side * effects, it won't take an duk_hthread argument and its * arguments may be duk_tval pointers (which are safe as long * as no side effects take place). ** - If complex coercions are required (e.g. a "ToNumber" coercion) * or errors may be thrown, the operation takes an duk_hthread * argument. This also implies that the operation may have * arbitrary side effects, invalidating any duk_tval pointers. ** - For operations with potential side effects, arguments can be * taken in several ways: ** a) as duk_tval pointers, which makes sense if the "common case" * can be resolved without side effects (e.g. coercion); the * arguments are pushed to the valstack for coercion if * necessary ** b) as duk_tval values ** c) implicitly on value stack top ** d) as indices to the value stack ** Future work: ** - Argument styles may not be the most sensible in every case now. ** - In-place coercions might be useful for several operations, if * in-place coercion is OK for the bytecode executor and the API.
label: code-design
6875. Note: may be triggered even if minimal new_size would not reach the limit, * plan limit accordingly (taking DUK_VALSTACK_GROW_STEP into account).
6876. **comment:** A little tricky string approach to provide the flags string. * This depends on the specific flag values in duk_reEXP.h, * which needs to be asserted for. In practice this doesn't * produce more compact code than the easier approach in use.
label: code-design
6877. Note: intentionally use approximations to shave a few instructions: * a_used = old_used (accurate: old_used + 1) * a_size = arr_idx (accurate: arr_idx + 1)
6878. Slot C is used in a non-standard fashion (range of regs), * emitter code has special handling for it (must not set the * "no shuffle" flag).
6879. Note: if atom were to contain e.g. captures, we would need to * re-match the atom to get correct captures. Simply quantifiers * do not allow captures in their atom now, so this is not an issue.
6880. * Criteria for augmenting: ** - augmentation enabled in build (naturally) * - error value internal prototype chain contains the built-in * Error prototype object (i.e. 'val instanceof Error') ** Additional criteria for built-in augmenting: ** - error value is an extensible object
6881. **comment:** XXX: solve into closed form (smaller code)
label: code-design
6882. * Check the function type, handle bound function chains, and prepare * parameters for the rest of the call handling. Also figure out the * effective 'this' binding, which replaces the current value at * idx_func + 1. ** If the target function is a 'bound' one, follow the chain of 'bound' * functions until a non-bound function is found. During this process, * bound arguments are 'prepended' to existing ones, and the "this" * binding is overridden. See E5 Section 15.3.4.5.1. ** If the final target function cannot be handled by an ecma-to-ecma * call, return to the caller with a return value indicating this case. * The bound chain is resolved and the caller can resume with a plain * function call.
6883. must be signed for loop structure
6884. is_extra
6885. **comment:** * Memory calls: relative to heap, GC interaction, but no error throwing. ** XXX: Currently a mark-and-sweep triggered by memory allocation will run * using the heap->heap_thread. This thread is also used for running * mark-and-sweep finalization; this is not ideal because it breaks the * isolation between multiple global environments. ** Notes: ** - DUK_FREE() is required to ignore NULL and any other possible return * value of a zero-sized alloc/realloc (same as ANSI C free()). ** - There is no DUK_REALLOC_ZEROED because we don't assume to know the * old size. Caller must zero the reallocated memory. ** - DUK_REALLOC_INDIRECT() must be used when a mark-and-sweep triggered * by an allocation failure might invalidate the original 'ptr', thus * causing a realloc retry to use an invalid pointer. Example: we're * reallocating the value stack and a finalizer resizes the same value * stack during mark-and-sweep. The indirect variant requests for the * current location of the pointer being reallocated using a callback * right before every realloc attempt; this circuitous approach is used * to avoid strict aliasing issues in a more straightforward indirect * pointer (void **) approach. Note: the pointer in the storage * location is read but is NOT updated; the caller must do that.

6969. Sync so that augmentation sees up-to-date activations, NULL * thr->ptr_curr_pc so that it's not used if side effects occur * in augmentation or longjmp handling.

6970. thread not currently running

6971. Refzero head is still the same. This is the case even if finalizer * inserted more refzero objects; they are inserted to the tail.

6972. [... key arg1 ... argN]

6973. * GETIDREF: A GetIdentifierReference-like helper. ** Provides a parent traversing lookup and a single level lookup * (for HasBinding). ** Instead of returning the value, returns a bunch of values allowing * the caller to read, write, or delete the binding. Value pointers * are duk_tval pointers which can be mutated directly as long as * refcounts are properly updated. Note that any operation which may * reallocate valstacks or compact objects may invalidate the returned * duk_tval (but not object) pointers, so caller must be very careful. ** If starting environment record 'env' is given, 'act' is ignored. * However, if 'env' is NULL, the caller may identify, in 'act', an * activation which hasn't had its declarative environment initialized * yet. The activation registers are then looked up, and its parent * traversed normally. ** The 'out' structure values are only valid if the function returns * success (non-zero).

6974. Ignore the normalize/validate helper outputs on the value stack, * they're popped automatically.

6975. **comment:** A union is used here as a portable struct size / alignment trick: * by adding a 32-bit or a 64-bit (unused) union member, the size of * the struct is effectively forced to be a multiple of 4 or 8 bytes * (respectively) without increasing the size of the struct unless * necessary.

label: code-design

7308. -> [... val this]

7309. **comment:** code emission temporary
label: code-design

7310. * TypedArray.prototype.set() is pretty interesting to implement because: ** - The source argument may be a plain array or a typedarray. If the * source is a TypedArray, values are decoded and re-encoded into the * target (not as a plain byte copy). This may happen even when the * element byte size is the same, e.g. integer values may be re-encoded * into floats. ** - Source and target may refer to the same underlying buffer, so that * the set() operation may overlap. The specification requires that this * must work as if a copy was made before the operation. Note that this * is NOT a simple memmove() situation because the source and target * byte sizes may be different -- e.g. a 4-byte source (Int8Array) may * expand to a 16-byte target (Uint32Array) so that the target overlaps * the source both from beginning and the end (unlike in typical memmove). ** - Even if 'buf' pointers of the source and target differ, there's no * guarantee that their memory areas don't overlap. This may be the * case with external buffers. ** Even so, it is nice to optimize for the common case: ** - Source and target separate buffers or non-overlapping. ** - Source and target have a compatible type so that a plain byte copy * is possible. Note that while e.g. uint8 and int8 are compatible * (coercion one way or another doesn't change the byte representation), * e.g. int8 and uint8clamped are NOT compatible when writing int8 * values into uint8clamped typedarray (-1 would clamp to 0 for instance). ** See test-bi-typedarray-proto-set.js.

7311. (quotient-remainder (* r B) s) using a dummy subtraction loop

7312. Note: either pointer may be NULL (at entry), so don't assert

7313. String-number-buffer/object -> coerce object to primitive (apparently without hint), then try again.

7314. * Property handling ** The API exposes only the most common property handling functions. * The caller can invoke Ecmascript built-ins for full control (e.g. * defineProperty, getOwnPropertyDescriptor).

7315. Format of magic, bits: * 0...1: elem size shift (0-3) * 2...5: elem type (DUK_HBUFFEROBJECT_ELEM_xxx)

7316. **comment:** Slow gathering of value using either 64-bit arithmetic * or IEEE doubles if 64-bit types not available. Handling * of negative numbers is a bit non-obvious in both cases.
label: code-design

7317. Built-in 'name' is not writable by default. Function '.name' * is writable to allow user code to set a '.name' on a native * function.

7449. idx of first argument on stack

7450. Add trailer if: * a) non-empty input * b) empty input and no (zero size) match found (step 11)

7451. check stack first

7452. mod_id may be NULL

7453. http://en.wikipedia.org/wiki/ANSI_escape_code

7454. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway

7455. DUK_TOK_SET

7456. * Lookup variable and update in-place if found.

7457. 'Int8Array'

7458. Last component name in resolved path

7459. Must match src/extract_chars.py, generate_match_table3().

7460. Resize target buffer for requested size. Called by the macro only when the * fast path test (= there is space) fails.

7461. Ready to make the copy. We must proceed element by element * and must avoid any side effects that might cause the buffer * validity check above to become invalid. ** Although we work through the value stack here, only plain * numbers are handled which should be side effect safe.

7462. **comment:** * Compared to a direct macro expansion this wrapper saves a few * instructions because no heap dereferencing is required.
label: code-design

7463. Force pause if we were doing "step into" in another activation.

7464. allow fmt==NULL

7465. **comment:** * Reallocate property allocation, moving properties to the new allocation. ** Includes key compaction, rehashing, and can also optionally abandoning * the array part, 'migrating' array entries into the beginning of the * new entry part. Arguments are not validated here, so e.g. new_h_size * MUST be a valid prime. ** There is no support for in-place reallocation or just compacting keys * without resizing the property allocation. This is intentional to keep * code size minimal. ** The implementation is relatively straightforward, except for the array * abandonment process. Array abandonment requires that new string keys * are interned, which may trigger GC. All keys interned so far must be * reachable for GC at all times; valstack is used for that now. ** Also, a GC triggered during this reallocation process must not interfere * with the object being resized. This is currently controlled by using * heap->mark_and_sweep_base_flags to indicate that no finalizers will be * executed (as they can affect ANY object) and no objects are compacted * (it would suffice to protect this particular object only, though). ** Note: a non-checked variant would be nice but is a bit tricky to * implement for the array abandonment process. It's easy for * everything else. ** Note: because we need to potentially resize the valstack (as part * of abandoning the array part), any tval pointers to the valstack * will become invalid after this call.
label: code-design

7475. built-in strings

7476. * Process messages and send status if necessary. ** If we're paused, we'll block for new messages. If we're not * paused, we'll process anything we can peek but won't block * for more. Detach (and re-attach) handling is all localized * to duk_debug_process_messages() too. ** Debugger writes outside the message loop may cause debugger * detach1 phase to run, after which dbg_read_cb == NULL and * dbg_detaching != 0. The message loop will finish the detach * by running detach2 phase, so enter the message loop also when * detaching.

7477. * The error object has been augmented with a traceback and other * info from its creation point -- usually the current thread. * The error handler, however, is called right before throwing * and runs in the yielder's thread.

7478. * Error throwing helpers

7479. [... new_glob new_env new_glob new_glob]

7480. For lightfuncs, simply read the virtual property.

7481. 0x70-0x7f

7482. stable

7483. XXX: Could add fast path (for each transform callback) with direct byte * lookups (no shifting) and no explicit check for x < 0x80 before table * lookup.

7484. Duktape.Thread.resume()

7485. **comment:** * Note: of native Ecmascript objects, only Function instances * have a [[HasInstance]] internal property. Custom objects might * also have it, but not in current implementation. ** XXX: add a separate flag, DUK_HOBJECT_FLAG_ALLOW_INSTANCEOF?
label: code-design

7486. nothing to NULL

7487. use SameValue instead of non-strict equality

7488. a value is left on stack regardless of rc

7489. Detach is pending; can be triggered from outside the * debugger loop (e.g. Status notify write error) or by * previous message handling. Call detached callback * here, in a controlled state, to ensure a possible * reattach inside the detached_cb is handled correctly. ** Recheck for detach in a while loop: an immediate * reattach involves a call to duk_debugger_attach() * which writes a debugger handshake line immediately * inside the API call. If the transport write fails * for that handshake, we can immediately end up in a * "transport broken, detaching" case several times here. * Loop back until we're either cleanly attached or * fully detached. ** NOTE: Reset dbg_processing = 1 forcibly, in case we * re-attached; duk_debugger_attach() sets dbg_processing * to 0 at the moment.

7490. Run the finalizer, duk_hobject_run_finalizer() sets FINALIZED. * Next mark-and-sweep will collect the object unless it has * become reachable (i.e. rescued). FINALIZED prevents the * finalizer from being executed again before that.

7491. Note: this must match ToObject() behavior
7492. 'new' MemberExpression
7493. The code below is incorrect if .toString() or .valueOf() have * have been overridden. The correct approach would be to look up * the method(s) and if they resolve to the built-in function we * can safely bypass it and look up the internal value directly. * Unimplemented for now, abort fast path for boxed values.
7494. 1111 0xxx 10xx xxxx 10xx xxxx 10xx xxxx [21 bits]
7495. **comment:** XXX: avoid this at least when enum_target is an Array, it has an * array part, and no ancestor properties were included? Not worth * it for JSON, but maybe worth it for forEach().
label: code-design
7496. Report it to the debug client
7497. no compact
7498. restricted to regs
7499. dummy so sp won't get updated
7500. * Replace global object.
7501. require a (mutable) temporary as a result (or a const if allowed)
7502. contains value
7503. %6s' and NULL is not portable, so special case * it for debug printing.
7504. Compiler SyntaxErrors (and other errors) come first, and are * blamed by default (not flagged "noblame").
7505. Relevant PC is just before current one because PC is * post-incremented. This should match what error augment * code does.
7506. Parse formals.
7507. [... key arg1 ... argN func]
7508. exit bytecode execution with return value
7509. * Status message and helpers
7510. Note: 'func' is popped from valstack here, but it is * already reachable from the activation.
7511. points to LABEL; pc+1 = jump site for break; pc+2 = jump site for continue
7512. DUK_SELFTEST_H_INCLUDED
7513. Duktape object
7514. 0xb0-0xbf
7515. * 'key_obj' tracks keys encountered so far by associating an * integer with flags with already encountered keys. The checks * below implement E5 Section 11.1.5, step 4 for production: * * PropertyNameAndValueList: PropertyNameAndValueList , PropertyAssignment
7516. [... res]
7517. * UTF-8 decoder which accepts longer than standard byte sequences. * This allows full 32-bit code points to be used.
7518. accessor with defined getter
7519. **comment:** XXX: optimize for packed duk_tval directly?
label: code-design
7520. * Augment created errors upon creation (not when they are thrown or * rethrown). __FILE__ and __LINE__ are not desirable here; the call * stack reflects the caller which is correct.
7521. allow source elements
7522. one token before
7523. 'filename'
7524. Neutered. We could go into the switch-case safely with * buf == NULL because check_length == 0. To avoid scanbuild * warnings, fail directly instead.
7525. -> x in J-2**32, 2**32[
7526. no need to incref
7527. Ecmascript function
7528. embed: void ptr
7529. Lightfuncs are always native functions and have "newenv".
7530. This upper value has been experimentally determined; debug build will check * bigint size with assertions.
7531. **comment:** XXX: cover this with the generic >1 case?
label: code-design
7532. * Variant 1 or 3
7533. 'enumerable'
7534. **comment:** * There are two [[Construct]] operations in the specification: * * - E5 Section 13.2.2: for Function objects * - E5 Section 15.3.4.5.2: for "bound" Function objects * * The chain of bound functions is resolved in Section 15.3.4.5.2, * with arguments "piling up" until the [[Construct]] internal * method is called on the final, actual Function object. Note * that the "prototype" property is looked up *only* from the * final object, *before* calling the constructor. * * Currently we follow the bound function chain here to get the * "prototype" property value from the final, non-bound function. * However, we let duk_handle_call() handle the argument "piling" * when the constructor is called. The bound function chain is * thus now processed twice. * * When constructing new Array instances, an unnecessary object is * created and discarded now: the standard [[Construct]] creates an * object, and calls the Array constructor. The Array constructor * returns an Array instance, which is used as the result value for * the "new" operation; the object created before the Array constructor * call is discarded. * * This would be easy to fix, e.g. by knowing that the Array constructor * will always create a replacement object and skip creating the fallback * object in that case. * * Note: functions called via "new" need to know they are called as a * constructor. For instance, built-in constructors behave differently * depending on how they are called.
label: code-design
7535. zero size not an issue: pointers are valid
7536. fromPresent = true
7537. The counter value is one less than the init value: init value should * indicate how many instructions are executed before interrupt. To * execute 1 instruction (after interrupt handler return), counter must * be 0.
7538. assumes that allocated pointers and alloc funcs are valid * if res exists
7539. DUK_TOK_EQ
7540. * >>> struct.pack('>d', 102030405060).encode('hex') * '4237c17c6dc40000'
7541. XXX: add 'language' argument when locale/language sensitive rule * support added.
7542. Currently there are no deletable virtual properties, but * with force_flag we might attempt to delete one.
7543. **comment:** XXX: This helper is a bit awkward because the handling for the different iteration * callers is quite different. This now compiles to a bit less than 500 bytes, so with * 5 callers the net result is about 100 bytes / caller.
label: code-design
7544. Infinity
7545. **comment:** XXX: unoptimal use of temps, resetting
label: code-design
7546. -> [... regexp string] -> [... res_obj]
7547. token type (with reserved words as DUK_TOK_IDENTIFIER)
7548. Note: assumes that these string indexes are 8-bit, genstrings.py must ensure that
7549. start variant 3/4 left-hand-side code (L1 in doc/compiler.rst example)
7550. # argument registers target function wants (< 0 => "as is")
7551. 'magic' constants for Murmurhash2
7552. If something is thrown with the debugger attached and nobody will * catch it, execution is paused before the longjmp, turning over * control to the debug client. This allows local state to be examined * before the stack is unwound. Errors are not intercepted when debug * message loop is active (e.g. for Eval).
7553. Object built-in methods
7554. Skip fully.
7555. switch (ch2)
7556. type

7557. * Allocate memory with garbage collection
7558. * Main switch for statement / source element type.
7559. Shared entry handling for object/array serialization.
7560. overwrite sep
7561. [message error message]
7562. [... parent stash stash] -> [... parent stash]
7563. Non-verbose errors for low memory targets: no file, line, or message.
7564. DUK_BUFOBJ_ARRAYBUFFER
7565. **comment:** * Recursion limit check. ** Note: there is no need for an "ignore recursion limit" flag * for duk_handle_safe_call now.
 label: code-design
7566. Exponent handling: if exponent format is used, record exponent value and * fake k such that one leading digit is generated (e.g. digits=123 -> "1.23"). ** toFixed() prevents exponent use; otherwise apply a set of criteria to * match the other API calls (toString(), toPrecision, etc).
7567. **comment:** We want the argument expression value to go to "next temp" * without additional moves. That should almost always be the * case, but we double check after expression parsing. ** This is not the cleanest possible approach.
 label: code-design
7568. seconds, doesn't fit into 16 bits
7569. unreferenced w/o tracebacks
7570. We want to avoid making a copy to process set() but that's * not always possible: the source and the target may overlap * and because element sizes are different, the overlap cannot * always be handled with a memmove() or choosing the copy * direction in a certain way. For example, if source type is * uint8 and target type is uint32, the target area may exceed * the source area from both ends! ** Note that because external buffers may point to the same * memory areas, we must ultimately make this check using * pointers. ** NOTE: careful with side effects: any side effect may cause * a buffer resize (or external buffer pointer/length update)!
7571. **comment:** NEXTENUM needs a jump slot right after the main instruction. * When the JUMP is taken, output spilling is not needed so this * workaround is possible. The jump slot PC is exceptionally * plumbed through comp_ctx to minimize call sites.
 label: code-design
7572. must be updated to work properly (e.g. creation of 'arguments')
7573. Unescaped '/' ANYWHERE in the regexp (in disjunction, * inside a character class, ...) => same escape works.
7574. 1:1 or special conversions, but not locale/context specific: script generated rules
7575. roughly 0.5 kB
7576. * Value stack resize and stack top adjustment helper. ** XXX: This should all be merged to duk_valstack_resize_raw().
7577. **comment:** * Macro support functions for reading/writing raw data. ** These are done using memcpy to ensure they're valid even for unaligned * reads/writes on platforms where alignment counts. On x86 at least gcc * is able to compile these into a bswap+mov. "Always inline" is used to * ensure these macros compile to minimal code. ** Not really bufwriter related, but currently used together.
 label: code-design
7578. If tracebacks are enabled, the '_Tracedata' property is the only * thing we need: 'fileName' and 'lineNumber' are virtual properties * which use '_Tracedata'.
7579. **comment:** XXX: could duk_is_undefined() provide defaulting undefined to 'len' * (the upper limit)?
 label: code-design
7580. DUK_TOK_WITH
7581. 0xa0-0xaf
7582. * Table for base-64 decoding
7583. **comment:** XXX: duk_xdef_prop_index_wec() would be more appropriate * here but it currently makes some assumptions that might * not hold (e.g. that previous property is not an accessor).
 label: code-design
7584. [... buf]
7585. * Regexp compilation. ** See doc/regexp.rst for a discussion of the compilation approach and * current limitations. ** Regexp bytecode assumes jumps can be expressed with signed 32-bit * integers. Consequently the bytecode size must not exceed 0x7fffffffL. * The implementation casts duk_size_t (buffer size) to duk_(u)int32_t * in many places. Although this could be changed, the bytecode format * limit would still prevent regexps exceeding the signed 32-bit limit * from working. ** XXX: The implementation does not prevent bytecode from exceeding the * maximum supported size. This could be done by limiting the maximum * input string size (assuming an upper bound can be computed for number * of bytecode bytes emitted per input byte) or checking buffer maximum * size when emitting bytecode (slower).
7586. Production allows 'DecimalDigits', including leading zeroes
7587. Note: must coerce to a (writable) temp register, so that e.g. "!x" where x * is a reg-mapped variable works correctly (does not mutate the variable register).
7588. [] -> []
7589. key
7590. * Exception for Duktape internal throws when C++ exceptions are used * for long control transfers. ** Doesn't inherit from any exception base class to minimize the chance * that user code would accidentally catch this exception.
7591. -> [array totalLength buf]
7592. Maximum prototype traversal depth. Sanity limit which handles e.g. * prototype loops (even complex ones like 1->2->3->4->2->3->4->2->3->4).
7593. is valid size
7594. [O Properties obj]
7595. extra coercion of strings is OK
7596. **comment:** XXX: increase ctx->expr_tokens here for every consumed token * (this would be a nice statistic)?
 label: code-design
7597. FAIL
7598. Two digit octal escape, digits validated. ** The if-condition is a bit tricky. We could catch e.g. '\039' in the three-digit escape and fail it there (by * validating the digits), but we want to avoid extra * additional validation code.
7599. For n == 0, Node.js ignores totalLength argument and * returns a zero length buffer.
7600. * Push result object and init its flags
7601. number of continuation (non-initial) bytes in [0x80,0xbf]
7602. External buffer with 'curr_alloc' managed by user code and pointing to an * arbitrary address. When heap pointer compression is not used, this struct * has the same layout as duk_hbuffer_dynamic.
7603. **comment:** Note: we can reuse 'desc' here
 label: code-design
7604. empty statement with an explicit semicolon
7605. * Constructor
7606. * Array exotic behaviors can be implemented at this point. The local variables * are essentially a 'value copy' of the input descriptor (Desc), which is modified * by the Array [[DefineOwnProperty]] (E5 Section 15.4.5.1).
7607. * Expression parsing. ** Upon entry to 'expr' and its variants, 'curr_tok' is assumed to be the * first token of the expression. Upon exit, 'curr_tok' will be the first * token not part of the expression (e.g. semicolon terminating an expression * statement).
7608. The index range space is conceptually the array part followed by the * entry part. Unlike normal enumeration all slots are exposed here as * is and return 'unused' if the slots are not in active use. In particular * the array part is included for the full a_size regardless of what the * array .length is.
7609. * toString()
7610. shuffle registers if large number of regs/consts
7611. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8
7612. **comment:** XXX: add support for variables to not be register bound always, to * handle cases with a very large number of variables?
 label: code-design
7613. entry_top + 2
7614. [result]

7615. * Determine call type, then finalize activation, shift to * new value stack bottom, and call the target.
7616. [source]
7617. * Arguments object creation. ** Creating arguments objects involves many small details, see E5 Section * 10.6 for the specific requirements. Much of the arguments object exotic * behavior is implemented in duk_hobject_props.c, and is enabled by the * object flag DUK_HOBJECT_FLAG_EXOTIC_ARGUMENTS.
7618. **comment:** XXX: space in valstack? see discussion in duk_handle_call_xxx().
 label: code-design
7619. combines steps 2 and 5; -len ensures max() not needed for step 5
7620. for register-bound and declarative env identifiers
7621. bound functions are never in act 'func'
7622. Lightfuncs cannot be bound.
7623. **comment:** The resulting buffer object gets the same class and prototype as * the buffer in 'this', e.g. if the input is a Node.js Buffer the * result is a Node.js Buffer; if the input is a Float32Array, the * result is a Float32Array. ** For the class number this seems correct. The internal prototype * is not so clear: if 'this' is a bufferobject with a non-standard * prototype object, that value gets copied over into the result * (instead of using the standard prototype for that object type).
 label: code-design
7624. Don't allow mixed padding and actual chars.
7625. reject RegExp literal on next advance() call; needed for handling IdentifierName productions
7626. DUK_TOK_CONTINUE
7627. unbalanced stack on purpose
7628. arguments MUST have an initialized lexical environment reference
7629. **comment:** XXX: sanitize to printable (and maybe ASCII)
 label: code-design
7630. tags
7631. regexp compiler should catch these
7632. **comment:** Current 'this' binding is the value just below idx_bottom. * Previously, 'this' binding was handled with an index to the * (calling) valstack. This works for everything except tail * calls, which must not "cumulate" valstack temps.
 label: code-design
7633. * ctx->prev_token token to process with duk__expr_nud() * ctx->curr_token updated by caller ** Note: the token in the switch below has already been eaten.
7634. -> [... voidp true]
7635. The E5.1 specification does not seem to allow IdentifierPart characters * to be used as identity escapes. Unfortunately this includes '\$', which * cannot be escaped as '\$'; it needs to be escaped e.g. as '\u0024'. * Many other implementations (including V8 and Rhino, for instance) do * accept '\$' as a valid identity escape, which is quite pragmatic. * See: test-regexp-identity-escape-dollar.js.
7636. mp <- b^(e+1)
7637. * Debugger handling for executor restart ** Check for breakpoints, stepping, etc, and figure out if we should execute * in checked or normal mode. Note that we can't do this when an activation * is created, because breakpoint status (and stepping status) may change * later, so we must recheck every time we're executing an activation. * This primitive should be side effect free to avoid changes during check.
7638. at most sizeof(buf) - 1
7639. val
7640. Old solution: don't iterate, incorrect
7641. * API calls related to general value stack manipulation: resizing the value * stack, pushing and popping values, type checking and reading values, * coercing values, etc. * * Also contains internal functions (such as duk_get_tval()), defined * in duk_api_internal.h, with semantics similar to the public API.
7642. No BC shuffling now.
7643. syntactically left-associative but parsed as right-associative
7644. * Local result type for duk__get_identifier_reference() lookup.
7645. **comment:** XXX: would be nice to enumerate an object at specified index
 label: code-design
7646. ''
7647. * Heap stringtable handling, string interning.
7648. By default the global object is read-only which is often much * more of an issue than having read-only built-in objects (like * RegExp, Date, etc). Use a RAM-based copy of the global object * and the global environment object for convenience.
7649. Creation time error augmentation
7650. The casts through duk_intr_pt is to avoid the following GCC warning: * * warning: cast from pointer to integer of different size [-Wpointer-to-int-cast] * * This still generates a /Wp64 warning on VS2010 when compiling for x86.
7651. **comment:** * Note: currently register bindings must be fixed for the entire * function. So, even though the catch variable is in a register * we know, we must use an explicit environment record and slow path * accesses to read/write the catch binding to make closures created * within the catch clause work correctly. This restriction should * be fixable (at least in common cases) later. ** See: test-bug-catch-binding-2.js. ** XXX: improve to get fast path access to most catch clauses.
 label: code-design
7652. check that byte has the form 10xx xxxx
7653. * Memory constants
7654. return 'res' (of right part) as our result
7655. -> [func funcname env]
7656. this variant is used when an assert would generate a compile warning by * being always true (e.g. ≥ 0 comparison for an unsigned value
7657. Stringcache is used for speeding up char-offset-to-byte-offset * translations for non-ASCII strings.
7658. **comment:** Note: strictness is *not* inherited from the current Duktape/C. * This would be confusing because the current strictness state * depends on whether we're running inside a Duktape/C activation * (= strict mode) or outside of any activation (= non-strict mode). * See tests/api/test-strictness.c for more discussion.
 label: code-design
7659. * Finalizer check. ** Note: running a finalizer may have arbitrary side effects, e.g. * queue more objects on refzero_list (tail), or even trigger a * mark-and-sweep. * * Note: quick reject check should match vast majority of * objects and must be safe (not throw any errors, ever).
7660. Get Proxy target object. If the argument is not a Proxy, return it as is. * If a Proxy is revoked, an error is thrown.
7661. * Assertion helpers.
7662. is_setget
7663. * Compute new alloc size and alloc new area. ** The new area is allocated as a dynamic buffer and placed into the * valstack for reachability. The actual buffer is then detached at * the end. ** Note: heap_mark_and_sweep_base_flags are altered here to ensure * no-one touches this object while we're resizing and rehashing it. * The flags must be reset on every exit path after it. Finalizers * and compaction is prevented currently for all objects while it * would be enough to restrict it only for the current object.
7664. replacer function
7665. [...]
7666. **comment:** remove the string (mark DELETED), could also call * duk_heap_string_remove() but that would be slow and * pointless because we already know the slot.
 label: code-design
7667. +(function(){}) -> NaN
7668. **comment:** * Date built-ins ** Unlike most built-ins, Date has some platform dependencies for getting * UTC time, converting between UTC and local time, and parsing and * formatting time values. These are all abstracted behind DUK_USE_xxx * config options. There are built-in platform specific providers for * POSIX and Windows, but external providers can also be used. ** See doc/datetime.rst. *

7669. Reject attempt to change a read-only object.

7670. final result is already in 'res'
7671. 21: getUTCSeconds
7672. Eval is just a wrapper now.
7673. With ROM objects "needs refcount update" is true when the value is * heap allocated and is not a ROM object.
7674. 22: getMilliseconds
7675. binary arithmetic using extraops; DUK_EXTRAOP_INSTOF etc
7676. combined algorithm matching E5 Sections 9.5 and 9.6
7677. Evaluates to (duk_uint8_t *) pointing to start of area.
7678. module.id = resolved_id
7679. Property access expressions ('a[b]') are critical to correct * LHS evaluation ordering, see test-dev-assign-eval-order*.js. * We must make sure that the LHS target slot (base object and * key) don't change during RHS evaluation. The only concrete * problem is a register reference to a variable-bound register * (i.e., non-temp).
Require temp regs for both key and base. * * Don't allow a constant for the object (even for a number * etc), as it goes into the 'A' field of the opcode.
7680. Maximum number of characters in formatted value.
7681. Read fully.
7682. * Prototypes
7683. For indirect allocs.
7684. always allow 'in', coerce to 'tr' just in case
7685. DUK_USE_DEBUGGER_SUPPORT && (DUK_USE_DEBUGGER_THROW_NOTIFY || DUK_USE_DEBUGGER_PAUSE_UNCAUGHT)
7686. Pointer object internal value is immutable
7687. Leave 'value' on stack
7688. prev char
7689. * [[DefaultValue]] (E5 Section 8.12.8) * * ==> implemented in the API.
7690. 'extends'
7691. result: hash_prime(floor(1.2 * e_size))
7692. bp is assumed to be even
7693. stridx_logfunc[] must be static to allow initializer with old compilers like BCC
7694. Positive index can be higher than valstack top but must * not go above allocated stack (equality is OK).
7695. out_desc is left untouched (possibly garbage), caller must use return * value to determine whether out_desc can be looked up
7696. If buffer has been exhausted, truncate bitstream
7697. Can be called multiple times with no harm.
7698. Helper for component setter calls: check 'this' binding, get the * internal time value, split it into parts (either as UTC time or * local time), modify one or more components as specified, recompute * the time value, set it as the internal value. Finally, push the * new time value as a return value to the value stack and return 1 * (caller can then tail call us).
7699. error
7700. 1:1 conversion
7701. Encode into a double constant (53 bits can encode 6*8 = 48 bits + 3-bit length
7702. not LS/PS
7703. invalid codepoint encoding or codepoint
7704. **comment:** packed advance/token number macro used by multiple functions
label: code-design
7705. The JO(value) operation: encode object. * * Stack policy: [object] -> [object].
7706. DUK_TOK_BAND_EQ
7707. remaining
7708. **comment:** * Duktape built-ins * * Size optimization note: it might seem that vararg multipurpose functions * like fin(), enc(), and dec() are not very size optimal, but using a single * user-visible Ecmascript function saves a lot of run-time footprint; each * Function instance takes >100 bytes. Using a shared native helper and a * 'magic' value won't save much if there are multiple Function instances * anyway.
label: code-design
7709. Value is required to be a number in the fast path so there * are no side effects in write coercion.
7710. Faster but value stack overruns are memory unsafe.
7711. register for writing value of 'non-empty' statements (global or eval code), -1 is marker
7712. * Possible pending array length update, which must only be done * if the actual entry write succeeded.
7713. E5 Section 7.3, treat the following as newlines: * LF * CR [not followed by LF] * LS * PS * * For CR LF, CR is ignored if it is followed by LF, and the LF will bump * the line number.
7714. If XUTF-8 decoding fails, treat the offending byte as a codepoint directly * and go forward one byte. This is of course very lossy, but allows some kind * of output to be produced even for internal strings which don't conform to * XUTF-8. All standard Ecmascript strings are always CESU-8, so this behavior * does not violate the Ecmascript specification. The behavior is applied to * all modes, including Ecmascript standard JSON. Because the current XUTF-8 * decoding is not very strict, this behavior only really affects initial bytes * and truncated codepoints. * * Another alternative would be to scan forwards to start of next codepoint * (or end of input) and emit just one replacement codepoint.
7715. For initial entry use default value; zero forces an * interrupt before executing the first instruction.
7716. already in correct reg
7717. the next 'if' is guaranteed to match after swap
7718. Encoding state. Heap object references are all borrowed.
7719. -> [... repl_value]
7720. no prototype
7721. Note: 'q' is top-1
7722. **comment:** * Abandon array part because all properties must become non-configurable. * Note that this is now done regardless of whether this is always the case * (skips check, but performance problem if caller would do this many times * for the same object; not likely).
label: code-design
7723. **comment:** XXX: incref by count (2) directly

7775. [... res_obj re_obj input bc saved_buf]
7776. B -> register for writing enumerator object * C -> value to be enumerated (register)
7777. entire string is whitespace
7778. 'multiline'
7779. '+'
7780. * Parse an identifier and then check whether it is: * - reserved word (keyword or other reserved word) * - "null" (NullLiteral) * - "true" (BooleanLiteral) * - "false" (BooleanLiteral) * - anything else => identifier * * This does not follow the E5 productions cleanly, but is * useful and compact. * * Note that identifiers may contain Unicode escapes, * see E5 Sections 6 and 7.6. They must be decoded first, * and the result checked against allowed characters. * The above if-clause accepts an identifier start and an * '\ character -- no other token can begin with a '. * * Note that "get" and "set" are not reserved words in E5 * specification so they are recognized as plain identifiers * (the tokens DUK_TOK_GET and DUK_TOK_SET are actually not * used now). The compiler needs to work around this. * * Strictly speaking, following Ecmascript longest match * specification, an invalid escape for the first character * should cause a syntax error. However, an invalid escape * for IdentifierParts should just terminate the identifier * early (longest match), and let the next tokenization * fail. For instance Rhino croaks with 'foo\z' when * parsing the identifier. This has little practical impact.
7781. 'lineNumber'
7782. refer to callstack entries below current
7783. statement parsing
7784. **comment:** Pick a destination register. If either base value or key * happens to be a temp value, reuse it as the destination. * * XXX: The temp must be a "mutable" one, i.e. such that no * other expression is using it anymore. Here this should be * the case because the value of a property access expression * is neither the base nor the key, but the lookup result.
label: code-design
7785. Property access expressions are critical for correct LHS ordering, * see comments in duk__expr()!
7786. ignore retval -> [key]
7787. %ld
7788. * Octal escape or zero escape: * \0 (lookahead not DecimalDigit) * \1 ... \7 (lookahead not DecimalDigit) * \ZeroToThree OctalDigit (lookahead not DecimalDigit)
* \FourToSeven OctalDigit (no lookahead restrictions) * \ZeroToThree OctalDigit (no lookahead restrictions) * * Zero escape is part of the standard syntax. Octal escapes are * defined in E5 Section B.1.2, and are only allowed in non-strict mode. * Any other productions starting with a decimal digit are invalid.
7789. **comment:** XXX: for Object.keys() the [[OwnPropertyKeys]] result (trap result) * should be filtered so that only enumerable keys remain. Enumerability * should be checked with [[GetOwnProperty]] on the original object * (i.e., the proxy in this case). If the proxy has a getOwnPropertyDescriptor * trap, it should be triggered for every property. If the proxy doesn't have * the trap, enumerability should be checked against the target object instead. * We don't do any of this now, so Object.keys() and Object.getOwnPropertyNames() * return the same result now for proxy traps. We still do clean up the trap * result, so that Object.keys() and Object.getOwnPropertyNames() will return a * clean array of strings without gaps.

8024. * Shift to new valstack_bottom.
8025. 0 = don't push current value
8026. "." is not accepted in any format
8027. tmp -> res
8028. [body formals source]
8029. **comment:** XXX: for simple cases like x['y'] an unnecessary LDREG is * emitted for the base value; could avoid it if we knew that * the key expression is safe (e.g. just a single literal).
label: code-design

8030. Other initial bytes.
8031. Similar to String comparison.
8032. Finally, blame the innermost callstack entry which has a *.fileName property.
8033. skip finalizers; queue finalizable objects to heap_allocated
8034. Note that duk__exptop() here can clobber any reg above current temp_next, * so any loop variables (e.g. enumerator) must be "preallocated".
8035. * Parse a statement list. ** Handles automatic semicolon insertion and implicit return value. ** Upon entry, 'curr_tok' should contain the first token of the first * statement (parsed in the "allow regexp literal" mode). Upon exit, * 'curr_tok' contains the token following the statement list terminator * (EOF or closing brace).
8036. fixed top level hashtable size (separate chaining)
8037. not present
8038. end marker
8039. handle negative values
8040. invalidated by pushes, so get out of the way
8041. h is NULL for lightfunc
8042. * Error throwing
8043. Non-buffer value is first ToString() coerced, then converted * to a buffer (fixed buffer is used unless a dynamic buffer is * explicitly requested).
8044. **comment:** unused: not accepted in inbound messages
label: code-design

8045. Reuse buffer as is unless buffer has grown large.
8046. Offset is coerced first to signed integer range and then to unsigned. * This ensures we can add a small byte length (1-8) to the offset in * bound checks and not wrap.
8047. internal align target for props allocation, must be 2*n for some n
8048. Set timeval to 'this' from dparts, push the new time value onto the * value stack and return 1 (caller can then tail call us). Expects * the value stack to contain 'this' on the stack top.
8049. target
8050. DUK_FLD_FLOAT
8051. XXX: shared helper fortoFixed(), toExponential(), toPrecision()
8052. **comment:** * Run an duk_hobject finalizer. Used for both reference counting * and mark-and-sweep algorithms. Must never throw an error. ** There is no return value. Any return value or error thrown by * the finalizer is ignored (although errors are debug logged). ** Notes: ** - The thread used for calling the finalizer is the same as the * 'thr' argument. This may need to change later. ** - The finalizer thread 'top' assertions are there because it is * critical that strict stack policy is observed (i.e. no cruft * left on the finalizer stack).
label: code-design

8053. -> x in [0, 2**32[
8054. rethrow original error
8055. \xffThis'
8056. Round up digits to a given position. If position is out-of-bounds, * does nothing. If carry propagates over the first digit, a '1' is * prepended to digits and 'k' will be updated. Return value indicates * whether carry propagated over the first digit. ** Note that nc_ctx->count is NOT updated based on the rounding position * (it is updated only if carry overflows over the first digit and an * extra digit is prepended).
8057. Check if any lookup above had a negative result.
8058. DUK_USE_DEBUGGER_SUPPORT
8059. * For/for-in main variants are: ** 1. for(ExpressionNoIn_opt; Expression_opt; Expression_opt) Statement * 2. for(var VariableDeclarationNoIn; Expression_opt; Expression_opt) Statement * 3. for(LeftHandSideExpression in Expression) Statement * 4. for(var VariableDeclarationNoIn in Expression) Statement ** Parsing these without arbitrary lookahead or backtracking is relatively * tricky but we manage to do so for now. ** See doc/compiler.rst for a detailed discussion of control flow * issues, evaluation order issues, etc.
8060. The specification is a bit vague what to do if the return * value is not a number. Other implementations seem to * tolerate non-numbers but e.g. V8 won't apparently do a * ToNumber().
8061. DUK_TOK_SUB_EQ
8062. * Do a longjmp call, calling the fatal error handler if no * catchpoint exists.
8063. Fixed header info.
8064. nothing to finalize
8065. throw flag irrelevant (false in std alg)
8066. **comment:** This approach is a bit shorter than a straight * if-else-ladder and also a bit faster.
label: code-design

8067. All lightfunc own properties are non-writable and the lightfunc * is considered non-extensible. However, the write may be captured * by an inherited setter which means we can't stop the lookup here.

8068. name
8069. accept string if next char is NUL (otherwise reject)
8070. * "WhiteSpace" production check.
8071. value1 -> yield value, iserror -> error / normal
8072. Number of characters that the atom matches (e.g. 3 for 'abc'), * -1 if atom is complex and number of matched characters either * varies or is not known.
8073. **comment:** 'funcs' is quite rarely used, so no local for it

8087. Non-critical.
8088. **comment:** XXX: tail call: return duk_push_false(ctx)
 label: code-design
8089. **comment:** * Sweep garbage and remove marking flags, and move objects with * finalizers to the finalizer work list. ** Objects to be swept need to get their refcounts finalized before * they are swept. In other words, their target object refcounts * need to be decreased. This has to be done before freeing any * objects to avoid decreffing dangling pointers (which may happen * even without bugs, e.g. with reference loops) ** Because strings don't point to other heap objects, similar * finalization is not necessary for strings.
 label: code-design
8090. Note: target registers a and a+1 may overlap with DUK__REGCONSTP(b) * and DUK__REGCONSTP(c). Careful here.
8091. DUK_USE_DATE_NOW_GETTIMEofday
8092. **comment:** XXX: what's the safest way of creating a negative zero?
 label: code-design
8093. **comment:** XXX: several nice-to-have improvements here: * - Use direct reads avoiding value stack operations * - Avoid triggering getters, indicate getter values to debug client * - If side effects are possible, add error catching
 label: code-design
8094. ptr may be NULL
8095. E5 Sections 15.10.2.8, 7.3
8096. Target must be stored so that we can recheck whether or not * keys still exist when we enumerate. This is not done if the * enumeration result comes from a proxy trap as there is no * real object to check against.
8097. * Note: currently no fast path for array index writes. * They won't be possible anyway as strings are immutable.
8098. Important to do a fastint check so that constants are * properly read back as fastints.
8099. remove artificial bump
8100. important to use normalized NaN with 8-byte tagged types
8101. Only objects in heap_allocated may have finalizers. Check that * the object itself has a _Finalizer property (own or inherited) * so that we don't execute finalizers for e.g. Proxy objects.
8102. crossed offsets or zero size
8103. [... escaped_source bytecode]
8104. * E5 Section 11.4.8
8105. * Manipulate valstack so that args are on the current bottom and the * previous caller's 'this' binding (which is the value preceding the * current bottom) is replaced with the new 'this' binding: * * [... this_old | (crud) func this_new arg1 ... argN] * --> [... this_new | arg1 ... argN] ** For tail calling to work properly, the valstack bottom must not grow * here; otherwise crud would accumulate on the valstack.
8106. * ToInteger() (E5 Section 9.4)
8107. invalidates tv
8108. * Fatal error * * There are no fatal error macros at the moment. There are so few call * sites that the fatal error handler is called directly.
8109. num_stack_args
8110. property is virtual: used in duk_propdesc, never stored * (used by e.g. buffer virtual properties)
8111. \xffVarmap'
8112. Compute (extended) utf-8 length without codepoint encoding validation, * used for string interning. ** NOTE: This algorithm is performance critical, more so than string hashing * in some cases. It is needed when interning a string and needs to scan * every byte of the string with no skipping. Having an ASCII fast path * is useful if possible in the algorithm. The current algorithms were * chosen from several variants, based on x64 gcc -O2 testing. See: * <https://github.com/svaarala/duktape/pull/422> ** NOTE: must match src/dukutil.py:duk_unicode_unvalidated_utf8_length().
8113. Only allow Duktape.Buffer when support disabled.
8114. * Digit generation loop. ** Different termination conditions: * * 1. Free format output. Terminate when shortest accurate * representation found. * * 2. Fixed format output, with specific number of digits. * Ignore termination conditions, terminate when digits * generated. Caller requests an extra digit and rounds. * * 3. Fixed format output, with a specific absolute cut-off * position (e.g. 10 digits after decimal point). Note * that we always generate at least one digit, even if * the digit is below the cut-off point already.
8115. number of digits changed
8116. **comment:** re-lookup to update curr.flags * XXX: would be faster to update directly
 label: code-design
8117. * Heap Buffer object representation. Used for all Buffer variants.
8118. **comment:** Note: reuse variables
 label: code-design
8119. _Varmap
8120. = 1 + arg count
8121. * Tables generated with src/gennumdigits.py. ** duk_str2num_digits_for_radix indicates, for each radix, how many input * digits should be considered significant for string-to-number conversion. * The input is also padded to this many digits to give the Dragon4 * conversion enough (apparent) precision to work with. ** duk_str2num_exp_limits indicates, for each radix, the radix-specific * minimum/maximum exponent values (for a Dragon4 integer mantissa) * below and above which the number is guaranteed to underflow to zero * or overflow to Infinity. This allows parsing to keep bigint values * bounded.
8122. 'case'
8123. num_pairs and temp_start reset at top of outer loop
8124. Because size > 0, NULL check is correct
8125. 17: getUTCHours
8126. [... enum]-> [... next_key]
8127. if density < L, abandon array part, L = 3-bit fixed point, e.g. 2 -> 2/8 = 25%
8128. Encode to CESU-8; 'out' must have space for at least * DUK_UNICODE_MAX_CESU8_LENGTH bytes; codepoints above U+10FFFF * will encode to garbage but won't overwrite the output buffer.
8129. * Finalize stack

8130. Only a reg fits into 'A' so coerce 'res' into a register * for PUTVAR. ** XXX: here the current A/B/C split is suboptimal: we could * just use 9 bits for reg_res (and support constants) and 17 * instead of 18 bits for the varname const index.

8131. * Helper for setting up var_env and lex_env of an activation, * assuming it does NOT have the DUK_HOBJECT_FLAG_NEWENV flag.

8132. no need for 'caller' post-check, because 'key' must be an array index

8133. [arg undefined]

8134. "

8135. * String-to-number conversion

8136. We can't shortcut zero here if it goes through special formatting * (such as forced exponential notation).

8137. 0x10...0x1f

8138. Main operation

8139. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8CLAMPED * Note: INT8 is -not- copy compatible, e.g. -1 would coerce to 0x00.

8140. invalidated

8141. DUK_USE_CPP_EXCEPTIONS

8142. max(incl)

8143. * Arguments objects have exotic [[DefineOwnProperty]] which updates * the internal 'map' of arguments for writes to currently mapped * arguments. More concretely, writes to mapped arguments generate * a write to a bound variable. * * The [[Put]] algorithm invokes [[DefineOwnProperty]] for existing * data properties and new properties, but not for existing accessors. * Hence, in E5 Section 10.6 ([[DefinedOwnProperty]] algorithm), we * have a Desc with 'Value' (and possibly other properties too), and * we end up in step 5.b.i.

8144. A top-level assignment is e.g. "x = y;". For these it's safe * to use the RHS as-is as the expression value, even if the RHS * is a reg-bound identifier. The RHS ('res') is right associative * so it has consumed all other assignment level operations; the * only relevant lower binding power construct is comma operator * which will ignore the expression value provided here. Usually * the top level assignment expression value is ignored, but it * is relevant for e.g. eval code.

8145. **comment:** XXX: use helper for size optimization
label: code-design

8146. 'ignoreCase'

8147. Note: env_thr != thr is quite possible and normal, so careful * with what thread is used for valstack lookup.

8148. frozen and sealed

8149. tv -> value just before prev top value; must relookup

8150. * Found existing inherited plain property. * Do an access control check, and if OK, write * new property to 'orig'.

8151. initial estimate for ASCII only codepoints

8152. Parser separator masks.

8153. just in case callback is broken and won't write 'x'

8154. **comment:** NEXTENUM needs a jump slot right after the main opcode. * We need the code emitter to reserve the slot: if there's * target shuffling, the target shuffle opcodes must happen * after the jump slot (for NEXTENUM the shuffle opcodes are * not needed if the enum is finished).
label: code-design

8155. then to a register

8156. retval to result[i]

8157. Sanity limit on max number of properties (allocated, not necessarily used). * This is somewhat arbitrary, but if we're close to 2**32 properties some * algorithms will fail (e.g. hash size selection, next prime selection). * Also, we use negative array/entry table indices to indicate 'not found', * so anything above 0x80000000 will cause trouble now.

8158. expect EOF instead of {

8159. resizing parameters

8160. value from target

8161. this is especially critical to avoid another write call in detach1()

8162. **comment:** Stripping the filename might be a good idea * (""/foo/bar/quux.js" -> logger name "quux"), * but now used verbatim.
label: code-design

8163. return the argument object

8164. new buffer of specified size

8176. advance, expecting current token to be a specific token; parse next token in regexp context

8177. stack prepped for func call: [... trap handler]

8178. {"_nan":true}'

8179. tagged null pointers should never occur

8180. * Heap header definition and assorted macros, including ref counting. * Access all fields through the accessor macros.

8181. * Finally, longjmp

8182. e.g. DUK_OP_POSTINCP

8183. Allow leading minus sign

8184. copy to buffer with spare to avoid Valgrind gripes from strptime

8185. throw

8186. 4: toLocaleDateString

8187. eat 'with'

8188. [... this func]

8189. setters

8190. step 4.c

8191. Note: cannot assume that a non-zero return value of signbit() would * always be the same -- hence cannot (portably) use something like: * * signbit(x) == signbit(y)

8192. check func supports [[HasInstance]] (this is checked for every function * in the bound chain, including the final one)

8193. There is no need to NUL delimit the sscanf() call: trailing garbage is * ignored and there is always a NUL terminator which will force an error * if no error is encountered before it. It's possible that the scan * would scan further than between [js_ctx->p,p[though and we'd advance * by less than the scanned value. * * Because pointers are platform specific, a failure to scan a pointer * results in a null pointer which is a better placeholder than a missing * value or an error.

8194. **comment:** XXX: relocate
label: code-design

8195. match fail

8196. * Make a value copy of the input val. This ensures that * side effects cannot invalidate the pointer.

8197. DUK_USE_DATE_TZO_GMTIME

8198. Treat like debugger statement: `nop`
8199. Get valstack index for the func argument or throw if insane stack.
8200. **comment:** 'd3' is never NaN, so no need to normalize
 label: code-design
8201. XXX: `push_uint_string / push_u32_string`
8202. return value from `Duktape.Thread.resume()`
8203. For the case `n==1` `Node.js` doesn't seem to type check * the sole member but we do it before returning it. * For this case only the original buffer object is * returned (not a copy).
8204. end of loop (careful with `len==0`)
8205. Result is always fastint compatible.
8206. Handle a BREAK/CONTINUE opcode. Avoid using `longjmp()` for BREAK/CONTINUE * handling because it has a measurable performance impact in ordinary * environments and an extreme impact in Emscripten (GH-342).
8207. `DUK_TOK_TRY`
8208. Optional UTC conversion.
8209. 6
8210. [requested_id require require.id resolved_id last_comp Duktape modLoaded undefined fresh_require exports module]
8211. * Self test main
8212. prototype is `lex_env` before catcher created
8213. `ToInteger()` coercion; NaN -> 0, infinities are clamped to 0 and 10
8214. Keep throwing an error whenever we get here. The unusual values * are set this way because no instruction is ever executed, we just * throw an error until all try/catch/finally and other catchpoints * have been exhausted. Duktape/C code gets control at each protected * call but whenever it enters back into Duktape the RangeError gets * raised. User exec timeout check must consistently indicate a timeout * until we've fully bubbled out of Duktape.
8215. `tc1 = true, tc2 = false`
8216. no need to handle thread state book-keeping here
8217. Not found. Empty string case is handled specially above.
8218. 4 low bits
8219. **comment:** XXX: option to pretend property doesn't exist if sanity limit is * hit might be useful.
 label: code-design
8220. Use explicit steps in computation to try to ensure that * computation happens with intermediate results coerced to * double values (instead of using something more accurate). * E.g. E5.1 Section 15.9.1.11 requires use of IEEE 754 * rules (= Ecmascript '+' and '*'). * * Without 'volatile' even this approach fails on some platforms * and compiler combinations. For instance, gcc 4.8.1 on Ubuntu * 64-bit, with -m32 and without -std=c99, `test-bi-date-canceling.js` * would fail because of some optimizations when computing `tmp_time` * (MakeTime below). Adding 'volatile' to `tmp_time` solved this * particular problem (annoyingly, also adding debug prints or * running the executable under valgrind hides it).
8221. **comment:** Smaller header than for other objects, because strings are held * in string intern table which requires no link pointers. Much of * the 32-bit flags field is unused by flags, so we can stuff a 16-bit * field in there.
 label: code-design
8222. **comment:** Delete semantics are a bit tricky. The description in E5 specification * is kind of confusing, because it distinguishes between resolvability of * a reference (which is only known at runtime) seemingly at compile time * (= `SyntaxError` throwing).
 label: code-design
8223. [... enum] -> [...]
8224. * Augment an error being created using Duktape specific properties * like `_Tracedata` or `.fileName/.lineNumber`.

8247. **comment:** not sure whether or not needed; Thursday
 label: requirement
8248. emergency mode: try extra hard
8249. Set object 'length'.
8250. byte index limit for element access, exclusive
8251. We could rely on max temp/const checks: if they don't exceed BC * limit, nothing here can either (just asserts would be enough). * Currently we check for the limits, which provides additional * protection against creating invalid bytecode due to compiler * bugs.
8252. require initializer for var/const
8253. `DUK_TOK_FALSE`
8254. fall-through control flow patchup; note that `pc_prevstmt` may be * < 0 (i.e. no case clauses), in which case this is a no-op.
8255. [... eval "eval" eval_input level]
8256. * `ToObject()` (E5 Section 9.9) * * ==> implemented in the API.
8257. `DUK_USE_MARKANDSWEEP_FINALIZER_TORTURE`
8258. **comment:** * Handle integers in 32-bit range (that is, $[-(2^{32}-1), 2^{32}-1]$) * specially, as they're very likely for embedded programs. This * is now done for all radix values. We must be careful not to use * the fast path when special formatting (e.g. forced exponential) * is in force. * * XXX: could save space by supporting

radix 10 only and using * sprintf "%lu" for the fast path and for exponent formatting.

label: code-design

8259. !(p < r)

8260. Maximum exponent value when parsing numbers. This is not strictly * compliant as there should be no upper limit, but as we parse the * exponent without a bigint, impose some limit.

8261. num_stack_args

8262. **comment:** Executor interrupt counter check, used to implement breakpoints, * debugging interface, execution timeouts, etc. The counter is heap * specific but is maintained in the current thread to make the check * as fast as possible. The counter is copied back to the heap struct * whenever a thread switch occurs by the DUK_HEAP_SWITCH_THREAD() macro.

label: code-design

8263. complete 'sub atom'

8264. * Intern key via the valstack to ensure reachability behaves * properly. We must avoid longjmp's here so use non-checked * primitives. * * Note: duk_check_stack() potentially reallocs the valstack, * invalidating any duk_tval pointers to valstack. Callers * must be careful.

8265. round out to 8 bytes

8266. for convenience

8267. buffer limits

8268. Handle TypedArray vs. Node.js Buffer arg differences

8269. DUK_TOK_WHILE

8270. offset/value order different from Node.js

8271. * Other cases (function declaration, anonymous function expression, * strict direct eval code). The "outer" environment will be whatever * the caller gave us.

8272. * Setup environment record properties based on the template and * its flags. * * If DUK_HOBJECT_HAS_NEWENV(fun_temp) is true, the environment * records represent identifiers "outside" the function; the * "inner" environment records are created on demand. Otherwise, * the environment records are those that will be directly used * (e.g. for declarations). * * _Lexenv is always set; _Varenv defaults to _Lexenv if missing, * so _Varenv is only set if _Lexenv != _Varenv. * * This is relatively complex, see doc/identifier-handling.rst.

8273. * Detach actual buffer from dynamic buffer in valstack, and * pop it from the stack. * * XXX: the buffer object is certainly not reachable at this point, * so it would be nice to free it forcibly even with only * mark-and-sweep enabled. Not a big issue though.

8274. continue matched this label -- we can only continue if this is the empty * label, for which duplication is allowed, and thus there is hope of * finding a match deeper in the label stack.

8275. Plus sign must be accepted for positive exponents * (e.g. '1.5e+2'). This clause catches NULs.

8276. DUK_TOK_VOID

8277. DUK_USE_PC2LINE

8278. DUK_HOBJECT_FLAG_STRICT varies

8279. [... errval errhandler]

8280. **comment:** XXX: Valstack, callstack, and catchstack are currently assumed * to have non-NULL pointers. Relaxing this would not lead to big * benefits (except perhaps for terminated threads).

label: code-design

8281. serialize the wrapper with empty string key

8282. * Free a heap object. * * Free heap object and its internal (non-heap) pointers. Assumes that * caller has removed the object from heap allocated list or the string * intern table, and any weak references (which strings may have) have * been already dealt with.

8283. BITWISE EXPRESSIONS

8284. **comment:** * Copy some internal properties directly * * The properties will be writable and configurable, but not enumerable.

label: code-design

8285. Valstack resize flags

8286. **comment:** XXX: Hex encoded, length limited buffer summary here?

label: code-design

8287. finish up pending jump and split for last alternative

8288. nop

8289. * Local declarations.

8290. stack[0] = object (this) * stack[1] = ToUInt32(length) * stack[2] = elem at index 0 (retval)

8291. A finalizer is looked up from the object and up its prototype chain * (which allows inherited finalizers). A prototype loop must not cause * an error to be thrown here; duk_hobject_hasprop_raw() will ignore a * prototype loop silently and indicate that the property doesn't exist.

8292. **comment:** XXX: coerce to regs? it might be better for enumeration use, where the * same PROP ivalue is used multiple times. Or perhaps coerce PROP further * there?

label: code-design

8293. x > y --> y < x

8294. * Found existing accessor property (own or inherited). * Call setter with 'this' set to orig, and value as the only argument. * Setter calls are OK even for ROM objects. * * Note: no exotic arguments object behavior, because [[Put]] never * calls [[DefineOwnProperty]] (E5 Section 8.12.5, step 5.b).

8295. resume: [...] initial_func] (currently actually: [initial_func])

8296. Lookup 'key' from arguments internal 'map', and leave replacement value * on stack top if mapped (and return non-zero). * Used in E5 Section 10.6 algorithm for [[GetOwnProperty]] (used by [[Get]]).

8297. proto can also be NULL here (allowed explicitly)

8298. * split()

8299. Validate that the whole slice [0,length[is contained in the underlying * buffer. Caller must ensure 'buf' != NULL.

8300. could also just pop?

8301. Parser part indices.

8302. Compiler SyntaxError (or other error) gets the primary blame. * Currently no flag to prevent blaming.

8303. We don't check the zero padding bytes here right now * (that they're actually zero). This seems to be common * behavior for base-64 decoders.

8304. An object may be in heap_allocated list with a zero * refcount if it has just been finalized and is waiting * to be collected by the next cycle.

8305. * Local prototypes

8306. low-level property functions

8307. helpers for defineProperty() and defineProperties()

8308. w/o refcounts

8309. Skip dvalues to EOM.

8310. all native functions have NEWENV

8311. +1, right after inserted jump

8312. only accept lowercase 'utf8' now.

8313. **comment:** XXX: duplicates should be eliminated here

label: code-design

8314. **comment:** XXX: block removal API primitive

label: code-design

8315. LOGICAL EXPRESSIONS

8316. %lf, %ld etc

8317. * Switch is pretty complicated because of several conflicting concerns: * * - Want to generate code without an intermediate representation, * i.e., in one go * * - Case selectors are expressions, not values, and may thus e.g. throw * exceptions (which causes evaluation order concerns) * * - Evaluation semantics of case selectors and default clause need to be * carefully implemented to provide correct behavior even with case value * side effects * * - Fall through case and default clauses; avoiding dead JUMPs if case * ends with an unconditional jump (a break or a continue) * * - The same case value may occur multiple times, but evaluation rules * only process the first match before switching to a "propagation" mode * where case values are no longer evaluated * * See E5 Section 12.11. Also see doc/compiler.rst for compilation * discussion.

8318. 8: getFullYear
8319. * Debug connection peek and flush primitives
8320. 'do'
8321. duk_xdef_prop() will define an own property without any array * special behaviors. We'll need to set the array length explicitly * in the end. For arrays with elisions, the compiler will emit an * explicit SETALEN which will update the length.
8322. exponential notation forced
8323. NB: 'val' may be invalidated here because put_value may realloc valstack, * caller beware.
8324. Here we'd have the option to normalize -0 to +0.
8325. **comment:** XXX: share helper from lexer; duk_lexer.c / hexval().
label: code-design
8326. **comment:** * Create an internal enumerator object E, which has its keys ordered * to match desired enumeration ordering. Also initialize internal control * properties for enumeration. * * Note: if an array was used to hold enumeration keys instead, an array * scan would be needed to eliminate duplicates found in the prototype chain.
label: code-design
8327. **comment:** This is essentially the 'scale' algorithm, with recursion removed. * Note that 'k' is either correct immediately, or will move in one * direction in the loop. There's no need to do the low/high checks * on every round (like the Scheme algorithm does). * * The scheme algorithm finds 'k' and updates 's' simultaneously, * while the logical algorithm finds 'k' with 's' having its initial * value, after which 's' is updated separately (see the Burger-Dybvig * paper, Section 3.1, steps 2 and 3). * * The case where m+ == m- (almost always) is optimized for, because * it reduces the bigint operations considerably and almost always * applies. The scale loop only needs to work with m+, so this works.
label: code-design
8328. A -> flags * BC -> regCatch; base register for two registers used both during * trycatch setup and when catch is triggered * * If DUK_BC_TRYCATCH_FLAG_CATCH_BINDING set: * regCatch + 0: catch binding variable name (string). * Automatic declarative environment is established for * the duration of the 'catch' clause. * * If DUK_BC_TRYCATCH_FLAG_WITH_BINDING set: * regCatch + 0: with 'target value', which is coerced to * an object and then used as a bindind object for an * environment record. The binding is initialized here, for * the 'try' clause. * * Note that a TRYCATCH generated for a 'with' statement has no * catch or finally parts.
8329. default: false
8330. **comment:** fill new_h with u32 0xff = UNUSED
label: code-design
8331. A non-extensible object cannot gain any more properties, * so this is a good time to compact.
8332. if direct eval, calling activation must exist
8333. **comment:** XXX: because of the final check below (that the literal is not * followed by a digit), this could maybe be simplified, if we bail * out early from a leading zero (and if there are no periods etc). * Maybe too complex.
label: code-design
8334. * Create escaped RegExp source (E5 Section 15.10.3). * * The current approach is to special case the empty RegExp * (" -> '(?:')") and otherwise replace unescaped '/' characters * with '\' regardless of where they occur in the regexp. * * Note that normalization does not seem to be necessary for * RegExp literals (e.g. '/foo/') because to be acceptable as * a RegExp literal, the text between forward slashes must * already match the escaping requirements (e.g. must not contain * unescaped forward slashes or be empty). Escaping IS needed * for expressions like 'new RegExp("...","")' however. * Currently, we re-escape in either case. * * Also note that we process the source here in UTF-8 encoded * form. This is correct, because any non-ASCII characters are * passed through without change.
8335. Value stack is used to ensure reachability of constants and * inner functions being loaded. Require enough space to handle * large functions correctly.
8336. **comment:** Automatic defaulting of logger name from caller. This would * work poorly with tail calls, but constructor calls are currently * never tail calls, so tail calls are not an issue now.
label: code-design
8337. Fast check for extending array: check whether or not a slow density check is required.
8338. **comment:** XXX: using duk_put_prop_index() would cause obscure error cases when Array.prototype * has write-protected array index named properties. This was seen as DoubleErrors * in e.g. some test262 test cases. Using duk_xdef_prop_index() is better but heavier. * The best fix is to fill in the tracedata directly into the array part. There are * no side effect concerns if the array part is allocated directly and only INCREFs * happen after that.
label: code-design
8339. filename may be NULL in which case file/line is not recorded
8340. unsigned
8341. **comment:** XXX: function flag to make this automatic?
label: requirement
8342. Must have array part and no conflicting exotic behaviors. * Doesn't need to have array special behavior, e.g. Arguments * object has array part.
8343. Breakpoint entries above the used area are left as garbage.
8344. allow_source_elem
8345. JSON parsing code is allowed to read [p_start,p_end]: p_end is * valid and points to the string NUL terminator (which is always * guaranteed for duk_hstrings).
8346. fall through if overflow etc
8347. inner function numbering
8348. **comment:** XXX: could write output in chunks with fewer ensure calls, * but relative benefit would be small here.
label: code-design
8349. Assumes that saved[0] and saved[1] are always * set by regexp bytecode (if not, char_end_offset * will be zero). Also assumes clen reflects the * correct char length.
8350. **comment:** XXX: V8 throws a TypeError for negative values. Would it * be more useful to interpret negative offsets here from the * end of the buffer too?
label: code-design
8351. function needs shuffle registers
8352. The compiler should never emit DUK_OP_REGEXP if there is no * regexp support.
8353. invalid padding
8354. Note: here we must be wary of the fact that a pointer may be * valid and be a NULL.
8355. **comment:** Here we can choose either to end parsing and ignore * whatever follows, or to continue parsing in case * multiple (possibly padded) base64 strings have been * concatenated. Currently, keep on parsing.
label: code-design
8356. [requested_id require require.id resolved_id last_comp]
8357. advance to get one step of lookup
8358. Write signed 32-bit integer.
8359. * Canonicalize() abstract operation needed for canonicalization of individual * codepoints during regexp compilation and execution, see E5 Section 15.10.2.8. * Note that codepoints are canonicalized one character at a time, so no context * specific rules can apply. Locale specific rules can apply, though.
8360. This should not be necessary because no-one should tamper with the * regexp bytecode, but is prudent to avoid potential segfaults if that * were to happen for some reason.
8361. Needs lookahead
8362. * Churn refzero_list until empty
8363. Note: 'q_instr' is still used below
8364. duk_unicode_caseconv_uc[]
8365. **comment:** * Make a copy of tv_obj, tv_key, and tv_val to avoid any issues of * them being invalidated by a valstack resize. * * XXX: this is now an overkill for many fast paths. Rework this * to be faster (although switching to a valstack discipline might * be a better solution overall).
label: code-design
8366. failed, resize and try again
8367. extend with undefined
8368. **comment:** * Traceback handling * * The unified helper decodes the traceback and produces various requested * outputs. It should be optimized for size, and may leave garbage on stack, * only the topmost return value matters. For instance, traceback separator * and decoded strings are pushed even when looking for filename

only. ** NOTE: although _Tracedata is an internal property, user code can currently * write to the array (or replace it with something other than an array). * The code below must tolerate arbitrary _Tracedata. It can throw errors * etc, but cannot cause a segfault or memory unsafe behavior.

label: code-design

8369. Error; error value is in heap->j.value1.

8370. -> [... key val toJSON val key]

8371. callstack

8372. read 3 bytes into 't', padded by zero

8373. XXX: remove this feature entirely? it would only matter for * emergency GC. Disable for lowest memory builds.

8374. * Computed values (e.g. INFINITY)

8375. DUK_TOK_DIV_EQ

8376. already set

8377. input 'd' in Windows UTC, 100ns units

8378. Keep current size

8379. 50x heap size

8380. Dynamic buffer with 'curr_alloc' pointing to a dynamic area allocated using * heap allocation primitives. Also used for external buffers when low memory * options are not used.

8381. [name this]

8382. [... holder name val enum obj_key new_elem]

8383. patched later

8384. [... regexp_object]

8385. **comment:** * Note: the description in E5 Section 15.10.2.6 has a typo, it * contains 'A' twice and lacks 'a'; the intent is [0-9a-zA-Z].

label: documentation

8386. This was the last term, and q_last was * updated to match this term at loop top.

8387. x <- b^y; use t1 and t2 as temps

8388. prev_token.start_offset points to the closing brace here; when skipping * we're going to reparse the closing brace to ensure semicolon insertion * etc work as expected.

8389. more initializers

8390. ref.holder is global object, holder is the object with the * conflicting property.

8391. essentially tracks digit position of lowest 'f' digit

8392. **comment:** Prevent any side effects on the string table and the caller provided * str/blen arguments while interning is in progress. For example, if * the caller provided str/blen from a dynamic buffer, a finalizer might * resize that dynamic buffer, invalidating the call arguments.

label: code-design

8393. binding power "levels" (see doc/compiler.rst)

8394. Enter message processing loop for sending Status notifys and * to finish a pending detach.

8395. result reg

8396. strings are only tracked by stringtable

8397. to avoid relookups

8398. abandoning requires a props allocation resize and * 'rechecks' the valstack, invalidating any existing * valstack value pointers!

8399. If object has a .toJSON() property, we can't be certain * that it wouldn't mutate any value arbitrarily, so bail * out of the fast path. * * If an object is a Proxy we also can't avoid side effects * so abandon.

8400. !'

8401. **comment:** Unlike in duk_hex_encode() 'dst' is not necessarily aligned by 2. * For platforms where unaligned accesses are not allowed, shift 'dst' * ahead by 1 byte to get alignment and then DUK_MEMMOVE() the result * in place. The faster encoding loop makes up the difference. * There's always space for one extra byte because a terminator always * follows the hex data and that's been accounted for by the caller.

label: code-design

8402. E5 Section 7.3, treat the following as newlines: * LF * CR [not followed by LF] * LS * PS * * For CR LF, CR is ignored if it is followed by LF, and the LF will bump * the line number.

8403. **comment:** * 'nregs' registers are allocated on function entry, at most 'nargs' * are initialized to arguments, and the rest to undefined. Arguments * above 'nregs' are not mapped to registers. All registers in the * active stack range must be initialized because they are GC reachable. * 'nargs' is needed so that if the function is given more than 'nargs' * arguments, the additional arguments do not 'clobber' registers * beyond 'nregs' which must be consistently initialized to undefined. * * Usually there is no need to know which registers are mapped to * local variables. Registers may be allocated to variable in any * way (even including gaps). However, a register-variable mapping * must be the same for the duration of the function execution and * the register cannot be used for anything else. * * When looking up variables by name, the '_Varmap' map is used. * When an activation closes, registers mapped to arguments are * copied into the environment record based on the same map. The * reverse map (from register to variable) is not currently needed * at run time, except for debugging, so it is not maintained.

label: code-design

8404. Slice starting point is beyond current length.

8405. ... target is extensible

8406. duk_unicode_support.c

8407. **comment:** XXX: easier check with less code?

label: code-design

8414. **comment:** has inner functions which may slow access (XXX: this can be optimized by looking at the inner functions)

label: code-design

8415. **comment:** XXX: need to determine LHS type, and check that it is LHS compatible

label: code-design

8416. false

8417. * Built-in strings

8418. * Clear (reachable) flags of finalize_list * * We could mostly do in the sweep phase when we move objects from the * heap into the finalize_list. However, if a finalizer run is skipped * during a mark-and-sweep, the objects on the finalize_list will be marked * reachable during the next mark-and-sweep. Since they're already on the * finalize_list, no-one will be clearing their REACHABLE flag so we do it * here. (This now overlaps with the sweep handling in a harmless way.)

8419. * Variant 3

8420. * On second pass, skip the function.

8421. Note: key issue here is to re-lookup the base pointer on every attempt. * The pointer being reallocated may change after every mark-and-sweep.

8422. -> [... key val toJSON val]

8423. **comment:** XXX: It would be nice to build the string directly but ToUint16() * coercion is needed so a generic helper would not be very * helpful (perhaps coerce the value stack first here and then * build a string from a duk_tval number sequence in one go?).

label: code-design

8424. Note: getprop may invoke any getter and invalidate any * duk_tval pointers, so this must be done first.

8425. [obj trap_result res_arr propname]

8426. split1: prefer direct execution (no jump)

8427. in resumer's context

8428. Conceptually we'd extract the plain underlying buffer * or its slice and then do a type mask check below to * see if we should reject it. Do the mask check here * instead to avoid making a copy of the buffer slice.

8429. 'try'

8430. -> [in_val]

8431. **comment:** Currently all built-in native functions are strict. * This doesn't matter for many functions, but e.g. * String.prototype.charAt (and other string functions) * rely on being strict so that their 'this' binding is * not automatically coerced.

label: code-design

8432. **comment:** * Helper for handling an Ecmascript-to-Ecmascript call or an Ecmascript * function (initial) Duktape.Thread.resume(). * * Compared to normal calls handled by duk_handle_call(), there are a * bunch of differences: * * - the call is never protected * - there is no C recursion depth increase (hence an "ignore recursion * limit" flag is not applicable) * - instead of making the call, this helper just performs the thread * setup and returns; the bytecode executor then restarts execution * internally * - ecmascript functions are never 'vararg' functions (they access * varargs through the 'arguments' object) * * The callstack of the target contains an earlier Ecmascript call in case * of an Ecmascript-to-Ecmascript call (whose idx_retval is updated), or * is empty in case of an initial Duktape.Thread.resume(). * * The first thing to do here is to figure out whether an ecma-to-ecma * call is actually possible. It's not always the case if the target is * a bound function; the final function may be native. In that case, * return an error so caller can fall back to a normal call path.

label: code-design

8433. Note: 0xff != DUK_BC_B_MAX

8434. * Unions and structs for self tests

8435. Note: masking is done for 'i' to deal with negative numbers correctly

8436. * For property layout 1, tweak e_size to ensure that the whole entry * part (key + val + flags) is a suitable multiple for alignment * (platform specific). * * Property layout 2 does not require this tweaking and is preferred * on low RAM platforms requiring alignment.

8437. don't run finalizers; queue finalizable objects back to heap_allocated

8438. val1 = count

8439. * Function declaration, function expression, or (non-standard) * function statement. * * The E5 specification only allows function declarations at * the top level (in "source elements"). An ExpressionStatement * is explicitly not allowed to begin with a "function" keyword * (E5 Section 12.4). Hence any non-error semantics for such * non-top-level statements are non-standard. Duktape semantics * for function statements are modelled after V8, see * test-dev-func-decl-outside-top.js.

8440. Get minimum array part growth for a certain size.

8441. **comment:** XXX: very slow - better to bulk allocate a gap, and copy * from args_array directly (we know it has a compact array * part, etc).

label: code-design

8442. 'enumerate'

8443. DUK_TOK_RSHIFT

8444. roughly 256 bytes

8445. **comment:** For now, just use duk_safe_call() to wrap duk_new(). We can't * simply use a protected duk_handle_call() because there's post * processing which might throw. It should be possible to ensure * the post processing never throws (except in internal errors and * out of memory etc which are always allowed) and then remove this * wrapper.

label: code-design

8446. object is now reachable

8447. flags: "im"

8448. Copy trap result keys into the enumerator object.

8449. * Mark-and-sweep flags * * These are separate from heap level flags now but could be merged. * The heap structure only contains a 'base mark-and-sweep flags' * field and the GC caller can impose further flags.

8450. Success path.

8451. * If entering a 'catch' block which requires an automatic * catch variable binding, create the lexical environment. * * The binding is mutable (= writable) but not deletable. * Step 4 for the catch production in E5 Section 12.14; * no value is given for CreateMutableBinding 'D' argument, * which implies the binding is not deletable.

8452. t1 <- (* r B)

8453. DUK_BUFOBJ_UINT8ARRAY

8454. Accept any duk_hbufferobject, though we're only normally * called for Duktape.Buffer values.

8455. Lenient: allow function declarations outside top level in * non-strict mode but reject them in strict mode.

8456. assertions: env must be closed in the same thread as where it runs

8457. EOF (-1) will be cast to an unsigned value first * and then re-cast for the switch. In any case, it * will match the default case (syntax error).

8458. refzero not running -> must be empty

8459. **comment:** XXX: differentiate null pointer from empty string?

label: code-design

8460. Normal object which doesn't get automatically coerced to a * primitive value. Functions are checked for specially. The * primitive value coercions for Number, String, Pointer, and * Boolean can't result in functions so suffices to check here.

8461. DUK_USE_MARK_AND_SWEEP

8462. * Coercion and fast path processing

8463. y == +Infinity

8464. caller required to know

8465. * Function name (if any) * * We don't check for prohibited names here, because we don't * yet know whether the function will be strict. Function body * parsing handles this retroactively. * * For function expressions and declarations function name must * be an Identifier (excludes reserved words). For setter/getter * it is aPropertyName which allows reserved words and also * strings and numbers (e.g. "{ get 1() { ... } }").

8466. **comment:** XXX: There are no format strings in duk_config.h yet, could add * one for formatting duk_int64_t. For now, assumes "%lld" and that * "long long" type exists. Could also rely on C99 directly but that * won't work for older MSVC.

label: code-design

8467. 'toLocaleString'

8468. * Manipulate value stack so that exactly 'num_stack_rets' return * values are at 'idx_rebase' in every case, assuming there are * 'rc' return values on top of stack. * * This is a bit tricky, because the called C function operates in * the same activation record and may have e.g. popped the stack * empty (below idx_rebase).

8469. Exotic behaviors are only enabled for arguments objects * which have a parameter map (see E5 Section 10.6 main * algorithm, step 12). * * In particular, a non-strict arguments object with no * mapped formals does *NOT* get exotic behavior, even * for e.g. "caller" property. This seems counterintuitive * but seems to be the case.

8470. buffer is automatically zeroed

8471. num_args

8472. DUK_OP_EXTRA, sub-operation in A

8473. insert the required matches (qmin) by copying the atom

8474. DUK_USE_INTEGER_BE

8475. out_clamped

8476. adv = 2 default OK

8477. There is no need to decref anything else than 'env': if 'env' * becomes unreachable, refzero will handle decref'ing its prototype.

8478. '-0'

8479. module table remains registered to modLoaded, minimize its size

8480. * Detach handling

8481. write back

8482. [... filename (temp) func]

8483. **comment:** It's not strictly necessary to track the current size, but * it is useful for writing robust native code.

label: code-design

8484. * Second pass parsing.

8485. **comment:** Note: cannot portably debug print a function pointer, hence 'func' not printed!

label: code-design

8486. * Arbitrary byteswap for potentially unaligned values * * Used to byteswap pointers e.g. in debugger code.

8487. **comment:** XXX: There's some overlap with duk_js_closure() here, but * seems difficult to share code. Ensure that the final function * looks the same as created by duk_js_closure().**label:** code-design8488. **comment:** It is important not to call this if the last byte read was an EOM. * Reading ahead in this scenario would cause unnecessary blocking if * another message is not available.**label:** code-design

8489. DUK_USE_EXEC_TIMEOUT_CHECK

8490. * Misc defines

8491. E5.1 Section 15.1.3.4: uriUnescaped

8492. Combined size of separators already overflows

8493. -> [... res]

8494. [... this name message]

8495. "/" and not in regexp mode

8496. DUK_USE_BYTECODE_DUMP_SUPPORT

8497. **comment:** may indirectly slow access through a direct eval**label:** code-design

8498. no incref needed

8499. variable binding register if register-bound (otherwise < 0)

8500. How much to advance before next loop; note that next loop * will advance by 1 anyway, so -1 from the total escape * length (e.g. len("\uXXXXX") - 1 = 6 - 1). As a default, * 1 is good.

8501. **comment:** 'sce' points to the wrong entry here, but is no longer used**label:** code-design

8502. Note: this check relies on the fact that even a zero-size string * has a non-NUL pointer.

8503. [... varname val this] (because throw_flag == 1, always resolved)

8504. No need to reinit setjmp() catchpoint, as call handling * will store and restore our state.

8505. embed: duk_hbuffer ptr

8506. t >= 0 always true, unsigned

8507. Maximum expansion per input byte is 6: * - invalid UTF-8 byte causes "\uXXXX" to be emitted (6/1 = 6). * - 2-byte UTF-8 encodes as "\uXXXX" (6/2 = 3). * - 4-byte UTF-8 encodes as "\Uxxxxxxxx" (10/4 = 2.5).

8508. Shared helper to implement Object.getPrototypeOf and the ES6 * Object.prototype.__proto__ getter. * * http://www.ecma-international.org/ecma-262/6.0/index.html#sec-get-object.prototype._proto_

8509. xxx -> DUK_HBUFFEROBJECT_ELEM_INT16

8510. vararg function, careful arg handling (e.g. thisArg may not be present)

8511. implicit this value always undefined for * declarative environment records.

8512. **comment:** * IsCallable() (E5 Section 9.11) * * XXX: API equivalent is a separate implementation now, and this has * currently no callers.**label:** code-design

8513. Extract 'top' bits of curval; note that the extracted bits do not need * to be cleared, we just ignore them on next round.

8514. duk_unicode_ids_noabmp[]

8515. Return value of 'sz' or more indicates output was (potentially) * truncated.

8516. A finalizer is looked up from the object and up its prototype chain * (which allows inherited finalizers).

8517. Encoding/decoding flags

8518. Shared helper to implement ES6 Object.setPrototypeOf and * Object.prototype.__proto__ setter. * * http://www.ecma-international.org/ecma-262/6.0/index.html#sec-get-object.prototype._proto_ * http://www.ecma-international.org/ecma-262/6.0/index.html#sec-object.setprototypeof

8519. no need to write 'out_bufdata'

8520. new_used / size <= 1 / DIV <=> new_used <= size / DIV

8521. Register the module table early to modLoaded[] so that we can * support circular references even in modSearch(). If an error * is thrown, we'll delete the reference.

8522. label handling

8523. Expression

8524. **comment:** This is performance critical because it appears in every DECREF.**label:** code-design

8525. code_idx = entry_top + 0

8526. -> [... lval rval]

8527. * Standard algorithm succeeded without errors, check for exotic post-behaviors. * * Arguments exotic behavior in E5 Section 10.6 occurs after the standard * [[DefineOwnProperty]] has completed successfully. * * Array exotic behavior in E5 Section 15.4.5.1 is implemented partly * prior to the default [[DefineOwnProperty]], but: * - for an array index key (e.g. "10") the final 'length' update occurs here * - for 'length' key the element deletion and 'length' update occurs here

8528. * All defined array-indexed properties are in the array part * (we assume the array part is comprehensive), and all array * entries are writable, configurable, and enumerable. Thus, * nothing can prevent array entries from being deleted.

8529. **comment:** * Helpers for creating and querying pc2line debug data, which * converts a bytecode program counter to a source line number. * * The run-time pc2line data is bit-packed, and documented in: * * doc/function-objects.rst**label:** documentation

8530. Represent a null pointer as 'null' to be consistent with * the JX format variant. Native '%p' format for a NULL * pointer may be e.g. '(nil)'.

8531. eat 'throw'

8532. always grow the array, no sparse / abandon support here

8533. leave formals on stack for later use

8534. since index non-negative

8535. tzoffset

8536. duk_has_prop() popped the second 'name'

8537. varname

8538. * E5 Section 15.10.2.6 "IsWordChar" abstract operation. Assume * x < 0 for characters read outside the string.

8539. -----XXXX

8540. stack top: new time value, return 1 to allow tail calls

8541. basereg

8542. E5 Section 15.4.5.1, step 3, steps a - i are implemented here, j - n at the end

8543. jump for 'catch' case

8544. Module object containing module.exports, etc

8545. 'prototype' property for all built-in objects (which have it) has attributes: * [[Writable]] = false, * [[Enumerable]] = false, * [[Configurable]] = false

8546. stack[0] = start * stack[1] = deleteCount * stack[2...nargs-1] = items * stack[nargs] = ToObject(this) -3 * stack[nargs+1] = ToUint32(length) -2 * stack[nargs+2] = result array -1

8547. -> [... escaped_source bytecode]

8548. * Write to array part? * * Note: array abandoning requires a property resize which uses * 'rechecks' valstack for temporaries and may cause any existing * valstack pointers to be invalidated. To protect against this, * tv_obj, tv_key, and tv_val are copies of the original inputs.

8549. copy existing entries as is

8550. 5: toLocaleTimeString

8551. mark-and-sweep: children not processed

8552. Catches EOF of JSON input.

8553. radix

8554. **comment:** XXX: when optimizing for guaranteed property slots, use a guaranteed * slot for internal value; this call can then access it directly.

label: code-design

8555. no wrapping

8556. **comment:** * Create and throw an error (originating from Duktape internally) * * Push an error object on top of the stack, possibly throw augmenting * the error, and finally longjmp. * * If an error occurs while we're dealing with the current error, we might * enter an infinite recursion loop. This is prevented by detecting a * "double fault" through the heap->handling_error flag; the recursion * then stops at the second level.

label: code-design

8557. if property key begins with underscore, encode it with * forced quotes (e.g. "_Foo") to distinguish it from encoded * internal properties (e.g. \xffBar -> _Bar).

8558. object or array

8559. no need to check now: both success and error are OK

8560. Note: allow backtracking from p == ptr_end

8561. Relookup if relocated

8562. module.filename for .fileName, default to resolved ID if * not present.

8563. -> [... toLocaleString ToObject(val)]

8564. DUK_TOK_LBRACKET already eaten, current token is right after that

8565. **comment:** * Array needs to grow, but we don't want it becoming too sparse. * If it were to become sparse, abandon array part, moving all * array entries into the entries part (for good). * * Since we don't keep track of actual density (used vs. size) of * the array part, we need to estimate somehow. The check is made * in two parts: * * - Check whether the resize need is small compared to the * current size (relatively); if so, resize without further * checking (essentially we assume that the original part is * "dense" so that the result would be dense enough). * * - Otherwise, compute the resize using an actual density * measurement based on counting the used array entries.

label: code-design

8566. Restore stack top after unbalanced code paths.

8567. position of highest digit changed

8568. * duk_heap allocation and freeing.

8569. Careful with borrow condition: * - If borrow not subtracted: 0x12345678 - 0 - 0xffffffff = 0x12345679 (> 0x12345678) * - If borrow subtracted: 0x12345678 - 1 - 0xffffffff = 0x12345678 (= 0x12345678)

8570. no statement value (unlike function expression)

8571. Three digit octal escape, digits validated.

8572. **comment:** * Addition operator is different from other arithmetic * operations in that it also provides string concatenation. * Hence it is implemented separately. * * There is a fast path for number addition. Other cases go * through potentially multiple coercions as described in the * E5 specification. It may be possible to reduce the number * of coercions, but this must be done carefully to preserve * the exact semantics. * * E5 Section 11.6.1. * * Custom types also have special behavior implemented here.

label: code-design

8573. Quite approximate but should be useful for little and big endian.

8574. For X <op>= Y we need to evaluate the pre-op * value of X before evaluating the RHS: the RHS * can change X, but when we do <op> we must use * the pre-op value.

8575. Count is incremented before DUK__DRAGON4_OUTPUT_PREINC() call * on purpose, which is taken into account by the macro.

8576. NUL also comes here. Comparison order matters, 0x20 * is most common whitespace.

8577. retrval for success path

8578. * Wrapping duk_safe_call() will mangle the stack, just return stack top

8579. * Node.js Buffer.prototype: toJSON()

8580. We'll need to interrupt early so recompute the init * counter to reflect the number of bytecode instructions * executed so that step counts for e.g. debugger rate * limiting are accurate.

8581. 'fileName'

8582. * Convert duk_compiler_func to a function template and add it * to the parent function table.

8583. parse args starting from "next temp"

8584. This seems like a good overall approach. Fast path for ASCII in 4 byte * blocks.

8585. * Mark-and-sweep garbage collection.

8586. **comment:** * Object compaction (emergency only). * * Object compaction is a separate step after sweeping, as there is * more free memory for it to work with. Also, currently compaction * may insert new objects into the heap allocated list and the string * table which we don't want to do during a sweep (the reachability * flags of such objects would be incorrect). The objects inserted * are currently: * * - a temporary duk_hbuffer for a new properties allocation * - if array part is abandoned, string keys are interned * * The object insertions go to the front of the list, so they do not * cause an infinite loop (they are not compacted).

label: code-design

8587. **comment:** unnecessary div for last byte

label: code-design

8588. buffer values are coerced first to string here

8589. sanity limit for function pointer size

8602. DUK_USE_DATE_NOW_TIME

8603. XXX: valstack handling is awkward. Add a valstack helper which * avoids dup():ing; valstack_copy(src, dst)?

8604. On entry, item at idx_func is a bound, non-lightweight function, * but we don't rely on that below.

8605. * Reference counting implementation.

8606. use strict equality instead of non-strict equality

8607. This assert depends on the input parts representing time inside * the Ecmascript range.

8608. controls for minimum array part growth

8609. -> [... key]

8610. * Returns non-zero if a key and/or value was enumerated, and: * * [enum] -> [key] (get_value == 0) * [enum] -> [key value] (get_value == 1) * * Returns zero without pushing anything on the stack otherwise.

8611. allow basic ASCII whitespace

8612. Heap allocated: return heap pointer which is NOT useful * for the caller, except for debugging.

8613. activation is a direct eval call

8614. current lex_env of the activation (created for catcher)

8615. **comment:** Figure out all active breakpoints. A breakpoint is * considered active if the current function's fileName * matches the breakpoint's fileName, AND there is no * inner function that has matching line numbers * (otherwise a breakpoint would be triggered both * inside and outside of the inner function which would * be confusing). Example: * * function foo() { * print('foo'); * function bar() { <-. breakpoints in these * print('bar'); | lines should not affect * } <- foo() execution * bar(); * } * * We need a few things that are only available when * debugger support is enabled: (1) a line range for * each function, and (2) access to the function template to access the inner functions (and their * line ranges). * * It's important to have a narrow match for active * breakpoints so that we don't enter checked execution * when that's not necessary. For instance, if we're * running inside a certain function and there's * breakpoint outside in (after the call site), we * don't want to slow down execution of the function.

label: code-design

8616. start byte offset of token in lexer input

8617. * Note: lj.value1 is 'value', lj.value2 is 'resume'. * This differs from YIELD.

8618. curr_token = get/set name

8619. Initial T' has been checked and eaten by caller.

8620. Thread may have changed, e.g. YIELD converted to THROW.

8621. Lookup to encode one byte directly into 2 characters: * * def genhextab(bswap): * for i in xrange(256): * t = chr(i).encode('hex') * if bswap: * t = t[1] + t[0] * print('0x' + t.encode('hex') + 'U') * print('big endian'); genhextab(False) * print('little endian'); genhextab(True)

8622. * 64-bit arithmetic * * There are some platforms/compilers where 64-bit types are available * but don't work correctly. Test for known cases.

8623. be paranoid for 32-bit time values (even avoiding negative ones)

8624. * Node.js Buffer.byteLength()

8625. emit instruction; could return PC but that's not needed in the majority * of cases.

8626. Fast write calls which assume you control the spare beforehand. * Multibyte write variants exist and use a temporary write pointer * because byte writes alias with anything: with a stored pointer * explicit pointer load/stores get generated (e.g. gcc -Os).

8627. All the flags fit in 16 bits, so will fit into duk_bool_t.

8628. flags: "g"

8629. For cross-checking during development: ensure dispatch count * matches cumulative interrupt counter init value sums.

8630. valstack should not need changes

8631. end of _Varmap

8632. **comment:** Certain boxed types are required to go through * automatic unboxing. Rely on internal value being * sane (to avoid infinite recursion).

8636. [key getter this] -> [key retval]

8637. Retry allocation after mark-and-sweep for this * many times. A single mark-and-sweep round is * not guaranteed to free all unreferenced memory * because of finalization (in fact, ANY number of * rounds is strictly not enough).

8638. only functions can have arguments

8639. E5 Section 9.3.1

8640. * GETVAR * * See E5 Sections: * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * 11.13.1 Simple Assignment [example of where the Reference is GetValue'd] * 8.7.1 GetValue (V) * 8.12.1 [[GetOwnProperty]] (P) * 8.12.2 [[GetProperty]] (P) * 8.12.3 [[Get]] (P) * * If 'throw' is true, always leaves two values on top of stack: [val this]. * * If 'throw' is false, returns 0 if identifier cannot be resolved, and the * stack will be unaffected in this case. If identifier is resolved, returns * 1 and leaves [val this] on top of stack. * * Note: the 'strict' flag of a reference returned by GetIdentifierReference * is ignored by GetValue. Hence we don't take a 'strict' parameter. * * The 'throw' flag is needed for implementing 'typeof' for an unreferenced * identifier. An unreferenced identifier in other contexts generates a * ReferenceError.

8641. **comment:** XXX: top of stack must contain value, which helper doesn't touch, * rework to use tv_val directly?

label: code-design

8642. * Executor interrupt handling * * The handler is called whenever the interrupt countdown reaches zero * (or below). The handler must perform whatever checks are activated, * e.g. check for cumulative step count to impose an execution step * limit or check for breakpoints or other debugger interaction. * * When the actions are done, the handler must reinvoke the interrupt * init and counter values. The 'init' value must indicate how many * bytecode instructions are executed before the next interrupt. The * counter must interface with the bytecode executor loop. Concretely, * the new init value is normally one higher than the new counter value. * For instance, to execute exactly one bytecode instruction the init * value is set to 1 and the counter to 0. If an error is thrown by the * interrupt handler, the counters are set to the same value (e.g. both * to 0 to cause an interrupt when the next bytecode instruction is about * to be executed after error handling). * * Maintaining the init/counter value properly is important for accurate * behavior. For instance, executor step limit needs a cumulative step * count which is simply computed as a sum of 'init' values. This must * work accurately even when single stepping.

8705. * Poppers
8706. DUK_HOBJECT_H_INCLUDED
8707. always at least the header
8708. A -> target register * B -> bytecode (also contains flags) * C -> escaped source
8709. Fast path, decode as is.
8710. * "/" followed by something in regexp mode. See E5 Section 7.8.5. * * RegExp parsing is a bit complex. First, the regexp body is delimited * by forward slashes, but the body may also contain forward slashes as * part of an escape sequence or inside a character class (delimited by * square brackets). A mini state machine is used to implement these. * * Further, an early (parse time) error must be thrown if the regexp * would cause a run-time error when used in the expression new RegExp(...). * Parsing here simply extracts the (candidate) regexp, and also accepts * invalid regular expressions (which are delimited properly). The caller * (compiler) must perform final validation and regexp compilation. * * RegExp first char may not be '/' (single line comment) or '*' (multi- * line comment). These have already been checked above, so there is no * need below for special handling of the first regexp character as in * the E5 productions. * * About unicode escapes within regexp literals: * * E5 Section 7.8.5 grammar does NOT accept \uHHHH escapes. * However, Section 6 states that regexps accept the escapes, * see paragraph starting with "In string literals...". * The regexp grammar, which sees the decoded regexp literal * (after lexical parsing) DOES have a \uHHHH unicode escape. * So, for instance: * * \u1234/* * should first be parsed by the lexical grammar as: * * '\u' RegularExpressionBackslashSequence * '1' RegularExpressionNonTerminator * '2' RegularExpressionNonTerminator * '3' RegularExpressionNonTerminator * '4' RegularExpressionNonTerminator * * and the escape itself is then parsed by the regexp engine. * This is the current implementation. * * Minor spec inconsistency: * * E5 Section 7.8.5 RegularExpressionBackslashSequence is: * * \ RegularExpressionNonTerminator * * while Section A.1 RegularExpressionBackslashSequence is: * * \ NonTerminator * * The latter is not normative and a typo. *
8711. 'break'
8712. in yielder's context
8713. * E5 Section 15.4.5.1, steps 3.k - 3.n. The order at the end combines * the error case 3.l.iii and the success case 3.m-3.n. * * Note: 'length' is always in entries part, so no array abandon issues for * 'writable' update.
8714. * Avoid a GC if GC is already running. This can happen at a late * stage in a GC when we try to e.g. resize the stringtable * or compact objects.
8715. Reject attempt to change virtual properties: not part of the * standard algorithm, applies currently to e.g. virtual index * properties of buffer objects (which are virtual but writable). * (Cannot "force" modification of a virtual property.)
8716. MakeDay
8717. Push 'this' binding, check that it is a Date object; then push the * internal time value. At the end, stack is: [... this timeval]. * Returns the time value. Local time adjustment is done if requested.
8718. Cannot use duk_to_string() on the buffer because it is usually * larger than 'len'. Also, 'buf' is usually a stack buffer.
8719. non-leap year: sunday, monday, ...
8720. activation has tail called one or more times
8721. extended types: custom encoding
8722. reg
8723. -> [... enum key val]
8724. EOF
8725. XXX: optimize value stack operation
8726. * Proxy object handling
8727. * Then decode the builtins init data (see genbuiltins.py) to * init objects
8728. mark as complex (capture handling)
8729. string is a reserved word (non-strict)
8730. s <- b^(1-e) * 2
8731. * Object inspection commands: GetHeapObjInfo, GetObjPropDesc, * GetObjPropDescRange
8732. * Unreachable object about to be swept. Finalize target refcounts * (objects which the unreachable object points to) without doing * refzero processing. Recursive decrefs are also prevented when * refzero processing is disabled. * * Value cannot be a finalizable object, as they have been made * temporarily reachable for this round.
8733. Map DUK_FLX_xxx to byte size.
8734. Note that we currently parse -bytes-, not codepoints. * All non-ASCII extended UTF-8 will encode to bytes >= 0x80, * so they'll simply pass through (valid UTF-8 or not).

8735. * Get/require
8736. key, getter and setter, now reachable through object
8737. **comment:** * Finalize objects in the finalization work list. Finalized * objects are queued back to heap_allocated with FINALIZED set. ** Since finalizers may cause arbitrary side effects, they are * prevented during string table and object property allocation * resizing using the DUK_MS_FLAG_NO_FINALIZERS flag in * heap->mark_and_sweep_base_flags. In this case the objects * remain in the finalization work list after mark-and-sweep * exits and they may be finalized on the next pass. ** Finalization currently happens inside "MARKANDSWEET_RUNNING" * protection (no mark-and-sweep may be triggered by the * finalizers). As a side effect: ** 1) an out-of-memory error inside a finalizer will not * cause a mark-and-sweep and may cause the finalizer * to fail unnecessarily ** 2) any temporary objects whose refcount decreases to zero * during finalization will not be put into refzero_list; * they can only be collected by another mark-and-sweep ** This is not optimal, but since the sweep for this phase has * already happened, this is probably good enough for now.
- label:** code-design
8738. * A Dragon4 number-to-string variant, based on: ** Guy L. Steele Jr., Jon L. White: "How to Print Floating-Point Numbers * Accurately" ** Robert G. Burger, R. Kent Dybvig: "Printing Floating-Point Numbers * Quickly and Accurately" ** The current algorithm is based on Figure 1 of the Burger-Dybvig paper, * i.e. the base implementation without logarithm estimation speedups * (these would increase code footprint considerably). Fixed-format output * does not follow the suggestions in the paper; instead, we generate an * extra digit and round-with-carry. ** The same algorithm is used for number parsing (with b=10 and B=2) * by generating one extra digit and doing rounding manually. ** See doc/number-conversion.rst for limitations.
8739. holder will be set to the target object, not the actual object * where the property was found (see duk_get_identifier_reference()).
8740. 'Array'
8741. * INITSET/INITGET are only used to initialize object literal keys. * The compiler ensures that there cannot be a previous data property * of the same name. It also ensures that setter and getter can only * be initialized once (or not at all).
8742. extended utf-8 not allowed for URIs
8743. * E5 Section 15.7.2.1 requires that the constructed object * must have the original Number.prototype as its internal * prototype. However, since Number.prototype is non-writable * and non-configurable, this doesn't have to be enforced here: * The default object (bound to 'this') is OK, though we have * to change its class. ** Internal value set to ToNumber(arg) or +0; if no arg given, * ToNumber(undefined) = NaN, so special treatment is needed * (above). String internal value is immutable.
8744. bytecode limits
8745. guaranteed to find an empty slot
8746. Because 'day since epoch' can be negative and is used to compute weekday * using a modulo operation, add this multiple of 7 to avoid negative values * when year is below 1970 epoch. Ecmascript time values are restricted to * +/- 100 million days from epoch, so this adder fits nicely into 32 bits. * Round to a multiple of 7 (= floor(100000000 / 7) * 7) and add margin.
8747. Allow trailing garbage (e.g. treat "123foo" as "123")
8748. **comment:** XXX: Are steps 6 and 7 in E5 Section 15.11.4.4 duplicated by * accident or are they actually needed? The first ToString() * could conceivably return 'undefined'.
- label:** code-design
8749. **comment:** Size sanity check. Should not be necessary because caller is * required to check this, but we don't want to cause a segfault * if the size wraps either in duk_size_t computation or when * storing the size in a 16-bit field.
- label:** code-design
8750. steps 3.h and 3.i
8751. Note: toJSON() is a generic function which works even if 'this' * is not a Date. The sole argument is ignored.
8752. module (argument)
8753. valstack space that suffices for all local calls, including recursion * of other than Duktape calls (getters etc)
8754. current paren level allows 'in' token

8840. allow automatic semicolon even without lineterm (compatibility)
8841. Outside any activation -> put to global.
8842. +0 = break, +1 = continue
8843. try locale specific formatter; if it refuses to format the * string, fall back to an ISO 8601 formatted value in local * time.
8844. -> [val arr]
8845. * Byte matching for back-references would be OK in case- * sensitive matching. In case-insensitive matching we need * to canonicalize characters, so back-reference matching needs * to be done with codepoints instead. So, we just decode * everything normally here, too. * * Note: back-reference index which is 0 or higher than * NCapturingParens (= number of capturing parens in the * -entire- regexp) is a compile time error. However, a * backreference referring to a valid capture which has * not matched anything always succeeds! See E5 Section * 15.10.2.9, step 5, sub-step 3.
8846. this is needed for regexp mode
8847. jump to next case clause
8848. pop plain buffer, now reachable through h_bufres
8849. * PUTPROP: Ecmascript property write. * * Unlike Ecmascript primitive which returns nothing, returns 1 to indicate * success and 0 to indicate failure (assuming throw is not set). * * This is an extremely tricky function. Some examples: * * * Currently a decref may trigger a GC, which may compact an object's * property allocation. Consequently, any entry indices (e_idx) will * be potentially invalidated by a decref. * * * Exotic behaviors (strings, arrays, arguments object) require, * among other things: * * - Preprocessing before and postprocessing after an actual property * write. For example, array index write requires pre-checking the * array 'length' property for access control, and may require an * array 'length' update after the actual write has succeeded (but * not if it fails). * * - Deletion of multiple entries, as a result of array 'length' write. * * * Input values are taken as pointers which may point to the valstack. * If valstack is resized because of the

put (this may happen at least * when the array part is abandoned), the pointers can be invalidated. * (We currently make a copy of all of the input values to avoid issues.)

8850. add AD*2^16

8851. Proxy handler

8852. **comment:** * Tailcall handling ** Although the callstack entry is reused, we need to explicitly unwind * the current activation (or simulate an unwind). In particular, the * current activation must be closed, otherwise something like * test-bug-reduce-judofyr.js results. Also catchstack needs be unwound * because there may be non-error-catching label entries in valid tail calls.

label: code-design

8853. **comment:** Should not be required because the code below always sets both high * and low parts, but at least gcc-4.4.5 fails to deduce this correctly * (perhaps because the low part is set (seemingly) conditionally in a * loop), so this is here to avoid the bogus warning.

label: code-design

8854. Impose a maximum string length for now. Restricted artificially to * ensure adding a heap header length won't overflow size_t. The limit * should be synchronized with DUK_HBUFFER_MAX_BYTelen. ** E5.1 makes provisions to support strings longer than 4G characters. * This limit should be eliminated on 64-bit platforms (and increased * closer to maximum support on 32-bit platforms).

8855. relookup exports from module.exports in case it was changed by modSearch

8856. * Indexed read/write helpers (also used from outside this file)

8857. adv = 2 - 1 default OK

8858. **comment:** XXX: the key in 'key in obj' is string coerced before we're called * (which is the required behavior in E5/E5.1/E6) so the key is a string * here already.

label: code-design

8859. **comment:** XXX: side effect handling is quite awkward here

label: code-design

8860. act->func

8861. **comment:** Set stack top within currently allocated range, but don't reallocate. * This is performance critical especially for call handling, so whenever * changing, profile and look at generated code.

label: code-design

8862. **comment:** Neutered checks not necessary here: neutered buffers have * zero 'length' so we'll effectively skip them.

label: code-design

8863. Call setup checks callability.

8864. **comment:** Flags for intermediate value coercions. A flag for using a forced reg * is not needed, the forced_reg argument suffices and generates better * code (it is checked as it is used).

label: code-design

8894. always for register bindings

8895. **comment:** XXX: optimize: allocate an array part to the necessary size (upwards * estimate) and fill in the values directly into the array part; finally * update 'length'.

label: code-design

8896. heap->dbg_udata: keep

8897. If input_offset were assigned a negative value, it would * result in a large positive value. Most likely it would be * larger than input_length and be caught here. In any case * no memory unsafe behavior would happen.

8898. IdentifierStart production with Letter, ASCII, and non-BMP excluded

8899. **comment:** * Custom formatter for debug printing, allowing Duktape specific data * structures (such as tagged values and heap objects) to be printed with * a nice format string. Because debug printing should not affect execution * state, formatting here must be independent of execution (see implications * below) and must not allocate memory. ** Custom format tags begin with a '%!' to safely distinguish them from * standard format tags. The following conversions are supported: * * %!T tagged value (duk_tval *) * %!O heap object (duk_heapobj *) * %!I decoded bytecode instruction * %!C bytecode instruction opcode name (arg is long) * * Everything is serialized in a JSON-like manner. The default depth is one * level, internal prototype is not followed, and internal properties are not * serialized. The following modifiers change this behavior: * * @ print pointers * # print binary representations (where applicable) * d deep traversals of own properties (not prototype) * p follow prototype chain (useless without 'd') * i include internal properties (other than prototype) * x hexdump buffers * h heavy formatting ** For instance, the following serializes objects recursively, but does not * follow the prototype chain nor print internal properties: "%!dO". ** Notes: * * Standard snprintf return value semantics seem to vary. This * implementation returns the number of bytes it actually wrote * (excluding the null terminator). If retval == buffer size, * output was truncated (except for corner cases). *** Output format is intentionally different from EcmaScript * formatting requirements, as formatting here serves debugging * of internals. *** Depth checking (and updating) is done in each type printer * separately, to allow them to call each other

freely. *** Some pathological structures might take ages to print (e.g. * self recursion with 100 properties pointing to the object * itself). To guard against these, each printer also checks * whether the output buffer is full; if so, early exit. *** Reference loops are detected using a loop stack.

label: code-design

8900. dummy value used as marker

8901. never here, but fall through

8902. **comment:** * duk_handle_safe_call(): make a "C protected call" within the * current activation. ** The allowed thread states for making a call are the same as for * duk_handle_call_xxx(). * Error handling is similar to duk_handle_call_xxx(); errors may be thrown * (and result in a fatal error) for insane arguments.

8948. Yield/resume book-keeping.

8949. finally part will catch

8950. Quite lenient, e.g. allow empty as zero, but don't allow trailing * garbage.

8951. IEEE requires that NaNs compare false

8952. Load inner functions to value stack, but don't yet copy to buffer.

8953. [start end]

8954. **comment:** Try to make do with a stack buffer to avoid allocating a temporary buffer. * This works 99% of the time which is quite nice.

label: code-design

8955. This testcase fails when Emscripten-generated code runs on Firefox. * It's not an issue because the failure should only affect packed * duk_tval representation, which is not used with Emscripten.

8956. **comment:** XXX: keys is an internal object with all keys to be processed * in its (gapless) array part. Because nobody can touch the keys * object, we could iterate its array part directly (keeping in mind * that it can be reallocated).

label: code-design

8957. Return value is like write(), number of bytes written. * The return value matters because of code like: * "off += buf.copy(...)".

8958. Exponent without digits (e.g. "1e" or "1e+"). If trailing garbage is * allowed, ignore exponent part as garbage (= parse as "1", i.e. exp 0).

8959. DUK_TOK_THROW

8960. **comment:** Note: not a typo, "object" is returned for a null value

label: documentation

8961. atom_char_length, atom_start_offset, atom_start_offset reflect the * atom matched on the previous loop. If a quantifier is encountered * on this loop, these are needed to handle the quantifier correctly. * new_atom_char_length etc are for the atom parsed on this round; * they're written to atom_char_length etc at the end of the round.

8962. Original idiom used, minimal code size.

8963. **comment:** 'fun' is quite rarely used, so no local for it

label: code-design

8964. **comment:** XXX: fastint

label: code-design

8965. Note: in integer arithmetic, (x / 4) is same as floor(x / 4) for non-negative * values, but is incorrect for negative ones.

8966. normal

8967. Careful with wrapping (left shifting idx would be unsafe).

8968. **comment:** XXX: for negative input offsets, 'offset' will be a large * positive value so the result here is confusing.
label: code-design

8969. no overflow

8970. "+11:22:0"

8971. borrowed: function being executed; for bound function calls, this is the final, real function, NULL for lightfuncs

8972. **comment:** * Augment error (throw time), unless alloc/double error
label: code-design

8973. -> [... ToObject(this) ToUint32(length) arg[i]]

8974. The specification has quite awkward order of coercion and * checks for toPrecision(). The operations below are a bit * reordered, within constraints of observable side effects.

8975. caller

8976. match followed by capture(s)

8977. return input buffer, converted to a Duktape.Buffer object * if called as a constructor (no change if called as a * function).

8978. We could use a switch-case for the class number but it turns out * a small if-else ladder on class masks is better. The if-ladder * should be in order of relevancy.

8979. * New length is smaller than old length, need to delete properties above * the new length. * * If array part exists, this is straightforward: array entries cannot * be non-configurable so this is guaranteed to work. * * If array part does not exist, array-indexed values are scattered * in the entry part, and some may not be configurable (preventing length * from becoming lower than their index + 1). To handle the algorithm * in E5 Section 15.4.5.1, step 1 correctly, we scan the entire property * set twice.

8980. 'ptr' is evaluated both as LHS and RHS.

8981. * EcmaScript [[Class]]

8982. **comment:** Quick reject of too large or too small exponents. This check * would be incorrect for zero (e.g. "0e1000" is zero, not Infinity) * so zero check must be above.
label: code-design

8983. finalize_list will always be processed completely

8984. **comment:** XXX: exposed duk_debug_read_pointer
label: code-design

8985. -> [... key val replacer holder]

8986. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside bufferobject length.

8987. open scope information, for compiled functions only

8988. Handle empty separator case: it will always match, and always * triggers the check in step 13.c.iii initially. Note that we * must skip to either end of string or start of first codepoint, * skipping over any continuation bytes! * * Don't allow an empty string to match at the end of the input.

8989. temp reg handling

8990. * Parse function body

8991. x <- y - z

8992. 'Pointer'

8993. relookup if changed

8994. **comment:** * Augment an error at creation time with _Tracedata/fileName/lineNumber * and allow a user error handler (if defined) to process/replace the error. * The error to be augmented is at the stack top. * * thr: thread containing the error value * thr_callstack: thread which should be used for generating callstack etc. * c_filename: C __FILE__ related to the error * c_line: C __LINE__ related to the error * noblame_fileline: if true, don't fileName/line as error source, otherwise use traceback * (needed because user code filename/line are reported but internal ones * are not) * * XXX: rename noblame_fileline to flags field; combine it to some existing * field (there are only a few call sites so this may not be worth it).
label: code-design

8995. throw_flag

8996. * Else, must be one of: * - ExpressionStatement, possibly a directive (String) * - LabelledStatement (Identifier followed by ':') * * Expressions beginning with 'function' keyword are covered by a case * above (such expressions are not allowed in standard E5 anyway). * Also expressions starting with '{' are interpreted as block * statements. See E5 Section 12.4. * * Directive detection is tricky; see E5 Section 14.1 on directive * prologue. A directive is an expression statement with a single * string literal and an explicit or automatic semicolon. Escape * characters are significant and no parens etc are allowed: * * 'use strict'; // valid 'use strict' directive * 'use\u0020strict'; // valid directive, not a 'use strict' directive * ('use strict'); // not a valid directive * * The expression is determined to consist of a single string literal * based on duk_expr_nud() and duk_expr_led() call counts. The string literal * of a 'use strict' directive is determined to lack any escapes based * num_escapes count from the lexer. Note that other directives may be * allowed to contain escapes, so a directive with escapes does not * terminate a directive prologue. * * We rely on the fact that the expression parser will not emit any * code for a single token expression. However, it will generate an * intermediate value which we will then successfully ignore. * * A similar approach is used for labels.

8997. The act->prev_caller should only be set if the entry for 'caller' * exists (as it is only set in that case, and the property is not * configurable), but handle all the cases anyway.

8998. break/continue without label

8999. **comment:** XXX: the best typing needs to be validated by perf measurement: * e.g. using a small type which is the cast to a larger duk_idx_t * may be slower than declaring the variable as a duk_idx_t in the * first place.
label: code-design

9000. **comment:** XXX: conversion errors should not propagate outwards. * Perhaps values need to be coerced individually?
label: code-design

9001. XXX: here we need to know if 'left' is left-hand-side compatible. * That information is no longer available from current expr parsing * state; it would need to be carried into the 'left' ivalue or by * some other means.

9002. non-global regexp: lastIndex never updated on match

9003. Note: undefined from Section 11.8.5 always results in false * return (see e.g. Section 11.8.3) - hence special treatment here.

9004. If there's no catch block, rc_varname will be 0 and duk_patch_tryCatch() * will replace the LDCONST with a NOP. For any actual constant (including * constant 0) the DUK__CONST_MARKER flag will be set in rc_varname.

9005. exposed because lexer needs these too

9006. empty match (may happen with empty separator) -> bump and continue

9007. As with all inspection code, we rely on the debug client providing * a valid, non-stale pointer: there's no portable way to safely * validate the pointer here.

9008. Set up curr_pc for opcode dispatch.

9009. [... pattern flags escaped_source]

9010. **comment:** The 'magic' field allows an opaque 16-bit field to be accessed by the * Duktape/C function. This allows, for instance, the same native function * to be used for a set of very similar functions, with the 'magic' field * providing the necessary non-argument flags / values to guide the behavior * of the native function. The value is signed on purpose: it is easier to * convert a signed value to unsigned (simply AND with 0xffff) than vice * versa. * * Note: cannot place nargs/magic into the heaphdr flags, because * duk_hobject takes almost all flags already (and needs the spare).
label: code-design

9011. Get minimum entry part growth for a certain size.

9012. valstack index of start of args (arg1) (relative to entry valstack_bottom)

9013. [ToObject(this) item1 ... itemN arr item(i) item(i)[j]]

9014. thr->heap->lj.value2 is 'thread', will be wiped out at the end

9015. break/continue with label (label cannot be a reserved word, production is 'Identifier'

9016. property access

9017. Coerce all finite parts with ToInteger(). ToInteger() must not * be called for NaN/Infinity because it will convert e.g. NaN to * zero. If ToInteger() has already been called, this has no side * effects and is idempotent. * * Don't read dparts[DUK_DATE_IDX_WEEKDAY]; it will cause Valgrind * issues if the value is uninitialized.

9018. internal property functions

9019. Report thrown value to client coerced to string
9020. **comment:** ArrayBuffer argument is handled specially above; the rest of the * argument variants are handled by shared code below.
 label: code-design
9021. DUK_USE_USER_INITJS
9022. Range limited to [0, 0x7fffffff] range, i.e. range that can be * represented with duk_int32_t. Use this when the method doesn't * handle the full 32-bit unsigned range correctly.
9023. 110x xxxx 10xx xxxx
9024. Sanity limits for stack sizes.
9025. **comment:** Linear scan: more likely because most objects are small. * This is an important fast path. ** XXX: this might be worth inlining for property lookups.
 label: code-design
9026. XXX: will need a force flag if garbage collection is triggered * explicitly during paused state.
9027. Array length is larger than 'asize'. This shouldn't * happen in practice. Bail out just in case.
9028. No net refcount change.
9029. * Assert context is valid: non-NULL pointer, fields look sane. ** This is used by public API call entrypoints to catch invalid 'ctx' pointers * as early as possible; invalid 'ctx' pointers cause very odd and difficult to * diagnose behavior so it's worth checking even when the check is not 100%.
9030. * Setup value stack: clamp to 'nargs', fill up to 'nregs'
9031. This should not happen because DUK_TAG_OBJECT case checks * for this already, but check just in case.
9032. result array is already at the top of stack
9033. args go here as a comma expression in parens
9034. [...] source? filename? &comp_args] (depends on flags)
9035. no extra padding
9036. Start position (inclusive) and end position (exclusive)
9037. tentative, checked later
9038. slot A is a source (default: target)
9039. indexed by recursion_depth
9040. * Fixed buffer helper useful for debugging, requires no allocation * which is critical for debugging.
9041. Order of unwinding is important
9042. * Final sigma context specific rule. This is a rather tricky * rule and this handling is probably not 100% correct now. * The rule is not locale/language specific so it is supported.
9043. tracks maximum initialized index + 1
9044. **comment:** first register that is a temporary (below: variables)

9117. * ISO 8601 subset parser.
9118. Internal keys are prefixed with 0xFF in the stringtable * (which makes them invalid UTF-8 on purpose).
9119. without explicit non-BMP support, assume non-BMP characters * are always accepted as identifier characters.
9120. [res]
9121. dash is already 0
9122. Object flag. There are currently 26 flag bits available. Make sure * this stays in sync with debugger object inspection code.
9123. This may only happen if built-ins are being "torn down". * This behavior is out of specification scope.
9124. Not possible because array object 'length' is present * from its creation and cannot be deleted, and is thus * caught as an existing property above.
9125. Note: strictness is not inherited from the current Duktape/C * context. Otherwise it would not be possible to compile * non-strict code inside a Duktape/C activation (which is * always strict now). See tests/api/test-eval-strictness.c * for discussion.
9126. A -> flags * B -> base register for call (base -> func, base+1 -> this, base+2 -> arg1 ... base+2+N-1 -> argN) * (for DUK_OP_CALLI, 'b' is indirect) * C -> nargs
9127. * Wrapper for jmp_buf. * * This is used because jmp_buf is an array type for backward compatibility. * Wrapping jmp_buf in a struct makes pointer references, sizeof, etc, * behave more intuitively. * * http://en.wikipedia.org/wiki/Setjmp.h#Member_types
9128. * This is a bit tricky to implement portably. The result depends * on the timestamp (specifically, DST depends on the timestamp). * If e.g. UNIX APIs are used, they'll have portability issues with * very small and very large years. * * Current approach: * * - Stay within portable UNIX limits by using equivalent year mapping. * Avoid year 1970 and 2038 as some conversions start to fail, at * least on some platforms. Avoiding 1970 means that there are * currently DST discrepancies for 1970. * * - Create a UTC and local time breakdowns from 't'. Then create * a time_t using gmtime() and localtime() and compute the time * difference between the two. * * Equivalent year mapping (E5 Section 15.9.1.8): * * If the host environment provides functionality for determining * daylight saving time, the implementation of ECMAScript is free * to map the year in question to an equivalent year (same * leap-year-ness and same starting week day for the year) for which * the host environment provides daylight saving time information. * The only restriction is that all equivalent years should produce * the same result. * * This approach is quite reasonable but not entirely correct, e.g. * the specification also states (E5 Section 15.9.1.8): * * The implementation of ECMAScript should not try to determine * whether the exact time was subject to daylight saving time, but * just whether daylight saving time would have been in effect if * the _current daylight saving time algorithm_ had been used at the * time. This avoids complications such as taking into account the * years that the locale observed daylight saving time year round. * * Since we rely on the platform APIs for conversions between local * time and UTC, we can't guarantee the above. Rather, if the platform * has historical DST rules they will be applied. This seems to be the * general preferred direction in Ecmascript standardization (or at least * implementations) anyway, and even the equivalent year mapping should * be disabled if the platform is known to handle DST properly for the * full Ecmascript range. * * The following has useful discussion and links: * * https://bugzilla.mozilla.org/show_bug.cgi?id=351066

9182. while repl

9183. Note: we don't parse back exponent notation for anything else * than radix 10, so this is not an ambiguous check (e.g. hex * exponent values may have 'e' either as a significand digit * or as an exponent separator). ** If the exponent separator occurs twice, 'e' will be interpreted * as a digit (= 14) and will be rejected as an invalid decimal * digit.

9184. Setup state. Initial ivalue is 'undefined'.

9185. 'object'

9186. If we processed any debug messages breakpoints may have * changed; restart execution to re-check active breakpoints.

9187. 1 1 1 <32 bits>

9188. **comment:** Leading / trailing whitespace is sometimes accepted and * sometimes not. After white space trimming, all valid input * characters are pure ASCII.

label: code-design

9189. patch in range count later

9190. * If tracebacks are disabled, 'fileName' and 'lineNumber' are added * as plain own properties. Since Error.prototype has accessors of * the same name, we need to define own properties directly (cannot * just use e.g. duk_put_prop_stridx). Existing properties are not * overwritten in case they already exist.

9191. 0: toString

9192. **comment:** XXX: unnecessary string coercion for array indices, * intentional to keep small.

label: code-design

9193. UTF-8 encoded bytes escaped as %xx%xx%xx... -> 3 * nbytes. * Codepoint range is restricted so this is a slightly too large * but doesn't matter.

9194. lowest mantissa for this exponent

9195. * Traceback handling when tracebacks disabled. ** The fileName / lineNumber stubs are now necessary because built-in * data will include the accessor properties in Error.prototype. If those * are removed for builds without tracebacks, these can also be removed. * 'stack' should still be present and produce a ToString() equivalent: * this is useful for user code which prints a stacktrace and expects to * see something useful. A normal stacktrace also begins with a ToString() * of the error so this makes sense.

9196. all we need to know

9197. ASSIGNMENT EXPRESSION

9198. IdentityEscape

9199. Must decrease recursion depth before returning.

9200. note: mixing len into seed improves hashing when skipping

9201. For join(), nargs is 1. For toLocaleString(), nargs is 0 and * setting the top essentially pushes an undefined to the stack, * thus defaulting to a comma separator.

9202. Return with final function pushed on stack top.

9203. Note: 'e' and 'E' are also accepted here.

9204. %c, passed concretely as int

9205. thread resumed another thread (active but not running)

9206. or a non-catching entry

9207. next char

9208. -> [... key val]

9209. add F

9210. **comment:** return a specific NaN (although not strictly necessary)

label: code-design

9214. Current size (not counting a dynamic buffer's "spare").

9215. +2 = catcher value, catcher lj_type

9216. parsing in "directive prologue", recognize directives
9217. non-strict: non-deletable, writable
9218. DUK_USE_64BIT_OPS
9219. simulate alloc failure on every realloc (except when mark-and-sweep is running)
9220. 7
9221. **comment:** alloc temp just in case, to update max temp
label: code-design
9222. * An array must have a 'length' property (E5 Section 15.4.5.2). * The special array behavior flag must only be enabled once the * length property has been added. *
* The internal property must be a number (and preferably a * fastint if fastint support is enabled).
9223. * Create a hstring and insert into the heap. The created object * is directly garbage collectable with reference count zero. * * The caller must place the interned string into the stringtable * immediately (without chance of a longjmp); otherwise the string * is lost.
9224. Note: this is correct even for default clause statements: * they participate in 'fall-through' behavior even if the * default clause is in the middle.
9225. exposed, used by e.g. duk.bi.date.c
9226. * Parsing of ints and floats
9227. flags: "gi"
9228. For TypedArrays 'undefined' return value is specified * by ES6 (matches V8).
9229. * Return target object
9230. side effects
9231. [... result]
9232. only objects have finalizers
9233. interpret e.g. '0x' and '0xg' as a NaN (= parse error)
9234. **comment:** * Get and call the finalizer. All of this must be wrapped * in a protected call, because even getting the finalizer * may trigger an error (getter may throw one, for instance).
label: code-design
9235. **comment:** * String/JSON conversions * * Human readable conversions are now basically ISO 8601 with a space * (instead of 'T') as the date/time separator. This is a good baseline * and is platform independent. * * A shared native helper to provide many conversions. Magic value contains * a set of flags. The helper provides: * * toString() * toDateString() * toTimeString() * toLocaleString() * toLocaleDateString() * toLocaleTimeString() * toUTCString() * toISOString() * * Notes: * * - Date.prototype.toGMTString() and Date.prototype.toUTCString() are * required to be the same Ecmascript function object (!), so it is * omitted from here. * * - Date.prototype.toUTCString(): E5.1 specification does not require a * specific format, but result should be human readable. The * specification suggests using ISO 8601 format with a space (instead of 'T') separator if a more human readable format is not available. * * - Date.prototype.toISOString(): unlike other conversion functions, * toISOString() requires a RangeError for invalid date values.
label: code-design
9236. * Thread support.
9237. bytecode start offset of the atom parsed in this loop * (allows quantifiers to copy the atom bytecode)
9238. temp copy, write back for next loop
9239. char loop
9240. basic platform types
9241. we currently assume virtual properties are not configurable (as none of them are)
9242. Stage 1: find highest preventing non-configurable entry (if any). * When forcing, ignore non-configurability.
9243. **comment:** XXX: keep property attributes or tweak them here? * Properties will now be non-configurable even when they're * normally configurable for the global object.
label: code-design
9244. address
9245. * Property already exists. Steps 5-6 detect whether any changes need * to be made.
9246. may be NULL
9247. * Parse Ecmascript source InputElementDiv or InputElementRegExp * (E5 Section 7), skipping whitespace, comments, and line terminators. * * Possible results are: * (1) a token * (2) a line terminator (skipped) * (3) a comment (skipped) * (4) EOF * * White space is automatically skipped from the current position (but * not after the input element). If input has already ended, returns * DUK_TOK_EOF indefinitely. If a parse error occurs, uses an DUK_ERROR() * macro call (and hence a longjmp through current heap longjmp context). * Comments and line terminator tokens are automatically skipped. * * The input element being matched is determined by regexp_mode; if set, * parses a InputElementRegExp, otherwise a InputElementDiv. The * difference between these are handling of productions starting with a * forward slash. * * If strict_mode is set, recognizes additional future reserved words * specific to strict mode, and refuses to parse octal literals. * * The matching strategy below is to (currently) use a six character * lookup window to quickly determine which production is the -longest- * matching one, and then parse that. The top-level if-else clauses * match the first character, and the code blocks for each clause * handle -all- alternatives for that first character. Ecmascript * specification uses the "longest match wins" semantics, so the order * of the if-clauses matters. * * Misc notes: * * * Ecmascript numeric literals do not accept a sign character. * Consequently e.g. "-1.0" is parsed as two tokens: a negative * sign and a positive numeric literal. The compiler performs * the negation during compilation, so this has no adverse impact. * * * There is no token for "undefined": it is just a value available * from the global object (or simply established by doing a reference * to an undefined value). * * * Some contexts want Identifier tokens, which are IdentifierNames * excluding reserved words, while some contexts want IdentifierNames * directly. In the latter case e.g. "while" is interpreted as an * identifier name, not a DUK_TOK WHILE token. The solution here is * to provide both token types: DUK_TOK WHILE goes to 't' while * DUK_TOK_IDENTIFIER goes to 't_noes', and 'slot1' always contains * the identifier / keyword name. * * * Directive prologue needs to identify string literals such as * "use strict" and 'use strict', which are sensitive to line * continuations and escape sequences. For instance, "use\0020strict" * is a valid directive but is distinct from "use strict". The solution * here is to decode escapes while tokenizing, but to keep track of the * number of escapes. Directive detection can then check that the * number of escapes is zero. * * * Multi-line comments with one or more internal LineTerminator are * treated like a line terminator to comply with automatic semicolon * insertion.
9248. IEEE double is approximately 16 decimal digits; print a couple extra
9249. * Resizing and hash behavior
9250. String sanitizer which escapes ASCII control characters and a few other * ASCII characters, passes Unicode as is, and replaces invalid UTF-8 with * question marks. No errors are thrown for any input string, except in out * of memory situations.
9251. **comment:** Try to optimize X <op>= Y for reg-bound * variables. Detect side-effect free RHS * narrowly by seeing whether it emits code. * If not, rewind the code emitter and overwrite * the unnecessary temp reg load.

9451. a label site has been emitted by duk_parse_stmt() automatically * (it will also emit the ENDLABEL).

9452. * Variable access

9453. **comment:** function: function must not be tail called
label: code-design

9454. third arg: absolute index (to entire valstack) of idx_bottom of new activation

9455. **comment:** * HASPROP variant used internally. * * This primitive must never throw an error, callers rely on this. * In particular, don't throw an error for prototype loops; instead, * pretend like the property doesn't exist if a prototype sanity limit * is reached. * * Does not implement proxy behavior: if applied to a proxy object, * returns key existence on the proxy object itself.
label: code-design

9456. 'out_buf' must be at least DUK_BI_DATE_ISO8601_BUFSIZE long.

9457. !DUK_USE_HSTRING_CLEN

9458. DUK_ERR_EVAL: no macros needed

9459. DUK_USE_PREFER_SIZE

9460. Inref copies, keep originals.

9461. object is a buffer object (duk_hbufferobject) (always exotic)

9462. recheck that the property still exists

9463. jump from true part to end

9464. **comment:** XXX: fastint fast path would be very useful here
label: code-design

9465. XXX: happens e.g. when evaluating: String(Buffer.prototype).

9466. 'name'

9467. eat identifier

9468. * Init stringtable: fixed variant
9469. Copy values through direct validated reads and writes.
9470. break matches always
9471. * "length" maps to number of formals (E5 Section 13.2) for function * declarations/expressions (non-bound functions). Note that 'nargs' * is NOT necessarily equal to the number of arguments.
9472. -1 for opcode
9473. * Regexp instance check, bytecode check, input coercion. ** See E5 Section 15.10.6.
9474. **comment:** hash part size or 0 if unused
label: code-design
9475. **comment:** XXX: this duplicates functionality in duk_regex.c where a similar loop is * required anyway. We could use that BUT we need to update the regexp compiler * 'nranges' too. Work this out a bit more cleanly to save space.
label: code-design
9476. helper to insert a (non-string) heap object into heap allocated list
9477. * Internal API calls which have (stack and other) semantics similar * to the public API.
9478. retval is directly usable
9479. **comment:** * Error throwing helpers ** The goal is to provide verbose and configurable error messages. Call * sites should be clean in source code and compile to a small footprint. * Small footprint is also useful for performance because small cold paths * reduce code cache pressure. Adding macros here only makes sense if there * are enough call sites to get concrete benefits.
label: code-design
9480. digit count
9481. * Hobject property set/get functionality. ** This is very central functionality for size, performance, and compliance. * It is also rather intricate; see hobject-algorithms.rst for discussion on * the algorithms and memory-management.rst for discussion on refcounts and * side effect issues. ** Notes: ** - It might be tempting to assert "refcount nonzero" for objects * being operated on, but that's not always correct: objects with * a zero refcount may be operated on by the refcount implementation * (finalization) for instance. Hence, no refcount assertions are made. ** - Many operations (memory allocation, identifier operations, etc) * may cause arbitrary side effects (e.g. through GC and finalization). * These side effects may invalidate duk_tval pointers which point to * areas subject to reallocation (like value stack). Heap objects * themselves have stable pointers. Holding heap object pointers or * duk_tval copies is not problematic with respect to side effects; * care must be taken when holding and using argument duk_tval pointers. ** - If a finalizer is executed, it may operate on the same object * we're currently dealing with. For instance, the finalizer might * delete a certain property which has already been looked up and * confirmed to exist. Ideally finalizers would be disabled if GC * happens during property access. At the moment property table realloc * disables finalizers, and all DECREFs may cause arbitrary changes so * handle DECREF carefully. ** - The order of operations for a DECREF matters. When DECREF is executed, * the entire object graph must be consistent; note that a refzero may * lead to a mark-and-sweep through a refcount finalizer.
9482. **comment:** * Compact the closure, in most cases no properties will be added later. * Also, without this the closures end up having unused property slots * (e.g. in Duktape 0.9.0, 8 slots would be allocated and only 7 used). * A better future solution would be to allocate the closure directly * to correct size (and setup the properties directly without going * through the API).
label: code-design
9483. $2^3 \rightarrow 1/8 = 12.5\%$ min growth
9484. * Reference count updates ** Note: careful manipulation of refcounts. The top is * not updated yet, so all the activations are reachable * for mark-and-sweep (which may be triggered by decref). * However, the pointers are NULL so this is not an issue.
9485. 'hex'
9486. borrowed label name
9487. * String table algorithm: closed hashing with a probe sequence ** This is the default algorithm and works fine for environments with * minimal memory constraints.
9488. Longjmp state is kept clean in success path
9489. Longjmp callers are required to sync-and-null thr->ptr_curr_pc * before longjmp.
9490. Return invalid index; if caller uses this without checking * in another API call, the index won't map to a valid stack * entry.
9491. **comment:** XXX: faster internal way to get this
label: code-design
9492. old value is number: no refcount
9493. Using classification has smaller footprint than direct comparison.
9494. DUK_USE_ROM_GLOBAL_CLONE || DUK_USE_ROM_GLOBAL_INHERIT
9495. leading byte of match string
9496. **comment:** * Formal argument list ** We don't check for prohibited names or for duplicate argument * names here, because we don't yet know whether the function will * be strict. Function body parsing handles this retroactively.
label: code-design
9497. canonicalized by compiler
9498. [source template closure this]
9499. initial index
9500. 5 heap flags
9501. DUK_TOK_FUNCTION
9502. exponent for 'f'
9503. * Duktape includes (other than duk_features.h) ** The header files expect to be included in an order which satisfies header * dependencies correctly (the headers themselves don't include any other * includes). Forward declarations are used to break circular struct/typedef * dependencies.
9504. always 1 arg
9505. helpers
9506. ignore result
9507. DUK_JMPBUF_H_INCLUDED
9508. 'static'
9509. * sort() ** Currently qsort with random pivot. This is now really, really slow, * because there is no fast path for array parts. ** Signed indices are used because qsort() leaves and degenerate cases * may use a negative offset.
9510. extended types: compatible encoding
9511. **comment:** not allowed in strict mode, regardless of whether resolves; * in non-strict mode DELVAR handles both non-resolving and * resolving cases (the specification description is a bit confusing).
label: code-design
9512. valstack limit caller has check, prevents wrapping
9513. Note that byte order doesn't affect this test: all bytes in * 'test' will be 0xFF for two's complement.
9514. Note: number has no explicit tag (in 8-byte representation)
9515. * Calendar helpers ** Some helpers are used for getters and can operate on normalized values * which can be represented with 32-bit signed integers. Other helpers are * needed by setters and operate on un-normalized double values, must watch * out for non-finite numbers etc.
9516. Unlike year, the other parts fit into 16 bits so %d format * is portable.
9517. reg/const for case value
9518. Equivalent year mapping, used to avoid DST trouble when platform * may fail to provide reasonable DST answers for dates outside the * ordinary range (e.g. 1970-2038). An equivalent year has the same * leap-year-ness as the original year and begins on the same weekday * (Jan 1). ** The year 2038 is avoided because there seem to be problems with it * on some platforms. The year 1970 is also avoided as there were * practical problems with it; an equivalent year is used for it too, * which breaks some DST computations for 1970 right now, see e.g. * test-bi-date-tzoffset-brute-fi.js.
9519. signed integer encoding needed to work with UTF-8
9520. Here val would be potentially invalid if we didn't make * a value copy at the caller.
9521. '&'
9522. jump is inserted here (variant 3)

9523. * Closing environment records. ** The environment record MUST be closed with the thread where its activation * is. In other words (if 'env' is open): ** - 'thr' must match _env.thread * - 'func' must match _env.callee * - 'regbase' must match _env.regbase ** These are not looked up from the env to minimize code size. *
* XXX: should access the own properties directly instead of using the API

9524. resume: [... initial_func undefined(= this) resume_value]

9525. ignore reclimit, not constructor

9526. '\xffCallee'

9527. is normalized

9528. Variant for writing duk_tvals so that any heap allocated values are * written out as tagged heap pointers.

9529. Coerce like boolean

9530. mark-and-sweep marking reached a recursion limit and must use multi-pass marking

9531. [(builtin objects)]

9532. **comment:** XXX: tv_func is not actually needed
label: requirement

9533. * Source filename (or equivalent), for identifying thrown errors.

9534. '_proto_'

9535. **comment:** XXX: this is probably a useful shared helper: for a * duk_hbufferobject, get a validated buffer pointer/length.
label: code-design

9536. parent env is the prototype

9537. get varenv for varname (callee's declarative lexical environment)

9538. Use a new environment and there's an 'arguments' object. * We need to initialize it right now.

9539. The timevalue must be in valid Ecmascript range, but since a local * time offset can be applied, we need to allow a +/- 24h leeway to * the value. In other words, although the UTC time is within the * Ecmascript range, the local part values can be just outside of it.

9540. Note: can be safely scanned as bytes (undecoded)

9541. =====

9542. No activation matches, use undefined for both .fileName and * .lineNumber (matches what we do with a _Tracedata based * no-match lookup).

9543. also goes into flags

9544. UnaryExpression

9545. **comment:** XXX: return something more useful, so that caller can throw?
label: code-design

9546. Tailcalls are handled by back-patching the TAILCALL flag to the * already emitted instruction later (in return statement parser). * Since A and C have a special meaning here, they cannot be "shuffled".

9547. all virtual properties are non-configurable and non-writable

9548. [obj trap_result res_arr]

9549. **comment:** * The string conversion here incorporates all the necessary Ecmascript * semantics without attempting to be generic. nc_ctx->digits contains * nc_ctx->count digits (>= 1), with the topmost digit's 'position' * indicated by nc_ctx->k as follows: ** digits="123" count=3 k=0 --> 0.123 * digits="123" count=3 k=1 --> 1.23 * digits="123" count=3 k=5 --> 12300 * digits="123" count=3 k=-1 --> 0.0123 ** Note that the identifier names used for format selection are different * in Burger-Dybvig paper and Ecmascript specification (quite confusingly * so, because e.g. 'k' has a totally different meaning in each). See * documentation for discussion. ** Ecmascript doesn't specify any specific behavior for format selection * (e.g. when to use exponent notation) for non-base-10 numbers. ** The bigint space in the context is reused for string output, as there * is more than enough space for that (>1kB at the moment), and we avoid * allocating even more stack.
label: code-design

9550. depth check is done when printing an actual type

9551. Preinc/predic for object properties.

9552. * duk_re_range_callback for generating character class ranges. ** When ignoreCase is false, the range is simply emitted as is. * We don't, for instance, eliminate duplicates or overlapping * ranges in a character class. ** When ignoreCase is true, the range needs to be normalized through * canonicalization. Unfortunately a canonicalized version of a * continuous range is not necessarily continuous (e.g. [x-{}] is * continuous but [X-{}] is not). The current algorithm creates the * canonicalized range(s) space efficiently at the cost of compile * time execution time (see doc/regexp.rst for discussion). ** Note that the ctx->nranges is a context-wide temporary value * (this is OK because there cannot be multiple character classes * being parsed simultaneously).

9553. init function state: init valstack allocations

9554. **comment:** Currently about 7*152 = 1064 bytes. The space for these * duk_bignums is used also as a temporary buffer for generating * the final string. This is a bit awkward; a union would be * more correct.
label: code-design

9555. Check statement type based on the first token type. ** Note: expression parsing helpers expect 'curr_tok' to * contain the first token of the expression upon entry.

9556. **comment:** * The 'in' operator requires an object as its right hand side, * throwing a TypeError unconditionally if this is not the case. ** However, lightfuncs need to behave like fully fledged objects * here to be maximally transparent, so we need to handle them * here.
label: code-design

9557. * Number-to-string conversion. The semantics of these is very tightly * bound with the Ecmascript semantics required for call sites.

9558. **comment:** SCANBUILD: with suitable dmin/dmax limits 'd' is unused
label: code-design

9559. 0xff => 255 - 256 = -1; 0x80 => 128 - 256 = -128

9560. DUK_USE_PARANOI_ERROR

9561. Does not assume that jump_pc contains a DUK_OP_JUMP previously; this is intentional * to allow e.g. an INVALID opcode be overwritten with a JUMP (label management uses this).

9562. A 32-bit unsigned integer formats to at most 32 digits (the * worst case happens with radix == 2). Output the digits backwards, * and use a memmove() to get them in the right place.

9563. Without ROM objects "needs refcount update" == is heap allocated.

9564. **comment:** Note: 'act' is dangerous here because it may get invalidated at many * points, so we re-lookup it multiple times.
label: code-design

9565. **comment:** XXX: Add a flag to reject an attempt to re-attach? Otherwise * the detached callback may immediately reattach.
label: code-design

9566. side effects -> don't use tv_x, tv_y after

9567. [... enum]

9568. if gap is empty, behave as if not given at all

9569. When JX/JC not in use, the type mask above will avoid this case if needed.

9570. DUK_TOK_LT

9571. no value

9572. * HASVAR: check identifier binding from a given environment record * without traversing its parents. ** This primitive is not exposed to user code as such, but is used * internally for e.g. declaration binding instantiation. ** See E5 Sections: * 10.2.1.1 HasBinding(N) * 10.2.1.2.1 HasBinding(N) ** Note: strictness has no bearing on this check. Hence we don't take * a 'strict' parameter.

9573. hash probe sequence

9574. * Make the C call

9575. DUK_USE_NONSTD_FUNC_STMT

9576. has access to 'this' binding

9577. **comment:** Create a temporary enumerator to get the (non-duplicated) key list; * the enumerator state is initialized without being needed, but that * has little impact.
label: code-design

9578. **comment:** XXX: optimize for string inputs: no need to coerce to a buffer * which makes a copy of the input.
label: code-design

9579. initial size guess
9580. Buffer writes are often integers.
9581. env[funcname] = closure
9582. Safe to call multiple times.
9583. Default variants. Selection depends on speed/size preference. * Concretely: with gcc 4.8.1 -Os x64 the difference in final binary * is about +1kB for _FAST variants.
9584. formatted result limited
9585. [] -> [res]
9586. may be NaN
9587. 'undefined', artifact of lookup
9588. assume array part is comprehensive (contains all array indexed elements * or none of them); hence no need to check the entries part here.
9589. lJ value1: value
9590. pushes function template
9591. Identifier, i.e. don't allow reserved words
9592. **comment:** Parse an inner function, adding the function template to the current function's * function table. Return a function number to be used by the outer function. * * Avoiding O(depth^2) inner function parsing is handled here. On the first pass, * compile and register the function normally into the 'funcs' array, also recording * a lexer point (offset/line) to the closing brace of the function. On the second * pass, skip the function and return the same 'fnum' as on the first pass by using * a running counter. * * An unfortunate side effect of this is that when parsing the inner function, almost * nothing is known of the outer function, i.e. the inner function's scope. We don't * need that information at the moment, but it would allow some optimizations if it * were used.
label: code-design
9593. [arg toLogString]
9594. out_token->lineterm set by caller
9595. note: any entries above the catchstack top are garbage and not zeroed
9596. Error code also packs a tracedata related flag.
9597. enumerator must have no keys deleted
9598. Stack size increases or stays the same.
9599. known to be number; in fact an integer
9600. avail_bytes += need_bytes
9601. **comment:** XXX: this illustrates that a C catchpoint implemented using duk_safe_call() * is a bit heavy at the moment. The wrapper compiles to ~180 bytes on x64. * Alternatives would be nice.
label: code-design
9602. temp variable to pass constants and flags to shared code
9603. char length of the atom parsed in this loop
9604. -> [... fn x y]
9605. **comment:** ToBoolean() does not require any operations with side effects so * we can do it efficiently. For footprint it would be better to use * duk_js_tobool()and then push+replace to the result slot.
label: code-design
9606. -> [...]
9607. topmost activation idx_retval is considered garbage, no need to init
9608. * Delayed activation environment record initialization (for functions * with NEWENV). * * The non-delayed initialization is handled by duk_handle_call().
9609. ref.value, ref.this.binding invalidated here by getprop call
9610. * Field accessor macros
9611. [... buf]
9612. idx_base and idx_base+1 get completion value and type
9613. integer number in range
9614. **comment:** XXX: duk_xdef_prop_index_wec() would be more appropriate * here but it currently makes some assumptions that might * not hold (e.g. that previous property is not an accessor). * * Using duk_put_prop() works incorrectly with '__proto__' * if the own property with that name has been deleted. This * does not happen normally, but a clever reviver can trigger * that, see complex reviver case in: test-bug-json-parse-__proto__.js.
label: code-design
9615. Force interrupt right away if we're paused or in "checked mode". * Step out is handled by callstack unwind.
9616. check stack before interning (avoid hanging temp)
9617. The extra (+4) is tight.
9618. Send version identification and flush right afterwards. Note that * we must write raw, unframed bytes here.
9619. DUK_TOK_STATIC
9620. No pointer compression because pointer is potentially outside of * Duktape heap.
9621. 'null'
9622. pc2line
9623. always normalized
9624. JUMP L1 omitted
9625. **comment:** writable, not configurable
label: code-design
9626. * Init/assert flags, copying them where appropriate. Some flags * (like NEWENV) are processed separately below.
9627. big endian
9628. entry_top + 3
9629. must match bytecode defines now; build autogenerate?
9630. Although NAMEBINDING is not directly needed for using * function instances, it's needed by bytecode dump/load * so copy it too.
9631. ''
9632. * Automatically generated by genbuiltins.py, do not edit!
9633. * Debug connection read primitives
9634. Note: when parsing a formal list in non-strict context, e.g. * "implements" is parsed as an identifier. When the function is * later detected to be strict, the argument list must be rechecked * against a larger set of reserved words (that of strict mode). * This is handled by duk_parse_func_body(). Here we recognize * whatever tokens are considered reserved in current strictness * (which is not always enough).
9635. **comment:** XXX: optimize with more direct internal access
label: code-design
9636. __proto__ setter returns 'undefined' on success unlike the * setPrototypeOf() call which returns the target object.
9637. 0x00-0x0f
9638. * String comparison (E5 Section 11.8.5, step 4), which * needs to compare codepoint by codepoint. * * However, UTF-8 allows us to use strcmp directly: the shared * prefix will be encoded identically (UTF-8 has unique encoding) * and the first differing character can be compared with a simple * unsigned byte comparison (which strcmp does). * * This will not work properly for non-xutf-8 strings, but this * is not an issue for compliance.
9639. DUK_TOK_BOR_EQ
9640. Argument must be a string, e.g. a buffer is not allowed.
9641. Note: val is a stable duk_tval pointer. The caller makes * a value copy into its stack frame, so 'tv_val' is not subject * to side effects here.
9642. number of formal arguments
9643. register, constant, or value
9644. Note: intentionally allow leading zeroes here, as the * actual parser will check for them.
9645. Impose a maximum buffer length for now. Restricted artificially to * ensure resize computations or adding a heap header length won't * overflow size_t and that a signed duk_int_t can hold a buffer * length. The limit should be synchronized with DUK_HSTRING_MAX_BYTELEN.
9646. h_code: held in bw_code

9647. * Forward declarations.
9648. heap pointer comparison suffices
9649. Note: 'count' is currently not adjusted by rounding (i.e. the * digits are not "chopped off". That shouldn't matter because * the digit position (absolute or relative) is passed on to the * convert-and-push function.
9650. **comment:** The variable environment for magic variable bindings needs to be * given by the caller and recorded in the arguments object. * * See E5 Section 10.6, the creation of setters/getters. * * The variable environment also provides access to the callee, so * an explicit (internal) callee property is not needed.
label: code-design
9651. All components default to 0 except day-of-month which defaults * to 1. However, because our internal day-of-month is zero-based, * it also defaults to zero here.
9652. Backtrack.
9653. **comment:** XXX: code duplication
label: code-design
9654. arg count
9655. **comment:** Switch to caller's setjmp() catcher so that if an error occurs * during error handling, it is always propagated outwards instead * of causing an infinite loop in our own handler.
label: code-design
9656. [... number] -> [... string]
9657. 'data' (and everything in it) is reachable through h_res now
9658. Fast path.
9659. called as a normal function: return new Date().toString()
9660. -----XX
9661. must be computed after realloc
9662. 'join'
9663. Get the value represented by an duk_ispec to a register or constant. * The caller can control the result by indicating whether or not: * * (1) a constant is allowed (sometimes the caller needs the result to * be in a register) * * (2) a temporary register is required (usually when caller requires * the register to be safely mutable; normally either a bound * register or a temporary register are both OK) * * (3) a forced register target needs to be used * * Bytecode may be emitted to generate the necessary value. The return * value is either a register or a constant.
9664. **comment:** XXX: FP_ZERO check can be removed, the else clause handles it * correctly (preserving sign).
label: code-design
9665. **comment:** XXX: the string shouldn't appear twice, but we now loop to the * end anyway; if fixed, add a looping assertion to ensure there * is no duplicate.
label: code-design
9666. re-lookup first char on first loop
9667. [... buf loop (proplist)]
9668. DUK_BUFOBJ_INT16ARRAY
9669. No net refcount changes.
9670. DUK_USE_DATE_FMT_STRFTIME
9671. eat the right paren
9672. **comment:** A straightforward 64-byte lookup would be faster * and cleaner, but this is shorter.
label: code-design
9673. For this to work, DATEMSK must be set, so this is not very * convenient for an embeddable interpreter.
9674. Fixed buffer; data follows struct, with proper alignment guaranteed by * struct size.
9675. **comment:** * Call handling. * * Main functions are: * * - duk_handle_call_unprotected(): unprotected call to Ecmascript or * Duktape/C function * - duk_handle_call_protected(): protected call to Ecmascript or * Duktape/C function * - duk_handle_safe_call(): make a protected C call within current * activation * - duk_handle_ecma_call_setup(): Ecmascript-to-Ecmascript calls * (not always possible), including tail calls and coroutine resume * * See 'execution.rst'. * * Note: setjmp() and local variables have a nasty interaction, * see execution.rst; non-volatile locals modified after setjmp() * call are not guaranteed to keep their value.
label: code-design
9676. -1 if disjunction is complex, char length if simple
9677. noblame_fileline
9678. Backtrack to previous slash or start of buffer.
9679. func limits
9680. This is a rare property helper; it sets the global thrower (E5 Section 13.2.3) * setter/getter into an object property. This is needed by the 'arguments' * object creation code, function instance creation code, and Function.prototype.bind().
9681. For anything other than an Error instance, we calculate the error * location directly from the current activation.
9682. **comment:** Workaround for some exotic platforms where NAN is missing * and the expression (0.0 / 0.0) does NOT result in a NaN. * Such platforms use the global 'duk_computed_nan' which must * be initialized at runtime. Use 'volatile' to ensure that * the compiler will actually do the computation and not try * to do constant folding which might result in the original * problem.
label: code-design
9683. A -> target register (A, A+1) for call setup * (for DUK_OP_CSREGI, 'a' is indirect) * B -> register containing target function (not type checked here)
9684. Return the Buffer to allow chaining: b.fill(0x11).fill(0x22, 3, 5).toString()
9685. **comment:** code_idx: not needed
label: requirement
9686. keep func->h_funcs; inner functions are not reparsed to avoid O(depth^2) parsing
9687. load factor min 25%
9688. 1111 0xxx 10xx xxxx 10xx xxxx 10xx xxxx
9689. Note: peek cannot currently trigger a detach * so the dbg_detaching == 0 assert outside the * loop is correct.
9690. Assume interrupt init/counter are properly initialized here.
9691. * Parse a case or default clause.
9692. **comment:** XXX: when this error is caused by a nonexistent * file given to duk_peval_file() or similar, the * error message is not the best possible.
label: code-design
9693. impose a reasonable exponent limit, so that exp * doesn't need to get tracked using a bigint.
9694. marker value; in E5 2^32-1 is not a valid array index (2^32-2 is highest valid)
9695. maxval
9696. valstack space allocated especially for proxy lookup which does a * recursive property lookup
9697. Accept ASCII strings which conform to identifier requirements * as being emitted without key quotes. Since we only accept ASCII * there's no need for actual decoding: 'p' is intentionally signed * so that bytes >= 0x80 extend to negative values and are rejected * as invalid identifier codepoints.
9698. The Str(key, holder) operation. * * Stack policy: [... key] -> [...]
9699. * Bitstream encoder
9700. -> [sep ToObject(this) len str sep]
9701. Decrement PC if that was requested, this requires a PC sync.
9702. Array properties have exotic behavior but they are concrete, * so no special handling here. * * Arguments exotic behavior (E5 Section 10.6, [[GetOwnProperty]]) * is only relevant as a post-check implemented below; hence no * check here.
9703. XXX: request a "last statement is terminal" from duk_parse_stmt() and duk_parse_stmts(); * we could avoid the last RETURN if we could ensure there is no way to get here * (directly or via a jump)
9704. [... key_obj key key flags]
9705. no side effects
9706. INACTIVE: no activation, single function value on valstack
9707. Equality may be OK but >length not. Checking * this explicitly avoids some overflow cases * below.
9708. this cannot initiate a detach

9709. done so that duk__mark_heaphdr() works correctly
9710. if highest bit of a register number is set, it refers to a constant instead
9711. **comment:** Slow variants, call to a helper to reduce code size. * Can be used explicitly when size is always more important than speed.
 label: code-design

9825. accept anything, expect first value (EOF will be * caught by key parsing below.
9826. unknown, ignore
9827. * Note: fmax() does not match the E5 semantics. E5 requires * that if -any- input to Math.max() is a NaN, the result is a * NaN. fmax() will return a NaN only if - both- inputs are NaN. * Same applies to fmin(). * * Note: every input value must be coerced with ToNumber(), even * if we know the result will be a NaN anyway: ToNumber() may have * side effects for which even order of evaluation matters.
9828. [... v1 v2 name filename]
9829. !DUK_USE_PANIC_HANDLER
9830. **comment:** XXX: inlined DECREF macro would be nice here: no NULL check, * refzero queueing but no refzero algorithm run (= no pointer * instability), inline code.
label: code-design
9831. expected ival
9832. **comment:** A 16-bit listlen makes sense with 16-bit heap pointers: there * won't be space for 64k strings anyway.
label: code-design
9833. * Finalize refcounts for heap elements just about to be freed. * This must be done for all objects before freeing to avoid any * stale pointer dereferences. * * Note that this must deduce the set of objects to be freed * identically to duk_sweep_heap().
9834. no sce, or sce scan not best
9835. caller must have decref'd values above new_a_size (if that is necessary)

9836. [... buf loop (proplist) (gap)]

9837. **comment:** XXX: duk_hobject_hasprop() would be correct for * non-Proxy objects too, but it is about ~20-25% * slower at present so separate code paths for * Proxy and non-Proxy now.
label: code-design

9838. Coercion may be needed, the helper handles that by pushing the * tagged values to the stack.

9839. checked by caller

9840. 'Int16Array'

9841. res->strs16[] is zeroed and zero decodes to NULL, so no NULL inits.

9842. entry part must not contain any configurable properties, or * writable properties (if is_frozen).

9843. thread; minimizes argument passing

9844. step 4.d

9845. **comment:** * The Number constructor uses ToNumber(arg) for number coercion * (coercing an undefined argument to NaN). However, if the * argument is not given at all, +0 must be used instead. To do * this, a vararg function is used.
label: code-design

9846. one operator (= assign)

9847. no need to init reg, it will be undefined on entry

9848. string objects must not created without internal value

9849. eat backslash on entry

9850. * Cached module check. * * If module has been loaded or its loading has already begun without * finishing, return the same cached value ('exports'). The value is * registered when module load starts so that circular references can * be supported to some extent.

9851. * Setup a preliminary activation and figure out nargs/nregs. * * Don't touch valstack_bottom or valstack_top yet so that Duktape API * calls work normally.

9852. **comment:** XXX: Rework to use an always-inline function?
label: code-design

9853. **comment:** * Common heap header * * All heap objects share the same flags and refcount fields. Objects other * than strings also need to have a single or double linked list pointers * for insertion into the "heap allocated" list. Strings are held in the * heap-wide string table so they don't need link pointers. * * Technically, 'h_refcount' must be wide enough to guarantee that it cannot * wrap (otherwise objects might be freed incorrectly after wrapping). This * means essentially that the refcount field must be as wide as data pointers. * On 64-bit platforms this means that the refcount needs to be 64 bits even * if an 'int' is 32 bits. This is a bit unfortunate, and compromising on * this might be reasonable in the future. * * Heap header size on 32-bit platforms: 8 bytes without reference counting, * 16 bytes with reference counting.
label: code-design

9854. We're a varargs function because we need to detect whether * initialValue was given or not.

9855. cannot be strict (never mapped variables)

9856. Avoid recursive re-entry; enter when we're attached or * detaching (to finish off the pending detach).

9857. DUK_DEBUGGER_H_INCLUDED

9858. Maximum length of CommonJS module identifier to resolve. Length includes * both current module ID, requested (possibly relative) module ID, and a * slash in between.

9859. **comment:** * Property count check. This is the only point where we ensure that * we don't get more (allocated) property space that we can handle. * There aren't hard limits as such, but some algorithms fail (e.g. * finding next higher prime, selecting hash part size) if we get too * close to the 4G property limit. * * Since this works based on allocation size (not actually used size), * the limit is a bit approximate but good enough in practice.
label: code-design

9860. This loop intentionally does not ensure characters are valid * ([0-9a-fA-F]) because the hex decode call below will do that.

9861. 0 if no used entries

9862. * Basic double / byte union memory layout.

9863. copy values (no overlap even if to_ctx == from_ctx; that's not * allowed now anyway)

9864. Use match charlen instead of bytelen, just in case the input and * match codepoint encodings would have different lengths.

9865. **comment:** Count actually used array part entries and array minimum size. * NOTE: 'out_min_size' can be computed much faster by starting from the * end and breaking out early when finding first used entry, but this is * not needed now.
label: code-design

9866. if new_p == NULL, all of these pointers are NULL

9867. -> [... obj retval/error]

9868. [... holder key] -> [... holder]

9869. 'this' binding is just before current activation's bottom

9870. **comment:** * Error handling macros, assertion macro, error codes. * * There are three level of 'errors': * * 1. Ordinary errors, relative to a thread, cause a longjmp, catchable. * 2. Fatal errors, relative to a heap, cause fatal handler to be called. * 3. Panic errors, unrelated to a heap and cause a process exit. * * Panics are used by the default fatal error handler and by debug code * such as assertions. By providing a proper fatal error handler, user * code can avoid panics in non-debug builds.
label: code-design

9871. Arguments can be: [source? filename? &comp_args] so that * nargs is 1 to 3. Call site encodes the correct nargs count * directly into flags.

9872. a

9873. Allow leading zeroes (e.g. "0123" -> "123")

9874. * Default clause.

9875. d <- (quotient (* r B) s) (in range 0...B-1)

9876. **comment:** XXX: There used to be a shared log buffer here, but it was removed * when dynamic buffer spare was removed. The problem with using * bufwriter is that, without the spare, the buffer gets passed on * as an argument to the raw() call so it'd need to be resized * (reallocated) anyway. If raw() call convention is changed, this * could be made more efficient.

9942. **comment:** XXX: how to figure correct size?

label: code-design

9943. **comment:** * See the following documentation for discussion: * * doc/execution.rst: control flow details * * Try, catch, and finally "parts" are Blocks, not Statements, so * they must always be delimited by curly braces. This is unlike e.g. * the if statement, which accepts any Statement. This eliminates any * questions of matching parts of nested try statements. The Block * parsing is implemented inline here (instead of calling out). * * Finally part has a 'let scoped' variable, which requires a few kinks * here.

10224. * The 'duktape.h' header provides the public API, but also handles all * compiler and platform specific feature detection, Duktape feature * resolution, inclusion of system headers, etc. These have been merged * because the public API is also dependent on e.g. detecting appropriate * C types which is quite platform/compiler specific especially for a non-C99 * build. The public API is also dependent on the resolved feature set. * * Some actions taken by the merged header (such as

including system headers) * are not appropriate for building a user application. The define * DUK_COMPILING_DUKTAPE allows the merged header to skip/include some * sections depending on what is being built.

10225. * Check the function type, handle bound function chains, and prepare * parameters for the rest of the call handling. Also figure out the * effective 'this' binding, which replaces the current value at * idx_func + 1. * * If the target function is a 'bound' one, follow the chain of 'bound' * functions until a non-bound function is found. During this process, * bound arguments are 'prepended' to existing ones, and the "this" * binding is overridden. See E5 Section 15.3.4.5.1. * * Lightfunc detection happens here too. Note that lightweight functions * can be wrapped by (non-lightweight) bound functions so we must resolve * the bound function chain first.

10226. avoid side effects

10227. result in csreg

10228. * Other heap related defines

10229. * Start doing property attributes updates. Steps 12-13. * * Start by computing new attribute flags without writing yet. * Property type conversion is done above if necessary.

10230. strict: non-deletable, non-writable

10231. * Assuming a register binds to a variable declared within this * function (a declarative binding), the 'this' for the call * setup is always 'undefined'. E5 Section 10.2.1.1.6.

10232. This may happen when forward and backward scanning disagree * (possible for non-extended-UTF-8 strings).

10233. use fallback as 'this' value

10234. Caller has already eaten the first character ('(') which we don't need.

10235. r <- (* r B) * s <- s * m+ <- (* m+ B) * m- <- (* m- B) * k <- (- k 1)

10236. A -> object reg * B -> key reg/const * C -> value reg/const * * Note: intentional difference to register arrangement * of e.g. GETPROP; 'A' must contain a register-only value.

10237. C recursion check.

10238. b

10239. Misc

10240. catches EOF (0x00)

10485. **comment:** Call this.raw(msg); look up through the instance allows user to override * the raw() function in the instance or in the prototype for maximum * flexibility.
 label: code-design
10486. restore stack top
10487. DUK_USE_BASE64_FASTPATH
10488. Valstack should suffice here, required on function valstack init
10489. duk_hnativefunction specific fields.
10490. $r < (*f b 2) [if b==2 -> (*f 4)] * s <- (* (expt b (- 1 e)) 2) == b^{(1-e)} * 2 [if b==2 -> b^{(2-e)}] * m+ <- b == 2 * m- <- 1 * k <- 0 * B <- B * low_ok <- round * high_ok <- round$
10491. Insert bytes in the middle of the buffer from an external buffer.
10492. identifier names (E5 Section 7.6)
10493. * Set up the resolution input which is the requested ID directly * (if absolute or no current module path) or with current module * ID prepended (if relative and current module path exists). * Suppose current module is 'foo/bar' and relative path is './quux'. * The 'bar' component must be replaced so the initial input here is * 'foo/bar/././quux'.
10494. A non-Array object should not have an array part in practice. * But since it is supported internally (and perhaps used at some * point), check and abandon if that's the case.
10495. keep heap->dbg_detached_cb
10496. For tv1 == tv2, both pointing to stack top, the end result * is same as duk_pop(ctx).
10497. If input_offset were assigned a negative value, it would * result in a large positive value. Most likely it would be * larger than input_length and be caught here. In any case * no memory unsafe behavior would happen.
10498. During parsing, month and day are one-based; set defaults here.
10499. **comment:** * Logger arguments are: * * magic: log level (0-5) * this: logger * stack: plain log args * * We want to minimize memory churn so a two-pass approach * is used: first pass formats arguments and computes final * string length, second pass copies strings either into a * pre-allocated and reused buffer (short messages) or into a * newly allocated fixed buffer. If the backend function plays * nice, it won't coerce the buffer to a string (and thus * intern it).
 label: code-design
10500. Non-zero refcounts should not happen because we refcount * finalize all unreachable objects which should cancel out * refcounts (even for cycles).
10501. token allows automatic semicolon insertion (eof or preceded by newline)
10502. Use special opcodes to load short strings
10503. * Add .fileName and .lineNumber to an error on the stack top.
10504. * CommonJS require() and modules support
10505. * Lexing helpers
10506. * Create built-in objects by parsing an init bitstream generated * by genbuiltins.py.
10507. explicit PropertyList
10508. Special handling for call setup instructions. The target * is expressed indirectly, but there is no output shuffling.
10509. * Create mantissa
10510. NOTE: act may be NULL if an error is thrown outside of any activation, * which may happen in the case of, e.g. syntax errors.
10511. ToNumber() for a fastint is a no-op.
10512. [key] -> [undefined] (default value)
10513. traceback depth fits into 16 bits
10514. [thisArg arg1 ... argN func boundFunc argArray]
10515. * Parser duk__advance() token eating functions
10516. **comment:** cleanup varmap from any null entries, compact it, etc; returns number * of final entries after cleanup.
 label: code-design
10517. **comment:** * Needs a save of multiple saved[] entries depending on what range * may be overwritten. Because the regexp parser does no such analysis, * we currently save the entire saved array here. Lookaheads are thus * a bit expensive. Note that the saved array is not needed for just * the lookahead sub-match, but for the matching of the entire sequel. * * The temporary save buffer is pushed on to the valstack to handle * errors correctly. Each lookahead causes a C recursion and pushes * more stuff on the value stack. If the C recursion limit is less * than the value stack spare, there is no need to check the stack. * We do so regardless, just in case.
 label: code-design
10518. **comment:** XXX: split into separate functions for each field type?
 label: code-design
10519. Same as above but for unsigned int range.
10520. comma after a value, expected
10521. duplicate key
10522. Given a day number, determine year and day-within-year.
10523. **comment:** Vararg function: must be careful to check/require arguments. * The JSON helpers accept invalid indices and treat them like * non-existent optional parameters.

10531. * Debugging disabled
10532. fixed offset in valstack
10533. DUK_TOK_ENUM
10534. when key is NULL, value is garbage so no need to set
10535. **comment:** * Error during call. The error value is at heap->lj.value1. * * The very first thing we do is restore the previous setjmp catcher. * This means that any error in error handling will propagate outwards * instead of causing a setjmp() re-entry above.
 label: code-design
10536. Standard behavior for map(): trailing non-existent * elements don't invoke the user callback and are not * counted towards result 'length'.
10537. * Append a Unicode codepoint to the temporary byte buffer. Performs * CESU-8 surrogate pair encoding for codepoints above the BMP. * Existing surrogate pairs are allowed and also encoded into CESU-8.
10538. * Proxy helpers
10539. * Found; post-processing (Function and arguments objects)
10540. maps to finalizer 2nd argument
10541. DUK_USE_AVOID_PLATFORM_FUNCPTRS

10542. 'roundpos' is relative to nc_ctx->k and increases to the right * (opposite of how 'k' changes).
10543. key encountered as a plain property
10544. e.g. DUK_OP_POSTINCV
10545. Allow empty string to be interpreted as 0
10546. Math.pow(-0,y) where y<0 should be: * -Infinity if y<0 and an odd integer * - Infinity otherwise * NetBSD pow() returns -Infinity for all finite y<0. The * if clause also catches y == -Infinity (which works even * without the fix).
10547. **comment:** XXX: add temporary duk__p pointer here too; sharing
label: code-design
10548. not minimum exponent
10549. * Avoid nested calls. Concretely this happens during debugging, e.g. * when we eval() an expression. * * Also don't interrupt if we're currently doing debug processing * (which can be initiated outside the bytecode executor) as this * may cause the debugger to be called recursively. Check required * for correct operation of throw intercept and other "exotic" halting * scenarios.
10550. Because new_size > duk_count_used_probe(heap), guaranteed to work
10551. bump refcount to prevent refzero during finalizer processing
10552. * Pointers to function data area for faster access. Function * data is a buffer shared between all closures of the same * "template" function. The data buffer is always fixed (non- * dynamic, hence stable), with a layout as follows: * * constants (duk_tval) * inner functions (duk_hobject) * bytecode (duk_instr_t) * * Note: bytecode end address can be computed from 'data' buffer * size. It is not strictly necessary functionally, assuming * bytecode never jumps outside its allocated area. However, * it's a safety/robustness feature for avoiding the chance of * executing random data as bytecode due to a compiler error. * * Note: values in the data buffer must be incref'd (they will * be decref'd on release) for every compiledfunction referring * to the 'data' element.
10553. **comment:** * Advance lookup window by N characters, filling in new characters as * necessary. After returning caller is guaranteed a character window of * at least DUK_LEXER_WINDOW_SIZE characters. * * The main function duk_advance_bytes() is called at least once per every * token so it has a major lexer/compiler performance impact. There are two * variants for the main duk_advance_bytes() algorithm: a sliding window * approach which is slightly faster at the cost of larger code footprint, * and a simple copying one. * * Decoding directly from the source string would be another lexing option. * But the lookup window based approach has the advantage of hiding the * source string and its encoding effectively which gives more flexibility * going forward to e.g. support chunked streaming of source from flash. * * Decodes UTF-8/CESU-8 leniently with support for code points from U+0000 to * U+10FFFF, causing an error if the input is unparseable. Leniency means: * * * Unicode code point validation is intentionally not performed, * except to check that the codepoint does not exceed 0x10ffff. * * * In particular, surrogate pairs are allowed and not combined, which * allows source files to represent all SourceCharacters with CESU-8. * Broken surrogate pairs are allowed, as Ecmascript does not mandate * their validation. * * * Allow non-shortest UTF-8 encodings. * * Leniency here causes few security concerns because all character data is * decoded into Unicode codepoints before lexer processing, and is then * re-encoded into CESU-8. The source can be parsed as strict UTF-8 with * a compiler option. However, Ecmascript source characters include -all- * 16-bit unsigned integer codepoints, so leniency seems to be appropriate. * * Note that codepoints above the BMP are not strictly SourceCharacters, * but the lexer still accepts them as such. Before ending up in a string * or an identifier name, codepoints above BMP are converted into surrogate * pairs and then CESU-8 encoded, resulting in 16-bit Unicode data as * expected by Ecmascript. * * An alternative approach to dealing with invalid or partial sequences * would be to skip them and replace them with e.g. the Unicode replacement * character U+FFFD. This has limited utility because a replacement character * will most likely cause a parse error, unless it occurs inside a string. * Further, Ecmascript source is typically pure ASCII. * * See: * * http://en.wikipedia.org/wiki=UTF-8 * http://en.wikipedia.org/wiki/CESU-8 * http://tools.ietf.org/html/rfc3629 * http://en.wikipedia.org/wiki/UTF-8#Invalid_byte_sequences * * Future work: * * * Reject other invalid Unicode sequences (see Wikipedia entry for examples) * in strict UTF-8 mode. * * * Size optimize. An attempt to use a 16-byte lookup table for the first * byte resulted in a code increase though. * * * Is checking against maximum 0x10ffff really useful? 4-byte encoding * imposes a certain limit anyway. * * * Support chunked streaming of source code. Can be implemented either * by streaming chunks of bytes or chunks of codepoints.

10691. decl type

10692. -> [sep ToObject(this) len sep str]

10693. Shared lenient buffer length clamping helper. Indices are treated as * element indices (though output values are byte offsets) which only * really matters for TypedArray views as other buffer object have a zero * shift. Negative indices are counted from end of input slice; crossed * indices are clamped to zero length; and final indices are clamped * against input slice. Used for e.g. ArrayBuffer slice().

10694. XXX: perhaps refactor this to allow caller to specify some parameters, or * at least a 'compact' flag which skips any spare or round-up .. useful for * emergency gc.

10695. [...] enum_target res handler trap]

10696. XXX: Decrementing and restoring act->curr_pc works now, but if the * debugger message loop gains the ability to adjust the current PC * (e.g. a forced jump) restoring the PC here will break. Another * approach would be to use a state flag for the "decrement 1 from * topmost activation's PC" and take it into account whenever dealing * with PC values.

10697. Create a fresh object environment for the global scope. This is * needed so that the global scope points to the newly created RAM-based * global object.

10698. x <- (1<<y)

10699. * HASPROP: EcmaScript property existence check ("in" operator). * * Interestingly, the 'in' operator does not do any coercion of * the target object.

10700. Any 'res' will do.

10701. If neutered must return 0; length is zeroed during * neutering.

10702. XXX: assert idx_base

10703. **comment:** XXX: refactor into internal helper, duk_clone_hobject()

label: code-design

10704. * Get starting character offset for match, and initialize 'sp' based on it. * * Note: lastIndex is non-configurable so it must be present (we check the * internal class of the object above, so we know it is). User code can set * its value to an arbitrary (garbage) value though; E5 requires that lastIndex * be coerced to a number before using. The code below works even if the * property is missing: the value will then be coerced to zero. * * Note: lastIndex may be outside Uint32 range even after ToInteger() coercion. * For instance, ToInteger(+Infinity) = +Infinity. We track the match offset * as an integer, but pre-check it to be inside the 32-bit range before the loop. * If not, the check in E5 Section 15.10.6.2, step 9.a applies.

10705. avoid side effect issues

10706. * Setup call: target and 'this' binding. Three cases: * * 1. Identifier base (e.g. "foo()") * 2. Property base (e.g. "foo.bar()") * 3. Register base (e.g. "foo()0"; i.e. when a return value is a function)

10707. SHIFT EXPRESSION

10708. overflow, fall through

10709. restored if ecma-to-ecma setup fails

10710. Match labels starting from latest label because there can be duplicate empty * labels in the label set.

10711. If debugger is paused, garbage collection is disabled by default.

10712. DUK_ERR_REFERENCE_ERROR: no macros needed

10713. XXX: shared helper for duk_push_hobject_or_undefined()

10714. * Strings have no internal references but do have "weak" * references in the string cache. Also note that strings * are not on the heap_allocated list like other heap * elements.
10715. unconditionally
10716. **comment:** XXX: At the moment Duktape accesses internal keys like _Finalizer using a * normal property set/get which would allow a proxy handler to interfere with * such behavior and to get access to internal key strings. This is not a problem * as such because internal key strings can be created in other ways too (e.g. * through buffers). The best fix is to change Duktape internal lookups to * skip proxy behavior. Until that, internal property accesses bypass the * proxy and are applied to the target (as if the handler did not exist). * This has some side effects, see test-bi-proxy-internal-keys.js.
label: code-design
10717. Get local time offset (in seconds) for a certain (UTC) instant 'd'.
10718. **comment:** Can be called multiple times with no harm. Mark the transport * bad (dbg_read_cb == NULL) and clear state except for the detached * callback and the udata field. The detached callback is delayed * to the message loop so that it can be called between messages; * this avoids corner cases related to immediate debugger reattach * inside the detached callback.
label: code-design
10719. resume
10720. * Parse a function body or a function-like expression, depending * on flags.
10721. actually used, non-NULL entries
10722. Fast path check.
10723. length check
10724. Do decrefs only with safe pointers to avoid side effects * disturbing e_idx.
10725. '{"_ninf":true}'
10726. shared checks for all descriptor types
10727. There's no need to check for buffer validity status for the * target here: the property access code will do that for each * element. Moreover, if we did check the validity here, side * effects from reading the source argument might invalidate * the results anyway.
10728. * Process space (3rd argument to JSON.stringify)
10729. Difference to non-strict/strict comparison is that NaNs compare * equal and signed zero signs matter.
10730. DUK_USE_PANIC_HANDLER
10731. avoid array abandoning which interns strings
10732. traits are separate; in particular, arguments not an array
10733. duk_get_min_grow_a() is always >= 1
10734. 9: getUTCFullYear
10735. [key getter this key] -> [key retval]
10736. Source end clamped silently to available length.
10737. First character has already been eaten and checked by the caller. * We can scan until a NUL in stridx string because no built-in strings * have internal NULs.
10738. * Proxy built-in (ES6)
10739. Native function, no relevant lineNumber.
10740. * Limited functionality bigint implementation. * * Restricted to non-negative numbers with less than 32 * DUK_BI_MAX_PARTS bits, * with the caller responsible for ensuring this is never exceeded. No memory * allocation (except stack) is needed for bigint computation. Operations * have been tailored for number conversion needs. * * Argument order is "assignment order", i.e. target first, then arguments: * x <- y * z --> duk_bi_mul(x, y, z);
10741. * InitJS code - Ecmascript code evaluated from a built-in source * which provides e.g. backward compatibility. User can also provide * JS code to be evaluated at startup.

10865. catches EOF (NUL) and initial comma

10866. **comment:** If no explicit message given, put error code into message field * (as a number). This is not fully in keeping with the EcmaScript * error model because messages are supposed to be strings (Error * constructors use ToString() on their argument). However, it's * probably more useful than having a separate 'code' property.**label:** code-design

10867. The #ifdef clutter here needs to handle the three cases: * (1) JX+JC, (2) JX only, (3) JC only.

10868. currently running thread

10869. temproots

10870. Tail call check: if last opcode emitted was CALL(I), and * the context allows it, change the CALL(I) to a tail call. * This doesn't guarantee that a tail call will be allowed at * runtime, so the RETURN must still be emitted. (Duktape * 0.10.0 avoided this and simulated a RETURN if a tail call * couldn't be used at runtime; but this didn't work * correctly with a thread yield/resume, see * test-bug-tailcall-thread-yield-resume.js for discussion.) * * In addition to the last opcode being CALL, we also need to * be sure that 'rc_val' is the result register of the CALL(I). * For instance, for the expression 'return 0, (function () * { return 1; }), 2' the last opcode emitted is CALL (no * bytecode is emitted for '2') but 'rc_val' indicates * constant '2'. Similarly if '2' is replaced by a register * bound variable, no opcodes are emitted but tail call would * be incorrect. * * This is tricky and easy to get wrong. It would be best to * track enough expression metadata to check that 'rc_val' came * from that last CALL instruction. We don't have that metadata * now, so we check that 'rc_val' is a temporary register result * (not a constant or a register bound variable). There should * be no way currently for 'rc_val' to be a temporary for an * expression following the CALL instruction without emitting * some opcodes following the CALL. This proxy check is used * below. * * See: test-bug-comma-expr-gh131.js. * * The non-standard 'caller' property disables tail calls * because they pose some special cases which haven't been * fixed yet.

10871. * Helper: handle Array object 'length' write which automatically * deletes properties, see E5 Section 15.4.5.1, step 3. This is * quite tricky to get right. * * Used by duk_hobject_putprop().

10872. vararg

10873. Use 'res' as the expression value (it's side effect * free and may be a plain value, a register, or a * constant) and write it to the LHS binding too.

11007. DUK_USE_FILE_IO
11008. ReferenceError
11009. timeval breakdown: replace year with equivalent year in the [1971,2037] range for DST calculations
11010. * Ecmascript operators
11011. args
11012. * Some defines forwarded from feature detection
11013. (internal) take strlen() of src_buffer (avoids double evaluation in macro)
11014. set/clear enumerable
11015. internal use
11016. * Error handling
11017. EvalError
11018. * Object prototype
11019. setter: perform 2-digit year fixup (00...99 -> 1900...1999)
11020. nop: no need to normalize
11021. * Compilation and evaluation
11022. or is a normalized NaN
11023. AllocError
11024. month: 0 to 11
11025. internal flag: create backing ArrayBuffer; keep in one byte
11026. additional values begin at bit 12
11027. * Constants
11028. **comment:** XXX: replace with plain Error?
 label: code-design
11029. * Object finalizer
11030. Reverse operation is the same.
11031. duk_context is now defined in duk_config.h because it may also be * referenced there by prototypes.
11032. * C++ name mangling
11033. UncaughtError
11034. Ecmascript year range: * > new Date(100e6 * 24 * 3600e3).toISOString() * '+275760-09-13T00:00:00.000Z' * > new Date(-100e6 * 24 * 3600e3).toISOString() * '-271821-04-20T00:00:00.000Z'
11035. create a new global environment
11036. * Global object
11037. DUKTAPE_H_INCLUDED
11038. E == 0x7ff, F != 0 => NaN
11039. DUK_USE_PACKED_TVAL
11040. * Logging
11041. safe variants of a few coercion operations
11042. Indicates that a native function does not have a fixed number of args, * and the argument stack should not be capped/extended at all.
11043. * Get operations: no coercion, returns default value for invalid * indices and invalid value types. * * duk_get_undefined() and duk_get_null() would be pointless and * are not included.
11044. **comment:** use locale specific formatting if available
 label: code-design
11045. External duk_config.h provides platform/compiler/OS dependent * typedefs and macros, and DUK_USE_xxx config options so that * the rest of Duktape doesn't need to do any feature detection.
11046. internal: don't care about fixed/dynamic nature
11047. * Property access * * The basic function assumes key is on stack. The _string variant takes * a C string as a property name, while the _index variant takes an array * index as a property name (e.g. 123 is equivalent to the key "123").
11048. * Debugging
11049. 64-bit byteswap, same operation independent of target endianness.
11050. * Type checks * * duk_is_none(), which would indicate whether index is outside of stack, * is not needed; duk_is_valid_index() gives the same information.
11051. sort array indices, use with DUK_ENUM_ARRAY_INDICES_ONLY
11052. force change if possible, may still fail for e.g. virtual properties
11053. Millisecond count constants.
11054. used by packed duk_tval, assumes sizeof(void *) == 4
11055. set value (given on value stack)
11056. Used to represent invalid index; if caller uses this without checking, * this index will map to a non-existent stack entry. Also used in some * API calls as a marker to denote "no value".
11057. * Module helpers: put multiple function or constant properties
11058. raw void pointer
11059. Flags for duk_push_thread_raw()

11070. Flags for duk_push_string_file_raw()
11071. Duktape debug protocol version used by this build.
11072. **comment:** DUK_COMPILE_xxx bits 0-2 are reserved for an internal 'nargs' argument * (the nargs value passed is direct stack arguments + 1 to account for an * internal extra argument).
label: code-design
11073. fixed or dynamic, garbage collected byte buffer
11074. * Thread management
11075. * Double NaN manipulation macros related to NaN normalization needed when * using the packed duk_tval representation. NaN normalization is necessary * to keep double values compatible with the duk_tval format. * * When packed duk_tval is used, the NaN space is used to store pointers * and other tagged values in addition to NaNs. Actual NaNs are normalized * to a specific quiet NaN. The macros below are used by the implementation * to check and normalize NaN values when they might be created. The macros * are essentially NOPs when the non-packed duk_tval representation is used. * * A FULL check is exact and checks all bits. A NOTFULL check is used by * the packed duk_tval and works correctly for all NaNs except those that * begin with 0x7ff0. Since the 'normalized NaN' values used with packed * duk_tval begin with 0x7ff8, the partial check is reliable when packed * duk_tval is used. The 0x7ff8 prefix means the normalized NaN will be a * quiet NaN regardless of its remaining lower bits. * * The ME variant below is specifically for ARM byte order, which has the * feature that while doubles have a mixed byte order (32107654), unsigned * long long values has a little endian byte order (76543210). When writing * a logical double value through a ULL pointer, the 32-bit words need to be * swapped; hence the #ifdefs below for ULL writes with DUK_USE_DOUBLE_ME. * This is not full ARM support but suffices for some environments.
11076. either not a NaN
11077. convert time value to local time
11078. not directly applicable, byte order differs from a double
11079. end 'extern "C"' wrapper
11080. * Object operations
11081. set writable (effective if DUK_DEFPROP_HAVE_WRITABLE set)
11082. UnsupportedError
11083. **comment:** Internal API call flags, used for various functions in this file. * Certain flags are used by only certain functions, but since the flags * don't overlap, a single flags value can be passed around to multiple * functions. * * The unused top bits of the flags field are also used to pass values * to helpers (duk_get_part_helper() and duk_set_part_helper()). * * (Must be in-sync with genbuiltins.py.)
label: code-design
11084. There are currently no native functions to yield/resume, due to the internal * limitations on coroutine handling. These will be added later.
11085. Concrete macros for NaN handling used by the implementation internals. * Chosen so that they match the duk_tval representation: with a packed * duk_tval, ensure NaNs are properly normalized; with a non-packed duk_tval * these are essentially NOPs.
11086. (internal) no source string on stack
11087. * Function (method) calls
11088. plain
11089. Ecmascript string: CESU-8 / extended UTF-8 encoded
11090. internal flag: don't zero allocated buffer
11091. use strict (outer) context for global, eval, or function code
11092. in non-packed representation we don't care about which NaN is used
11093. * Union for accessing double parts, also serves as packed duk_tval
11094. include date part in string conversion result
11095. internal flag: dynamic buffer
11096. Ecmascript null
11097. enumerate non-enumerable properties in addition to enumerable
11098. **comment:** XXX: replace with RangeError?
label: code-design
11099. * Push operations * * Push functions return the absolute (relative to bottom of frame) * position of the pushed value for convenience. * * Note: duk_dup() is technically a push.
11100. string
11101. * ROM pointer compression
11102. * Union to access IEEE double memory representation, indexes for double * memory representation, and some macros for double manipulation. * * Also used by packed duk_tval. Use a union for bit manipulation to * minimize aliasing issues in practice. The C99 standard does not * guarantee that this should work, but it's a very widely supported * practice for low level manipulation. * * IEEE double format summary: * * seeeeeeee eeeeefff ffffffff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H * * s sign bit * eee... exponent field * fff... fraction * * See http://en.wikipedia.org/wiki/Double_precision_floating-point_format. * * NaNs are represented as exponent 0x7ff and mantissa != 0. The NaN is a * signaling NaN when the highest bit of the mantissa is zero, and a quiet * NaN when the highest bit is set. * * At least three memory layouts are relevant here: * * A B C D E F G H Big endian (e.g. 68k) DUK_USE_DOUBLE_BE * H G F E D C B A Little endian (e.g. x86) DUK_USE_DOUBLE_LE * D C B A H G F E Mixed/cross endian (e.g. ARM) DUK_USE_DOUBLE_ME * * ARM is a special case: ARM

double values are in mixed/cross endian * format while ARM duk_uint64_t values are in standard little endian * format (H G F E D C B A). When a double is read as a duk_uint64_t * from memory, the register will contain the (logical) value * E F G H A B C D. This requires some special handling below. ** Indexes of various types (8-bit, 16-bit, 32-bit) in memory relative to * the logical (big endian) order: ** byte order duk_uint8_t duk_uint16_t duk_uint32_t * BE 01234567 0123 01 * LE 76543210 3210 10 * ME (ARM) 32107654 1032 01 ** Some processors may alter NaN values in a floating point load+store. * For instance, on X86 a FLD + FSTP may convert a signaling NaN to a * quiet one. This is catastrophic when NaN space is used in packed * duk_tval values. See: misc/clang_aliasing.c.

11103. * Helper macros for reading/writing memory representation parts, used * by duk_numconv.c and duk_tval.h.

11104. string conversion: use 'T' instead of '' as a separator

11105. Ecmascript number: double

11106. TypeError

11107. Support array for ROM pointer compression. Only declared when ROM * pointer compression is active.

11108. **comment:** Although extra/top could be an unsigned type here, using a signed type * makes the API more robust to calling code calculation errors or corner * cases (where caller might occasionally come up with negative values). * Negative values are treated as zero, which is better than casting them * to a large unsigned number. (This principle is used elsewhere in the * API too.)

label: code-design

11109. * Misc conversion

11110. Ecmascript object: includes objects, arrays, functions, threads

11111. URIError

11112. all doubles are considered normalized

11113. AUTHORS.rst

11114. day within month: 0 to 30

11115. setter: call is a time setter (affects hour, min, sec, ms); otherwise date setter (affects year, month, day-in-month)

11116. (internal) no filename on stack

11117. compile eval code (instead of global code)

11118. One problem with this macro is that expressions like the following fail * to compile: "(void) duk_error(...)". But because duk_error() is noreturn, * they make little sense anyway.

11119. set setter (given on value stack)

11120. prefer number, unless input is a Date, in which * case prefer string (E5 Section 8.12.8)

11121. Part indices for internal breakdowns. Part order from DUK_DATE_IDX_YEAR * to DUK_DATE_IDX_MILLISECOND matches argument ordering of Ecmascript API * calls (like Date constructor call). Some functions in duk.bi_date.c * depend on the specific ordering, so change with care. 16 bits are not * enough for all parts (year, specifically). * * (Must be in-sync with genbuiltins.py.)

11122. E == 0x7ff, F == 8 => normalized NaN

11123. Enumeration flags for duk_enum()

11124. year

11125. * Other state related functions

11126. DUK_USE_PROVIDE_DEFAULT_ALLOC_FUNCTIONS

11127. * Default allocation functions. * * Assumes behavior such as malloc allowing zero size, yielding * a NULL or a unique pointer which is a no-op for free.

11128. * Buffer

11129. maximum size check is handled by callee

11130. **comment:** Forget the previous allocation, setting size to 0 and alloc to * NULL. Caller is responsible for freeing the previous allocation. * Getting the allocation and clearing it is done in the same API * call to avoid any chance of a realloc.

label: code-design

11131. Load constants onto value stack but don't yet copy to buffer.

11132. -> [func funcname env]

11133. _Formals

11134. Setup function properties.

11135. Push function object, init flags etc. This must match * duk_js_push_closure() quite carefully.

11136. **comment:** * Bytecode dump/load * * The bytecode load primitive is more important performance-wise than the * dump primitive. * * Unlike most Duktape API calls, bytecode dump/load is not guaranteed to be * memory safe for invalid arguments - caller beware! There's little point * in trying to achieve memory safety unless bytecode instructions are also * validated which is not easy to do with indirect register references etc.

label: code-design

11137. _Varmap is dense

11138. We know _Formals is dense and all entries will be in the * array part. GC and finalizers shouldn't affect _Formals * so side effects should be fine.

11139. skip line info

11140. Bound functions don't have all properties so we'd either need to * lookup the non-bound target function or reject bound functions. * For now, bound functions are rejected.

11141. end of _Formals

11142. **comment:** XXX: There's some overlap with duk_js_closure() here, but * seems difficult to share code. Ensure that the final function * looks the same as created by duk_js_closure().

label: code-design

11143. The caller is responsible for being sure that bytecode being loaded * is valid and trusted. Invalid bytecode can cause memory unsafe * behavior directly during loading or later during bytecode execution * (instruction validation would be quite complex to implement). * * This signature check is the only sanity check for detecting * accidental invalid inputs. The initial 0xFF byte ensures no * ordinary string will be accepted by accident.

11144. buffer limits

11145. Inner functions recursively.

11146. known to be number; in fact an integer

11147. Object extra properties. * * There are some difference between function templates and functions. * For example, function templates don't have .length and nargs is * normally used to instantiate the functions.

11148. Bytecode instructions: endian conversion needed unless * platform is big endian.

11149. **comment:** Load a function from bytecode. The function object returned here must * match what is created by duk_js_push_closure() with respect to its flags, * properties, etc. * * NOTE: there are intentionally no input buffer length / bound checks. * Adding them would be easy but wouldn't ensure memory safety as untrusted * or broken bytecode is unsafe during execution unless the opcodes themselves * are validated (which is quite complex, especially for indirect opcodes).

label: code-design

11150. duk_hcompiledfunction flags; quite version specific

11151. standard prototype

11152. Load bytecode instructions.

11153. string limits

11154. no side effects

11155. We know _Varmap only has own properties so walk property * table directly. We also know _Varmap is dense and all * values are numbers; assert for these. GC and finalizers * shouldn't affect _Varmap so side effects should be fine.

11156. **comment:** known to be 32-bit

label: code-design

11157. Fixed header info.

11158. constants are strings or numbers now

11159. Create function 'data' buffer but don't attach it yet.

11160. With constants and inner functions on value stack, we can now * atomically finish the function 'data' buffer, bump refcounts, * etc. * * Here we take advantage of the value stack being just a duk_tval * array: we can just memcpy() the constants as long as we incref * them afterwards.

11161. Estimating the result size beforehand would be costly, so * start with a reasonable size and extend as needed.

11162. DUK_USE_BYTECODE_DUMP_SUPPORT
11163. ensures no overflow
11164. The function object is now reachable and refcounts are fine, * so we can pop off all the temporaries.
11165. _Varmap
11166. -> [func funcname env funcname func]
11167. XXX: This causes recursion up to inner function depth * which is normally not an issue, e.g. mark-and-sweep uses * a recursion limiter to avoid C stack issues.
 Avoiding * this would mean some sort of a work list or just refusing * to serialize deep functions.
11168. Constants: variable size encoding.
11169. Return with final function pushed on stack top.
11170. [... func buf] -> [... buf]
11171. [... buf func] -> [... func]
11172. Original function instance/template had NAMEBINDING. * Must create a lexical environment on loading to allow * recursive functions like 'function foo() { foo(); }'.
11173. **comment:** * Dump/load helpers, xxx_raw() helpers do no buffer checks
 label: code-design
11174. may be NULL if no constants or inner funcs
11175. assert just a few critical flags
11176. Load inner functions to value stack, but don't yet copy to buffer.
11177. **comment:** XXX: awkward
 label: code-design
11178. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway
11179. **comment:** Array is dense and contains only strings, but ASIZE may * be larger than used part and there are UNUSED entries.
 label: code-design
11180. Important to do a fastint check so that constants are * properly read back as fastints.
11181. Value stack is used to ensure reachability of constants and * inner functions being loaded. Require enough space to handle * large functions correctly.
11182. Explicit zero size check to avoid NULL 'tv1'.
11183. func.prototype.constructor = func
11184. end of _Varmap
11185. -> [func funcname env funcname]
11186. -> [... cons target]
11187. noblame_fileline
11188. [... func this arg1 ... argN]
11189. thread
11190. * Figure out the final, non-bound constructor, to get "prototype" * property.
11191. **comment:** * Calls. * * Protected variants should avoid ever throwing an error.
 label: code-design
11192. num_stack_res
11193. class Object, extensible
11194. note that we can't reliably pop anything here
11195. [... retval]
11196. Strict by default.
11197. **comment:** XXX: merge this with duk_js_call.c, as this function implements * core semantics (or perhaps merge the two files altogether).
 label: code-design
11198. num_stack_args
11199. nrets
11200. Anything else is not constructable.
11201. Prepare value stack for a method call through an object property. * May currently throw an error e.g. when getting the property.
11202. not protected, respect reclimit, is a constructor call
11203. respect reclimit, not constructor
11204. * Augment created errors upon creation (not when they are thrown or * rethrown). __FILE__ and __LINE__ are not desirable here; the call * stack reflects the caller which is correct.
11205. **comment:** XXX: code duplication
 label: code-design
11206. not protected, respect reclimit, not constructor
11207. pop_final_cons
11208. [... fallback retval]
11209. -> [... target]
11210. For user code this could just return 1 (strict) always * because all Duktape/C functions are considered strict, * and strict is also the default when nothing is running.
 * However, Duktape may call this function internally when * the current activation is an Ecmascript function, so * this cannot be replaced by a 'return 1' without fixing * the internal call sites.
11211. make absolute
11212. use fallback as 'this' value
11213. [... fallback constructor fallback(this) arg1 ... argN]; * Note: idx_cons points to first 'fallback', not 'constructor'.
11214. **comment:** * XXX: if duk_handle_call() took values through indices, this could be * made much more sensible. However, duk_handle_call() needs to fudge * the 'this' and 'func' values to handle bound function chains, which * is now done "in-place", so this is not a trivial change.
 label: code-design
11215. * Determine whether to use the constructor return value as the created * object instance or not.
11216. Lightfuncs cannot be bound.
11217. * Call the constructor function (called in "constructor mode").
11218. [... key arg1 ... argN]
11219. Inputs: explicit arguments (nargs), +1 for key, +2 for obj_index/nargs passing. * If the value stack does not contain enough args, an error is thrown; this matches * behavior of the other protected call API functions.
11220. **comment:** * There are two [[Construct]] operations in the specification: * * - E5 Section 13.2.2: for Function objects * - E5 Section 15.3.4.5.2: for "bound" Function objects * * The chain of bound functions is resolved in Section 15.3.4.5.2, * with arguments "piling up" until the [[Construct]] internal * method is called on the final, actual Function object. Note * that the "prototype" property is looked up *only* from the * final object, *before* calling the constructor. * * Currently we follow the bound function chain here to get the * "prototype" property value from the final, non-bound function. * However, we let duk_handle_call() handle the argument "piling" * when the constructor is called. The bound function chain is * thus now processed twice. * * When constructing new Array instances, an unnecessary object is * created and discarded now: the standard [[Construct]] creates an * object, and calls the Array constructor. The Array constructor * returns an Array instance, which is used as the result value for * the "new" operation; the object created before the Array constructor * call is discarded. * * This would be easy to fix, e.g. by knowing that the Array constructor * will always create a replacement object and skip creating the fallback * object in that case. * * Note: functions called via "new" need to know they are called as a * constructor. For instance, built-in constructors behave differently * depending on how they are called.
 label: code-design
11221. [... constructor arg1 ... argN final_cons]
11222. See comments in duk_pcall().
11223. because callstack_top > 0
11224. Checking callability of the immediate target * is important, same for constructability. * Checking it for functions down the bound * function chain is not strictly necessary * because .bind() should normally reject them. * But it's good to check anyway because it's * technically possible to edit the bound function * chain via

internal keys.

11225. * Create "fallback" object to be used as the object instance, * unless the constructor returns a replacement value. * Its internal prototype needs to be set based on "prototype" * property of the constructor.

11226. call_flags

11227. Get the original arguments. Note that obj_index may be a relative * index so the stack must have the same top when we use it.

11228. must work for nargs <= 0

11229. * Duktape/C function magic

11230. fall through

11231. unreachable

11591. [... func]
11592. nrets
11593. Error code also packs a tracedata related flag.
11594. For tv1 == tv2, both pointing to stack top, the end result * is same as duk_pop(ctx).
11595. allow fmt==NULL
11596. thr->heap->ljjmpbuf_ptr is checked by duk_err_longjmp() so we don't * need to check that here. If the value is NULL, a panic occurs because * we can't return.
11597. DUK_BUFOBJ_NODEJS_BUFFER
11598. Stack size increases or stays the same.
11599. Exact halfway, round to even.
11600. **comment:** If no explicit message given, put error code into message field * (as a number). This is not fully in keeping with the EcmaScript * error model because messages are supposed to be strings (Error * constructors use ToString() on their argument). However, it's * probably more useful than having a separate 'code' property.
 label: code-design
11601. Note: may be triggered even if minimal new_size would not reach the limit, * plan limit accordingly (taking DUK_VALSTACK_GROW_STEP into account).
11602. We intentionally ignore the duk_safe_call() return value and only * check the output type. This way we don't also need to check that * the returned value is indeed a string in the success case.
11603. Cannot use duk_to_string() on the buffer because it is usually * larger than 'len'. Also, 'buf' is usually a stack buffer.
11604. Clamping needed if duk_int_t is 64 bits.
11605. Note: src_data may be NULL if input is a zero-size * dynamic buffer.
11606. !DUK_USE_PREFER_SIZE
11607. Error: try coercing error to string once.
11608. Note: the realloc may have triggered a mark-and-sweep which may * have resized our valstack internally. However, the mark-and-sweep * MUST NOT leave the stack bottom/top in a different state. Particular * assumptions and facts: * * - The thr->valstack pointer may be different after realloc, * and the offset between thr->valstack_end <-> thr->valstack * may have changed. * - The offset between thr->valstack_bottom <-> thr->valstack * and thr->valstack_top <-> thr->valstack MUST NOT have changed, * because mark-and-sweep must adhere to a strict stack policy. * In other words, logical bottom and top MUST NOT have changed. * - All values above the top are unreachable but are initialized * to UNDEFINED, up to the post-realloc valstack_end. * - 'old_end_offset' must be computed after realloc to be correct.
11609. **comment:** XXX: inlined DECREF macro would be nice here: no NULL check, * refzero queueing but no refzero algorithm run (= no pointer * instability), inline code.
 label: code-design
11610. **comment:** XXX: other variants like uint, u32 etc
 label: code-design
11611. rely on interning, must be this string
11612. DUK_USE_FASTINT
11613. Because value stack init policy is 'undefined above top', * we don't need to write, just assert.
11614. sanity limit for function pointer size
11615. Initial stack size satisfies the stack spare constraints so there * is no need to require stack here.
11616. * Error throwing
11617. can't resize below 'top'
11618. -> [... retval]
11619. Non-buffer value is first ToString() coerced, then converted * to a buffer (fixed buffer is used unless a dynamic buffer is * explicitly requested).
11620. shared flags for a subset of types
11621. round up roughly to next 'grow step'
11622. Custom coercion for API
11623. NULL with zero length represents an empty string; NULL with higher * length is also now treated like an empty string although it is * a bit dubious. This is unlike duk_push_string() which pushes a * 'null' if the input string is a NULL.
11624. tv -> value just before prev top value; must relookup
11625. Init newly allocated slots (only).
11626. default: NULL, length 0
11627. * instanceof
11628. Assume value stack sizes (in elements) fits into duk_idx_t.
11629. useful for debugging
11630. **comment:** Relookup in case duk_js_tointeger() ends up e.g. coercing an object.
 label: code-design
11631. valstack limit caller has check, prevents wrapping
11632. default: NaN
11633. Coercion may be needed, the helper handles that by pushing the * tagged values to the stack.

11634. Note: this check relies on the fact that even a zero-size string * has a non-NULL pointer.
11635. Negative indices are always within allocated stack but * must not go below zero index.
11636. covers -Infinity
11637. * Get/require
11638. **comment:** * Number should already be in NaN-normalized form, * but let's normalize anyway.
 label: code-design
11639. Note: number has no explicit tag (in 8-byte representation)
11640. Positive index can be higher than valstack top but must * not go above allocated stack (equality is OK).
11641. Same as above but for unsigned int range.
11642. Errors are augmented when they are created, not when they are * thrown or re-thrown. The current error handler, however, runs * just before an error is thrown.
11643. **comment:** XXX: Hex encoded, length limited buffer summary here?
 label: code-design
11644. When src_size == 0, src_data may be NULL (if source * buffer is dynamic), and dst_data may be NULL (if * target buffer is dynamic). Avoid zero-size memcpy()
 * with an invalid pointer.
11645. check stack before interning (avoid hanging temp)
11646. **comment:** Try to make do with a stack buffer to avoid allocating a temporary buffer. * This works 99% of the time which is quite nice.
 label: code-design
11647. * Stack slice primitives
11648. **comment:** unused

11672. nop
11673. Faster but value stack overruns are memory unsafe.
11674. E5 Section 9.4, ToInteger()
11675. Note: need to re-lookup because ToNumber() may have side effects
11676. Relookup in case coerce_func() has side effects, e.g. ends up coercing an object
11677. Buffer is kept as is, with the fixed/dynamic nature of the * buffer only changed if requested. An external buffer * is converted into a non-external dynamic buffer in a * duk_to_dynamic_buffer() call.
11678. * Type checking
11679. Double error
11680. no compact
11681. w/o refcounting
11682. [... func/retval] -> [...]
11683. Special coercion for Uint8ClampedArray.
11684. flags is unsigned
11685. Example: d=3.5, t=0.5 -> ret = (3 + 1) & 0xfe = 4 & 0xfe = 4 * Example: d=4.5, t=0.5 -> ret = (4 + 1) & 0xfe = 5 & 0xfe = 4
11686. **comment:** XXX: optimize loops
 label: code-design
11687. Handle change in value stack top. Respect value stack * initialization policy: 'undefined' above top. Note that * DECREF may cause a side effect that reallocates valstack, * so must relookup after DECREF.
11688. nbytes * <-----> * [... | p | x | x | q] * => [... | q | p | x | x]
11689. tagged null pointers should never occur
11690. no throw
11691. Care must be taken to avoid pointer wrapping in the index * validation. For instance, on a 32-bit platform with 8-byte * duk_tval the index 0x20000000UL would wrap the memory space * once.
11692. * Conversions and coercions * * The conversion/coercions are in-place operations on the value stack. * Some operations are implemented here directly, while others call a * helper in duk_js_ops.c after validating arguments.
11693. initialize built-ins - either by copying or creating new ones
11694. may throw an error
11695. **comment:** Set stack top within currently allocated range, but don't reallocate. * This is performance critical especially for call handling, so whenever * changing, profile and look at generated code.
 label: code-design
11696. **comment:** XXX: size optimize
 label: code-design
11697. **comment:** NUL terminator handling doesn't matter here
 label: code-design
11698. Index validation is strict, which differs from duk_equals(). * The strict behavior mimics how instanceof itself works, e.g. * it is a TypeError if rval is not a - callable- object. It would * be somewhat inconsistent if rval would be allowed to be * non-existent without a TypeError.
11699. **comment:** Clamping to zero makes the API more robust to calling code * calculation errors.

label: code-design

11700. Surround with parentheses like in JX, ensures NULL pointer * is distinguishable from null value ("(null)" vs "null").
11701. * Value stack resizing. ** This resizing happens above the current "top": the value stack can be * grown or shrunk, but the "top" is not affected. The value stack cannot * be resized to a size below the current "top". ** The low level reallocation primitive must carefully recompute all value * stack pointers, and must also work if ALL pointers are NULL. The resize * is quite tricky because the valstack realloc may cause a mark-and-sweep, * which may run finalizers. Running finalizers may resize the valstack * recursively (the same value stack we're working on). So, after realloc * returns, we know that the valstack "top" should still be the same (there * should not be live values above the "top"), but its underlying size and * pointer may have changed.
11702. Stack size decreases.
11703. format plus something to avoid just missing
11704. copy values (no overlap even if to_ctx == from_ctx; that's not * allowed now anyway)
11705. unreachable
11706. **comment:** XXX: this is probably a useful shared helper: for a * duk_hbufferobject, get a validated buffer pointer/length.
label: code-design
11707. Represent a null pointer as 'null' to be consistent with * the JX format variant. Native '%p' format for a NULL * pointer may be e.g. '(nil)'.

11766. **comment:** XXX: expensive check (also shared elsewhere - so add a shared internal API call?)
label: code-design
11767. swap elements; deal with non-existent elements correctly
11768. move pivot to its final place
11769. return ToObject(this)

11770. **comment:** Note: 'this' is not necessarily an Array object. The push() * algorithm is supposed to work for other kinds of objects too, * so the algorithm has e.g. an explicit update for the 'length' * property which is normally "magical" in arrays.
label: code-design

11771. -> [sep ToObject(this) len str]
11772. end of loop (careful with len==0)
11773. stack[0] = start * stack[1] = deleteCount * stack[2...nargs-1] = items * stack[nargs] = ToObject(this) -3 * stack[nargs+1] = ToUint32(length) -2 * stack[nargs+2] = result array -1
11774. for lastIndexOf, result may be -1 (mark immediate termination)
11775. According to E5.1 Section 15.4.4.4 nonexistent trailing * elements do not affect 'length' of the result. Test262 * and other engines disagree, so update idx_last here too.
11776. For now, restrict result array into 32-bit length range.
11777. avoid degenerate cases, so that (len - 1) won't underflow
11778. * shift()
11779. fixed offsets in valstack
11780. k+argCount-1; note that may be above 32-bit range
11781. intermediate join to avoid valstack overflow
11782. orig value
11783. fromPresent = true
11784. XXX: len >= 0x80000000 won't work below because we need to be * able to represent -len.
11785. right exists, [[Put]] regardless whether or not left exists
11786. [ToObject(this) item1 ... itemN arr item(i) item(i)[j]]
11787. topmost element is the result array already
11788. -> [sep ToObject(this) len sep str]
11789. [ToObject(this) item1 ... itemN arr]
11790. The lo/hi indices may be crossed and hi < 0 is possible at entry.
11791. **comment:** XXX: This helper is a bit awkward because the handling for the different iteration * callers is quite different. This now compiles to a bit less than 500 bytes, so with * 5 callers the net result is about 100 bytes / caller.
label: code-design

11792. [sep ToObject(this) len sep result]
11793. **comment:** XXX: there's no explicit recursion bound here now. For the average * qsort recursion depth O(log n) that's not really necessary: e.g. for * 2**32 recursion depth would be about 32 which is OK. However, qsort * worst case recursion depth is O(n) which may be a problem.
label: code-design

11794. Index clamping is a bit tricky, we must ensure that we'll only iterate * through elements that exist and that the specific requirements from E5.1 * Sections 15.4.4.14 and 15.4.4.15 are fulfilled; especially: * * - indexOf: clamp to [-len,len], negative handling -> [0,len], * if clamped result is len, for-loop bails out immediately * * - lastIndexOf: clamp to [-len-1, len-1], negative handling -> [-1, len-1], * if clamped result is -1, for-loop bails out immediately * * If fromIndex is not given, ToInteger(undefined) = 0, which is correct * for indexOf() but incorrect for lastIndexOf(). Hence special handling, * and why lastIndexOf() needs to be a vararg function.
11795. **comment:** XXX: best behavior for real world compatibility?
label: code-design

11796. Range limited to [0, 0xffffffff] range, i.e. range that can be * represented with duk_int32_t. Use this when the method doesn't * handle the full 32-bit unsigned range correctly.
11797. **comment:** Fall back to the initial (original) Object.toString(). We don't * currently have pointers to the built-in functions, only the top * level global objects (like "Array") so this is now done in a bit * of a hacky manner. It would be cleaner to push the (original) * function and use duk_call_method().
label: code-design

11798. -> [... toLocaleString ToObject(val)]
11799. Note that 'l' and 'r' may cross, i.e. r < l
11800. **comment:** XXX: the insert here is a bit expensive if there are a lot of items. * It could also be special cased in the outermost for loop quite easily * (as the element is dup()'d anyway).
label: code-design

11801. In some cases it may be that lo > hi, or hi < 0; these * degenerate cases happen e.g. for empty arrays, and in * recursion leaves.
11802. -> [... ToObject(this) ToUint32(length)]
11803. trivial cases
11804. find elements to swap
11805. args start at index 2
11806. indexOf: clamp fromIndex to [-len, len] * (if fromIndex == len, for-loop terminates directly) * * lastIndexOf: clamp fromIndex to [-len - 1, len - 1] * (if clamped to -len-1 -> fromIndex becomes -1, terminates for-loop directly)
11807. [... ToObject(this) ToUint32(length) val]
11808. **comment:** XXX: an array can have length higher than 32 bits; this is not handled * correctly now.
label: code-design

11809. **comment:** XXX: this compiles to over 500 bytes now, even without special handling * for an array part. Uses signed ints so does not handle full array range correctly.
label: code-design

11810. For len == 0, i is initialized to len - 1 which underflows. * The condition (i < len) will then exit the for-loop on the * first round which is correct. Similarly, loop termination * happens by i underflowing.
11811. Step 16: update length; note that the final length may be above 32 bit range * (but we checked above that this isn't the case here)
11812. stack top contains 'true'
11813. stack[0] = start * stack[1] = end * stack[2] = ToObject(this) * stack[3] = ToUint32(length) * stack[4] = result array
11814. Step 9: copy elements-to-be-deleted into the result array
11815. retval is directly usable
11816. result array is already at the top of stack
11817. has access to 'this' binding
11818. stack[0...nargs-1] = unshift args (vararg) * stack[nargs] = ToObject(this) * stack[nargs+1] = ToUint32(length)
11819. The original value needs to be preserved for filter(), hence * this funny order. We can't re-get the value because of side * effects.
11820. * splice()
11821. * isArray()
11822. The E5.1 Section 15.4.4.4 algorithm doesn't set the length explicitly * in the end, but because we're operating with an internal value which * is known to be an array, this should be equivalent.
11823. Debug print which visualizes the qsort partitioning process.
11824. for indexOf, ToInteger(undefined) would be 0, i.e. correct, but * handle both indexOf and lastIndexOf specially here.
11825. -> [sep ToObject(this) len str sep]
11826. stack[0] = compareFn * stack[1] = ToObject(this) * stack[2] = ToUint32(length)
11827. * indexOf(), lastIndexOf()
11828. move pivot out of the way
11829. **comment:** XXX: must be able to represent -len
label: code-design

11830. * reverse()
11831. !(l < p)
11832. XXX: len >= 0x80000000 won't work below because a signed type * is needed by qsort.

11833. result index for filter()
11834. loop iterator init and limit changed from standard algorithm
11835. [... val callback thisArg val i obj]
11836. !(p < r)
11837. [ToObject(this) ToUint32(length) lowerValue upperValue]
11838. **comment:** XXX: could duk_is_undefined() provide defaulting undefined to 'len' * (the upper limit)?
 label: code-design
11839. Perform an intermediate join when this many elements have been pushed * on the value stack.
11840. **comment:** stack[0] = callback * stack[1] = thisArg * stack[2] = object * stack[3] = ToUint32(length) (unused, but avoid unnecessary pop) * stack[4] = result array (or undefined)
 label: code-design
11841. XXX: if 'len' is low, may want to ensure array part is kept: * the caller is likely to want a dense array.
11842. string compare is the default (a bit oddly)
11843. * pop(), push()
11844. [arg1 ... argN obj length new_length]
11845. lastIndexOf() needs to be a vararg function because we must distinguish * between an undefined fromIndex and a "not given" fromIndex; indexOf() is * made vararg for symmetry although it doesn't strictly need to be.
11846. E5.1 standard behavior when deleteCount is not given would be * to treat it just like if 'undefined' was given, which coerces * ultimately to 0. Real world behavior is to splice to the end * of array, see test-bi-array-proto-splice-no-delcount.js.
11847. no need to check callable; duk_call() will do that
11848. if thisArg not supplied, behave as if undefined was supplied
11849. * reduce(), reduceRight()
11850. [sep ToObject(this) len]
11851. NOTE: The Array special behaviors are NOT invoked by duk_xdef_prop_index() * (which differs from the official algorithm). If no error is thrown, this * doesn't matter as the length is updated at the end. However, if an error * is thrown, the length will be unset. That shouldn't matter because the * caller won't get a reference to the intermediate value.
11852. -> [... fn x y]
11853. -> [... res]
11854. stack[0] = callback fn * stack[1] = initialValue * stack[2] = object (coerced this) * stack[3] = length (not needed, but not popped above) * stack[4] = accumulator
11855. idx_step is +1 for indexOf, -1 for lastIndexOf
11856. [A B C D E F G H] rel_index = 2, del_count 3, item count 3 * -> [A B F G H] (conceptual intermediate step) * -> [A B . . . F G H] (placeholder marked) * [A B C D E F G H] (actual result at this point)
11857. * concat()
11858. [sep ToObject(this) len sep str0 ... str(count-1)]
11859. * sort() ** Currently qsort with random pivot. This is now really, really slow, * because there is no fast path for array parts. ** Signed indices are used because qsort() leaves and degenerate cases * may use a negative offset.
11860. [... func this]
11861. stack[0] = searchElement * stack[1] = fromIndex * stack[2] = object * stack[3] = length (not needed, but not popped above)
11862. [ToUint32(len) array ToUint32(len)] -> [ToUint32(len) array]
11863. idx_step is +1 for reduce, -1 for reduceRight
11864. The extra (+4) is tight.
11865. -> [ToObject(this)]
11866. [sep ToObject(this) len sep]
11867. XXX: can shift() / unshift() use the same helper? * shift() is (close to?) <-> splice(0, 1) * unshift is (close to?) <-> splice(0, 0, [items])?
11868. stack[0] = object (this) * stack[1] = ToUint32(length) * stack[2] = elem at index 0 (retval)
11869. randomized pivot selection
11870. **comment:** XXX: optimize by creating array into correct size directly, and * operating on the array part directly; values can be memcpy()'d from * value stack directly as long as recounts are increased.
 label: code-design
11871. * slice()
11872. * unshift()
11873. retval to result[i]
11874. * Constructor
11875. if true, the stack already contains the final result
11876. * every(), some(), forEach(), map(), filter()
11877. * toString()
11878. Strict standard behavior, ignore trailing elements for * result 'length'.

11880. fixed offset in valstack
11881. rnd in [lo,hi]
11882. Standard behavior for map(): trailing non-existent * elements don't invoke the user callback and are not * counted towards result 'length'.
11883. -> [... ToObject(this) ToUint32(length) final_len final_len]
11884. nop
11885. Technically Array.prototype.push() can create an Array with length * longer than 2^32-1, i.e. outside the 32-bit range. The final length * is *not* wrapped to 32 bits in the specification. ** This implementation tracks length with a uint32 because it's much * more practical. ** See: test-bi-array-push-maxlen.js.
11886. The specification is a bit vague what to do if the return * value is not a number. Other implementations seem to * tolerate non-numbers but e.g. V8 won't apparently do a * ToNumber().
11887. We're a varargs function because we need to detect whether * initialValue was given or not.
11888. -> [... ToObject(this) ToUint32(length) arg[i]]
11889. [arg1 ... argN obj length]
11890. throw flag irrelevant (false in std alg)
11891. Step 15: insert itemCount elements into the hole made above
11892. For join(), nargs is 1. For toLocaleString(), nargs is 0 and * setting the top essentially pushes an undefined to the stack, * thus defaulting to a comma separator.
11893. **comment:** XXX: 'this' will be ToObject() coerced twice, which is incorrect * but should have no visible side effects.
 label: code-design
11894. [A B C D E F G H] rel_index = 2, del_count 3, item count 1 * -> [A B F G H] (conceptual intermediate step) * -> [A B . F G H] (placeholder marked) * [A B C F G H] (actual result at this point, C will be replaced)
11895. If len <= 1, middle will be 0 and for-loop bails out * immediately (0 < 0 -> false).
11896. Note: unshift() may operate on indices above unsigned 32-bit range * and the final length may be >= 2**32. However, we restrict the * final result to 32-bit range for practicality.
11897. i >= 0 would always be true
11898. **comment:** Fast exit if indices are identical. This is valid for a non-existent property, * for an undefined value, and almost always for ToString() coerced comparison of * arbitrary values (corner cases where this is not the case include e.g. a an * object with varying ToString() coercion). ** The specification does not prohibit "caching" of values read from the array, so * assuming equality for comparing an index with itself falls into the category of * "caching". ** Also, compareFn may be inconsistent, so skipping a call to compareFn here may * have an effect on the final result. The specification does not require any * specific behavior for inconsistent compare functions, so again, this fast path * is OK.
 label: code-design

11899. fromPresent = false
11900. -> [... x y fn]
11901. [... this func]
11902. each call this helper serves has nargs==2
11903. -> [ToObject(this) item1 ... itemN arr]
11904. [ToObject(this) item1 ... itemN arr item(i)]
11905. * join(), toLocaleString() ** Note: checking valstack is necessary, but only in the per-element loop. ** Note: the trivial approach of pushing all the elements on the value stack * and then calling duk_join() fails when the array contains a large number * of elements. This problem can't be offloaded to duk_join() because the * elements to join must be handled here and have special handling. Current * approach is to do intermediate joins with very large number of elements. * There is no fancy handling; the prefix gets re-joined multiple times.
11906. **comment:** * Array built-ins ** Note that most Array built-ins are intentionally generic and work even * when the 'this' binding is not an Array instance. To ensure this, * Array algorithms do not assume "magical" Array behavior for the "length" * property, for instance. ** XXX: the "Throw" flag should be set for (almost?) all [[Put]] and * [[Delete]] operations, but it's currently false throughout. Go through * all put/delete cases and check throw flag use. Need a new API primitive * which allows throws flag to be specified. ** XXX: array lengths above 2G won't work reliably. There are many places * where one needs a full signed 32-bit range ([-0xffffffff, 0xffffffff], * i.e. -33- bits). Although array 'length' cannot be written to be outside * the unsigned 32-bit range (E5.1 Section 15.4.5.1 throws a RangeError if so) * some intermediate values may be above 0xffffffff and this may not be always * correctly handled now (duk_uint32_t is not enough for all algorithms). ** For instance, push() can legitimately write entries beyond length 0xffffffff * and cause a RangeError only at the end. To do this properly, the current * push() implementation tracks the array index using a 'double' instead of a * duk_uint32_t (which is somewhat awkward). See test-bi-array-push-maxlen.js. ** On using "put" vs. "def" prop * ===== * * Code below must be careful to use the appropriate primitive as it matters * for compliance. When using "put" there may be inherited properties in * Array.prototype which cause side effects when values are written. When * using "define" there are no such side effects, and many test262 test cases * check for this (for real world code, such side effects are very rare). * Both "put" and "define" are used in the E5.1 specification; as a rule, * "put" is used when modifying an existing array (or a non-array 'this' * binding) and "define" for setting values into a fresh result array. ** Also note that Array instance 'length' should be writable, but not * enumerable and definitely not configurable: even Duktape code internally * assumes that an Array instance will always have a 'length' property. * Preventing deletion of the property is critical.
label: code-design
11907. XXX: proper flags?

11918. throw_flag
11919. **comment:** XXX: encoding is ignored now.
label: code-design
11920. This behavior mostly mimics Node.js now.
11921. nargs
11922. Fast path: source is a TypedArray (or any bufferobject).
11923. NOTE! Caller must ensure that any side effects from the * coercions below are safe. If that cannot be guaranteed * (which is normally the case), caller must coerce the * argument using duk_to_number() before any pointer * validations; the result of duk_to_number() always coerces * without side effects here.
11924. Don't accept relative indices now.
11925. bits 0...1: shift
11926. default is explicit index read/write copy
11927. Clamp to target's end if too long. ** NOTE: there's no overflow possibility in the comparison; * both target_ustart and copy_size are >= 0 and based on * values in duk_int_t range. Adding them as duk_uint_t * values is then guaranteed not to overflow.
11928. [offset noAssert], when ftype != DUK_FLD_VARINT
11929. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT32
11930. Select copy mode. Must take into account element * compatibility and validity of the underlying source * buffer.
11931. For the case n==1 Node.js doesn't seem to type check * the sole member but we do it before returning it. * For this case only the original buffer object is * returned (not a copy).
11932. Push the resulting view object and attach the ArrayBuffer.
11933. DUK_FLD_32BIT
11934. >= 0
11935. arg count
11936. DUK_FLD_8BIT
11937. Neutered. We could go into the switch-case safely with * buf == NULL because check_length == 0. To avoid scanbuild * warnings, fail directly instead.
11938. * TypedArray.prototype.set() ** TypedArray set() is pretty interesting to implement because: ** - The source argument may be a plain array or a typedarray. If the * source is a TypedArray, values are decoded and re-encoded into the * target (not as a plain byte copy). This may happen even when the * element byte size is the same, e.g. integer values may be re-encoded * into floats. ** - Source and target may refer to the same underlying buffer, so that * the set() operation may overlap. The specification requires that this * must work as if a copy was made before the operation. Note that this * is NOT a simple memmove() situation because the source and target * byte sizes may be different -- e.g. a 4-byte source (Int8Array) may * expand to a 16-byte target (Uint32Array) so that the target overlaps * the source both from beginning and the end (unlike in typical memmove). ** - Even if 'buf' pointers of the source and target differ, there's no * guarantee that their memory areas don't overlap. This may be the * case with external buffers. ** Even so, it is nice to optimize for the common case: ** - Source and target separate buffers or non-overlapping. ** - Source and target have a compatible type so that a plain byte copy * is possible. Note that while e.g. uint8 and int8 are compatible * (coercion one way or another doesn't change the byte representation), * e.g. int8 and uint8clamped are NOT compatible when writing int8 * values into uint8clamped typedarray (-1 would clamp to 0 for instance). ** See test-bi-typedarray-proto-set.js.
11939. Non-object argument is simply int coerced, matches * V8 behavior (except for "null", which we coerce to * 0 but V8 TypeErrors).
11940. Array or Array-like
11941. **comment:** Static call style.
label: code-design
11942. [offset fieldByteLength noAssert], when ftype == DUK_FLD_VARINT
11943. sign doesn't matter when writing
11944. Format of magic, bits: * 0...1: elem size shift (0-3) * 2...5: elem type (DUK_HBUFFEROBJECT_ELEM_xxx)
11945. **comment:** Slow gathering of value using either 64-bit arithmetic * or IEEE doubles if 64-bit types not available. Handling * of negative numbers is a bit non-obvious in both cases.
label: code-design
11946. Resolve start/end offset as element indices first; arguments * at idx_start/idx_end are element offsets. Working with element * indices first also avoids potential for wrapping.
11947. Write in little endian
11948. [targetBuffer targetStart sourceStart sourceEnd]
11949. source starts after dest ends

11950. * Misc helpers
11951. For TypedArrays 'undefined' return value is specified * by ES6 (matches V8).
11952. Check that value is a duk_hbufferobject and return a pointer to it.
11953. **comment:** Fill offset handling is more lenient than in Node.js.
 label: code-design
11954. byte sizes will match
11955. return h_bufres
11956. Must be element size multiple from * start offset to end of buffer.
11957. * Node.js Buffer: toString([encoding], [start], [end])
11958. We want to do a straight memory copy if possible: this is * an important operation because .set() is the TypedArray * way to copy chunks of memory. However, because set() * conceptually works in terms of elements, not all views are * compatible with direct byte copying. ** If we do manage a direct copy, the "overlap issue" handled * below can just be solved using memmove() because the source * and destination element sizes are necessarily equal.
11959. new buffer with string contents
11960. XXX: could add fast path for u8 compatible views
11961. A validated read() is always a number, so it's write coercion * is always side effect free and won't invalidate pointers etc.
11962. Slice offsets are element (not byte) offsets, which only matters * for TypedArray views, Node.js Buffer and ArrayBuffer have shift * zero so byte and element offsets are the same. Negative indices * are counted from end of slice, crossed indices are allowed (and * result in zero length result), and final values are clamped * against the current slice. There's intentionally no check * against the underlying buffer here.
11963. We could fit built-in index into magic but that'd make the magic * number dependent on built-in numbering (genbuiltins.py doesn't * handle that yet). So map both class and prototype from the * element type.
11964. bytes in dest
11965. Use byte copy.
11966. Argument variants. When the argument is an ArrayBuffer a view to * the same buffer is created; otherwise a new ArrayBuffer is always * created.
11967. Accept plain buffer values like array initializers * (new in Duktape 1.4.0).
11968. Shared lenient buffer length clamping helper. Indices are treated as * element indices (though output values are byte offsets) which only * really matters for TypedArray views as other buffer object have a zero * shift. Negative indices are counted from end of input slice; crossed * indices are clamped to zero length; and final indices are clamped * against input slice. Used for e.g. ArrayBuffer slice().
11969. 0xff => 255 - 256 = -1; 0x80 => 128 - 256 = -128
11970. DUK_FLD_16BIT
11971. Update 'buffer_length' to be the effective, safe limit which * takes into account the underlying buffer. This value will be * potentially invalidated by any side effect.
11972. xxx -> DUK_HBUFFEROBJECT_ELEM_INT32
11973. avoid side effects!
11974. Node.js accepts only actual Arrays.
11975. **comment:** XXX: regetting the pointer may be overkill - we're writing * to a side-effect free array here.
 label: code-design
11976. crossed offsets or zero size
11977. Must use memmove() because copy area may overlap (source and target * buffer may be the same, or from different slices).
11978. Gather in little endian
11979. unsigned
11980. We need 'nbytes' even for a failed offset; return value must be * (offset + nbytes) even when write fails due to invalid offset.
11981. **comment:** XXX: function flag to make this automatic?
 label: requirement
11982. XXX: happens e.g. when evaluating: String(Buffer.prototype).
11983. For all duk_hbufferobjects, get the plain buffer inside * without making a copy. This is compatible with Duktape 1.2 * but means that a slice/view information is ignored and the * full underlying buffer is returned. * If called as a constructor, a new Duktape.Buffer object * pointing to the same plain buffer is created below.
11984. DUK_FLD_VARINT; not relevant here
11985. Shared helper.
11986. **comment:** ArrayBuffer argument is handled specially above; the rest of the * argument variants are handled by shared code below.
 label: code-design
11987. Copy values by index reads and writes. Let virtual * property handling take care of coercion.
11988. Accept any duk_hbufferobject, though we're only normally * called for Duktape.Buffer values.
11989. idx_end
11990. may be NULL
11991. -> [buffer]
11992. [offset value littleEndian], when DUK_FLD_TYPEDARRAY (regardless of ftype)
11993. Node.js return value for noAssert out-of-bounds reads is * usually (but not always) NaN. Return NaN consistently.
11994. Copy values through direct validated reads and writes.
11995. Return the Buffer to allow chaining: b.fill(0x11).fill(0x22, 3, 5).toString()
11996. Gather in big endian
11997. compare: similar to string comparison but for buffer data.

12027. * Shared readfield and writefield methods * * The readfield/writefield methods need support for endianness and field * types. All offsets are byte based so no offset shifting is needed.

12028. not reachable

12029. * Node.js Buffer.prototype: toJSON()

12030. Check actual underlying buffers for validity and that they * cover the copy. No side effects are allowed after the check * so that the validity status doesn't change.

12031. length check

12032. We want to avoid making a copy to process set() but that's * not always possible: the source and the target may overlap * and because element sizes are different, the overlap cannot * always be handled with a memmove() or choosing the copy * direction in a certain way. For example, if source type is * uint8 and target type is uint32, the target area may exceed * the source area from both ends! * * Note that because external buffers may point to the same * memory areas, we must ultimately make this check using * pointers. * * NOTE: careful with side effects: any side effect may cause * a buffer resize (or external buffer pointer/length update)!

12033. There's no need to check for buffer validity status for the * target here: the property access code will do that for each * element. Moreover, if we did check the validity here, side * effects from reading the source argument might invalidate * the results anyway.

12034. Must be ≥ 0 and multiple of element size.

12035. * Duktape.Buffer: constructor

12036. Ready to make the copy. We must proceed element by element * and must avoid any side effects that might cause the buffer * validity check above to become invalid. * * Although we work through the value stack here, only plain * numbers are handled which should be side effect safe.

12037. * Constructor arguments are currently somewhat compatible with * (keep it that way if possible): * * <http://nodejs.org/api/buffer.html> * * Note that the ToBuffer() coercion (duk_to_buffer()) does NOT match * the constructor behavior.

12038. Handle single character fills as memset() even when * the fill data comes from a one-char argument.

12039. Just skip, leaving zeroes in the result.

12040. Equality may be OK but $>\text{length}$ not. Checking * this explicitly avoids some overflow cases * below.

12041. Byte length would overflow.

12042. Set .buffer

12043. equals

12044. We want to compare the slice/view areas of the arguments. * If either slice/view is invalid (underlying buffer is shorter) * ensure equals() is false, but otherwise the only thing that * matters is to be memory safe.

12045. **comment:** Format of magic, bits: * 0..1: field type; 0:uint8, 1:uint16, 2:uint32, 3=float, 4=double, 5=unused, 6=unused, 7=unused * 3: endianness: 0=little, 1=big * 4: signed: 1=yes, 0=no * 5: typedarray: 1=yes, 0=no
label: code-design

12046. Shared offset/length coercion helper.

12047. bytes in source

12048. Source end clamped silently to available length.

12049. **comment:** Internal class is Object: Object.prototype.toString.call(new Buffer(0)) * prints "[object Object]".
label: code-design

12050. elems in source and dest

12051. XXX: fast path for array arguments?

12052. either nonzero value is ok

12053. Handle TypedArray vs. Node.js Buffer arg differences

12054. Negative offsets cause a RangeError.

12055. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8CLAMPED * Note: INT8 is -not- copy compatible, e.g. -1 would coerce to 0x00.

12056. Shared lenient buffer length clamping helper. No negative indices, no * element/byte shifting.

12057. * Node.js Buffer.prototype.slice([start], [end]) * ArrayBuffer.prototype.slice(begin, [end]) * TypedArray.prototype.slice(begin, [end]) * * The API calls are almost identical; negative indices are counted from end * of buffer, and final indices are clamped (allowing crossed indices). Main * differences: * * - Copy/view behavior; Node.js .slice() and TypedArray .subarray() create * views, ArrayBuffer .slice() creates a copy * * - Resulting object has a different class and prototype depending on the * call (or 'this' argument) * * - TypedArray .subarray() arguments are element indices, not byte offsets

12058. offset/value order different from Node.js

12059. Node.js Buffer: return offset + #bytes written (i.e. next * write offset).

12060. Check that 'this' is a duk_hbufferobject and return a pointer to it * (NULL if not).

12061. ArrayBuffer: unlike any other argument variant, create * a view into the existing buffer.

12062. one i_step added at top of loop

12063. **comment:** unnecessary div for last byte
label: code-design

12064. **comment:** Serialize uncovered backing buffer as a null; doesn't * really matter as long we're memory safe.
label: code-design

12065. Ensure copy is covered by underlying buffers.

12066. At the moment Buffer(<str>) will just use the string bytes as * is (ignoring encoding), so we return the string length here * unconditionally.

12067. **comment:** Node.js Buffer variable width integer field. We don't really * care about speed here, so aim for shortest algorithm.
label: code-design

12068. **comment:** XXX: accept any duk_hbufferobject type as an input also?
label: code-design

12069. User totalLength overrides a computed length, but we'll check * every copy in the copy loop. Note that duk_to_uint() can * technically have arbitrary side effects so we need to recheck * the buffers in the copy loop.

12070. * ArrayBuffer, DataView, and TypedArray constructors

12071. guaranteed by duk_to_string()

12072. Map DUK_HBUFFEROBJECT_ELEM_xxx to prototype object built-in index. * Sync with duk_hbufferobject.h

12073. -> [array totalLength buf]

12074. source ends before dest starts

12075. Bitfield for each DUK_HBUFFEROBJECT_ELEM_xxx indicating which element types * are compatible with a blind byte copy for the TypedArray set() method (also * used for TypedArray constructor). Array index is target buffer elem type, * bitfield indicates compatible source types. The types must have same byte * size and they must be coercion compatible.

12076. source out-of-bounds (but positive)

12077. Map DUK_FLX_xxx to byte size.

12078. **comment:** The DataView .buffer property is ordinarily set to the argument * which is an ArrayBuffer. We accept any duk_hbufferobject as * an argument and .buffer will be set to the argument regardless * of what it is. This may be a bit confusing if the argument * is e.g. a DataView or another TypedArray view. * * XXX: Copy .buffer property from a DataView/TypedArray argument? * Create a fresh ArrayBuffer for Duktape.Buffer and Node.js Buffer * arguments? See: test-bug-dataview-buffer-prop.js.
label: code-design

12079. **comment:** XXX: split into separate functions for each field type
label: code-design

12080. [start end]

12081. [array totalLength bufres buf]
12082. Offset is coerced first to signed integer range and then to unsigned. * This ensures we can add a small byte length (1-8) to the offset in * bound checks and not wrap.
12083. one i_step over
12084. default to false
12085. Unlike for negative arguments, some call sites * want length to be clamped if it's positive.
12086. For n == 0, Node.js ignores totalLength argument and * returns a zero length buffer.
12087. Return value is like write(), number of bytes written. * The return value matters because of code like: * "off += buf.copy(...)".
12088. xxx -> DUK_HBUFFEROBJECT_ELEM_INT8
12089. xxx -> DUK_HBUFFEROBJECT_ELEM_INT16
12090. These are not needed when only Duktape.Buffer is supported.
12091. DUK_FLD_FLOAT
12092. undefined coerces to zero which is correct
12093. Copy values, the copy method depends on the arguments. * * Copy mode decision may depend on the validity of the underlying * buffer of the source argument; there must be no harmful side effects * from there to here for copy_mode to still be valid.
12094. DUK_FLD_DOUBLE
12095. Map DUK_HBUFFEROBJECT_ELEM_xxx to duk_hobject class number. * Sync with duk_hbufferobject.h and duk_hobject.h.
12096. xxx -> DUK_HBUFFEROBJECT_ELEM_FLOAT32
12097. [offset littleEndian], when DUK_FLD_TYPEDARRAY (regardless of ftype)
12098. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT8
12099. even for zero-length string
12100. xxx -> DUK_HBUFFEROBJECT_ELEM_UINT16
12101. new buffer of specified size
12102. pop plain buffer, now reachable through h_bufres
12103. Node.js return value for failed writes is offset + #bytes * that would have been written.
12104. DUK_USE_BUFFEROBJECT_SUPPORT
12105. Custom behavior: plain buffer is used as internal buffer * without making a copy (matches Duktape.Buffer).
12106. ignore_loop
12107. Shift to sign extend.
12108. No copy, leave zero bytes in the buffer. There's no * ambiguity with Float32/Float64 because zero bytes also * represent 0.0.
12109. **comment:** XXX: for negative input offsets, 'offset' will be a large * positive value so the result here is confusing.
 label: code-design
12110. no overflow
12111. **comment:** Copy the .buffer property, needed for TypedArray.prototype.subarray(). * * XXX: limit copy only for TypedArray classes specifically?
 label: code-design
12112. stack is unbalanced, but: [<something> buf]
12113. **comment:** The condition could be more narrow and check for the * copy area only, but there's no need for fine grained * behavior when the underlying buffer is misconfigured.
 label: code-design
12114. Set .buffer to the argument ArrayBuffer.
12115. **comment:** unnecessary shift for last byte
 label: code-design
12116. **comment:** Slow writing of value using either 64-bit arithmetic * or IEEE doubles if 64-bit types not available. There's * no special sign handling when writing varints.
 label: code-design
12117. * ArrayBuffer.isView()
12118. **comment:** XXX: easier check with less code?
 label: code-design
12119. **comment:** The resulting buffer object gets the same class and prototype as * the buffer in 'this', e.g. if the input is a Node.js Buffer the * result is a Node.js Buffer; if the input is a Float32Array, the * result is a Float32Array. * * For the class number this seems correct. The internal prototype * is not so clear: if 'this' is a bufferobject with a non-standard * prototype object, that value gets copied over into the result * (instead of using the standard prototype for that object type).
 label: code-design
12120. return input buffer, converted to a Duktape.Buffer object * if called as a constructor (no change if called as a * function).
12121. * Indexed read/write helpers (also used from outside this file)
12122. * Node.js Buffer: constructor
12123. Write in big endian
12124. replaced
12125. * Node.js Buffer.byteLength()
12126. non-zero: make copy
12127. There's overlap: the desired end result is that * conceptually a copy is made to avoid "trampling" * of source data by destination writes. We make * an actual temporary copy to handle this case.
12128. Note: unbalanced stack on purpose
12129. Copy slice, respecting underlying buffer limits; remainder * is left as zero.
12130. Nominal size check.
12131. Coerce value to a number before computing check_length, so that * the field type specific coercion below can't have side effects * that would invalidate check_length.
12132. **comment:** Neutered checks not necessary here: neutered buffers have * zero 'length' so we'll effectively skip them.
 label: code-design
12133. Check that 'this' is a duk_hbufferobject and return a pointer to it.
12134. **comment:** XXX: The duk_to_number() cast followed by integer coercion * is platform specific so NaN, +/- Infinity, and out-of-bounds * values result in platform specific output now. * See: test-bi-nodejs-buffer-proto-varint-special.js
 label: code-design
12135. as elements
12136. Argument must be a string, e.g. a buffer is not allowed.
12137. target out-of-bounds (but positive)
12138. unbalanced stack on purpose
12139. Compute result length and validate argument buffers.
12140. only accept lowercase 'utf8' now.
12141. Cannot overlap.
12142. Convert indices to byte offsets.
12143. no need to decref
12144. [... this]
12145. stack top: new time value, return 1 to allow tail calls
12146. Convert day from one-based to zero-based (internal). This may * cause the day part to be negative, which is OK.
12147. 3
12148. Apply timezone offset to get the main parts in UTC
12149. **comment:** XXX: there is a small risk here: because the ISO 8601 parser is * very loose, it may end up parsing some datetime values which * would be better parsed with a platform specific parser.

label: code-design

12150. 8: getFullYear
12151. now expected to fit into a 32-bit integer
12152. All components default to 0 except day-of-month which defaults * to 1. However, because our internal day-of-month is zero-based, * it also defaults to zero here.
12153. MakeDate
12154. 37: setUTCFullYear
12155. * Return $(t - \text{LocalTime}(t))$ in minutes: * * $t - \text{LocalTime}(t) = t - (t + \text{LocalTZA} + \text{DaylightSavingTA}(t)) * = -(\text{LocalTZA} + \text{DaylightSavingTA}(t))$ * * where DaylightSavingTA() is checked for time 't'. * * Note that the sign of the result is opposite to common usage, * e.g. for EE(S)T which normally is +2h or +3h from UTC, this * function returns -120 or -180. *
12156. Integer division which floors also negative values correctly.
12157. `""`-
12158. invalid value which never matches
12159. 7
12160. estimate year upwards (towards positive infinity), then back down; * two iterations should be enough
12161. Helper for string conversion calls: check 'this' binding, get the * internal time value, and format date and/or time in a few formats. * Return value allows tail calls.
12162. Here we'd have the option to normalize -0 to +0.
12163. $\rightarrow [\text{O} \text{ toISOString O}]$
12164. $\rightarrow [\text{timeval this} \text{ timeval }]$
12165. Optional UTC conversion.
12166. Note: %06d for positive value, %07d for negative value to include * sign and 6 digits.
12167. Internal timevalue is already NaN, so don't touch it.
12168. 5: toLocaleTimeString
12169. Old solution: don't iterate, incorrect
12170. 38: getYear
12171. 6
12172. * Other file level defines
12173. zero-based \rightarrow one-based
12174. called as a normal function: return new Date().toString()
12175. * ISO 8601 subset parser.
12176. 39: setYear
12177. Rule control flags.
12178. 1: toDateString
12179. E5.1 Section 15.9.1.6
12180. tzoffset seconds are dropped; 16 bits suffice for * time offset in minutes
12181. if-digit-else-ctrl
12182. Causes a ToNumber() coercion, but doesn't break coercion order since * year is coerced first anyway.
12183. Unlike most built-ins, the internal [[PrimitiveValue]] of a Date * is mutable.
12184. Parts are in local time, convert when setting.
12185. **comment:** * String/JSON conversions * * Human readable conversions are now basically ISO 8601 with a space * (instead of 'T') as the date/time separator. This is a good baseline * and is platform independent. * * A shared native helper to provide many conversions. Magic value contains * a set of flags. The helper provides: * * $\text{toString}()$ * $\text{toDateString}()$ * $\text{toTimeString}()$ * $\text{toLocaleString}()$ * $\text{toLocaleDateString}()$ * $\text{toLocaleTimeString}()$ * $\text{toUTCString}()$ * $\text{toISOString}()$ * * Notes: * * - Date.prototype.toGMTString() and Date.prototype.toUTCString() are * required to be the same EcmaScript function object (!), so it is * omitted from here. * * - Date.prototype.toUTCString(): E5.1 specification does not require a * specific format, but result should be human readable. The * specification suggests using ISO 8601 format with a space (instead of 'T') separator if a more human readable format is not available. * * - Date.prototype.toISOString(): unlike other conversion functions, * $\text{toISOString}()$ requires a RangeError for invalid date values.
label: code-design
12186. $\rightarrow [\dots \text{ this}]$
12187. 16: getHours
12188. Note2
12189. char loop
12190. 33: setUTCDate
12191. 25: setUTCMilliseconds
12192. Use explicit steps in computation to try to ensure that * computation happens with intermediate results coerced to * double values (instead of using something more accurate). * E.g. E5.1 Section 15.9.1.11 requires use of IEEE 754 * rules (= EcmaScript '+' and '*' operators). * * Without 'volatile' even this approach fails on some platforms * and compiler combinations. For instance, gcc 4.8.1 on Ubuntu * 64-bit, with -m32 and without -std=c99, test-bi-date-canceling.js * would fail because of some optimizations when computing tmp_time * (MakeTime below). Adding 'volatile' to tmp_time solved this * particular problem (annoyingly, also adding debug prints or * running the executable under valgrind hides it).
12193. match against rule part/sep bits
12194. Coerce all finite parts with ToInteger(). ToInteger() must not * be called for NaN/Infinity because it will convert e.g. NaN to * zero. If ToInteger() has already been called, this has no side * effects and is idempotent. * * Don't read dparts[DUK_DATE_IDX_WEEKDAY]; it will cause Valgrind * issues if the value is uninitialized.
12195. NaN timevalue: we need to coerce the arguments, but * the resulting internal timestamp needs to remain NaN. * This works but is not pretty: parts and dparts will * be partially uninitialized, but we only write to them.
12196. Rule table: first matching rule is used to determine what to do next.
12197. flags
12198. fits into duk_small_int_t
12199. 'out_buf' must be at least DUK_BI_DATE_ISO8601_BUFSIZE long.
12200. formatters always get one-based month/day-of-month
12201. Setter APIs detect special year numbers (0...99) and apply a +1900 * only in certain cases. The legacy getYear() getter applies -1900 * unconditionally.
12202. 2: toTimeString
12203. **comment:** TimeClip() should never be necessary
label: code-design
12204. continue matching, set neg_tzoffset flag
12205. $\rightarrow [\dots \text{ timeval_new}]$
12206. 30: setHours
12207. TimeClip(), which also handles Infinity \rightarrow NaN conversion
12208. unsigned
12209. zero-based day
12210. 34: setMonth
12211. Note: rely on index ordering
12212. Parser part masks.
12213. 20: getSeconds
12214. Expects 'this' at top of stack on entry.
12215. 28: setMinutes
12216. $t1 = \text{milliseconds}$ within day (fits 32 bit) * $t2 = \text{day number from epoch}$ (fits 32 bit, may be negative)
12217. * Indirect magic value lookup for Date methods. * * Date methods don't put their control flags into the function magic value * because they wouldn't fit into a LIGHFUNC's magic field. Instead, the * magic value is set to an index pointing to the array of control flags * below. * * This must be kept in strict sync with genbuiltins.py!

12218. Day-of-month is one-based in the API, but zero-based * internally, so fix here. Note that month is zero-based * both in the API and internally.
12219. 1
12220. * Determining which datetime components to overwrite based on * stack arguments is a bit complicated, but important to factor * out from setters themselves for compactness. ** If DUK_DATE_FLAG_TIMESETTER, maxnargs indicates setter type: ** 1 -> millisecond * 2 -> second, [millisecond] * 3 -> minute, [second], [millisecond] * 4 -> hour, [minute], [second], [millisecond] ** Else: ** 1 -> date * 2 -> month, [date] * 3 -> year, [month], [date] ** By comparing nargs and maxnargs (and flags) we know which * components to override. We rely on part index ordering.
12221. zero-based month
12222. Parser part count.
12223. 6: toUTCString
12224. no argument given -> leave components untouched
12225. msec
12226. Compute time value from (double) parts. The parts can be either UTC * or local time; if local, they need to be (conceptually) converted into * UTC time. The parts may represent valid or invalid time, and may be * wildly out of range (but may cancel each other and still come out in * the valid Date range).
12227. Matching separator index is used in the control table
12228. don't care value, year is mandatory
12229. **comment:** * Date built-ins ** Unlike most built-ins, Date has some platform dependencies for getting * UTC time, converting between UTC and local time, and parsing and * formatting time values. These are all abstracted behind DUK_USE_xxx * config options. There are built-in platform specific providers for * POSIX and Windows, but external providers can also be used. ** See doc/datetime.rst.

12271. 32: setDate
12272. Note: DST adjustment is determined using UTC time. * If 'd' is NaN, tzoffset will be 0.
12273. **comment:** XXX: idx_val would fit into 16 bits, but using duk_small_uint_t * might not generate better code due to casting.
label: code-design
12274. 7: toISOString
12275. **comment:** * Setters. ** Setters are a bit more complicated than getters. Component setters * break down the current time value into its (normalized) component * parts, replace one or more components with -unnormalized- new values, * and the components are then converted back into a time value. As an * example of using unnormalized values: ** var d = new Date(1234567890); ** is equivalent to: ** var d = new Date(0); * d.setUTCSeconds(1234567890); ** A shared native helper to provide almost all setters. Magic value * contains a set of flags and also packs the "maxnargs" argument. The * helper provides: ** setMilliseconds() * setUTCSeconds() * setSeconds() * setUTCSeconds() * setMinutes() * setUTCMinutes() * setHours() * setUTCHours() * setDate() * setUTCDate() * setMonth() * setUTCMonth() * setFullYear() * setUTCFullYear() * setYear() * Notes: ** - Date.prototype.setYear() (Section B addition): special year check * is omitted. NaN / Infinity will just flow through and ultimately * result in a NaN internal time value. ** - Date.prototype.setYear() does not have optional arguments

for * setting month and day-in-month (like setFullYear()), but we indicate * 'maxnargs' to be 3 to get the year written to the correct component * index in duk__set_part_helper(). The function has nargs == 1, so only * the year will be set regardless of actual argument count.

label: code-design

12276. 13: getUTCDate

12277. No locale specific formatter; this is OK, we fall back * to ISO 8601.

12278. 2

12279. Maximum iteration count for computing UTC-to-local time offset when * creating an Ecmascript time value from local parts.

12280. Assume that year, month, day are all coerced to whole numbers. * They may also be NaN or infinity, in which case this function * must return NaN or infinity to ensure time value becomes NaN. * If 'day' is NaN, the final return will end up returning a NaN, * so it doesn't need to be checked here.

12281. 23: getUTCMilliseconds

12282. -> [timeval this]

12283. We should never exit the loop above.

12284. e.g. a = -4, b = 5 --> -4 - 5 + 1 / 5 --> -8 / 5 --> -1 * a = -5, b = 5 --> -5 - 5 + 1 / 5 --> -9 / 5 --> -1 * a = -6, b = 5 --> -6 - 5 + 1 / 5 --> -10 / 5 --> -2

12285. Parser separator indices.

12286. -> [... this timeval_new timeval_new]

12287. "-1234560"

12288. rule match

12289. deal with negative values

12290. 10: getMonth

12291. * Calendar helpers * * Some helpers are used for getters and can operate on normalized values * which can be represented with 32-bit signed integers. Other helpers are * needed by setters and operate on un-normalized double values, must watch * out for non-finite numbers etc.

12292. **comment:** Debug macro to print all parts and dparts (used manually because of debug level).

label: code-design

12293. Unlike year, the other parts fit into 16 bits so %d format * is portable.

12294. * Date/time parsing helper. * * Parse a datetime string into a time value. We must first try to parse * the input according to the standard format in E5.1 Section 15.9.1.15. * If that fails, we can try to parse using custom parsing, which can * either be platform neutral (custom code) or platform specific (using * existing platform API calls). * * Note in particular that we must parse whatever toString(), toUTCString(), * and toISOString() can produce; see E5.1 Section 15.9.4.2. * * Returns 1 to allow tail calling. * * There is much room for improvement here with respect to supporting * alternative datetime formats. For instance, V8 parses '2012-01-01' as * UTC and '2012/01/01' as local time.

12295. unpack args

12296. Set timeval to 'this' from dparts, push the new time value onto the * value stack and return 1 (caller can then tail call us). Expects * the value stack to contain 'this' on the stack top.

12297. Given a day number, determine year and day-within-year.

12298. Parser separator masks.

12299. Equivalent year mapping, used to avoid DST trouble when platform * may fail to provide reasonable DST answers for dates outside the * ordinary range (e.g. 1970-2038). An equivalent year has the same * leap-year-ness as the original year and begins on the same weekday * (Jan 1). * * The year 2038 is avoided because there seem to be problems with it * on some platforms. The year 1970 is also avoided as there were * practical problems with it; an equivalent year is used for it too, * which breaks some DST computations for 1970 right now, see e.g. * test-bi-date-tzoffset-brute-fi.js.

12300. * Helper to format a time value into caller buffer, used by logging. * 'out_buf' must be at least DUK_BI_DATE_ISO8601_BUFSIZE long.

12301. * Constructor calls

12302. Helper for component setter calls: check 'this' binding, get the * internal time value, split it into parts (either as UTC time or * local time), modify one or more components as specified, recompute * the time value, set it as the internal value. Finally, push the * new time value as a return value to the value stack and return 1 * (caller can then tail call us).

12303. ignore millisecond fractions after 3

12304. try locale specific formatter; if it refuses to format the * string, fall back to an ISO 8601 formatted value in local * time.

12305. 15: getUTCDate

12306. This assert depends on the input parts representing time inside * the Ecmascript range.

12307. **comment:** XXX: getter with class check, useful in built-ins

label: code-design

12308. get as double to handle huge numbers correctly

12309. these computations are guaranteed to be exact for the valid * E5 time value range, assuming milliseconds without fractions.

12310. if no NaN handling flag, may still be NaN here, but not Inf

12311. 0: toString

12312. 26: setSeconds

12313. Split time value into parts. The time value is assumed to be an internal * one, i.e. finite, no fractions. Possible local time adjustment has already * been applied when reading the time value.

12314. Because 'day since epoch' can be negative and is used to compute weekday * using a modulo operation, add this multiple of 7 to avoid negative values * when year is below 1970 epoch. Ecmascript time values are restricted to * +/- 100 million days from epoch, so this adder fits nicely into 32 bits. * Round to a multiple of 7 (= floor(100000000 / 7) * 7) and add margin.

12315. Contract, either: * - Push string to value stack and return 1 * - Don't push anything and return 0

12316. 19: getUTCMilliseconds

12317. 14: getDay

12318. **comment:** Note: this is very tricky; we must never 'overshoot' the * correction downwards.

label: code-design

12319. * Forward declarations

12320. conservative

12321. Note: in integer arithmetic, (x / 4) is same as floor(x / 4) for non-negative * values, but is incorrect for negative ones.

12322. Compute day number of the first day of a given year.

12323. 29: setUTCMilliseconds

12324. Behavior for nargs < 2 is implementation dependent: currently we'll * set a NaN time value (matching V8 behavior) in this case.

12325. "+11:22:0"

12326. Note: toJSON() is a generic function which works even if 'this' * is not a Date. The sole argument is ignored.

12327. **comment:** Two value cycle, see e.g. test-bi-date-tzoffset-basic-fi.js. * In these cases, favor a higher tzoffset to get a consistent * result which is independent of iteration count. Not sure if * this is a generically correct solution.

label: code-design

12328. complete the millisecond field

12329. * Getters. * * Implementing getters is quite easy. The internal time value is either * NaN, or represents milliseconds (without fractions) from Jan 1, 1970. * The internal time value can be converted to integer parts, and each * part will be normalized and will fit into a 32-bit signed integer. * * A shared native helper to provide all getters. Magic value contains * a set of flags and also packs the date component index argument. The * helper provides: * * getFullYear() * getUTCFullYear() * getMonth() * getUTCMonth() * getDate() * getUTCDate() * getDay() * getUTCDay() * getHours() * getUTCHours() * getMinutes() * getUTCMilliseconds() * getSeconds() * getUTCSeconds() * getMilliseconds() * getUTCMinutes() * getYear() * * Notes: * * - Date.prototype.getDate(): 'date' means day-of-month, and is * zero-based in internal calculations but public API expects it to * be one-based. * * - Date.prototype.getTime() and Date.prototype.valueOf() have identical * behavior. They have separate function objects, but share the same C * function (duk.bi.date.prototype.valueOf).

12381. Get current Ecmascript time (= UNIX/Posix time, but in milliseconds).
12382. UTC
12383. * This is a bit tricky to implement portably. The result depends * on the timestamp (specifically, DST depends on the timestamp). * If e.g. UNIX APIs are used, they'll have portability issues with * very small and very large years. * * Current approach: * * - Stay within portable UNIX limits by using equivalent year mapping. * Avoid year 1970 and 2038 as some conversions start to fail, at * least on some platforms. Avoiding 1970 means that there are * currently DST discrepancies for 1970. * * - Create a UTC and local time breakdowns from 't'. Then create * a time_t using gmtime() and localtime() and compute the time * difference between the two. * * Equivalent year mapping (E5 Section 15.9.1.8): * * If the host environment provides functionality for determining * daylight saving time, the implementation of ECMAScript is free * to map the year in question to an equivalent year (same * leap-year-ness and same starting week day for the year) for which * the host environment provides daylight saving time information. * The only restriction is that all equivalent years should produce * the same result. * * This approach is quite reasonable but not entirely correct, e.g. * the specification also states (E5 Section 15.9.1.8): * * The implementation of ECMAScript should not try to determine * whether the exact time was subject to daylight saving time, but * just whether daylight saving time would have been in effect if * the _current daylight saving time algorithm_ had been used at the * time. This avoids complications such as taking into account the * years that the locale observed daylight saving time year round. * * Since we rely on the platform APIs for conversions between local * time and UTC, we can't guarantee the above. Rather, if the platform * has historical DST rules they will be applied. This seems to be the * general preferred direction in Ecmascript standardization (or at least * implementations) anyway, and even the equivalent year mapping should * be disabled if the platform is known to handle DST properly for the * full Ecmascript range. * * The following has useful discussion and links: * * https://bugzilla.mozilla.org/show_bug.cgi?id=351066

12777. All other object types.
12778. * Helper tables
12779. Flag handling currently assumes that flags are consistent. This is OK * because the call sites are now strictly controlled.
12780. **comment:** XXX: duplicates should be eliminated here
label: code-design
12781. **comment:** In compatible mode and standard JSON mode, output * something useful for non-BMP characters. This won't * roundtrip but will still be more or less readable and * more useful than an error.
label: code-design
12782. error message doesn't matter, ignored anyway
12783. must not truncate
12784. negative top-relative indices not allowed now
12785. Encode a fastint from duk_tval ptr, no value stack effects.
12786. avoid attempt to compact any objects
12787. Ensure space for 1:1 output plus one escape.
12788. **comment:** XXX: Could just lookup .toJSON() and continue in fast path, * as it would almost never be defined.
label: code-design
12789. DUK_USE_JSON_DECSTRING_FASTPATH
12790. [... number]-> [... string]
12791. **comment:** XXX: share helper from lexer; duk_lexer.c / hexval().
label: code-design
12792. **comment:** We've ensured space for one escaped input; then * bail out and recheck (this makes escape handling * quite slow but it's uncommon).
label: code-design
12793. **comment:** Use recursion_limit to ensure we don't overwrite js_ctx->visiting[] * array so we don't need two counter checks in the fast path. The * slow path has a much larger recursion limit which we'll use if * necessary.
label: code-design

12794. Recursive value reviver, implements the Walk() algorithm. No C recursion * check is done here because the initial parsing step will already ensure * there is a reasonable limit on C recursion depth and hence object depth.

12795. Note: space must cater for both JX and JC.

12796. **comment:** Indent helper. Calling code relies on js_ctx->recursion_depth also being * directly related to indent depth.
label: code-design

12797. temp copy, write back for next loop

12798. [... buf loop (proplist)]

12799. unsigned

12800. but don't allow leading plus

12801. **comment:** XXX: Here a "slice copy" would be useful.
label: code-design

12802. 0x00: finish (not part of number) * 0x01: continue

12803. -> [... val root ""]

12804. [... holder name val enum obj_key val obj_key]

12805. "-Infinity", '-' has been eaten

12806. JSON parsing code is allowed to read [p_start,p_end]: p_end is * valid and points to the string NUL terminator (which is always * guaranteed for duk_hstrings).

12807. Could also rely on native sprintf(), but it will handle * values like NaN, Infinity, -0, exponent notation etc in * a JSON-incompatible way.

12808. original target at entry_top - 1

12809. catches EOF and invalid digits

12810. safe, because matched (NUL causes a break)

12811. not emitted

12812. [... arr val]

12813. maxval

12814. To handle deeper indents efficiently, make use of copies we've * already emitted. In effect we can emit a sequence of 1, 2, 4, * 8, etc copies, and then finish the last run. Byte counters * avoid multiply with gap_len on every loop.

12815. Must prevent finalizers which may have arbitrary side effects.

12816. expensive flag

12817. Accept ASCII strings which conform to identifier requirements * as being emitted without key quotes. Since we only accept ASCII * there's no need for actual decoding: 'p' is intentionally signed * so that bytes >= 0x80 extend to negative values and are rejected * as invalid identifier codepoints.

12818. The stack has a variable shape here, so force it to the * desired one explicitly.

12819. The Str(key, holder) operation. ** Stack policy: [... key] -> [...]

12820. -> [... holder name val new_elem]

12821. NUL term or -1 (EOF), NUL check would suffice

12822. proplist is very rare

12823. DUK_USE_JC

12824. -> [... key val replacer holder key val]

12825. Decode a plain string consisting entirely of identifier characters. * Used to parse plain keys (e.g. "foo: 123").

12826. **comment:** 0x00 ... 0x7f: as is * 0x80: escape generically * 0x81: slow path * 0xa0 ... 0xff: backslash + one char
label: code-design

12827. -> [...]

12828. -> [... key val toJSON val key]

12829. Caller ensures space for at least DUK_JSON_MAX_ESC_LEN.

12830. Zero length string is not accepted without quotes

12831. Getter might have arbitrary side effects, * so bail out.

12832. nret

12833. Negative zero needs special handling in JX/JC because * it would otherwise serialize to '0', not '-0'.

12834. -> [... voidp voidp]

12835. [... holder name val enum obj_key new_elem]

12836. Disabled until fixed, see above.

12837. Error message doesn't matter: the error is ignored anyway.

12838. -> [... key val']

12839. Value would normally be omitted, replace with 'null'.

12840. Value would yield 'undefined', so skip key altogether. * Side effects have already happened.

12841. XXX: array internal?

12842. For JX, expressing the whole unsigned 32-bit range matters.

12843. Caller must ensure 'tv' is indeed a fastint!

12844. safe

12845. will result in undefined

12846. **comment:** Execute the fast path in a protected call. If any error is thrown, * fall back to the slow path. This includes e.g. recursion limit * because the fast path has a smaller recursion limit (and simpler, * limited loop detection).
label: code-design

12847. typed for duk_unicode_decode_xutf8()

12848. **comment:** XXX: Would be nice to share the fast path loop from duk_hex_decode() * and avoid creating a temporary buffer. However, there are some * differences which prevent trivial sharing: ** - Pipe char detection * - EOF detection * - Unknown length of input and output ** The best approach here would be a bufwriter and a reasonably sized * safe inner loop (e.g. 64 output bytes at a time).
label: code-design

12849. Once recursion depth is increased, exit path must decrease * it (though it's OK to abort the fast path).

12850. If object has a .toJSON() property, we can't be certain * that it wouldn't mutate any value arbitrarily, so bail * out of the fast path. ** If an object is a Proxy we also can't avoid side effects * so abandon.

12851. **comment:** Unlike in duk_hex_encode() 'dst' is not necessarily aligned by 2. * For platforms where unaligned accesses are not allowed, shift 'dst' * ahead by 1 byte to get alignment and then DUK_MEMMOVE() the result * in place. The faster encoding loop makes up the difference. * There's always space for one extra byte because a terminator always * follows the hex data and that's been accounted for by the caller.
label: code-design

12852. catches EOF (NUL)

12853. The code below is incorrect if .toString() or .valueOf() have * have been overridden. The correct approach would be to look up * the method(s) and if they resolve to the built-in function we * can safely bypass it and look up the internal value directly. * Unimplemented for now, abort fast path for boxed values.

12854. accept comma, expect new value

12855. Array part may be larger than 'length'; if so, iterate * only up to array 'length'.

12856. -> [... reviver holder name val]

12857. [... holder name val]

12858. We rely on a few object flag / class number relationships here, * assert for them.

12859. Standard JSON omits functions

12860. unreachable

12861. nargs

12862. The JA(value) operation: encode array. ** Stack policy: [array] -> [array].

12863. x == 0x00 (EOF) causes syntax_error

12864. **comment:** XXX: move masks to js_ctx? they don't change during one * fast path invocation.
label: code-design

12865. Note: duk__dec_req_stridx() backtracks one char
12866. -> [... key val toJSON val]
12867. Here the specification requires correct array index enumeration * which is a bit tricky for sparse arrays (it is handled by the * enum setup code). We now enumerate ancestors too, although the * specification is not very clear on whether that is required.
12868. First pass parse is very lenient (e.g. allows '1.2.3') and extracts a * string for strict number parsing.
12869. -> [... key val]
12870. 0x00: slow path * other: as is
12871. value was undefined/unsupported
12872. **comment:** spaces[] must be static to allow initializer with old compilers like BCC
 label: code-design
12873. Ordinary gap, undefined encodes to 'null' in * standard JSON (and no JX/JC support here now).
12874. Conceptually we'd extract the plain underlying buffer * or its slice and then do a type mask check below to * see if we should reject it. Do the mask check here * instead to avoid making a copy of the buffer slice.
12875. * JSON.stringify() fast path ** Otherwise supports full JSON, JX, and JC features, but bails out on any * possible side effect which might change the value being serialized. The * fast path can take advantage of the fact that the value being serialized * is unchanged so that we can walk directly through property tables etc.
12876. **comment:** XXX: helper
 label: code-design
12877. coerce in-place
12878. Number serialization has a significant impact relative to * other fast path code, so careful fast path for fastints.
12879. [... num]
12880. * Entry points
12881. Caller has already eaten the first character '(' which we don't need.
12882. C recursion check.
12883. standard JSON; array gaps
12884. catches EOF (0x00)
12885. **comment:** XXX: refactor into an internal helper, pretty awkward
 label: code-design
12886. EOF (-1) will be cast to an unsigned value first * and then re-cast for the switch. In any case, it * will match the default case (syntax error).
12887. idx_space
12888. Normal object which doesn't get automatically coerced to a * primitive value. Functions are checked for specially. The * primitive value coercions for Number, String, Pointer, and * Boolean can't result in functions so suffices to check here.
12889. -> [... val']
12890. Caller must ensure 'tv' is indeed a double and not a fastint!
12891. Must set 'length' explicitly when using duk_xdef_prop_xxx() to * set the values.
12892. Caller has already eaten the first character ('|') which we don't need.
12893. Shared entry handling for object/array serialization.
12894. **comment:** XXX: There are no format strings in duk_config.h yet, could add * one for formatting duk_int64_t. For now, assumes "%lld" and that * "long long" type exists. Could also rely on C99 directly but that * won't work for older MSVC.
 label: code-design
12895. Previous entry was inside visited[], nothing to do.
12896. slow path decode
12897. We come here for actual aborts (like encountering .toJSON()) * but also for recursion/loop errors. Bufwriter size can be * kept because we'll probably need at least as much as we've * allocated so far.
12898. **comment:** This fast path is pretty marginal in practice. * XXX: candidate for removal.

12900. **comment:** XXX: substring in-place at idx_place?
 label: code-design
12901. * Process replacer/proplist (2nd argument to JSON.stringify)
12902. Gap in array; check for inherited property, * bail out if one exists. This should be enough * to support gappy arrays for all practical code.
12903. handle comma and closing brace
12904. '-0'
12905. * Process space (3rd argument to JSON.stringify)
12906. caller checks
12907. [... holder name val enum obj_key]
12908. XXX: duk_dup_unvalidated(ctx, -2) etc.
12909. accept anything, expect first value (EOF will be * caught by key parsing below).
12910. First character has already been eaten and checked by the caller. * We can scan until a NUL in stridx string because no built-in strings * have internal NULs.
12911. Assume that the native representation never contains a closing * parenthesis.
12912. **comment:** XXX: duk_xdef_prop_index_wec() would be more appropriate * here but it currently makes some assumptions that might * not hold (e.g. that previous property is not an accessor).
 label: code-design
12913. get_value
12914. -> [... res]
12915. Initial '{' has been checked and eaten by caller.
12916. [... key]
12917. **comment:** This seems faster than emitting bytes one at a time and * then potentially rewinding.
 label: code-design
12918. pop enum
12919. DUK_USE_JSON_STRINGIFY_FASTPATH
12920. leave stack unbalanced on purpose
12921. Most input bytes go through here.
12922. -> [... holder name val]
12923. [... buf loop (proplist) (gap)]
12924. disabled for now
12925. extra coercion of strings is OK
12926. ascii fast path: avoid decoding utf-8
12927. We only get here when doing non-standard JSON encoding
12928. idx_replacer
12929. Handle both full and partial slice (as long as covered).
12930. End of input (NUL) goes through slow path and causes SyntaxError.
12931. Assume arrays are dense in the fast path.
12932. handle comma and closing bracket
12933. Maximum expansion per input byte is 6: * - invalid UTF-8 byte causes "\uXXXX" to be emitted (6/1 = 6). * - 2-byte UTF-8 encodes as "\uXXXX" (6/2 = 3). * - 4-byte UTF-8 encodes as "\Uxxxxxxxx" (10/4 = 2.5).
12934. **comment:** XXX: keys is an internal object with all keys to be processed * in its (gapless) array part. Because nobody can touch the keys * object, we could iterate its array part directly (keeping in mind * that it can be reallocated).
 label: code-design

12935. need_bytes may be zero
12936. clamp to 10 chars
12937. A lightfunc might also inherit a .toJSON() so just bail out.
12938. **comment:** XXX: Stack discipline is annoying, could be changed in numconv.
 label: code-design
12939. XXX: A fast path for usual integers would be useful when * fastint support is not enabled.
12940. We could use a switch-case for the class number but it turns out * a small if-else ladder on class masks is better. The if-ladder * should be in order of relevancy.
12941. **comment:** This approach is a bit shorter than a straight * if-else-ladder and also a bit faster.
 label: code-design
12942. **comment:** XXX: for real world code, could just ignore array inheritance * and only look at array own properties.
 label: code-design
12943. This loop intentionally does not ensure characters are valid * ([0-9a-fA-F]) because the hex decode call below will do that.
12944. -> [... key val replacer holder]
12945. Select appropriate escape format automatically, and set 'tmp' to a * value encoding both the escape format character and the nybble count: * * (nybble_count << 16) | (escape_char1) | (escape_char2)
12946. * Fast path: assume no mutation, iterate object property tables * directly; bail out if that assumption doesn't hold.
12947. [... holder key] -> [... holder]
12948. **comment:** Fastint range is signed 48-bit so longest value is $-2^{47} = -140737488355328$ * (16 chars long), longest signed 64-bit value is $-2^{63} = -9223372036854775808$ * (20 chars long). Alloc space for 64-bit range to be safe.
 label: code-design
12949. Same coercion behavior as for Number.
12950. **comment:** For objects JSON.stringify() only looks for own, enumerable * properties which is nice for the fast path here. * * For arrays JSON.stringify() uses [[Get]] so it will actually * inherit properties during serialization! This fast path * supports gappy arrays as long as there's no actual inherited * property (which might be a getter etc). * * Since recursion only happens for objects, we can have both * recursion and loop checks here. We use a simple, depth-limited * loop check in the fast path because the object-based tracking * is very slow (when tested, it accounted for 50% of fast path * execution time for input data with a lot of small objects!).
 label: code-design

13065. fmax() with args -0 and +0 is not guaranteed to return * +0 as Ecmascript requires.
13066. Wrappers for calling standard math library methods. These may be required * on platforms where one or more of the math built-ins are defined as macros * or inline functions and are thus not suitable to be used as function pointers.
13067. Numbers half-way between integers must be rounded towards +Infinity, * e.g. -3.5 must be rounded to -3 (not -4). When rounded to zero, zero * sign must be set appropriately. E5.1 Section 15.8.2.15. ** Note that ANSI C round() is "round to nearest integer, away from zero", * which is incorrect for negative values. Here we make do with floor().
13068. DUK_USE_MATH_BUILTIN
13069. See test-bug-netbsd-math-pow.js: NetBSD 6.0 on x86 (at least) does not * correctly handle some cases where x=+/-0. Specific fixes to these * here.
13070. * Note: fmax() does not match the E5 semantics. E5 requires * that if -any- input to Math.max() is a NaN, the result is a * NaN. fmax() will return a NaN only if - both- inputs are NaN. * Same applies to fmin(). ** Note: every input value must be coerced with ToNumber(), even * if we know the result will be a NaN anyway: ToNumber() may have * side effects for which even order of evaluation matters.
13071. * x is finite and non-zero ** -1.6 -> floor(-1.1) -> -2 * -1.5 -> floor(-1.0) -> -1 (towards +Inf) * -1.4 -> floor(-0.9) -> -1 * -0.5 -> -0.0 (special case) * -0.1 -> -0.0 (special case) * +0.1 -> +0.0 (special case) * +0.5 -> floor(+1.0) -> 1 (towards +Inf) * +1.4 -> floor(+1.9) -> 1 * +1.5 -> floor(+2.0) -> 2 (towards +Inf) * +1.6 -> floor(+2.1) -> 2
13072. order must match constants in genbuiltins.py
13073. DUK_USE_AVOID_PLATFORM_FUNCPTRS
13074. * Math built-ins
13075. +0.5 is handled by floor, this is on purpose
13076. Math.pow(-0,y) where y<0 should be: * - -Infinity if y<0 and an odd integer * - Infinity otherwise * NetBSD pow() returns -Infinity for all finite y<0. The * if- clause also catches y == -Infinity (which works even * without the fix).
13077. Note: not normalized, but duk_push_number() will normalize
13078. **comment:** XXX: what's the safest way of creating a negative zero?
 label: code-design
13079. Math.pow(+0,y) should be Infinity when y<0. NetBSD pow() * returns -Infinity instead when y is <0 and finite. The * if-clause also catches y == -Infinity (which works even * without the fix).
13080. The ANSI C pow() semantics differ from Ecmascript. ** E.g. when x==1 and y is +/- infinite, the Ecmascript required * result is NaN, while at least Linux pow() returns 1.
13081. fmod() return value has same sign as input (negative) so * the result here will be in the range]-2,0], 1 indicates * odd. If x is -Infinity, NaN is returned and the odd check * always concludes "not odd" which results in desired outcome.
13082. * Use static helpers which can work with math.h functions matching * the following signatures. This is not portable if any of these math * functions is actually a macro. ** Typing here is intentionally 'double' wherever values interact with * the standard library APIs.
13083. The specification has quite awkward order of coercion and * checks for toPrecision(). The operations below are a bit * reordered, within constraints of observable side effects.
13084. * E5 Section 15.7.2.1 requires that the constructed object * must have the original Number.prototype as its internal * prototype. However, since Number.prototype is non-writable * and non-configurable, this doesn't have to be enforced here: * The default object (bound to 'this') is OK, though we have * to change its class. ** Internal value set to ToNumber(arg) or +0; if no arg given, * ToNumber(undefined) = NaN, so special treatment is needed * (above). String internal value is immutable.
13085. digits
13086. leading digit + fractions

13201. flags: ""

13202. Called as a function, pattern has [[Class]] "RegExp" and * flags is undefined -> return object as is.

13203. [regexp input]

13204. Else functionality is identical for function call and constructor * call.

13205. flags: "g"

13206. [regexp]

13207. This should not be necessary because no-one should tamper with the * regexp bytecode, but is prudent to avoid potential segfaults if that * were to happen for some reason.

13208. flags: "im"

13209. flags: "i"

13210. [regexp source bytecode]

13211. result object is created and discarded; wasteful but saves code space

13212. stack[0] = separator (string or regexp) * stack[1] = limit * stack[2] = input string * stack[3] = result array

13213. * The specification uses RegExp [[Match]] to attempt match at specific * offsets. We don't have such a primitive, so we use an actual RegExp * and tweak lastIndex. Since the RegExp may be non-global, we use a * special variant which forces global-like behavior for matching.

13214. * Case conversion

13215. **comment:** XXX: It would be nice to build the string directly but ToUint16() * coercion is needed so a generic helper would not be very * helpful (perhaps coerce the value stack first here and then * build a string from a duk_tval number sequence in one go?).
label: code-design

13216. lastIndex already set up for next match

13217. DUK_USE_REGEXP_SUPPORT

13218. Empty searchstring always matches; cpos must be clamped here. * (If q_blen were < 0 due to clamped coercion, it would also be * caught here.)

13219. [regexp string]

13220. **comment:** This loop is optimized for size. For speed, there should be * two separate loops, and we should ensure that memcmp() can be * used without an extra "will searchstring fit" check. Doing * the preconditioning for 'p' and 'p_end' is easy but cpos * must be updated if 'p' is wound back (backward scanning).
label: code-design

13221. The current implementation of localeCompare() is simply a codepoint * by codepoint comparison, implemented with a simple string compare * because UTF-8 should preserve codepoint ordering (assuming valid * shortest UTF-8 encoding). * * The specification requires that the return value must be related * to the sort order: e.g. negative means that 'this' comes before * 'that' in sort order. We assume an ascending sort order.

13222. prefix matches, lengths matter now

13223. min(incl)

13224. not found

13225. stack[0] = search value * stack[1] = replace value * stack[2] = input string * stack[3] = result buffer * stack[4] = regexp match OR match string

13226. For ECMAScript strings, this check can only match for * initial UTF-8 bytes (not continuation bytes). For other * strings all bets are off.

13227. match == search string, by definition

13228. res_obj

13229. ToUint16() coercion is mandatory in the E5.1 specification, but * this non-compliant behavior makes more sense because we support * non-BMP codepoints. Don't use CESU-8 because that'd create * surrogate pairs.

13230. match string

13231. empty match (may happen with empty separator) -> bump and continue

13232. * Various

13233. * toString(), valueOf()

13234. when going backwards, we decrement cpos 'early'; * 'p' may point to a continuation byte of the char * at offset 'cpos', but that's OK because we'll * backtrack all the way to the initial byte.

13235. trailer

13236. don't allow an empty match at the end of the string

13237. [... replacer match [captures] match_char_offset input]

13238. XXX: There are several limitations in the current implementation for * strings with $\geq 0x80000000UL$ characters. In some cases one would need * to be able to represent the range [-0xffffffff, 0xffffffff] and so on. * Generally character and byte length are assumed to fit into signed 32 * bits (< 0x80000000UL). Places with issues are not marked explicitly * below in all cases, look for signed type usage (duk_int_t etc) for * offsets/lengths.

13239. **comment:** XXX: could share code with duk_js_ops.c, duk_js_compare_helper
label: code-design

13240. * indexOf() and lastIndexOf()

13241. ch1 = (r_increment << 8) + byte

13242. * If matching with a regexp: * - non-global RegExp: lastIndex not touched on a match, zeroed * on a non-match * - global RegExp: on match, lastIndex will be updated by regexp * executor to point to next char after the matching part (so that * characters in the matching part are not matched again) * * If matching with a string: * - always non-global match, find first occurrence * * We need: * - The character offset of start-of-match for the replacer function * - The byte offsets for start-of-match and end-of-match to implement * the replacement values \$\$, \$, and \$', and to copy non-matching * input string portions (including header and trailer) verbatim. * * NOTE: the E5.1 specification is a bit vague how the RegExp should * behave in the replacement process; e.g. is matching done first for * all matches (in the global RegExp case) before any replacer calls * are made? See: test-bi-string-proto-replace.js for discussion.

13243. return as is

13244. repl_value

13245. Not found. Empty string case is handled specially above.

13246. stack[0] = regexp * stack[1] = string

13247. * substring(), substr(), slice()

13248. -> [... regexp string] -> [... res_obj]

13643. DUK_F_BCC
13644. Complex condition broken into separate parts.
13645. POSIX
13646. If not provided, use safe default for alignment.
13647. * Date provider selection * * User may define DUK_USE_DATE_GET_NOW() etc directly, in which case we'll * rely on an external provider. If this is not done, revert to previous * behavior and use Unix/Windows built-in provider.
13648. Cannot determine byte order.
13649. --- Cygwin ---
13650. !defined(DUK_USE_BYTORDER) && defined(__BYTE_ORDER__)

13651. More or less standard endianness predefines provided by header files. * The ARM hybrid case is detected by assuming that `__FLOAT_WORD_ORDER` will be big endian, see: <http://lists.mysql.com/internals/443>. * On some platforms some defines may be present with an empty value which * causes comparisons to fail: <https://github.com/svaarala/duktape/issues/453>.
13652. !defined(DUK_USE_BYTEORDER)
13653. **comment:** For custom platforms allow user to define byteorder explicitly. * Since endianness headers are not standardized, this is a useful * workaround for custom platforms for which endianness detection * is not directly supported. Perhaps custom hardware is used and * user cannot submit upstream patches.
label: code-design
13654. **comment:** Don't know how to declare unreachable point, so don't do it; this * may cause some spurious compilation warnings (e.g. "variable used * uninitialized").
label: code-design
13655. Good default is a bit arbitrary because alignment requirements * depend on target. See <https://github.com/svaarala/duktape/issues/102>.
13656. --- Windows ---
13657. User provided InitJS.
13658. These have been tested from VS2008 onwards; may work in older VS versions * too but not enabled by default.
13659. Error codes are represented with platform int. High bits are used * for flags and such, so 32 bits are needed.
13660. Intermediate define for 'have inttypes.h'
13661. build is not C99 or C++11, play it safe
13662. GCC: test not very accurate; enable only in relatively recent builds * because of bugs in gcc-4.4 (<http://lists.debian.org/debian-gcc/2010/04/msg00000.html>)
13663. Intel x86 (32-bit), x64 (64-bit) or x32 (64-bit but 32-bit pointers), * define only one of DUK_F_X86, DUK_F_X64, DUK_F_X32. * <https://sites.google.com/site/x32abi/>
13664. Enabled with debug/assertions just so that any issues can be caught.
13665. C99 or compatible
13666. --- Mac OSX, iPhone, Darwin ---
13667. C99 or above
13668. MinGW. Also GCC flags (DUK_F_GCC) are enabled now.
13669. This detection is not very reliable.
13670. Support for 48-bit signed integer duk_tval with transparent semantics.
13671. GCC and Clang provide endianness defines as built-in predefines, with * leading and trailing double underscores (e.g. `__BYTE_ORDER__`). See * output of "make gccpredefs" and "make clangpredefs". Clang doesn't * seem to provide `__FLOAT_WORD_ORDER__`; assume not mixed endian for clang. * <http://gcc.gnu.org/onlinedocs/cpp/Common-Predefined-Macros.html>
13672. 64-bit type detection is a bit tricky. * * `ULLONG_MAX` is a standard define. `__LONG_LONG_MAX__` and `__ULONGLONG_MAX__` * are used by at least GCC (even if system headers don't provide `ULLONG_MAX`). * Some GCC variants may provide `__LONG_LONG_MAX__` but not `__ULONGLONG_MAX__`. * * ULL / LL constants are rejected / warned about by some compilers, even if * the compiler has a 64-bit type and the compiler/system headers provide an * unsupported constant (ULL/LL)! Try to avoid using ULL / LL constants. * As a side effect we can only check that e.g. `ULONG_MAX` is larger than 32 * bits but can't be sure it is exactly 64 bits. Self tests will catch such * cases.
13673. Convert any input pointer into a "void **", losing a const qualifier. * This is not fully portable because casting through `duk_uintptr_t` may * not work on all architectures (e.g. those with long, segmented pointers).
13674. Small integers (16 bits or more) can fall back to the 'int' type, but * have a typedef so they are marked "small" explicitly.
13675. **comment:** Most portable, potentially wastes space
label: code-design
13676. PowerPC
13677. --- Solaris ---
13678. **comment:** Technically C99 (C++11) but found in many systems. On some systems * `__STDC_LIMIT_MACROS` and `__STDC_CONSTANT_MACROS` must be defined before * including stdint.h (see above).

13700. no parsing (not an error)
13701. **comment:** ANSI C (various versions) and some implementations require that the * pointer arguments to `memset()`, `memcpy()`, and `memmove()` be valid values * even when byte size is 0 (even a NULL pointer is considered invalid in * this context). Zero-size operations as such are allowed, as long as their * pointer arguments point to a valid memory area. The `DUK_MEMSET()`, * `DUK_MEMCPY()`, and `DUK_MEMMOVE()` macros require this same behavior, i.e.: * (1) pointers must be valid and non-NULL, (2) zero size must otherwise be * allowed. If these are not fulfilled, a macro wrapper is needed. * * <http://stackoverflow.com/questions/5243012/is-it-guaranteed-to-be-safe-to-perform-memcpy0-0-0> * <http://lists.cs.uiuc.edu/pipermail/l1vmdev/2007-October/011065.html> * * Not sure what's the required behavior when a pointer points just past the * end of a buffer, which often happens in practice (e.g. zero size memmoves). * For example, if allocation size is 3, the following pointer would not * technically point to a valid memory byte: * * <- alloc --> * | 0 | 1 | 2 | * ^ - p=3, points after last valid byte (2)

13708. GCC, Clang also defines __GNUC__ so don't detect GCC if using Clang.
13709. --- SuperH ---
13710. Pre-C99: va_list type is implementation dependent. This replacement * assumes it is a plain value so that a simple assignment will work. * This is not the case on all platforms (it may be a single-array element, * for instance).
13711. **comment:** The best type for an "all around int" in Duktape internals is "at least * 32 bit signed integer" which is most convenient. Same for unsigned type. * Prefer 'int' when large enough, as it is almost always a convenient type.
- label:** code-design
13712. uclibc
13713. Explicit marker needed; may be 'defined', 'undefined', 'or 'not provided'.
13714. No provider for DUK_USE_DATE_FORMAT_STRING(), fall back to ISO 8601 only.
13715. **comment:** Many platforms are missing fpclassify() and friends, so use replacements * if necessary. The replacement constants (FP_NAN etc) can be anything but * match Linux constants now.
- label:** code-design
13716. * Checks for config option consistency (DUK_USE_xxx)
13717. autodetect compiler
13718. Rely on C89 headers only; time.h must be here.
13719. These functions don't currently need replacement but are wrapped for * completeness. Because these are used as function pointers, they need * to be defined as concrete C functions (not macros).
13720. --- TI-Nspire ---
13721. **comment:** We need va_copy() which is defined in C99 / C++11, so an awkward * replacement is needed for pre-C99 / pre-C++11 environments. This * will quite likely need portability hacks for some non-C99 * environments.
- label:** code-design
13722. AmigaOS on M68K or PPC is always big endian.
13723. Feature option forcing.
13724. --- ARM 64-bit ---
13725. * Feature option handling
13726. **comment:** * Wrapper typedefs and constants for integer types, also sanity check types. * C99 typedefs are quite good but not always available, and we want to avoid * forcibly redefining the C99 typedefs. So, there are Duktape wrappers for * all C99 typedefs and Duktape code should only use these typedefs. Type * detection when C99 is not supported is best effort and may end up detecting * some types incorrectly. * * Pointer sizes are a portability problem: pointers to different types may * have a different size and function pointers are very difficult to manage * portably. * * http://en.wikipedia.org/wiki/C_data_types#Fixed-width_integer_types * * Note: there's an interesting corner case when trying to define minimum * signed integer value constants which leads to the current workaround of * defining e.g. -0x80000000 as (-0x7fffffffL - 1L). See doc/code-issues.txt * for a longer discussion. * * Note: avoid typecasts and computations in macro integer constants as they * can then no longer be used in macro relational expressions (such as * #if DUK_SIZE_MAX < 0xffffffffUL). There is internal code which relies on * being able to compare DUK_SIZE_MAX against a limit.
- label:** code-design
13727. Not standard but common enough
13728. --- QNX ---
13729. **comment:** Object property allocation layout has implications for memory and code * footprint and generated code size/speed. The best layout also depends * on whether the platform has alignment requirements or benefits from * having mostly aligned accesses.
- label:** code-design
13730. (v)sprintf() is missing before MSVC 2015. Note that _(v)sprintf() does * NOT NUL terminate on truncation, but Duktape code never assumes that. *
- <http://stackoverflow.com/questions/2915672/snprintf-and-visual-studio-2010>
13731. Motorola 68K. Not defined by VBCC, so user must define one of these * manually when using VBCC.
13732. [http://msdn.microsoft.com/en-us/library/aa235362\(VS.60\).aspx](http://msdn.microsoft.com/en-us/library/aa235362(VS.60).aspx)
13733. Non-C99 case, still relying on DUK_UINTPTR_MAX, as long as it is not a computed value
13734. <http://bellard.org/tcc/tcc-doc.html#SEC7>

13789. Workaround for older C++ compilers before including <inttypes.h>, * see e.g.: https://sourceware.org/bugzilla/show_bug.cgi?id=15366
13790. * Compiler autodetection
13791. --- SPARC 32-bit ---
13792. --- Clang ---
13793. On some platforms int is 16-bit but long is 32-bit (e.g. PureC)
13794. **comment:** * Byte order and double memory layout detection * * Endianness detection is a major portability hassle because the macros * and headers are not standardized. There's even variance across UNIX * platforms. Even with "standard" headers, details like underscore count * varies between platforms, e.g. both __BYTE_ORDER and _BYTE_ORDER are used * (Crossbridge has a single underscore, for instance). * * The checks below are structured with this in mind: several approaches are * used, and at the end we check if any of them worked. This allows generic * approaches to be tried first, and platform/compiler specific hacks tried * last. As a last resort, the user can force a specific endianness, as it's * not likely that automatic detection will work on the most exotic platforms. * * Duktape supports little and big endian machines. There's also support * for a hybrid used by some ARM machines where integers are little endian * but IEEE double values use a mixed order (12345678 -> 43218765). This * byte order for doubles is referred to as "mixed endian".
label: code-design
13795. **comment:** Check whether we should use 64-bit integers or not. * * Quite incomplete now. Use 64-bit types if detected (C99 or other detection) * unless they are known to be unreliable. For instance, 64-bit types are * available on VBCC but seem to misbehave.
label: code-design
13796. VS2013+ supports union initializers but there's a bug involving union-inside-struct: * <https://connect.microsoft.com/VisualStudio/feedback/details/805981> * The bug was fixed (at least) in VS2015 so check for VS2015 for now: * <https://blogs.msdn.microsoft.com/vcblog/2015/07/01/c-compiler-front-end-fixes-in-vs2015/> * Manually tested using VS2013, CL reports 18.00.31101, so enable for VS2013 too.
13797. no user declarations
13798. DUK_CONFIG_H_INCLUDED
13799. BCC (Bruce's C compiler): this is a "torture target" for compilation
13800. Generic Unix (includes Cygwin)
13801. There was a curious bug where test-bi-date-canceling.js would fail e.g. * on 64-bit Ubuntu, gcc-4.8.1, -m32, and no -std=c99. Some date computations * using doubles would be optimized which then broke some corner case tests. * The problem goes away by adding 'volatile' to the datetime computations. * Not sure what the actual triggering conditions are, but using this on * non-C99 systems solves the known issues and has relatively little cost * on other platforms.
13802. C99 / C++11 and above: rely on va_copy() which is required. * Omit parenthesis on macro right side on purpose to minimize differences * to direct use.
13803. C99 types
13804. DUK_SIZE_MAX (= SIZE_MAX) is often reliable
13805. --- PowerPC 64-bit ---
13806. See: /opt/qnx650/target/qnx6/usr/include/sys/platform.h
13807. --- SPARC 64-bit ---
13808. On platforms without any alignment issues, layout 1 is preferable * because it compiles to slightly less code and provides direct access * to property keys.
13809. Strict C99 case: DUK_UINTPTR_MAX (= UINTPTR_MAX) should be very reliable
13810. autodetect platform
13811. **comment:** NetBSD 6.0 x86 (at least) has a few problems with pow() semantics, * see test-bug-netbsd-math-pow.js. Use NetBSD specific workaround. * (This might be a wider problem; if so, generalize the define name.)
label: code-design
13812. autodetect architecture
13813. In VBCC (0.0 / 0.0) results in a warning and 0.0 instead of NaN. * In MSVC (VS2010 Express) (0.0 / 0.0) results in a compile error. * Use a computed NaN (initialized when a heap is created at the * latest).
13814. Clang: assume we have __va_copy() in non-C99 mode.
13815. --- Bruce's C compiler ---
13816. Same as 'duk_int_t' but guaranteed to be a 'fast' variant if this * distinction matters for the CPU. These types are used mainly in the * executor where it might really matter.
13817. vbcc + AmigaOS may be missing these
13818. C99 or C++11, no known issues
13819. **comment:** XXX: DUK_LIKELY, DUK_UNLIKELY for msvc?
label: code-design
13820. Initial fix: disable secure CRT related warnings when compiling Duktape * itself (must be defined before including Windows headers). Don't define * for user code including duktape.h.
13821. varargs
13822. * Fill-ins for platform, architecture, and compiler

13823. e.g. `strptime`
13824. **comment:** Note: PRS and FMT are intentionally left undefined for now. This means * there is no platform specific date parsing/formatting but there is still * the ISO 8601 standard format.
- label:** code-design
13825. `vsnprintf()` is technically not part of C89 but usually available.
13826. Rely on autodetection for byte order, alignment, and packed tval.
13827. AmigaOS + M68K seems to have math issues even when using GCC cross * compilation. Use replacements for all AmigaOS versions on M68K * regardless of compiler.
13828. Byte order is little endian but cannot determine IEEE double word order.
13829. C++
13830. MIPS. Related defines: `_MIPSEB_`, `_MIPSEL_`, `_mips_isa_rev`, `_LP64_`
13831. VBCC is missing the built-ins even in C99 mode (perhaps a header issue).
13832. `_MSC_VER`
13833. **comment:** Macro for suppressing warnings for potentially unreferenced variables. * The variables can be actually unreferenced or unreferenced in some * specific cases only; for instance, if a variable is only debug printed, * it is unreferenced when debug printing is disabled.
- label:** code-design
13834. Byte order varies, rely on autodetection.
13835. Use `_setjmp()` on Apple by default, see GH-55.
13836. TI-Nspire (using Ndless)
13837. --- PowerPC 32-bit ---
13838. Some math functions are C99 only. This is also an issue with some * embedded environments using uclibc where uclibc has been configured * not to provide some functions. For now, use replacements whenever * using uclibc.
13839. Most portable
13840. Boolean values are represented with the platform 'int'.
13841. Shared includes: `stdint.h` is C99
13842. BSD variant
13843. Old uclibcs have a broken `memcpy` so use `memmove` instead (this is overly wide * now on purpose): <http://lists.uclibc.org/pipermail/uclibc-cvs/2008-October/025511.html>
13844. `date.h` is omitted, and included per platform
13845. * Architecture autodetection
13846. The most portable current time provider is `time()`, but it only has a * one second resolution.
13847. Convenience, e.g. gcc 4.5.1 == 40501; <http://stackoverflow.com/questions/6031819/emulating-gccs-built-in-unreachable>
13848. `defined(DUK_USE_BYTEORDER)`
13849. In VBCC (1.0 / 0.0) results in a warning and 0.0 instead of infinity. * Use a computed infinity (initialized when a heap is created at the * latest).
13850. For now, hash part is dropped if and only if 16-bit object fields are used.
13851. MSVC dllexport/dllimport: appropriate `_declspec` depends on whether we're * compiling Duktape or the application.
13852. **comment:** On Windows, assume we're little endian. Even Itanium which has a * configurable endianness runs little endian in Windows.
- label:** code-design
13853. **comment:** Compiler specific hackery needed to force struct size to match alignment, * see e.g. `duk_hbuffer.h`. * * <http://stackoverflow.com/questions/11130109/c-struct-size-alignment> * <http://stackoverflow.com/questions/10951039/specifying-64-bit-alignment>
- label:** code-design

13900. %ld
13901. terminal type: no depth check
13902. may be NULL
13903. XXX: use DUK_HSTRING_FLAG_INTERNAL?
13904. **comment:** * Custom formatter for debug printing, allowing Duktape specific data * structures (such as tagged values and heap objects) to be printed with * a nice format string. Because debug printing should not affect execution * state, formatting here must be independent of execution (see implications * below) and must not allocate memory. * * Custom format tags begin with a '%!' to safely distinguish them from * standard format tags. The following conversions are supported: * * %!T tagged value (duk_tval *) * %!O heap object (duk_heaphdr *) * %!I decoded bytecode instruction * %!C bytecode instruction opcode name (arg is long) * * Everything is serialized in a JSON-like manner. The default depth is one * level, internal prototype is not followed, and internal properties are not * serialized. The following modifiers change this behavior: * * @ print pointers * # print binary representations (where applicable) * d deep traversals of own properties (not prototype) * p follow prototype chain (useless without 'd') * i include internal properties (other than prototype) * x hexdump buffers * h heavy formatting * * For instance, the following serializes objects recursively, but does not * follow the prototype chain nor print internal properties: "%!dO". * * Notes: * * * Standard snprintf return value semantics seem to vary. This * implementation returns the number of bytes it actually wrote * (excluding the null terminator). If retval == buffer size, * output was truncated (except for corner cases). * * * Output format is intentionally different from Ecmascript * formatting requirements, as formatting here serves debugging * of internals. * * * Depth checking (and updating) is done in each type printer * separately, to allow them to call each other freely. * * * Some pathological structures might take ages to print (e.g. * self recursion with 100 properties pointing to the object * itself). To guard against these, each printer also checks * whether the output buffer is full; if so, early exit. * * * Reference loops are detected using a loop stack.
 label: code-design

13937. Quite approximate but should be useful for little and big endian.
13938. %d; only 16 bits are guaranteed
13939. %s' and NULL is not portable, so special case * it for debug printing.
13940. **comment:** prototype should be last, for readability
 label: code-design
13941. fall through
13942. **comment:** dump all allocated entries, unused entries print as 'unused', * note that these may extend beyond current 'length' and look * a bit funny.
 label: code-design
13943. assume exactly 1 arg, which is why '*' is forbidden; arg size still * depends on type though.
13944. %u; only 16 bits are guaranteed
13945. heapobj recursion depth when deep printing is selected
13946. * Format tag parsing. Since we don't understand all the * possible format tags allowed, we just scan for a terminating * specifier and keep track of relevant modifiers that we do * understand. See man 3 printf.
13947. from next pc
13948. if property key begins with underscore, encode it with * forced quotes (e.g. "_Foo") to distinguish it from encoded * internal properties (e.g. \xffBar -> _Bar).

13949. **comment:** XXX: limit to quoted strings only, to save keys from being cluttered?
label: code-design

13950. return total chars written excluding terminator

13951. own pointer

13952. throw_flag

13953. nargs == 2 so we can pass a callstack level to eval().

13954. Write unsigned 32-bit integer.

13955. Use result value as is.

13956. PC/line semantics here are: * - For callstack top we're conceptually between two * opcodes and current PC indicates next line to * execute, so report that (matches Status). * - For other activations we're conceptually still * executing the instruction at PC-1, so report that * (matches error stacktrace behavior). * - See: <https://github.com/svaarala/duktape/issues/281>

13957. * Debug connection peek and flush primitives

13958. Reply with tvals pushed by request callback

13959. Request callback should push values for reply to client onto valstack

13960. * DumpHeap command

13961. **comment:** NULL not needed here
label: code-design

13962. **comment:** XXX: this should be optimized to be a raw query and avoid valstack * operations if possible.
label: code-design

13963. push to stack

13964. Report next pc/line to be executed.

13965. DUK_USE_DEBUGGER_DUMPHEAP || DUK_USE_DEBUGGER_INSPECT

13966. tolerates NULL h_buf

13967. The actual detached_cb call is postponed to message loop so * we don't need any special precautions here (just skip to EOM * on the already closed connection).

13968. Avoid doing an actual write callback with length == 0, * because that's reserved for a write flush.

13969. As with all inspection code, we rely on the debug client providing * a valid, non-stale pointer: there's no portable way to safely * validate the pointer here.

13970. shared pop

13971. **comment:** unused
label: code-design

13972. [... func varmap enum key value this]

13973. [... result]

13974. side effects

13975. * Duktape debugger

13976. * Halt execution helper

13977. **comment:** XXX: several nice-to-have improvements here: * - Use direct reads avoiding value stack operations * - Avoid triggering getters, indicate getter values to debug client * - If side effects are possible, add error catching
label: code-design

13978. ptr may be NULL

13979. save stack top

13980. * NYF <int: 5> <int: fatal> <str: msg> <str: filename> <int: linenumber> EOM

13981. DUK_USE_DEBUGGER_INSPECT

13982. **comment:** Called on a read/write error: NULL all callbacks except the detached * callback so that we never accidentally call them after a read/write * error has been indicated. This is especially important for the transport * I/O callbacks to fulfill guaranteed callback semantics.
label: code-design

13983. flags

13984. For strings, special form for short lengths.

13985. XXX: Decrementing and restoring act->curr_pc works now, but if the * debugger message loop gains the ability to adjust the current PC * (e.g. a forced jump) restoring the PC here will break. Another * approach would be to use a state flag for the "decrement 1 from * topmost activation's PC" and take it into account whenever dealing * with PC values.

13986. unsigned

13987. Read tvals from the message and push them onto the valstack, * then call the request callback to process the request.

13988. **comment:** XXX: comes out as signed now
label: code-design

13989. Report thrown value to client coerced to string

13990. heap->dbg_udata: keep

13991. **comment:** Process debug messages until we are no longer paused.
label: code-design

13992. Caller must trigger recomputation of active breakpoint list. To * ensure stale values are not used if that doesn't happen, clear the * active breakpoint list here.

13993. switch initial byte

13994. may be NULL

13995. For anything other than an Error instance, we calculate the error * location directly from the current activation.

13996. Note: array dump will include elements beyond * 'length'.

13997. Halt execution and enter a debugger message loop until execution is resumed * by the client. PC for the current activation may be temporarily decremented * so that the "current" instruction will be shown by the client. This helper * is callable from anywhere, also outside bytecode executor.

13998. **comment:** SCANBUILD: warning about 'thr' potentially being NULL here, * warning is incorrect because thr != NULL always here.
label: code-design

13999. **comment:** XXX: differentiate null pointer from empty string?
label: code-design

14000. Native function pointer may be different from a void pointer, * and we serialize it from memory directly now (no byte swapping etc).

14001. To use the shared helper need the virtual index.

14002. Breakpoint entries above the used area are left as garbage.

14003. Skip fully.

14004. Skip dvalue.

14005. Note: peek cannot currently trigger a detach * so the dbg_detaching == 0 assert outside the * loop is correct.

14006. **comment:** prevent multiple in-progress detaches
label: requirement

14007. DUK_USE_DEBUGGER_THROW_NOTIFY

14008. processed one or more messages

14009. index

14010. no_block

14011. * Simple commands

14012. Safe to call multiple times.

14013. **comment:** Can be called multiple times with no harm. Mark the transport * bad (dbg_read_cb == NULL) and clear state except for the detached * callback and the udata field. The detached callback is delayed * to the message loop so that it can be called between messages; * this avoids corner cases related to immediate debugger reattach * inside the detached callback.
label: code-design

14014. The debugger protocol doesn't support a plain integer encoding for * the full 32-bit unsigned range (only 32-bit signed). For now, * unsigned 32-bit values simply written as signed ones. This is not * a concrete issue except for 32-bit heaphdr fields. Proper solutions * would be to (a) write such integers as IEEE doubles or (b)

add an * unsigned 32-bit dvalue.

14015. tentative, checked later

14016. Write signed 32-bit integer.

14017. Peek ahead in the stream one byte.

14018. * Breakpoint management

14019. **comment:** Numbers are normalized to big (network) endian. We can * (but are not required) to use integer dvalues when there's * no loss of precision. * * XXX: share check with other code; this check is slow but * reliable and doesn't require careful exponent/mantissa * mask tricks as in the fastint downgrade code.
label: code-design

14020. Decrement PC if that was requested, this requires a PC sync.

14021. **comment:** For short strings, use a fixed temp buffer.
label: code-design

14022. restore stack top

14023. Pretend like we got EOM

14024. always push some string

14025. * Detach handling

14026. duk_hnativefunction specific fields.

14027. [... eval "eval" eval_input level]

14028. Process one debug message. Automatically restore value stack top to its * entry value, so that individual message handlers don't need exact value * stack handling which is convenient.

14029. For now shared handler is fine.

14030. Signed integers always map to 4 bytes now.

14031. No debugger support.

14032. * Debug connection message write helpers

14033. terminator

14034. enum_flags

14035. this cannot initiate a detach

14036. true even with reattach

14037. XXX: Current putvar implementation doesn't have a success flag, * add one and send to debug client?

14038. keep heap->dbg_detached_cb

14039. num_stack_args

14040. **comment:** It is important not to call this if the last byte read was an EOM. * Reading ahead in this scenario would cause unnecessary blocking if * another message is not available.
label: code-design

14041. We're conceptually between two opcodes; act->pc indicates the next * instruction to be executed. This is usually the correct pc/line to * indicate in Status. (For the 'debugger' statement this now reports * the pc/line after the debugger statement because the debugger opcode * has already been executed.)

14042. Return 1: got EOM

14043. heap->dbg_processing: keep on purpose to avoid debugger re-entry in detaching state

14044. NOTE: length may be zero

14045. Read fully.

14046. No activation, no variable access. Could also pretend * we're in the global program context and read stuff off * the global object.

14047. get_value

14048. * Process incoming debug requests * * Individual request handlers can push temporaries on the value stack and * rely on duk_debug_process_message() to restore the value stack top * automatically.

14049. even after a detach and possible reattach

14050. avoid calling write callback in detach1()

14051. **comment:** XXX: Not needed for now, so not implemented. Note that * function pointers may have different size/layout than * a void pointer.
label: requirement

14052. **comment:** XXX: optimize to use direct reads, i.e. avoid * value stack operations.
label: code-design

14053. pruned

14054. switch cmd

14055. NOTE: act may be NULL if an error is thrown outside of any activation, * which may happen in the case of, e.g. syntax errors.

14056. Careful here: state must be wiped before the call * so that we can cleanly handle a re-attach from * inside the callback.

14057. **comment:** Ensure there are no stale active breakpoint pointers. * Breakpoint list is currently kept - we could empty it * here but we'd need to handle refcounts correctly, and * we'd need a 'thr' reference for that. * * XXX: clear breakpoint on either attach or detach?
label: code-design

14058. Short circuit if is safe: if act->curr_pc != NULL, 'fun' is * guaranteed to be a non-NULL Ecmascript function.

14059. **comment:** unused: not accepted in inbound messages
label: code-design

14060. Allow NULL 'msg'

14061. * Object inspection commands: GetHeapObjInfo, GetObjPropDesc, * GetObjPropDescRange

14062. detached

14063. XXX: Currently no inspection of threads, e.g. value stack, call * stack, catch stack, etc.

14064. * Debug connection skip primitives

14065. isAccessor

14066. * Helper structs

14067. At least: ... [err]

14068. Error instance, use augmented error data directly

14069. just in case callback is broken and won't write 'x'

14070. Accept any pointer-like value; for 'object' dvalue, read * and ignore the class number.

14071. DUK_USE_DEBUGGER_DUMPHEAP

14072. -> [... func varmap enum]

14073. duk_hobject specific fields.

14074. The index range space is conceptually the array part followed by the * entry part. Unlike normal enumeration all slots are exposed here as * is and return 'unused' if the slots are not in active use. In particular * the array part is included for the full a_size regardless of what the * array .length is.

14075. enum_index

14076. this is especially critical to avoid another write call in detach1()

14077. * Debug connection write primitives

14078. For errors a string coerced result is most informative * right now, as the debug client doesn't have the capability * to traverse the error object.

14079. As an initial implementation, write flush after every EOM (and the * version identifier). A better implementation would flush only when * Duktape is finished processing messages so that a flush only happens * after all outbound messages are finished on that occasion.

14080. Inspect a property using a virtual index into a conceptual property list * consisting of (1) all array part items from [0,a_size[(even when above * .length) and (2) all entry part items from [0,e_next[. Unused slots are * indicated using dvalue 'unused'.

14081. Use b[] to access the size of the union, which is strictly not * correct. Can't use fixed size unless there's feature detection * for pointer byte size.

14082. **comment:** XXX: this has some overlap with object inspection; remove this and make * DumpHeap return lists of heapptrs instead?
label: code-design

14083. Detach is pending; can be triggered from outside the * debugger loop (e.g. Status notify write error) or by * previous message handling. Call detached callback * here, in a controlled state, to ensure a possible * reattach inside the detached_cb is handled correctly. * * Recheck for detach in a while loop: an immediate *

reattach involves a call to duk_debugger_attach() * which writes a debugger handshake line immediately * inside the API call. If the transport write fails * for that handshake, we can immediately end up in a * "transport broken, detaching" case several times here. * Loop back until we're either cleanly attached or * fully detached. ** NOTE: Reset dbg_processing = 1 forcibly, in case we * re-attached; duk_debugger_attach() sets dbg_processing * to 0 at the moment.

14084. The eval code is executed within the lexical environment of a specified * activation. For now, use global object eval() function, with the eval * considered a 'direct call to eval'. ** Callstack level for debug commands only affects scope -- the callstack * as seen by, e.g. Duktape.act() will be the same regardless.

14085. not an error

14086. As an initial implementation, read flush after exiting the message * loop. If transport is broken, this is a no-op (with debug logs).

14087. **comment:** NOTE: This is a bit fragile. It's important to ensure that * duk_debug_process_messages() never throws an error or * act->curr_pc will never be reset.
label: code-design

14088. thr->heap->dbg_detaching may be != 0 if a debugger write outside * the message loop caused a transport error and detach1() to run.

14089. DUK_USE_STRTAB_PROBE

14090. Process messages until we're no longer paused or we peek * and see there's nothing to read right now.

14091. may be set to 0 by duk_debugger_attach() inside callback

14092. Variant for writing duk_tvals so that any heap allocated values are * written out as tagged heap pointers.

14093. DUK_USE_DEBUGGER_SUPPORT

14094. Easy to get wrong, so assert for it.

14095. optional callstack level

14155. assertion disabled

14156. DUK_USE_PARANOI_ERRORS

14157. DUK_ERR_EVAL: no macros needed

14158. **comment:** * Normal error * * Normal error is thrown with a longjmp() through the current setjmp() * catchpoint record in the duk_heap. The 'curr_thread' of the duk_heap * identifies the throwing thread. * * Error formatting is usually unnecessary. The error macros provide a * zero argument version (no formatting) and separate macros for small * argument counts. Variadic macros are not used to avoid portability * issues and avoid the need for stash-based workarounds when they're not * available. Vararg calls are avoided for non-formatted error calls * because vararg call sites are larger than normal, and there are a lot * of call sites with no formatting. * * Note that special formatting provided by debug macros is NOT available. * * The _RAW variants allow the caller to specify file and line. This makes * it easier to write checked calls which want to use the call site of the * checked function, not the error macro call inside the checked function.

label: code-design

14159. * Helper for valstack space * * Caller of DUK_ASSERT_VALSTACK_SPACE() estimates the number of free stack entries * required for its own use, and any child calls which are not (a) Duktape API calls * or (b) Duktape calls which involve extending the valstack (e.g. getter call).

14160. **comment:** * Augment an error at creation time with _Tracedata/fileName/lineNumber * and allow a user error handler (if defined) to process/replace the error. * The error to be augmented is at the stack top. * * thr: thread containing the error value * thr_callstack: thread which should be used for generating callstack etc. * c_filename: C __FILE__ related to the error * c_line: C __LINE__ related to the error * noblame_fileline: if true, don't fileName/line as error source, otherwise use traceback * (needed because user code filename/line are reported but internal ones * are not) * * XXX: rename noblame_fileline to flags field; combine it to some existing * field (there are only a few call sites so this may not be worth it).

label: code-design

14161. unsigned

14162. **comment:** * Augmenting errors at their creation site and their throw site. * * When errors are created, traceback data is added by built-in code * and a user error handler (if defined) can process or replace the * error. Similarly, when errors are thrown, a user error handler * (if defined) can process or replace the error. * * Augmentation and other processing at error creation time is nice * because an error is only created once, but it may be thrown and * rethrown multiple times. User error handler registered for processing * an error at its throw site must be careful to handle rethrowing in * a useful manner. * * Error augmentation may throw an internal error (e.g. alloc error). * * Ecmascript allows throwing any values, so all values cannot be * augmented. Currently, the built-in augmentation at error creation * only augments error values which are Error instances (= have the * built-in Error.prototype in their prototype chain) and are also * extensible. User error handlers have no limitations in this respect.

14194. * Add line number to a compiler error.

14195. DUK_USE_AUGMENT_ERROR_CREATE

14196. * Add .fileName and .lineNumber to an error on the stack top.

14197. * Criteria for augmenting: * * - augmentation enabled in build (naturally) * - error value internal prototype chain contains the built-in * Error prototype object (i.e. 'val instanceof Error') * * Additional criteria for built-in augmenting: * * - error value is an extensible object

14198. since no recursive error handler calls

14199. DUK_USE_PC2LINE

14200. **comment:** * Check whether or not we have an error handler. ** We must be careful of not triggering an error when looking up the * property. For instance, if the property is a getter, we don't want * to call it, only plain values are allowed. The value, if it exists, * is not checked. If the value is not a function, a TypeError happens * when it is called and that error replaces the original one.

label: code-design

14201. invalidated by pushes, so get out of the way

14202. Compiler SyntaxError (or other error) gets the primary blame. * Currently no flag to prevent blaming.

14203. [... errhandler undefined errval]

14204. [... errval errhandler]

14205. -> [... arr num]

14206. [... error func fileName]

14207. DUK_USE_TRACEBACKS

14208. If the value has a prototype loop, it's critical not to * throw here. Instead, assume the value is not to be * augmented.

14209. DUK_USE_AUGMENT_ERROR_THROW

14210. [... error arr]

14211. [... error func fileName lineNumber]

14212. call_flags

14213. -> [... errhandler undefined(= this) errval]

14214. Compiler SyntaxErrors (and other errors) come first, and are * blamed by default (not flagged "noblame").

14215. [... arr]

14216. Add function object.

14217. **comment:** * Helper for calling a user error handler. ** 'thr' must be the currently active thread; the error handler is called * in its context. The valstack of 'thr' must have the error value on * top, and will be replaced by another error value based on the return * value of the error handler. ** The helper calls duk_handle_call() recursively in protected mode. * Before that call happens, no longjmps should happen; as a consequence, * we must assume that the valstack contains enough temporary space for * arguments and such. * While the error handler runs, any errors thrown will not trigger a * recursive error handler call (this is implemented using a heap level * flag which will "follow" through any coroutines resumed inside the * error handler). If the error handler is not callable or throws an * error, the resulting error replaces the original error (for Duktape * internal errors, duk_error_throw.c further substitutes this error with * a DoubleError which is not ideal). This would be easy to change and * even signal to the caller. * The user error handler is stored in 'Duktape.errCreate' or * 'Duktape.errThrow' depending on whether we're augmenting the error at * creation or throw time. There are several alternatives to this approach, * see doc/error-objects.rst for discussion. ** Note: since further longjmp(s) may occur while calling the error handler * (for many reasons, e.g. a labeled 'break' inside the handler), the * caller can make no assumptions on the thr->heap->lj state after the * call (this affects especially duk_error_throw.c). This is not an issue * as long as the caller writes to the lj state only after the error handler * finishes.

label: code-design

14218. * Add ._Tracedata to an error on the stack top.

14219. XXX: specify array size, as we know it

14220. (flags<<32) + (line), flags = 0

14221. * Augment an error being created using Duktape specific properties * like _Tracedata or .fileName/.lineNumber.

14222. * Augment an error at throw time; allow a user error handler (if defined) * to process/replace the error. The error to be augmented is at the * stack top.

14223. unreferenced w/o tracebacks

14224. Filename/line from C macros (_FILE_, _LINE_) are added as an * entry with a special format: (string, number). The number contains * the line and flags.

14225. **comment:** * Note: each API operation potentially resizes the callstack, * so be careful to re-lookup after every operation. Currently * these is no issue because we don't store a temporary 'act' * pointer at all. (This would be a non-issue if we operated * directly on the array part.)

label: code-design

14226. XXX: set with duk_hobject_set_length() when tracedata is filled directly

14227. unreferenced w/o asserts

14228. **comment:** XXX: using duk_put_prop_index() would cause obscure error cases when Array.prototype * has write-protected array index named properties. This was seen as DoubleErrors * in e.g. some test262 test cases. Using duk_xdef_prop_index() is better but heavier. * The best fix is to fill in the tracedata directly into the array part. There are * no side effect concerns if the array part is allocated directly and only INCREFS * happen after that.

label: code-design

14229. Add a number containing: pc, activation flags. ** PC points to next instruction, find offending PC. Note that * PC == 0 for native code.

14230. C call site gets blamed next, unless flagged not to do so. * XXX: file/line is disabled in minimal builds, so disable this * too when appropriate.

14231. **comment:** If we don't have a jmpbuf_ptr, there is little we can do * except panic. The caller's expectation is that we never * return. ** With C++ exceptions we now just propagate an uncaught error * instead of invoking the fatal error handler. Because there's * a dummy jmpbuf for C++ exceptions now, this could be changed.

label: code-design

14232. DUK_USE_CPP_EXCEPTIONS

14233. dummy

14234. * Do a longjmp call, calling the fatal error handler if no * catchpoint exists.

14235. * Error throwing helpers

14236. The file/line arguments are NULL and 0, they're ignored by DUK_ERROR_RAW() * when non-verbose errors are used.

14237. DUK_USE_VERBOSE_ERRORS

14238. **comment:** size for formatting buffers

label: code-design

14239. * Default fatal error handler

14240. !DUK_USE_PANIC_HANDLER

14241. omit print

14242. **comment:** dead code, but ensures portability (see Linux man page notes)

label: code-design

14243. SCANBUILD: "Dereference of null pointer", normal

14244. * Default panic handler

14245. * Error, fatal, and panic handling.

14246. exit() afterwards to satisfy "noreturn"

14247. DUK_USE_DEBUGGER_THROW_NOTIFY || DUK_USE_DEBUGGER_PAUSE_UNCAUGHT

14248. Don't intercept a DoubleError, we may have caused the initial double * fault and attempting to intercept it will cause us to be called * recursively and exhaust the C stack.

14249. Report it to the debug client

14250. * Helper to walk the thread chain and see if there is an active error * catcher. Protected calls or finally blocks aren't considered catching.

14251. * Get prototype object for an integer error code.

14252. **comment:** XXX: more specific error classes?

label: code-design

14253. DUK_USE_DEBUGGER_SUPPORT

14254. side effects

14255. XXX: Allow customizing the pause and notify behavior at runtime * using debugger runtime flags. For now the behavior is fixed using * config options.

14256. all we need to know

14257. **comment:** * XXX: As noted above, a protected API call won't be counted as a * catcher. This is usually convenient, e.g. in the case of a top- * level duk_pcall(), but may not always be desirable. Perhaps add an * argument to treat them as catchers?

label: code-design

14258. * Error helpers

14259. * Exposed helper for setting up heap longjmp state.

14260. use_prev_pc
14261. DUK_USE_DEBUGGER_SUPPORT && (DUK_USE_DEBUGGER_THROW_NOTIFY || DUK_USE_DEBUGGER_PAUSE_UNCAUGHT)
14262. If something is thrown with the debugger attached and nobody will * catch it, execution is paused before the longjmp, turning over * control to the debug client. This allows local state to be examined * before the stack is unwound. Errors are not intercepted when debug * message loop is active (e.g. for Eval).
14263. **comment:** * The __FILE__ and __LINE__ information is intentionally not used in the * creation of the error object, as it isn't useful in the tracedata. The * tracedata still contains the function which returned the negative return * code, and having the file/line of this function isn't very useful.
 label: code-design
14264. Sync so that augmentation sees up-to-date activations, NULL * thr->ptr_curr_pc so that it's not used if side effects occur * in augmentation or longjmp handling.
14265. **comment:** * Create and throw an error (originating from Duktape internally) * * Push an error object on top of the stack, possibly throw augmenting * the error, and finally longjmp. * * If an error occurs while we're dealing with the current error, we might * enter an infinite recursion loop. This is prevented by detecting a * "double fault" through the heap->handling_error flag; the recursion * then stops at the second level.
 label: code-design
14266. * Create and throw an Ecmascript error object based on a code and a message. * * Used when we throw errors internally. Ecmascript generated error objects * are created by Ecmascript code, and the throwing is handled by the bytecode * executor.
14267. **comment:** XXX: if attempt to push beyond allocated valstack, this double fault * handling fails miserably. We should really write the double error * directly to thr->heap->lj.value1 and avoid valstack use entirely.
 label: code-design
14268. * Create and push an error object onto the top of stack. * If a "double error" occurs, use a fixed error instance * to avoid further trouble.
14269. **comment:** XXX: unnecessary '%s' formatting here, but cannot use * 'msg' as a format string directly.
 label: code-design
14270. reset callstack limit
14271. **comment:** XXX: this generates quite large code - perhaps select the error * class based on the code and then just use the error 'name'?
 label: code-design
14272. just making sure
14273. * Finally, longjmp
14274. **comment:** Allow headroom for calls during error handling (see GH-191). * We allow space for 10 additional recursions, with one extra * for, e.g. a print() call at the deepest level.
 label: code-design
14275. **comment:** * Augment error (throw time), unless alloc/double error
 label: code-design
14276. **comment:** XXX: shared strings
 label: code-design
14277. Error object is augmented at its creation here.
14278. * Helper for C function call negative return values.
14279. * Exception for Duktape internal throws when C++ exceptions are used * for long control transfers. * * Doesn't inherit from any exception base class to minimize the chance * that user code would accidentally catch this exception.
14280. intentionally empty
14281. DUK_EXCEPTION_H_INCLUDED
14282. duk_tval intentionally skipped
14283. * Forward declarations
14284. * Forward declarations for all Duktape structures.
14285. DUK_FORWDECL_H_INCLUDED
14286. no typedef
14287. Current size (not counting a dynamic buffer's "spare").
14288. External buffer with 'curr_alloc' managed by user code and pointing to an * arbitrary address. When heap pointer compression is not used, this struct * has the same layout as duk_hbuffer_dynamic.
14289. No pointer compression because pointer is potentially outside of * Duktape heap.
14290. **comment:** It's not strictly necessary to track the current size, but * it is useful for writing robust native code.
 label: code-design
14291. Stored in duk_heaphdr h_extra16.
14292. * Flags * * Fixed buffer: 0 * Dynamic buffer: DUK_HBUFFER_FLAG_DYNAMIC * External buffer: DUK_HBUFFER_FLAG_DYNAMIC | DUK_HBUFFER_FLAG_EXTERNAL
14293. * Data following the header depends on the DUK_HBUFFER_FLAG_DYNAMIC * flag. * * If the flag is clear (the buffer is a fixed size one), the buffer * data follows the header directly, consisting of 'size' bytes. * * If the flag is set, the actual buffer is allocated separately, and * a few control fields follow the header. Specifically: * * - a "void *" pointing to the current allocation * - a duk_size_t indicating the full allocated size (always >= 'size') * * If DUK_HBUFFER_FLAG_EXTERNAL is set, the buffer has been allocated * by user code, so that Duktape won't be able to resize it and won't * free it. This allows buffers to point to e.g. an externally * allocated structure such as a frame buffer. * * Unlike strings, no terminator byte (NUL) is guaranteed after the * data. This would be convenient, but would pad aligned user buffers * unnecessarily upwards in size. For instance, if user code requested * a 64-byte dynamic buffer, 65 bytes would actually be allocated which * would then potentially round upwards to perhaps 68 or 72 bytes.
14294. **comment:** * Data follows the struct header. The struct size is padded by the * compiler based on the struct members. This guarantees that the * buffer data will be aligned-by-4 but not necessarily aligned-by-8. * * On platforms where alignment does not matter, the struct padding * could be removed (if there is any). On platforms where alignment * by 8 is required, the struct size must be forced to be a multiple * of 8 by some means. Without it, some user code may break, and also * Duktape itself breaks (e.g. the compiler stores duk_tvals in a * dynamic buffer).
 label: code-design
14295. size stored in duk_heaphdr unused flag bits
14296. * Misc defines
14297. indirect allocs
14298. may be NULL if alloc_size == 0
14299. * Prototypes
14300. **comment:** * Allocation size for 'curr_alloc' is alloc_size. There is no * automatic NUL terminator for buffers (see above for rationale). * * 'curr_alloc' is explicitly allocated with heap allocation * primitives and will thus always have alignment suitable for * e.g. duk_tval and an IEEE double.
 label: code-design
14301. Dynamic buffer with 'curr_alloc' pointing to a dynamic area allocated using * heap allocation primitives. Also used for external buffers when low memory * options are not used.
14302. * Heap buffer representation. * * Heap allocated user data buffer which is either: * * 1. A fixed size buffer (data follows header statically) * 2. A dynamic size buffer (data pointer follows header) * * The data pointer for a variable size buffer of zero size may be NULL.
14303. Get/set the current user visible size, without accounting for a dynamic * buffer's "spare" (= usable size).
14304. Intentionally not 0x7fffffffUL; at least JSON code expects that * 2*len + 2 fits in 32 bits.
14305. buffer pointer is to an externally allocated buffer
14306. assume 0 <=> NULL
14307. dynamic buffer ops
14308. DUK_HBUFFER_H_INCLUDED
14309. **comment:** A union is used here as a portable struct size / alignment trick: * by adding a 32-bit or a 64-bit (unused) union member, the size of * the struct is effectively forced to be a multiple of 4 or 8 bytes * (respectively) without increasing the size of the struct unless * necessary.
 label: code-design
14310. no extra padding
14311. * Field access
14312. Cannot be compressed as a heap pointer because may point to * an arbitrary address.

14313. Without heap pointer compression `duk_hbuffer_dynamic` and `duk_hbuffer_external *` have the same layout so checking for fixed vs. dynamic (or external) is enough.
14314. * Structs
14315. Get a pointer to the current buffer contents (matching current allocation * size). May be NULL for zero size dynamic/external buffer.
14316. Stored in `duk_heapheader` unused flags.
14317. Shared prefix for all buffer types.
14318. buffer is behind a pointer, dynamic or external
14319. Fixed buffer; data follows struct, with proper alignment guaranteed by * struct size.
14320. Impose a maximum buffer length for now. Restricted artificially to * ensure resize computations or adding a heap header length won't * overflow `size_t` and that a signed `duk_int_t` can hold a buffer * length. The limit should be synchronized with `DUK_HSTRING_MAX_BYTELEN`.
14321. Because size > 0, NULL check is correct
14322. **comment:** Size sanity check. Should not be necessary because caller is * required to check this, but we don't want to cause a segfault * if the size wraps either in `duk_size_t` computation or when * storing the size in a 16-bit field.
- label:** code-design
14323. alloc external with size zero
14324. the compressed pointer is zeroed which maps to NULL, so nothing to do.
14325. For indirect allocs.
14326. no need to write 'out_bufdata'
14327. zero everything unless requested not to do so
14328. * `duk_hbuffer` allocation and freeing.
14329. Allocate a new `duk_hbuffer` of a certain type and return a pointer to it * (NULL on error). Write buffer data pointer to 'out_bufdata' (only if * allocation successful).
14330. no wrapping
14331. **comment:** * `duk_hbuffer` operations such as resizing and inserting/appending data to * a dynamic buffer. * * Append operations append to the end of the buffer and they are relatively * efficient: the buffer is grown with a "spare" part relative to the buffer * size to minimize reallocations. Insert operations need to move existing * data forward in the buffer with `memmove()` and are not very efficient. * They are used e.g. by the regexp compiler to "backpatch" regexp bytecode.
- label:** code-design
14332. * Resizing
14333. 'res' may be NULL if new allocation size is 0.
14334. **comment:** * Note: use indirect realloc variant just in case mark-and-sweep * (finalizers) might resize this same buffer during garbage * collection.
- label:** code-design
14335. * Maximum size check
14336. * The entire allocated buffer area, regardless of actual used * size, is kept zeroed in resizes for simplicity. If the buffer * is grown, zero the new part.
14337. All element accessors are host endian now (driven by `TypedArray` spec).
14338. Validate that the whole slice [0,length[is contained in the underlying * buffer. Caller must ensure 'buf' != NULL.
14339. `DUK_HBUFFEROBJECT_H_INCLUDED`
14340. byte index limit for element access, exclusive
14341. **comment:** Slice and accessor information. * * Because the underlying buffer may be dynamic, these may be * invalidated by the buffer being modified so that both offset * and length should be validated before every access. Behavior * when the underlying buffer has changed doesn't need to be clean: * virtual 'length' doesn't need to be affected, reads can return * zero/NaN, and writes can be ignored. * * Note that a data pointer cannot be precomputed because 'buf' may * be dynamic and its pointer unstable.
- label:** code-design
14342. Validate byte read/write for virtual 'offset', i.e. check that the * offset, taking into account `h->offset`, is within the underlying * buffer size. This is a safety check which is needed to ensure * that even a misconfigured `duk_hbufferobject` never causes memory * unsafe behavior (e.g. if an underlying dynamic buffer changes * after being setup). Caller must ensure 'buf' != NULL.
14343. Shared object part.
14344. element type
14345. Underlying buffer (refcounted), may be NULL.
14346. Get the current data pointer (caller must ensure buf != NULL) as a * `duk_uint8_t` ptr.
14347. True if slice is full, i.e. offset is zero and length covers the entire * buffer. This status may change independently of the `duk_hbufferobject` if * the underlying buffer is dynamic and changes without the `hbufferobject` * being changed.
14348. element size shift: * 0 = u8/i8 * 1 = u16/i16 * 2 = u32/i32/float * 3 = double
14349. No assertions for offset or length; in particular, \ * it's OK for length to be longer than underlying \ * buffer. Just ensure they don't wrap when added. \
14350. byte offset to buf
14351. * Heap Buffer object representation. Used for all Buffer variants.
14352. Clamp an input byte length (already assumed to be within the nominal * `duk_hbufferobject` 'length') to the current dynamic buffer limits to * yield a byte length limit that's safe for memory accesses. This value * can be invalidated by any side effect because it may trigger a user * callback that resizes the underlying buffer.
14353. Slice starting point is beyond current length.
14354. `DUK_USE_BUFFEROBJECT_SUPPORT`
14355. Line number range for function. Needed during debugging to * determine active breakpoints.
14356. number of arguments allocated to regs
14357. * Additional control information is placed into the object itself * as internal properties to avoid unnecessary fields for the * majority of functions. The compiler tries to omit internal * control fields when possible. * * Function templates: * * { * name: "func", // declaration, named function expressions * `fileName`: <debug info for creating nice errors> * `_Varmap`: { "arg1": 0, "arg2": 1, "varname": 2 }, * `_Formals`: ["arg1", "arg2"], * `_Source`: "function func(arg1, arg2) { ... }", * `_Pc2line`: <debug info for pc-to-line mapping>, * } * * Function instances: * * { * length: 2, * prototype: { constructor: <func> }, * caller: <thrower>, * arguments: <thrower>, * name: "func", // declaration, named function expressions * `fileName`: <debug info for creating nice errors> * `_Varmap`: { "arg1": 0, "arg2": 1, "varname": 2 }, * `_Formals`: ["arg1", "arg2"], * `_Source`: "function func(arg1, arg2) { ... }", * `_Pc2line`: <debug info for pc-to-line mapping>, * `_Varenv`: <variable environment of closure>, * `_Lexenv`: <lexical environment of closure (if differs from `_Varenv`)> * } * * More detailed description of these properties can be found * in the documentation.
14358. **comment:** XXX: casts could be improved, especially for GET/SET DATA
- label:** code-design
14359. * Heap compiled function (EcmaScript function) representation. * * There is a single data buffer containing the EcmaScript function's * bytecode, constants, and inner functions.
14360. shared object part
14361. **comment:** * 'nregs' registers are allocated on function entry, at most 'nargs' * are initialized to arguments, and the rest to undefined. Arguments * above 'nregs' are not mapped to registers. All registers in the * active stack range must be initialized because they are GC reachable. * 'nargs' is needed so that if the function is given more than 'nargs' * arguments, the additional arguments do not 'clobber' registers * beyond 'nregs' which must be consistently initialized to undefined. * * Usually there is no need to know which registers are mapped to * local variables. Registers may be allocated to variable in any * way (even including gaps). However, a register-variable mapping * must be the same for the duration of the function execution and * the register cannot be used for anything else. * * When looking up variables by name, the '`_Varmap`' map is used. * When an activation closes, registers mapped to arguments are * copied into the environment record based on the same map. The * reverse map (from register to variable) is not currently needed * at run time, except for debugging, so it is not maintained.
- label:** code-design
14362. * Field accessor macros
14363. `DUK_HCOMPILEDFUNCTION_H_INCLUDED`
14364. regs to allocate
14365. **comment:** No need for constants pointer (= same as data). * * When using 16-bit packing alignment to 4 is nice. 'funcs' will be * 4-byte aligned because 'constants' are `duk_tvvals`. For now the * inner function pointers are not compressed, so that 'bytecode' will * also be 4-byte aligned.
- label:** code-design

14366. Data area, fixed allocation, stable data ptrs.
14367. Note: assumes 'data' is always a fixed buffer
14368. * Main struct
14369. * Pointers to function data area for faster access. Function * data is a buffer shared between all closures of the same * "template" function. The data buffer is always fixed (non- * dynamic, hence stable), with a layout as follows: * * constants (duk_tval) * inner functions (duk_hobject *) * bytecode (duk_instr_t) * * * Note: bytecode end address can be computed from 'data' buffer * size. It is not strictly necessary functionally, assuming * bytecode never jumps outside its allocated area. However, * it's a safety/robustness feature for avoiding the chance of * executing random data as bytecode due to a compiler error. * * Note: values in the data buffer must be incref'd (they will * be decref'd on release) for every compiledfunction referring * to the 'data' element.
14370. * Accessor macros for function specific data areas
14371. **comment:** XXX: double evaluation of DUK_HCOMPILEDFUNCTION_GET_DATA()
 label: code-design
14372. callback for indirect reallocs, request for current pointer
14373. Retry allocation after mark-and-sweep for this * many times. A single mark-and-sweep round is * not guaranteed to free all unreferenced memory * because of finalization (in fact, ANY number of * rounds is strictly not enough).
14374. **comment:** XXX: static alloc is OK until separate chaining stringtable * resizing is implemented.
 label: code-design
14375. heap destruction ongoing, finalizer rescue no longer possible
14376. resend state next time executor is about to run
14377. No field needed when strings are in ROM.
14378. indicates a deleted string; any fixed non-NULL, non-hstring pointer works
14379. **comment:** alloc size in elements
 label: code-design
14380. value1 -> label number, pseudo-type to indicate a break continuation (for ENDFIN)
14381. don't run finalizers; queue finalizable objects back to heap_allocated
14382. **comment:** unused
 label: code-design
14383. DUK_USE_ROM_STRINGS
14384. don't compact objects; needed during object property allocation resize
14385. borrowed; NULL if no step state (NULLED in unwind)
14386. breakpoints: [0,breakpoint_count[gc reachable
14387. value1 -> resume value, value2 -> resume thread, iserror -> error/normal
14388. * Other heap related defines
14389. Allocator functions.
14390. don't run finalizers; leave finalizable objects in finalize_list for next round
14391. Step types
14392. used entries + approx 100% -> reset load to 50%
14393. current thread
14394. * Mark-and-sweep flags * * These are separate from heap level flags now but could be merged. * The heap structure only contains a 'base mark-and-sweep flags' * field and the GC caller can impose further flags.
14395. * Memory constants
14396. force executor restart to recheck breakpoints; used to handle function returns (see GH-303)
14397. required, NULL implies detached
14398. no value, pseudo-type to indicate a normal continuation (for ENDFIN)
14399. heap thread, used internally and for finalization
14400. * Thread switching * * To switch heap->curr_thread, use the macro below so that interrupt counters * get updated correctly. The macro allows a NULL target thread because that * happens e.g. in call handling.
14401. * Longjmp types, also double as identifying continuation type for a rethrow (in 'finally')
14402. * Longjmp state, contains the information needed to perform a longjmp. * Longjmp related values are written to value1, value2, and iserror.
14403. **comment:** * String cache should ideally be at duk_hthread level, but that would * cause string finalization to slow down relative to the number of * threads; string finalization must check the string cache for "weak" * references to the string being finalized to avoid dead pointers. * * Thus, string caches are now at the heap level now.
 label: code-design
14404. Stringcache is used for speeding up char-offset-to-byte-offset * translations for non-ASCII strings.
14405. For manual debugging: instruction count based on executor and * interrupt counter book-keeping. Inspect debug logs to see how * they match up.
14406. Heap udata, used for allocator functions but also for other heap * level callbacks like pointer compression, etc.
14407. load factor min 25%
14408. helper to insert a (non-string) heap object into heap allocated list
14409. initial stringtable size, must be prime and higher than DUK_UTIL_MIN_HASH_PRIME
14410. used elements (includes DELETED)
14411. marker for detecting internal "double faults", see duk_error_throw.c
14412. callbacks and udata; dbg_read_cb != NULL is used to indicate attached state
14413. debugger state, only relevant when attached
14414. allocated heap objects
14415. 4'294'967'295
14416. longjmp type
14417. Mark-and-sweep interval is relative to combined count of objects and * strings kept in the heap during the latest mark-and-sweep pass. * Fixed point .8 multiplier and .0 adder. Trigger count (interval) is * decreased by each (re)allocation attempt (regardless of size), and each * refzero processed object. * * 'SKIP' indicates how many (re)allocations to wait until a retry if * GC is skipped because there is no thread do it with yet (happens * only during init phases).
14418. Precomputed pointers when using 16-bit heap pointer packing.
14419. Maximum number of breakpoints. Only breakpoints that are set are * consulted so increasing this has no performance impact.
14420. Milliseconds between status notify and transport peeks.
14421. value1 -> error object
14422. mark-and-sweep is currently running
14423. step type: none, step into, step over, step out
14424. refcount code is processing refzero list
14425. emergency mode: try extra hard
14426. time when status/peek was last done (Date-based rate limit)
14427. Opcode interval for a Date-based status/peek rate limit check. Only * relevant when debugger is attached. Requesting a timestamp may be a * slow operation on some platforms so this shouldn't be too low. On the * other hand a high value makes Duktape react to a pause request slowly.
14428. mark-and-sweep control
14429. if 0, 'str16' used, if > 0, 'strlist16' used
14430. * Stringtable entry for fixed size stringtable
14431. no refcounting
14432. currently processing messages or breakpoints: don't enter message processing recursively (e.g. no breakpoints when processing debugger eval)
14433. probe sequence (open addressing)
14434. * Heap structure. * * Heap contains allocated heap objects, interned strings, and built-in * strings for one or more threads.
14435. starting line number

14436. Fatal error handling, called e.g. when a longjmp() is needed but * ljjmpbuf_ptr is NULL. fatal_func must never return; it's not * declared as "noreturn" because doing that for typedefs is a bit * challenging portability-wise.

14437. if 0, 'str' used, if > 0, 'strlist' used

14438. heap level "stash" object (e.g., various reachability roots)

14439. * Heap flags

14440. value1 -> return value, pseudo-type to indicate a return continuation (for ENDFIN)

14441. * Raw memory calls: relative to heap, but no GC interaction

14442. mark-and-sweep flags automatically active (used for critical sections)

14443. heap string indices are autogenerated in duk_strings.h

14444. * Prototypes

14445. 50x heap size

14446. string access cache (codepoint offset -> byte offset) for fast string * character looping; 'weak' reference which needs special handling in GC.

14447. currently running thread

14448. fixed top level hashtable size (separate chaining)

14449. longjmp state

14450. debugger detaching; used to avoid calling detach handler recursively

14451. required

14452. **comment:** A 16-bit listlen makes sense with 16-bit heap pointers: there * won't be space for 64k strings anyway.
label: code-design

14453. built-in strings

14454. executor interrupt running (used to avoid nested interrupts)

14455. **comment:** * Memory calls: relative to heap, GC interaction, but no error throwing. * * XXX: Currently a mark-and-sweep triggered by memory allocation will run * using the heap->heap_thread. This thread is also used for running * mark-and-sweep finalization; this is not ideal because it breaks the * isolation between multiple global environments. * * Notes: * * - DUK_FREE() is required to ignore NULL and any other possible return * value of a zero-sized alloc/realloc (same as ANSI C free()). * * - There is no DUK_REALLOC_ZEROED because we don't assume to know the * old size. Caller must zero the reallocated memory. * * - DUK_REALLOC_INDIRECT() must be used when a mark-and-sweep triggered * by an allocation failure might invalidate the original 'ptr', thus * causing a realloc retry to use an invalid pointer. Example: we're * reallocating the value stack and a finalizer resizes the same value * stack during mark-and-sweep. The indirect variant requests for the * current location of the pointer being reallocated using a callback * right before every realloc attempt; this circuitous approach is used * to avoid strict aliasing issues in a more straightforward indirect * pointer (void ***) approach. Note: the pointer in the storage * location is read but is NOT updated; the caller must do that.
label: code-design

14456. current setjmp() catchpoint

14457. isError flag for yield

14458. **comment:** XXX: make active breakpoints actual copies instead of pointers?
label: code-design

14459. value1 -> label number, pseudo-type to indicate a continue continuation (for ENDFIN)

14460. These are for rate limiting Status notifications and transport peeking.

14461. Used to support single-byte stream lookahead.

14462. duk_handle_call / duk_handle_safe_call recursion depth limiting

14463. **comment:** unused
label: code-design

14464. * Main heap structure

14465. currently active breakpoints: NULL term, borrowed pointers

14467. resizing parameters

14468. 1st related value (type specific)

14469. an error handler (user callback to augment/replace error) is running

14470. mix-in value for computing string hashes; should be reasonably unpredictable

14471. Starting from this round, use emergency mode * for mark-and-sweep.

14472. work list for objects to be finalized (by mark-and-sweep)

14473. value of dbg_exec_counter when we last did a Date-based check

14474. * Stringtable

14475. DUK_USE_DEBUGGER_SUPPORT

14476. mark-and-sweep marking reached a recursion limit and must use multi-pass marking

14477. callstack index

14478. debugger

14479. DUK_HEAP_H_INCLUDED

14480. cumulative opcode execution count (overflows are OK)

14481. **comment:** alloc function typedefs in duktape.h
label: code-design

14482. value1 -> yield value, iserror -> error / normal

14483. work list for objects whose refcounts are zero but which have not been * "finalized"; avoids recursive C calls when refcounts go to zero in a * chain of objects.

14484. strings up to the this length are not cached

14485. * Built-in strings

14486. * Debugger support

14487. 1x heap size

14488. currently paused: talk with debug client until step/resume

14489. don't resize stringtable (but may sweep it); needed during stringtable resize

14490. rnd_state for duk_util_tinyrandom.c

14491. string intern table (weak refs)

14492. load factor max 75%

14493. Currently nothing to free

14494. No str[] pointer.

14495. explicit NULL inits

14496. some derived types

14497. **comment:** * Allocate heap struct * * Use a raw call, all macros expect the heap to be initialized
label: code-design

14498. **comment:** suppress warning, not used
label: code-design

14499. Bernstein hash init value is normally 5381; XOR it in in case pointer low bits are 0

14500. Run mark-and-sweep a few times just in case (unreachable object * finalizers run already here). The last round must rescue objects * from the previous round without running any more finalizers. This * ensures rescued objects get their FINALIZED flag cleared so that * their finalizer is called once more in forced finalization to * satisfy finalizer guarantees. However, we don't want to run any * more finalizer because that'd required one more loop, and so on.

14501. **comment:** Similar workaround for INFINITY.
label: code-design

14502. **comment:** XXX: make a common DUK_USE_option, and allow custom fixed seed?
label: code-design

14503. Note: heap->heap_thread, heap->curr_thread, and heap->heap_object * are on the heap allocated list.

14504. * All done
14505. 'thr' is now reachable
14506. **comment:** These is not 100% because format would need to be non-portable "long long". * Also print out as doubles to catch cases where the "long" type is not wide * enough; the limits will then not be printed accurately but the magnitude * will be correct.
 label: code-design
14507. **comment:** Silence a few global unused warnings here.
 label: code-design
14508. Internal keys are prefixed with 0xFF in the stringtable * (which makes them invalid UTF-8 on purpose).
14509. **comment:** XXX: here again finalizer thread is the heap_thread which needs * to be coordinated with finalizer thread fixes.
 label: code-design

14511. DUK_USE_HEAPTR16
14512. assumes that allocated pointers and alloc funcs are valid * if res exists
14513. **comment:** No need to length check string: it will never exceed even * the 16-bit length maximum.
 label: code-design
14514. basic platform types
14515. Currently nothing to free; 'data' is a heap object
14516. mark-and-sweep not running -> must be empty
14517. The casts through duk_intr_pt is to avoid the following GCC warning: * * warning: cast from pointer to integer of different size [-Wpointer-to-int-cast] * * This still generates a /Wp64 warning on VS2010 when compiling for x86.
14518. Only objects in heap_allocated may have finalizers. Check that * the object itself has a _Finalizer property (own or inherited) * so that we don't execute finalizers for e.g. Proxy objects.
14519. * Init the heap object
14520. **comment:** XXX: zero assumption
 label: code-design
14521. unsigned
14522. **comment:** XXX: Add a flag to reject an attempt to re-attach? Otherwise * the detached callback may immediately reattach.
 label: code-design
14523. Cannot wrap: each object is at least 8 bytes so count is * at most 1/8 of that.
14524. * Init stringtable: fixed variant
14525. Fixed seed value used with ROM strings.
14526. **comment:** Workaround for some exotic platforms where NAN is missing * and the expression (0.0 / 0.0) does NOT result in a NaN. * Such platforms use the global 'duk_computed_nan' which must * be initialized at runtime. Use 'volatile' to ensure that * the compiler will actually do the computation and not try * to do constant folding which might result in the original * problem.
 label: code-design
14527. refzero not running -> must be empty
14528. We don't log or warn about freeing zero refcount objects * because they may happen with finalizer processing.
14529. * Init the heap thread
14530. Constants for built-in string data depacking.
14531. structs from duk_forwdecl.h
14532. * Zero the struct, and start initializing roughly in order
14533. * duk_heap allocation and freeing.
14534. convenience
14535. just one 'int' for C++ exceptions
14536. **comment:** XXX: use the pointer as a seed for now: mix in time at least
 label: code-design
14537. 0 = uppercase, 32 = lowercase (= 'a' - 'A')
14538. * Init built-in strings
14539. **comment:** XXX: with 'caller' property the callstack would need * to be unwound to update the 'caller' properties of * functions in the callstack.
 label: code-design
14540. **comment:** Note: first argument not really used
 label: code-design
14541. * Free the heap. * * Frees heap-related non-heap-tracked allocations such as the * string intern table; then frees the heap allocated objects; * and finally frees the heap structure itself. Reference counts * and GC markers are ignored (and not updated) in this process, * and finalizers won't be called. * * The heap pointer and heap object pointers must not be used * after this call.
14542. rescue no longer supported
14543. Special flags checks. Since these strings are always * reachable and a string cannot appear twice in the string * table, there's no need to check/set these flags elsewhere. * The 'internal' flag is set by string intern code.
14544. res->mark_and_sweep_trigger_counter == 0 -> now causes immediate GC; which is OK
14545. important chosen base types
14546. * Allocate a heap. * * String table is initialized with built-in strings from genbuiltins.py, * either by dynamically creating the strings or by referring to ROM strings.
14547. **comment:** Execute finalizers before freeing the heap, even for reachable * objects, and regardless of whether or not mark-and-sweep is * enabled. This gives finalizers the chance to free any native * resources like file handles, allocations made outside Duktape, * etc. This is quite tricky to get right, so that all finalizer * guarantees are honored. * * XXX: this perhaps requires an execution time limit.
 label: code-design
14548. * Computed values (e.g. INFINITY)
14549. skip finalizers; queue finalizable objects to heap_allocated
14550. tval
14551. DUK_USE_DEBUG
14552. basic types from duk_features.h
14553. * Init stringcache
14554. no res->strs[]
14555. DUK_USE_EXPLICIT_NULL_INIT
14556. * Free a heap object. * * Free heap object and its internal (non-heap) pointers. Assumes that * caller has removed the object from heap allocated list or the string * intern table, and any weak references (which strings may have) have * been already dealt with.
14557. Detach a debugger if attached (can be called multiple times) * safely.
14558. res->strs16[] is zeroed and zero decodes to NULL, so no NULL inits.
14559. Decrease by 25% every round
14560. Each round of finalizer execution may spawn new finalizable objects * which is normal behavior for some applications. Allow multiple * rounds of finalization, but use a shrinking limit based on the * first round to detect the case where a runaway finalizer creates * an unbounded amount of new finalizable objects. Finalizer rescue * is not supported: the semantics are unclear because most of the * objects being finalized here are already reachable. The finalizer * is given a boolean to indicate that rescue is not possible. * * See discussion in: <https://github.com/svaarala/duktape/pull/473>
14561. nothing to NULL
14562. derived types
14563. strings are only tracked by stringtable
14564. Don't free h->resumer because it exists in the heap. * Callstack entries also contain function pointers which * are not freed for the same reason.
14565. DUK_USE_STRTAB_PROBE

14566. maps to finalizer 2nd argument
14567. * If selftests enabled, run them as early as possible
14568. zero
14569. **comment:** XXX: The incref macro takes a thread pointer but doesn't * use it right now.
label: code-design
14570. **comment:** XXX: error handling is incomplete. It would be cleanest if * there was a setjmp catchpoint, so that all init code could * freely throw errors. If that were the case, the return code * passing here could be removed.
label: code-design
14571. DUK_USE_STRTAB_CHAIN
14572. Prevent mark-and-sweep for the pending finalizers, also prevents * refzero handling from moving objects away from the heap_allocated * list. (The flag meaning is slightly abused here.)
14573. default prototype (Note: 'thr' must be reachable)
14574. basic types
14575. **comment:** XXX: this may now fail, and is not handled correctly
label: code-design
14576. * Debug dump type sizes
14577. With ROM-based strings, heap->strs[] and thr->strs[] are omitted * so nothing to initialize for strs[].
14578. * Init stringtable: probe variant
14579. **comment:** XXX: inefficient loop
label: code-design
14580. note: mixing len into seed improves hashing when skipping
14581. **comment:** Use Murmurhash2 directly for short strings, and use "block skipping" * for long strings: hash an initial part and then sample the rest of * the string with reasonably sized chunks. An initial offset for the * sampling is computed based on a hash of the initial part of the string; * this is done to (usually) avoid the case where all long strings have * certain offset ranges which are never sampled. * * Skip should depend on length and bound the total time to roughly * logarithmic. With current values: * * 1M string => 256 * 241 = 61696 bytes (0.06M) of hashing * 1G string => 256 * 16321 = 4178176 bytes (3.98M) of hashing * * XXX: It would be better to compute the skip offset more "smoothly" * instead of having a few boundary values.
label: code-design

14663. * Reset trigger counter
14664. **comment:** XXX: duk_small_uint_t would be enough for this loop
label: code-design
14665. **comment:** Run fake finalizer. Avoid creating unnecessary garbage.
label: code-design
14666. * Unreachable object about to be swept. Finalize target refcounts * (objects which the unreachable object points to) without doing * refzero processing. Recursive decrefs are also prevented when * refzero processing is disabled. ** Value cannot be a finalizable object, as they have been made * temporarily reachable for this round.
14667. Caller will finish the marking process if we hit a recursion limit.
14668. no mark-and-sweep gc
14669. may have FINALIZED
14670. log this with a normal debug level because this should be relatively rare
14671. * Marking functions for heap types: mark children recursively
14672. **comment:** * Finalize objects in the finalization work list. Finalized * objects are queued back to heap_allocated with FINALIZED set. ** Since finalizers may cause arbitrary side effects, they are * prevented during string table and object property allocation * resizing using the DUK_MS_FLAG_NO_FINALIZERS flag in * heap->mark_and_sweep_base_flags. In this case the objects * remain in the finalization work list after mark-and-sweep * exits and they may be finalized on the next pass. ** Finalization currently happens inside "MARKANDSWEEP_RUNNING" * protection (no mark-and-sweep may be triggered by the * finalizers). As a side effect: ** 1) an out-of-memory error inside a finalizer will not * cause a mark-and-sweep and may cause the finalizer * to fail unnecessarily ** 2) any temporary objects whose refcount decreases to zero * during finalization will not be put into refzero_list; * they can only be collected by another mark-and-sweep ** This is not optimal, but since the sweep for this phase has * already happened, this is probably good enough for now.
label: code-design
14673. hash part is a 'weak reference' and does not contribute
14674. **comment:** Checking this here rather than in memory alloc primitives * reduces checking code there but means a failed allocation * will go through a few retries before giving up. That's * fine because this only happens during debugging.
label: code-design
14675. A finalizer is looked up from the object and up its prototype chain * (which allows inherited finalizers). A prototype loop must not cause * an error to be thrown here; duk_hobject_hasprop_raw() will ignore a * prototype loop silently and indicate that the property doesn't exist.
14676. nothing to process

14677. * Clear (reachable) flags of refzero work list.
14678. * Begin
14679. * Mark roots, hoping that recursion limit is not normally hit. * If recursion limit is hit, run additional reachability rounds * starting from "temproots" until marking is complete. ** Marking happens in two phases: first we mark actual reachability * roots (and run "temproots" to complete the process). Then we * check which objects are unreachable and are finalizable; such * objects are marked as FINALIZABLE and marked as reachability * (and "temproots" is run again to complete the process). ** The heap finalize_list must also be marked as a reachability root. * There may be objects on the list from a previous round if the * previous run had finalizer skip flag.
14680. Run the finalizer, duk_hobject_run_finalizer() sets FINALIZED. * Next mark-and-sweep will collect the object unless it has * become reachable (i.e. rescued). FINALIZED prevents the * finalizer from being executed again before that.
14681. nop
14682. DUK_USE_STRTAB_PROBE
14683. * Reachable object, keep
14684. May happen in some out-of-memory corner cases.
14685. * Sweep stringtable
14686. An object may be in heap_allocated list with a zero * refcount also if it is a temporary object created by * a finalizer; because finalization now runs inside * mark-and-sweep, such objects will not be queued to * refzero_list and will thus appear here with refcount * zero.
14687. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed.
14688. **comment:** Select a thread for mark-and-sweep use. ** XXX: This needs to change later.
 label: code-design
14689. An object may be in heap_allocated list with a zero * refcount if it has just been finalized and is waiting * to be collected by the next cycle.
14690. * Sweep heap
14691. DUK_USE_STRTAB_CHAIN
14692. finalize_list will always be processed completely
14693. approximate
14694. **comment:** XXX: thread selection for mark-and-sweep is currently a hack. * If we don't have a thread, the entire mark-and-sweep is now * skipped (although we could just skip finalizations).
 label: code-design
14695. **comment:** XXX: which lists should participate? to be finalized?
 label: code-design
14696. nargs
14697. mark finalizable as reachability roots
14698. * Clear (reachable) flags of finalize_list ** We could mostly do in the sweep phase when we move objects from the * heap into the finalize_list. However, if a finalizer run is skipped * during a mark-and-sweep, the objects on the finalize_list will be marked * reachable during the next mark-and-sweep. Since they're already on the * finalize_list, no-one will be clearing their REACHABLE flag so we do it * here. (This now overlaps with the sweep handling in a harmless way.)
14699. Used during heap destruction: don't actually run finalizers * because we're heading into forced finalization. Instead, * queue finalizable objects back to the heap_allocated list.
14700. No finalizers for ROM objects
14701. * Misc
14702. * Memory allocation handling.
14703. Note: key issue here is to re-lookup the base pointer on every attempt. * The pointer being reallocated may change after every mark-and-sweep.
14704. for zero size allocations NULL is allowed
14705. **comment:** * Compared to a direct macro expansion this wrapper saves a few * instructions because no heap dereferencing is required.
 label: code-design
14706. Note: must behave like a no-op with NULL and any pointer * returned from malloc/realloc with zero size.
14707. simulate alloc failure on every realloc (except when mark-and-sweep is running)
14708. * Helpers * * The fast path checks are done within a macro to ensure "inlining" * while the slow path actions use a helper (which won't typically be * inlined in size optimized builds).
14709. * Avoid a GC if GC is already running. This can happen at a late * stage in a GC when we try to e.g. resize the stringtable * or compact objects.
14710. * Reallocate memory with garbage collection, using a callback to provide * the current allocated pointer. This variant is used when a mark-and-sweep * (e.g. finalizers) might change the original pointer.
14711. no voluntary gc
14712. * First attempt
14713. simulate alloc failure on every alloc (except when mark-and-sweep is running)
14714. DUK_USE_MARK_AND_SWEEP
14715. assume memset with zero size is OK
14716. * Allocate memory with garbage collection
14717. ptr before mark-and-sweep
14718. Must behave like a no-op with NULL and any pointer returned from * malloc/realloc with zero size.
14719. saves a few instructions to have this wrapper (see comment on duk_heap_mem_alloc)
14720. Count free operations toward triggering a GC but never actually trigger * a GC from a free. Otherwise code which frees internal structures would * need to put in NULLs at every turn to ensure the object is always in * consistent state for a mark-and-sweep.
14721. useful for debugging
14722. ptr may be NULL
14723. * Reallocate memory with garbage collection
14724. * Retry with several GC attempts. Initial attempts are made without * emergency mode; later attempts use emergency mode which minimizes * memory allocations forcibly.
14725. * Free memory
14726. * Voluntary periodic GC (if enabled)
14727. DUK_USE_MARK_AND_SWEEP && DUK_USE_VOLUNTARY_GC
14728. * Avoid a GC if GC is already running. See duk_heap_mem_alloc().
14729. For initial entry use default value; zero forces an * interrupt before executing the first instruction.
14730. DUK_USE_INTERRUPT_COUNTER
14731. * Support functions for duk_heap.
14732. may be NULL
14733. arbitrary remove only works with double linked heap, and is only required by * reference counting so far.
14734. **comment:** The prev/next pointers of the removed duk_heaphdr are left as garbage. * It's up to the caller to ensure they're written before inserting the * object back.
 label: code-design
14735. Copy interrupt counter/init value state to new thread (if any). * It's OK for new_thr to be the same as curr_thr.
14736. yes -> move back to heap allocated
14737. Require a lot of stack to force a value stack grow/shrink.
14738. * Refcount memory freeing loop. ** Frees objects in the refzero_pending list until the list becomes * empty. When an object is freed, its references get decref'd and * may cause further objects to be queued for freeing. ** This could be expanded to allow incremental freeing: just bail out * early and resume at a future alloc/decref/refzero.
14739. 'count' is more or less comparable to normal trigger counter update * which happens in memory block (re)allocation.
14740. * Buffers have no internal references. However, a dynamic * buffer has a separate allocation for the buffer. This is * freed by duk_heap_free_heaphdr_raw().
14741. DUK_USE_REFERENCE_COUNTING
14742. Avoid fake finalization when callstack limit has been reached. * Otherwise a callstack limit error will be created, then refzero'ed, * and we're in an infinite loop.
14743. DUK_USE_REFZERO_FINALIZER_TORTURE

14744. no -> decref members, then free
14745. Run fake finalizer. Avoid creating new refzero queue entries * so that we are not forced into a forever loop.
14746. ignored
14747. no refcounting
14748. **comment:** Avoid fake finalization for the duk__refcount_fake_finalizer function * itself, otherwise we're in infinite recursion.
 label: code-design
14749. * Finalizer check. * * Note: running a finalizer may have arbitrary side effects, e.g. * queue more objects on refzero_list (tail), or even trigger a * mark-and-sweep.
 * * Note: quick reject check should match vast majority of * objects and must be safe (not throw any errors, ever).
14750. An object may have FINALIZED here if it was finalized by mark-and-sweep * on a previous run and refcount then decreased to zero. We won't run the * finalizer again here.
14751. refcount is unsigned, so always true
14752. currently, always the case
14753. not emergency
14754. A finalizer is looked up from the object and up its prototype chain * (which allows inherited finalizers).
14755. must never longjmp
14756. Torture option to shake out finalizer side effect issues: * make a bogus function call for every finalizable object, * essentially simulating the case where everything has a * finalizer.
14757. * Rescue or free.
14758. May happen in some out-of-memory corner cases.
14759. * Once the whole refzero cascade has been freed, check for * a voluntary mark-and-sweep.
14760. tail insert: don't disturb head in case refzero is running
14761. * Detect recursive invocation
14762. nothing to finalize
14763. **comment:** unused
 label: code-design
14764. nothing now
14765. Refzero head is still the same. This is the case even if finalizer * inserted more refzero objects; they are inserted to the tail.
14766. not strictly necessary
14767. * Strings have no internal references but do have "weak" * references in the string cache. Also note that strings * are not on the heap_allocated list like other heap * elements.
14768. duk_object_run_finalizer() sets
14769. * Incref and decref functions. * * Decref may trigger immediate refzero handling, which may free and finalize * an arbitrary number of objects. *
14770. * Heap object refcount finalization. * * When an object is about to be freed, all other objects it refers to must * be decref'd. Refcount finalization does NOT free the object or its inner * allocations (mark-and-sweep shares these helpers), it just manipulates * the refcounts. * * Note that any of the decref's may cause a refcount to drop to zero, BUT * it will not be processed inline; instead, because refzero is already * running, the objects will just be queued to refzero list and processed * later. This eliminates C recursion.
14771. **comment:** XXX: do something to force a callstack grow/shrink, perhaps * just a manual forced resize?
 label: code-design
14772. bump refcount to prevent refzero during finalizer processing
14773. * Objects have internal references. Must finalize through * the "refzero" work list.
14774. * Pick an object from the head (don't remove yet).
14775. **comment:** XXX: ideally this would be just one flag (maybe a derived one) so * that a single bit test is sufficient to check the condition.
 label: test
14776. approximate
14777. * Remove the object from the refzero list. This cannot be done * before a possible finalizer has been executed; the finalizer * may trigger a mark-and-sweep, and mark-and-sweep must be able * to traverse a complete refzero_list.
14778. **comment:** XXX: better to get base and walk forwards?
 label: code-design
14779. nargs
14780. * Churn refzero_list until empty
14781. remove artificial bump
14782. cannot happen: strings are not put into refzero list (they don't even have the next/prev pointers)
14783. hash part is a 'weak reference' and does not contribute
14784. DUK_USE_MARK_AND_SWEEP && DUK_USE_VOLUNTARY_GC
14785. * Reference counting implementation.
14786. **comment:** * Refzero handling is skipped entirely if (1) mark-and-sweep is * running or (2) execution is paused in the debugger. The objects * are left in the heap, and will be freed by mark-and-sweep or * eventual heap destruction. * * This is necessary during mark-and-sweep because refcounts are also * updated during the sweep phase (otherwise objects referenced by a * swept object would have incorrect refcounts) which then calls here. * This could be avoided by using separate decref macros in * mark-and-sweep; however, mark-and-sweep also calls finalizers which * would use the ordinary decref macros anyway and still call this * function. * * This check must be enabled also when mark-and-sweep support has been * disabled: the flag is also used in heap destruction when running * finalizers for remaining objects, and the flag prevents objects from * being moved around in heap linked lists.
 label: code-design
14787. * Misc
14788. **comment:** * Delete references to given hstring from the heap string cache. * * String cache references are 'weak': they are not counted towards * reference counts, nor serve as roots for mark-and-sweep. When an * object is about to be freed, such references need to be removed.
 label: code-design
14789. update entry, allocating if necessary
14790. may be equal
14791. * String scanning helpers * * All bytes other than UTF-8 continuation bytes ([0x80,0xbf]) are * considered to contribute a character. This must match how string * character length is computed.
14792. take last entry
14793. * Scan from shortest distance: * - start of string * - end of string * - cache entry (if exists)
14794. LRU: move our entry to first
14795. **comment:** * Convert char offset to byte offset * * Avoid using the string cache if possible: for ASCII strings byte and * char offsets are equal and for short strings direct scanning may be * better than using the string cache (which may evict a more important * entry). * * Typing now assumes 32-bit string byte/char offsets (duk_uint_fast32_t). * Better typing might be to use duk_size_t.
 label: code-design
14796. no sce, or sce scan not best
14797. * Update cache entry (allocating if necessary), and move the * cache entry to the first place (in an "LRU" policy).
14798. clen == blen -> pure ascii
14799. **comment:** * For non-ASCII strings, we need to scan forwards or backwards * from some starting point. The starting point may be the start * or end of the string, or some cached midpoint in the string * cache. * * For "short" strings we simply scan without checking or updating * the cache. For longer strings we check and update the cache as * necessary, inserting a new cache entry if none exists.
 label: code-design
14800. **comment:** 'sce' points to the wrong entry here, but is no longer used
 label: code-design
14801. Scan error: this shouldn't normally happen; it could happen if * string is not valid UTF-8 data, and clen/blen are not consistent * with the scanning algorithm.
14802. **comment:** XXX: the string shouldn't appear twice, but we now loop to the * end anyway; if fixed, add a looping assertion to ensure there * is no duplicate.

label: code-design

14803. * For ASCII strings, the answer is simple.
14804. * String cache. * * Provides a cache to optimize indexed string lookups. The cache keeps * track of (byte offset, char offset) states for a fixed number of strings. * Otherwise we'd need to scan from either end of the string, as we store * strings in (extended) UTF-8.
14805. initialize for debug prints, needed if sce==NULL
14806. * A C * B A * C <- sce ==> B * D D
14807. may be less, since DELETED entries are NULLED by rehash
14808. **comment:** load factor too low or high, count actually used entries and resize

14920. object has an array part (a_size may still be 0)

14921. * Exposed data

14922. **comment:** * Heap object representation. * * Heap objects are used for Ecmascript objects, arrays, and functions, * but also for internal control like declarative and object environment * records. Compiled functions, native functions, and threads are also * objects but with an extended C struct. * * Objects provide the required Ecmascript semantics and exotic behaviors * especially for property access. * * Properties are stored in three conceptual parts: * * 1. A linear 'entry part' contains

ordered key-value-attributes triples * and is the main method of string properties. ** 2. An optional linear 'array part' is used for array objects to store a * (dense) range of [0,N[array indexed entries with default attributes * (writable, enumerable, configurable). If the array part would become * sparse or non-default attributes are required, the array part is * abandoned and moved to the 'entry part'. ** 3. An optional 'hash part' is used to optimize lookups of the entry * part; it is used only for objects with sufficiently many properties * and can be abandoned without loss of information. ** These three conceptual parts are stored in a single memory allocated area. * This minimizes memory allocation overhead but also means that all three * parts are resized together, and makes property access a bit complicated.

14930. maximum length for a SKIP-1 diffstream: 35 bits per entry, rounded up to bytes

14931. **comment:** XXX: when optimizing for guaranteed property slots, use a guaranteed * slot for internal value; this call can then access it directly.

label: code-design

14932. **comment:** * 'props' contains {key,value,flags} entries, optional array entries, and * an optional hash lookup table for non-array entries in a single 'sliced' * allocation. There are several layout options, which differ slightly in * generated code size/speed and alignment/padding; duk_features.h selects * the layout used. * * Layout 1 (DUK_USE_HOBJECT_LAYOUT_1): ** e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * * Layout 2 (DUK_USE_HOBJECT_LAYOUT_2): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * e_size * sizeof(duk_uint8_t) + pad bytes of entry flags (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * * Layout 3 (DUK_USE_HOBJECT_LAYOUT_3): ** e_size * sizeof(duk_propvalue) bytes of entry values (e_next gc reachable) * a_size * sizeof(duk_tval) bytes of (opt) array values (plain only) (all gc reachable) * e_size * sizeof(duk_hstring *) bytes of entry keys (e_next gc reachable) * h_size * sizeof(duk_uint32_t) bytes of (opt) hash indexes to entries (e_size), * 0xffffffffUL = unused, 0xfffffffffeUL = deleted * e_size * sizeof(duk_uint8_t) bytes of entry flags (e_next gc reachable) * * In layout 1, the 'e_next' count is rounded to 4 or 8 on platforms * requiring 4 or 8 byte alignment. This ensures proper alignment * for the entries, at the cost of memory footprint. However, it's * probably preferable to use another layout on such platforms instead. * * In layout 2, the key and value parts are swapped to avoid padding * the key array on platforms requiring alignment by 8. The flags part * is padded to get alignment for array entries. The 'e_next' count does * not need to be rounded as in layout 1. * * In layout 3, entry values and array values are always aligned properly, * and assuming pointers are at most 8 bytes, so are the entry keys. Hash * indices will be properly aligned (assuming pointers are at least 4 bytes). * Finally, flags don't need additional alignment. This layout provides * compact allocations without padding (even on platforms with alignment * requirements) at the cost of a bit slower lookups. * * Objects with few keys don't have a hash index; keys are looked up linearly, * which is cache efficient because the keys are consecutive. Larger objects * have a hash index part which contains integer indexes to the entries part. * * A single allocation reduces memory allocation overhead but requires more * work when any part needs to be resized. A sliced allocation for entries * makes linear key matching faster on most platforms (more locality) and * skimps on flags size (which would be followed by 3 bytes of padding in * most architectures if entries were placed in a struct). * * 'props' also contains internal properties distinguished with a non-BMP * prefix. Often used properties should be placed early in 'props' whenever * possible to make accessing them as fast as possible.

15041. [... enum]
15042. * Returns non-zero if a key and/or value was enumerated, and: * * [enum] -> [key] (get_value == 0) * [enum] -> [key value] (get_value == 1) ** Returns zero without pushing anything on the stack otherwise.
15043. still reachable
15044. compact; no need to seal because object is internal
15045. [... res]
15046. -> [... enum key enum_target val]
15047. * Get enumerated keys in an Ecmascript array. Matches Object.keys() behavior * described in E5 Section 15.2.3.14.
15048. return 1 to allow callers to tail call
15049. used for array, stack, and entry indices

15050. [enum_target res]
15051. enumerator must have no keys deleted
15052. [... enum_target res trap_result val true]
15053. * Some E5/E5.1 algorithms require that array indices are iterated * in a strictly ascending order. This is the case for e.g. * Array.prototype.forEach() and JSON.stringify() PropertyList * handling. * * To ensure this property for arrays with an array part (and * arbitrary objects too, since e.g. forEach() can be applied * to an array), the caller can request that we sort the keys * here.
15054. string objects must not created without internal value
15055. control props
15056. **comment:** XXX: not sure what the correct semantic details are here, * e.g. handling of missing values (gaps), handling of non-array * trap results, etc. * * For keys, we simply skip non-string keys which seems to be * consistent with how e.g. Object.keys() will process proxy trap * results (ES6, Section 19.1.2.14).
label: code-design
15057. Enumeration keys are checked against the enumeration target (to see * that they still exist). In the proxy enumeration case _Target will * be the proxy, and checking key existence against the proxy is not * required (or sensible, as the keys may be fully virtual).
15058. -> [... enum_target res]
15059. * Array part * * Note: ordering between array and entry part must match 'abandon array' * behavior in duk_hobject_props.c: key order after an array is abandoned * must be the same.
15060. The internal _Target property is kept pointing to the original * enumeration target (the proxy object), so that the enumerator * 'next' operation can read property values if so requested. The * fact that the _Target is a proxy disables key existence check * during enumeration.
15061. **comment:** * Create an internal enumerator object E, which has its keys ordered * to match desired enumeration ordering. Also initialize internal control * properties for enumeration. * * Note: if an array was used to hold enumeration keys instead, an array * scan would be needed to eliminate duplicates found in the prototype chain.
label: code-design
15062. [enum_target res key true]

15069. Initialize index so that we skip internal control keys.
15070. -> [... enum key enum_target key]
15071. -> [...]
15072. * Proxy object handling
15073. **comment:** Create a temporary enumerator to get the (non-duplicated) key list; * the enumerator state is initialized without being needed, but that * has little impact.
label: code-design
15074. **comment:** * Helper to sort array index keys. The keys are in the enumeration object * entry part, starting from DUK__ENUM_START_INDEX, and the entry part is dense. * * We use insertion sort because it is simple (leading to compact code,) * works nicely in-place, and minimizes operations if data is already sorted * or nearly sorted (which is a very common case here). It also minimizes * the use of element comparisons in general. This is nice because element * comparisons here involve re-parsing the string keys into numbers each * time, which is naturally very expensive. * * Note that the entry part values are all "true", e.g. * * "1" -> true, "3" -> true, "2" -> true * * so it suffices to only work in the key part without exchanging any keys, * simplifying the sort. * *
http://en.wikipedia.org/wiki/Insertion_sort * * (Compiles to about 160 bytes now as a stand-alone function.)
label: code-design
15075. [enum_target enum res]
15076. **comment:** * Hobject enumeration support. * * Creates an internal enumeration state object to be used e.g. with for-in * enumeration. The state object contains a snapshot of target object keys * and internal control state for enumeration. Enumerator flags allow caller * to e.g. request internal/non-enumerable properties, and to enumerate only * "own" properties. * * Also creates the result value for e.g. Object.keys() based on the same * internal structure. * * This snapshot-based enumeration approach is used to simplify enumeration: * non-snapshot-based approaches are difficult to reconcile with mutating * the enumeration target, running multiple long-lived enumerators at the * same time, garbage collection details, etc. The downside is that the * enumerator object is memory inefficient especially for iterating arrays.
label: code-design
15077. No need to replace the 'enum_target' value in stack, only the * enum_target reference. This also ensures that the original * enum target is reachable, which keeps the proxy and the proxy * target reachable. We do need to replace the internal _Target.
15078. **comment:** XXX: may need a 'length' filter for forEach()
label: code-design
15079. **comment:** XXX use get tval ptr, more efficient
label: code-design
15080. Needs to be inserted; scan backwards, since we optimize * for the case where elements are nearly in order.
15081. -> [... key val]
15082. Neutered buffer, zero length seems * like good behavior here.
15083. String and buffer enumeration behavior is identical now, * so use shared handler.
15084. [res]
15085. Target must be stored so that we can recheck whether or not * keys still exist when we enumerate. This is not done if the * enumeration result comes from a proxy trap as there is no * real object to check against.
15086. -> [... key]

label: code-design

15153. * Get old and new length

15154. * Note: although arguments object variable mappings are only established * for non-strict functions (and a call to a non-strict function created * the arguments object in question), an inner strict function may be doing * the actual property write. Hence the throw_flag applied here comes from * the property write call.

15155. **comment:** XXX: consolidated algorithm step 15.f -> redundant?

label: code-design

15156. **comment:** XXX: very basic optimization -> duk_get_prop_stridx_top

label: code-design

15157. * Check whether we need to abandon an array part (if it exists)

15158. no need to decref, as previous value is 'undefined'

15159. **comment:** * The 'in' operator requires an object as its right hand side, * throwing a TypeError unconditionally if this is not the case. ** However, lightfuncs need to behave like fully fledged objects * here to be maximally transparent, so we need to handle them * here.

label: code-design

15160. USE_PROP_HASH_PART

15161. Get default hash part size for a certain entry part size.

15162. Must coerce key: if key is an object, it may coerce to e.g. 'length'.

15163. key is 'length', cannot match argument exotic behavior

15164. * First check whether property exists; if not, simple case. This covers * steps 1-4.

15165. String is an own (virtual) property of a lightfunc.

15166. Input value should be on stack top and will be coerced and * popped. Refuse to update an Array's 'length' to a value * outside the 32-bit range. Negative zero is accepted as zero.

15167. If neutered must return 0; offset is zeroed during * neutering.

15168. * Ecmascript compliant [[GetProperty]](P), for internal use only. ** If property is found: * - Fills descriptor fields to 'out_desc' * - If

DUK_GETDESC_FLAG_PUSH_VALUE is set, pushes a value related to the * property onto the stack ('undefined' for accessor properties). * - Returns non-zero *

* If property is not found: * - 'out_desc' is left in untouched state (possibly garbage) * - Nothing is pushed onto the stack (not even with

DUK_GETDESC_FLAG_PUSH_VALUE * set) * - Returns zero * * May cause arbitrary side effects and invalidate (most) duk_tval * pointers.

15169. setter and/or getter may be NULL
15170. Not possible because array object 'length' is present * from its creation and cannot be deleted, and is thus * caught as an existing property above.
15171. replaces top of stack with new value if necessary
15172. **comment:** prev value must be unused, no decref
 label: code-design
15173. * Update an existing property of the base object.
15174. late lookup, avoid side effects
15175. * Debug logging after adjustment.
15176. Notes: * - only numbered indices are relevant, so arr_idx fast reject is good * (this is valid unless there are more than 4**32-1 arguments). * - since variable lookup has no side effects, this can be skipped if * DUK_GETDESC_FLAG_PUSH_VALUE is not set.
15177. **comment:** XXX: option to pretend property doesn't exist if sanity limit is * hit might be useful.
 label: code-design
15178. update length (curr points to length, and we assume it's still valid)
15179. * Post resize assertions.
15180. flags
15181. Abandon array part, moving array entries into entries part. * This requires a props resize, which is a heavy operation. * We also compact the entries part while we're at it, although * this is not strictly required.
15182. IsGenericDescriptor(desc) == true; this means in practice that 'desc' * only has [[Enumerable]] or [[Configurable]] flag updates, which are * allowed at this point.
15183. No resize has occurred so temp_desc->e_idx is still OK
15184. Lookup 'key' from arguments internal 'map', perform a variable write if mapped. * Used in E5 Section 10.6 algorithm for [[DefineOwnProperty]] (used by [[Put]]).
 * Assumes stack top contains 'put' value (which is NOT popped).
15185. **comment:** XXX: this is a major target for size optimization
 label: code-design
15186. implicit attributes
15187. [in_val in_val]
15188. leave result on stack top
15189. if fails, e_size will be zero = not an issue, except performance-wise
15190. Note: no recursion issue, we can trust 'map' to behave
15191. non-object base, no offending virtual property
15192. caller ensures; rom objects are never bufferobjects now
15193. * Some change(s) need to be made. Steps 7-11.
15194. For internal use: get non-accessor entry value and attributes
15195. * Write to entry part
15196. * All done, switch properties ('p') allocation to new one.
15197. * Slow delete, but we don't care as we're already in a very slow path. * The delete always succeeds: key has no exotic behavior, property * is configurable, and no resize occurs.
15198. hash probe sequence
15199. must have been, since in array part
15200. array entries are all plain values
15201. **comment:** XXX: the helper currently assumes stack top contains new * 'length' value and the whole calling convention is not very * compatible with what we need.
 label: code-design
15202. Coerce to number before validating pointers etc so that the * number coercions in duk_hbufferobject_validated_write() are * guaranteed to be side effect free and not invalidate the * pointer checks we do here.
15203. Buffer writes are often integers.
15204. XXX: duk_to_int() ensures we'll get 8 lowest bits as * as input is within duk_int_t range (capped outside it).
15205. [obj key value desc]
15206. resume delete to target
15207. stage 2: delete configurable entries above target length
15208. Lightfunc virtual properties are non-configurable, so * reject if match any of them.
15209. success
15210. [] -> [res]
15211. keep key reachable for GC etc; guaranteed not to fail
15212. Special behavior for 'caller' property of (non-bound) function objects * and non-strict Arguments objects: if 'caller' -value- (!) is a strict * mode function, throw a TypeError (E5 Sections 15.3.5.4, 10.6). * Quite interestingly, a non-strict function with no formal arguments * will get an arguments object -without- special 'caller' behavior! * * The E5.1 spec is a bit ambiguous if this special behavior applies when * a bound function is the base value (not the 'caller' value): Section * 15.3.4.5 (describing bind()) states that [[Get]] for bound functions * matches that of Section 15.3.5.4 ([[Get]] for Function instances). * However, Section 13.3.5.4 has "NOTE: Function objects created using * Function.prototype.bind use the default [[Get]] internal method." * The current implementation assumes this means that bound functions * should not have the special [[Get]] behavior. * * The E5.1 spec is also a bit unclear if the TypeError throwing is * applied if the 'caller' value is a strict bound function. The * current implementation will throw even for both strict non-bound * and strict bound functions. * * See test-dev-strict-func-as-caller-prop-value.js for quite extensive * tests. * * This exotic behavior is disabled when the non-standard 'caller' property * is enabled, as it conflicts with the free use of 'caller'.
15213. !DUK_USE_NONSTD_FUNC_CALLER_PROPERTY
15214. assume array part is comprehensive (contains all array indexed elements * or none of them); hence no need to check the entries part here.
15215. index is above internal buffer length -> property is fully normal
15216. write_to_array_part:
15217. E5 Section 15.5.5.1
15218. ignore retval -> [key]
15219. Resolve Proxy targets until Proxy chain ends. No explicit check for * a Proxy loop: user code cannot create such a loop without tweaking * internal properties directly.
15220. * Because buffer values are often looped over, a number fast path * is important.
15221. * E5 Section 15.4.5.1, steps 3.k - 3.n. The order at the end combines * the error case 3.l.iii and the success case 3.m-3.n. * * Note: 'length' is always in entries part, so no array abandon issues for * 'writable' update.
15222. don't push value
15223. Convert a duk_tval number (caller checks) to a 32-bit index. Returns * DUK_NO_ARRAY_INDEX if the number is not whole or not a valid array * index.
15224. * Intern key via the valstack to ensure reachability behaves * properly. We must avoid longjmp's here so use non-checked * primitives. * * Note: duk_check_stack() potentially reallocs the valstack, * invalidating any duk_tval pointers to valstack. Callers * must be careful.
15225. **comment:** never shrinks; auto-adds DUK_VALSTACK_INTERNAL_EXTRA, which is generous
 label: code-design
15226. increases key refcount
15227. Reject attempt to change virtual properties: not part of the * standard algorithm, applies currently to e.g. virtual index * properties of buffer objects (which are virtual but writable). * (Cannot "force" modification of a virtual property.)
15228. avoid attempts to add/remove object keys
15229. curr is accessor, desc is data
15230. Set up pointers to the new property area: this is hidden behind a macro * because it is memory layout specific.
15231. * Local defines
15232. E5 Section 15.4.5.1, step 4

15233. Lookup 'key' from arguments internal 'map', perform a variable lookup * if mapped, and leave the result on top of stack (and return non-zero). * Used in E5 Section 10.6 algorithms [[Get]] and [[GetOwnProperty]].

15234. Note: intentionally use approximations to shave a few instructions: * a_used = old_used (accurate: old_used + 1) * a_size = arr_idx (accurate: arr_idx + 1)

15235. [... old_result result] -> [... result]

15236. * Detach actual buffer from dynamic buffer in valstack, and * pop it from the stack. ** XXX: the buffer object is certainly not reachable at this point, * so it would be nice to free it forcibly even with only * mark-and-sweep enabled. Not a big issue though.

15237. Must avoid duk_pop() in exit path

15238. DUK_USE_FASTINT

15239. no decref needed for a number

15240. Leave 'getter' on stack

15241. [key] -> [undefined] (default value)

15242. **comment:** XXX: There is currently no support for writing buffer object * indexed elements here. Attempt to do so will succeed and * write a concrete property into the buffer object. This should * be fixed at some point but because buffers are a custom feature * anyway, this is relatively unimportant.
label: code-design

15243. **comment:** array part must not contain any non-unused properties, as they would * be configurable and writable.
label: code-design

15244. force_flag

15245. If not found, resume existence check from Function.prototype. * We can just substitute the value in this case; nothing will * need the original base value (as would be the case with e.g. * setters/getters).

15246. * Object internal value * * Returned value is guaranteed to be reachable / incref'd, caller does not need * to incref OR decref. No proxies or accessors are invoked, no prototype walk.

15247. curr value

15248. [key] (coerced)

15249. Note: no allocation pressure, no need to check refcounts etc

15250. This function is only called for objects with array exotic behavior. * The [[DefineOwnProperty]] algorithm for arrays requires that * 'length' can never have a value outside the unsigned 32-bit range, * attempt to write such a value is a RangeError. Here we can thus * assert for this. When Duktape internals go around the official * property write interface (doesn't happen often) this assumption is * easy to accidentally break, so such code must be written carefully. * See test-bi-array-push maxlen.js.

15251. [key setter this val key] -> [key retval]

15252. * Found existing accessor property (own or inherited). * Call setter with 'this' set to orig, and value as the only argument. * Setter calls are OK even for ROM objects. * * Note: no exotic arguments object behavior, because [[Put]] never * calls [[DefineOwnProperty]] (E5 Section 8.12.5, step 5.b).

15253. guaranteed to find an empty slot

15254. Lookup 'key' from arguments internal 'map', and leave replacement value * on stack top if mapped (and return non-zero). * Used in E5 Section 10.6 algorithm for [[GetOwnProperty]] (used by [[Get]]).

15255. [key trap_result] -> []

15256. **comment:** XXX: investigate whether write protect can be handled above, if we * just update length here while ignoring its protected status
label: code-design

15257. **comment:** XXX: unnecessary string coercion for array indices, * intentional to keep small.
label: code-design

15258. remove value

15259. * Object.isSealed() and Object.isFrozen() (E5 Sections 15.2.3.11, 15.2.3.13) * * Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. * * Note: all virtual (non-concrete) properties are currently non-configurable * and non-writable (and there are no accessor virtual properties), so they don't * need to be considered here now.

15260. * Fast path for defining array indexed values without interning the key. * This is used by e.g. code for Array prototype and traceback creation so * must avoid interning.

15261. * Object.getOwnPropertyDescriptor() (E5 Sections 15.2.3.3, 8.10.4) * * This is an actual function call.

15262. * Not found

15263. * Proxy helpers

15264. steps 3.h and 3.i

15265. * Found; post-processing (Function and arguments objects)

15266. [key val]

15267. valstack space that suffices for all local calls, including recursion * of other than Duktape calls (getters etc)

15268. the entries [new_e_next, new_e_size_adjusted[are left uninitialized on purpose (ok, not gc reachable)

15269. cannot be arguments exotic

15270. actually used, non-NULL keys

15271. avoid double coercion

15272. Note: assume array part is comprehensive, so that either * the write goes to the array part, or we've abandoned the * array above (and will not come here).

15273. Magically bound variable cannot be an accessor. However, * there may be an accessor property (or a plain property) in * place with magic behavior removed. This happens e.g. when * a magic property is redefined with defineProperty(). * Cannot assert for "not accessor" here.

15274. * Local prototypes

15275. Note: buffer is dynamic so that we can 'steal' the actual * allocation later.

15276. **comment:** XXX: post-checks (such as no duplicate keys)
label: code-design

15277. **comment:** The handler is looked up with a normal property lookup; it may be an * accessor or the handler object itself may be a proxy object. If the * handler is a proxy, we need to extend the valstack as we make a * recursive proxy check without a function call in between (in fact * there is no limit to the potential recursion here). * * (For sanity, proxy creation rejects another proxy object as either * the handler or the target at the moment so recursive proxy cases * are not realized now.)
label: code-design

15278. Check array density and indicate whether or not the array part should be abandoned.

15279. [key value] or [key undefined]

15280. descriptor type specific checks

15281. avoid multiple computations of flags address; bypasses macros

15282. * Found existing own (non-inherited) plain property. * Do an access control check and update in place.

15283. * Ecmascript compliant [[GetOwnProperty]](P), for internal use only. * * If property is found: * - Fills descriptor fields to 'out_desc' * - If DUK_GETDESC_FLAG_PUSH_VALUE is set, pushes a value related to the * property onto the stack ('undefined' for accessor properties). * - Returns non-zero * * If property is not found: * - 'out_desc' is left in untouched state (possibly garbage) * - Nothing is pushed onto the stack (not even with DUK_GETDESC_FLAG_PUSH_VALUE * set) * - Returns zero * * Notes: * * - Getting a property descriptor may cause an allocation (and hence * GC) to take place, hence reachability and refcount of all related * values matter. Reallocation of value stack, properties, etc may * invalidate many duk_tval pointers (concretely, those which reside * in memory areas subject to reallocation). However, heap object * pointers are never affected (heap objects have stable pointers). * * - The value of a plain property is always reachable and has a non-zero * reference count. * * - The value of a virtual property is not necessarily reachable from * elsewhere and may have a refcount of zero. Hence we push it onto * the valstack for the caller, which ensures it remains reachable * while it is needed. * * - There are no virtual accessor properties. Hence, all getters and * setters are always related to concretely stored properties, which * ensures that the get/set functions in the resulting descriptor are * reachable and have non-zero refcounts. Should there be virtual * accessor properties later, this would need to change.

15284. **comment:** * XXX: array indices are mostly typed as duk_uint32_t here; duk_uarridx_t * might be more appropriate.
label: code-design

15285. not enumerable

15286. * Allocate and initialize a new entry, resizing the properties allocation * if necessary. Returns entry index (e_idx) or throws an error if alloc fails. * * Sets the key of the entry (increasing the key's refcount), and updates * the hash part if it exists. Caller must set value and flags, and update * the entry value refcount. A decref

for the previous value is not necessary.

15287. should not happen

15288. previous value is assumed to be garbage, so don't touch it

15289. * Abandon array failed, need to decref keys already inserted * into the beginning of new_e_k before unwinding valstack.

15290. standard behavior, step 3.f.i

15291. index is above internal string length -> property is fully normal

15292. * Rebuild the hash part always from scratch (guaranteed to finish). * * Any resize of hash part requires rehashing. In addition, by rehashing * get rid of any elements marked deleted (DUK_HASH_DELETED) which is critical * to ensuring the hash part never fills up.

15293. must not be extensible

15294. **comment:** fill new_h with u32 0xff = UNUSED

label: code-design

15295. * Misc helpers

15296. side effects

15297. NULL if tv_obj is primitive

15298. actual update happens once write has been completed without * error below.

15299. IsDataDescriptor(desc) == true

15300. Target object must be checked for a conflicting * non-configurable property.

15301. guaranteed when building arguments

15302. With this check in place fast paths won't need read-only * object checks. This is technically incorrect if there are * setters that cause no writes to ROM objects, but current * built-ins don't have such setters.

15303. * Copy array elements to new array part.

15304. property exists, either 'desc' is empty, or all values * match (SameValue)

15305. we currently assume virtual properties are not configurable (as none of them are)

15306. * Property lookup

15307. Stage 1: find highest preventing non-configurable entry (if any). * When forcing, ignore non-configurability.

15308. Count actually used entry part entries (non-NULL keys).

15309. Note: use 'curr' as a temp propdesc

15310. Fast check for extending array: check whether or not a slow density check is required.

15311. * GETPROP: Ecmascript property read.

15312. * Property not found in prototype chain.

15313. unsigned

15314. **comment:** * In a fast check we assume old_size equals old_used (i.e., existing * array is fully dense). * * Slow check if: * * (new_size - old_size) / old_size > limit * new_size - old_size > limit * old_size * new_size > (1 + limit) * old_size || limit' is 3 bits fixed point * new_size > (1 + (limit' / 8)) * old_size || * 8 * 8 * new_size > (8 + limit') * old_size || : 8 * new_size > (8 + limit') * (old_size / 8) * new_size > limit" * (old_size / 8) || limit' = 9 -> max 25% increase * arr_idx + 1 > limit" * (old_size / 8) * * This check doesn't work well for small values, so old_size is rounded * up for the check (and the '+ 1' of arr_idx can be ignored in practice): * * arr_idx > limit" * ((old_size + 7) / 8)

label: code-design

15315. * Property already exists. Steps 5-6 detect whether any changes need * to be made.

15316. since new_alloc_size > 0

15317. Must have array part and no conflicting exotic behaviors. * Doesn't need to have array special behavior, e.g. Arguments * object has array part.

15318. Delete elements required by a smaller length, taking into account * potentially non-configurable elements. Returns non-zero if all * elements could be deleted, and zero if all or some elements could * not be deleted. Also writes final "target length" to 'out_result_len'. * This is the length value that should go into the 'length' property * (must be set by the caller). Never throws an error.

15319. * Compact an object. Minimizes allocation size for objects which are * not likely to be extended. This is useful for internal and non- * extensible objects, but can also be called for non-extensible objects. * May abandon the array part if it is computed to be too sparse. * * This call is relatively expensive, as it needs to scan both the * entries and the array part. * * The call may fail due to allocation error.

15320. XXX: fast path for arrays?

15321. force the property to 'undefined' to create a slot for it

15322. This may trigger mark-and-sweep with arbitrary side effects, * including an attempted resize of the object we're resizing, * executing a finalizer which may add or remove properties of * the object we're resizing etc.

15323. This is a pretty awkward control flow, but we need to recheck the * key coercion here.

15324. [obj key undefined]

15325. **comment:** * XXX: duk_uint_fast32_t should probably be used in many places here.

label: code-design

15326. [obj key desc value get set curr_value]

15327. valstack space allocated especially for proxy lookup which does a * recursive property lookup

15328. DUK_USE_HOBJECT_HASH_PART

15329. **comment:** XXX: pre-checks (such as no duplicate keys)

label: code-design

15330. coercion order matters

15331. XXX: The TypeError is currently not applied to bound * functions because the 'strict' flag is not copied by * bind(). This may or may not be correct, the specification * only refers to the value being a "strict mode Function * object" which is ambiguous.

15332. Undefine local defines

15333. [obj key value desc value]

15334. Array properties have exotic behavior but they are concrete, * so no special handling here. * * Arguments exotic behavior (E5 Section 10.6, [[GetOwnProperty]]) * is only relevant as a post-check implemented below; hence no * check here.

15335. since duk_abandon_array_checked() causes a resize, there should be no gaps in keys

15336. If the value happens to be 0xFFFFFFFF, it's not a valid array index * but will then match DUK_NO_ARRAY_INDEX.

15337. **comment:** * Make a copy of tv_obj, tv_key, and tv_val to avoid any issues of * them being invalidated by a valstack resize. * * XXX: this is now an overkill for many fast paths. Rework this * to be faster (although switching to a valstack discipline might * be a better solution overall).

label: code-design

15338. default value

15339. write to entry part

15340. For internal use: get array part value

15341. treat like property not found

15342. [... put_value]

15343. **comment:** * Relocate property allocation, moving properties to the new allocation. * * Includes key compaction, rehashing, and can also optionally abandoning * the array part, 'migrating' array entries into the beginning of the * new entry part. Arguments are not validated here, so e.g. new_h_size * MUST be a valid prime. * * There is no support for in-place reallocation or just compacting keys * without resizing the property allocation. This is intentional to keep * code size minimal. * * The implementation is relatively straightforward, except for the array * abandonment process. Array abandonment requires that new string keys * are interned, which may trigger GC. All keys interned so far must be * reachable for GC at all times; valstack is used for that now. * * Also, a GC triggered during this reallocation process must not interfere * with the object being resized. This is currently controlled by using * heap->mark_and_sweep_base_flags to indicate that no finalizers will be * executed (as they can affect ANY object) and no objects are compacted * (it would suffice to protect this particular object only, though). * * Note: a non-checked variant would be nice but is a bit tricky to * implement for the array abandonment process. It's easy for * everything else. * * Note: because we need to potentially resize the valstack (as part * of abandoning the array part), any tval pointers to the valstack * will become invalid after this call.

label: code-design

15344. **comment:** Note: reuse 'curr' as a temp propdesc

label: code-design

15345. XXX: share final setting code for value and flags? difficult because * refcount code is different. Share entry allocation? But can't allocate * until array index checked.

15346. [key] -> []

15347. if abandon_array, new_a_size must be 0

15348. * Helpers to resize properties allocation on specific needs.

15349. for resizing of array part, use slow path

15350. -> [... trap handler]

15351. Note: proxy handling must happen before key is string coerced.

15352. guaranteed to finish, as hash is never full

15353. Push an arbitrary duk_tval to the stack, coerce it to string, and return * both a duk_hstring pointer and an array index (or DUK_NO_ARRAY_INDEX).

15354. * Migrate array to start of entries if requested. ** Note: from an enumeration perspective the order of entry keys matters. * Array keys should appear wherever they appeared before the array abandon * operation.

15355. Note: unconditional throw

15356. If a setter/getter is missing (undefined), the descriptor must * still have the property present with the value 'undefined'.

15357. Avoid side effects that might disturb curr.e_idx until * we're done editing the slot.

15358. **comment:** actually used
label: code-design

15359. **comment:** XXX: any chance of unifying this with the 'length' key handling?
label: code-design

15360. * Array part

15361. -0 is accepted here as index 0 because ToString(-0) == "0" which is * in canonical form and thus an array index.

15362. see below

15363. hash lookup

15364. **comment:** * Note: zero works as a "no update" marker because the new length * can never be zero after a new property is written. ** Note: must re-lookup because calls above (e.g. duk_alloc_entry_checked()) * may realloc and compact properties and hence change e_idx.
label: code-design

15365. * NormalizePropertyDescriptor() related helper. ** Internal helper which validates and normalizes a property descriptor * represented as an Ecmascript object (e.g. argument to defineProperty()). * The output of this conversion is a set of defprop_flags and possibly * some values pushed on the value stack; some subset of: property value, * getter, setter. Caller must manage stack top carefully because the * number of values pushed depends on the input property descriptor. ** The original descriptor object must not be altered in the process.

15366. success: leave varname in stack

15367. Note: changing from writable to non-writable is OK

15368. don't touch property attributes or hash part

15369. stage 1 guarantees

15370. current assertion is quite strong: decref's and set to unused

15371. Length in elements: take into account shift, but * intentionally don't check the underlying buffer here.

15372. [key val] -> [key]

15373. * Argument exotic [[Delete]] behavior (E5 Section 10.6) is * a post-check, keeping arguments internal 'map' in sync with * any successful deletes (note that property does not need to * exist for delete to 'succeed'). ** Delete key from 'map'. Since 'map' only contains array index * keys, we can use arr_idx for a fast skip.

15374. [... key trap handler]

15375. * Get old and new length

15376. abandoning requires a props allocation resize and * 'rechecks' the valstack, invalidating any existing * valstack value pointers!

15377. * PUTPROP: Ecmascript property write. ** Unlike Ecmascript primitive which returns nothing, returns 1 to indicate * success and 0 to indicate failure (assuming throw is not set). ** This is an extremely tricky function. Some examples: *** Currently a decref may trigger a GC, which may compact an object's * property allocation. Consequently, any entry indices (e_idx) will * be potentially invalidated by a decref. *** Exotic behaviors (strings, arrays, arguments object) require, * among other things: ** - Preprocessing before and postprocessing after an actual property * write. For example, array index write requires pre-checking the * array 'length' property for access control, and may require an * array 'length' update after the actual write has succeeded (but * not if it fails). ** - Deletion of multiple entries, as a result of array 'length' write. *** Input values are taken as pointers which may point to the valstack. * If valstack is resized because of the put (this may happen at least * when the array part is abandoned), the pointers can be invalidated. * (We currently make a copy of all of the input values to avoid issues.)

15378. * Found existing own or inherited plain property, but original * base is a primitive value.

15379. * Note: zero works as a "no update" marker because the new length * can never be zero after a new property is written.

15380. V

15381. ... target is extensible

15382. duk_get_min_grow_e() is always >= 1

15383. * Nice debug log.

15384. * DELPROP: Ecmascript property deletion.

15385. [... varname]

15386. * Ecmascript compliant [[Delete]](P, Throw).

15387. **comment:** XXX: for fastints, could use a variant which assumes a double duk_tval * (and doesn't need to check for fastint again).
label: code-design

15388. **comment:** XXX: the key in 'key in obj' is string coerced before we're called * (which is the required behavior in E5/E5.1/E6) so the key is a string * here already.
label: code-design

15389. note: original, uncoerced base

15390. != 0 => post-update for array 'length' (used when key is an array index)

15391. only need to guarantee 1 more slot, but allocation growth is in chunks

15392. IsAccessorDescriptor(desc) == true

15393. no wrap assuming h_bufobj->length is valid

15394. avoid issues with relocation

15395. [key] -> []

15396. contains value

15397. Receiver: Proxy object

15398. **comment:** XXX: inline into a prototype walking loop?
label: code-design

15399. new entry: previous value is garbage; set to undefined to share write_value

15400. nargs

15401. * Found ** Arguments object has exotic post-processing, see E5 Section 10.6, * description of [[GetOwnProperty]] variant for arguments.

15402. happens when hash part dropped

15403. **comment:** Duktape 0.11.0 and prior tried to optimize the resize by not * counting the number of actually used keys prior to the resize. * This worked mostly well but also caused weird leak-like behavior * as in: test-bug-object-prop-alloc-unbounded.js. So, now we count * the keys explicitly to compute the new entry part size.
label: code-design

15404. no need for decref/incref because value is a number

15405. [key undefined] -> [key]

15406. shared exit path now

15408. Read value pushed on stack.

15409. curr and desc are data

15410. accessor with defined getter
15411. key coercion (unless already coerced above)
15412. covered by comparison
15413. * Must guarantee all actually used array entries will fit into * new entry part. Add one growth step to ensure we don't run out * of space right away.
15414. [key]
15415. * Object.prototype.hasOwnProperty() and Object.prototype.propertyIsEnumerable().
15416. -> [in_val]
15417. **comment:** Note: for an accessor without getter, falling through to * check for "caller" exotic behavior is unnecessary as * "undefined" will never activate the behavior. But it does * no harm, so we'll do it anyway.
label: code-design
15418. steps 4.a and 4.b are tricky
15419. defaults, E5 Section 8.6.1, Table 7
15420. * For property layout 1, tweak e_size to ensure that the whole entry * part (key + val + flags) is a suitable multiple for alignment * (platform specific). * * Property layout 2 does not require this tweaking and is preferred * on low RAM platforms requiring alignment.
15421. flag for later write
15422. Get minimum array part growth for a certain size.
15423. arrays MUST have a 'length' property
15424. * Note: assuming new_a_size == 0, and that entry part contains * no conflicting keys, refcounts do not need to be adjusted for * the values, as they remain exactly the same. * * The keys, however, need to be interned, incref'd, and be * reachable for GC. Any intern attempt may trigger a GC and * claim any non-reachable strings, so every key must be reachable * at all times. * * A longjmp must not occur here, as the new_p allocation would * be freed without these keys being decref'd, hence the messy * decref handling if intern fails.
15425. * Helpers for managing property storage size
15426. * Arguments handling helpers (argument map mainly). * * An arguments object has exotic behavior for some numeric indices. * Accesses may translate to identifier operations which may have * arbitrary side effects (potentially invalidating any duk_tval * pointers).
15427. NULL if not an object
15428. Catches >0x100000000 and negative values.
15429. currently required
15430. **comment:** XXX: Extensibility check for target uses IsExtensible(). If we * implemented the isExtensible trap and didn't reject proxies as * proxy targets, it should be respected here.
label: code-design
15431. Currently there are no deletable virtual properties, but * with force_flag we might attempt to delete one.
15432. * Start doing property attributes updates. Steps 12-13. * * Start by computing new attribute flags without writing yet. * Property type conversion is done above if necessary.
15433. **comment:** Note: array entries are always writable, so the writability check * above is pointless for them. The check could be avoided with some * refactoring but is probably not worth it.
label: code-design
15434. **comment:** XXX: for array instances we could take a shortcut here and assume * Array.prototype doesn't contain an array index property.
label: code-design
15435. retval indicates delete failed
15436. E5 Section 15.4.5.1, steps 4.e.i - 4.e.ii
15437. **comment:** XXX: handling for array part missing now; this doesn't affect * compliance but causes array entry writes using defineProperty() * to always abandon array part.
label: code-design
15438. Caller doesn't need to check exotic proxy behavior (but does so for * some fast paths).
15439. fall through
15440. * HASPROP: Ecmascript property existence check ("in" operator). * * Interestingly, the 'in' operator does not do any coercion of * the target object.
15441. **comment:** XXX: write protect after flag? -> any chance of handling it here?
label: code-design
15442. If neutered must return 0; length is zeroed during * neutering.
15443. array case is handled comprehensively above
15444. Note: array part values are [[Writable]], [[Enumerable]], * and [[Configurable]] which matches the required attributes * here.
15445. [key setter this val] -> [key retval]
15446. stage 3: update length (done by caller), decide return code
15447. * Not found as concrete or virtual
15448. minimum new length is highest_arr_idx + 1
15449. property is configurable and
15450. consistency requires this
15451. * Coercion and fast path processing
15452. **comment:** XXX: Refactor key coercion so that it's only called once. It can't * be trivially lifted here because the object must be type checked * first.
label: code-design
15453. If index is not valid, idx will be DUK__NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside object 'a_size'.
15454. The coercion order must match the ToPropertyDescriptor() algorithm * so that side effects in coercion happen in the correct order. * (This order also happens to be compatible with duk_def_prop(), * although it doesn't matter in practice.)
15455. relevant array index is non-configurable, blocks write
15456. Careful with wrapping: arr_idx upshift may easily wrap, whereas * length downshift won't.
15457. **comment:** Note: we could return the hash index here too, but it's not * needed right now.
label: code-design
15458. P
15459. * Internal helper for defining an accessor property, ignoring * normal semantics such as extensibility, write protection etc. * Overwrites any existing value and attributes. This is called * very rarely, so the implementation first sets a value to undefined * and then changes the entry to an accessor (this is to save code space).
15460. index/length check guarantees
15461. **comment:** XXX: At the moment Duktape accesses internal keys like _Finalizer using a * normal property set/get which would allow a proxy handler to interfere with * such behavior and to get access to internal key strings. This is not a problem * as such because internal key strings can be created in other ways too (e.g. * through buffers). The best fix is to change Duktape internal lookups to * skip proxy behavior. Until that, internal property accesses bypass the * proxy and are applied to the target (as if the handler did not exist). * This has some side effects, see test-bi-proxy-internal-keys.js.
label: code-design
15462. new value
15463. actually used, non-NULL entries
15464. Do decrefs only with safe pointers to avoid side effects * disturbing e_idx.
15465. shared checks for all descriptor types
15466. strict flag for putvar comes from our caller (currently: fixed)
15467. * Coercion and fast path processing.
15468. Not strictly necessary because if key == NULL, flag MUST be ignored.
15469. caller ensures
15470. traits are separate; in particular, arguments not an array
15471. 0 = don't push current value
15472. Note: new_e_next matches pushed temp key count, and nothing can * fail above between the push and this point.

15473. fill new entries with -unused- (required, gc reachable)
15474. duk_get_min_grow_a() is always ≥ 1
15475. [key getter this key] -> [key retval]
15476. * New length not lower than old length => no changes needed * (not even array allocation).
15477. **comment:** * Write to 'length' of an array is a very complex case * handled in a helper which updates both the array elements * and writes the new 'length'. The write may result in an * unconditional RangeError or a partial write (indicated * by a return code). ** Note: the helper has an unnecessary writability check * for 'length', we already know it is writable.
label: code-design
15478. important for callers
15479. * Arguments exotic behavior not possible for new properties: all * magically bound properties are initially present in the arguments * object, and if they are deleted, the binding is also removed from * parameter map.
15480. clear array part flag only after switching
15481. * Writability check
15482. tv1 points to value storage
15483. caller must have decref'd values above new_a_size (if that is necessary)
15484. * XXX: shrink array allocation or entries compaction here?
15485. not found in 'curr', next in prototype chain; impose max depth
15486. FOUND
15487. Buffer has virtual properties similar to string, but indexed values * are numbers, not 1-byte buffers/strings which would perform badly.
15488. **comment:** XXX: unnecessary string coercion for array indices, * intentional to keep small; some overlap with string * handling.
label: code-design
15489. entry part must not contain any configurable properties, or * writable properties (if is_frozen).
15490. t ≤ 0 always true, unsigned
15491. Storing the entry top is cheaper here to ensure stack is correct at exit, * as there are several paths out.
15492. Lookup 'key' from arguments internal 'map', delete mapping if found. * Used in E5 Section 10.6 algorithm for [[Delete]]. Note that the * variable/argument itself (where the map points) is not deleted.
15493. Set property slot to an empty state. Careful not to invoke * any side effects while using desc.e_idx so that it doesn't * get invalidated by a finalizer mutating our object.
15494. target
15495. fall thru
15496. [key setter this val]
15497. **comment:** Note: we can reuse 'desc' here
label: code-design
15498. * Array exotic behaviors can be implemented at this point. The local variables * are essentially a 'value copy' of the input descriptor (Desc), which is modified * by the Array [[DefineOwnProperty]] (E5 Section 15.4.5.1).
15499. data property or accessor without getter
15500. **comment:** XXX: fastint
label: code-design
15501. required to guarantee success of rehashing, * intentionally use unadjusted new_e_size
15502. Regardless of whether property is found in entry or array part, * it may have arguments exotic behavior (array indices may reside * in entry part for abandoned / non-existent array parts).
15503. Careful with wrapping (left shifting idx would be unsafe).
15504. [...] -> [...]
15505. currently used -> new size
15506. mask out flags not actually stored
15507. varenv remains reachable through 'obj'
15508. Careful with wrapping: arr_idx upshift may easily wrap, whereas * length downshift won't.
15509. * New length is smaller than old length, need to delete properties above * the new length. ** If array part exists, this is straightforward: array entries cannot * be non-configurable so this is guaranteed to work. ** If array part does not exist, array-indexed values are scattered * in the entry part, and some may not be configurable (preventing length * from becoming lower than their index + 1). To handle the algorithm * in E5 Section 15.4.5.1, step 1 correctly, we scan the entire property * set twice.
15510. **comment:** XXX: optimize this filling behavior later
label: code-design
15511. **comment:** * Property count check. This is the only point where we ensure that * we don't get more (allocated) property space that we can handle. * There aren't hard limits as such, but some algorithms fail (e.g. * finding next higher prime, selecting hash part size) if we get too * close to the 4G property limit. ** Since this works based on allocation size (not actually used size), * the limit is a bit approximate but good enough in practice.
label: code-design
15512. All lightfunc own properties are non-writable and the lightfunc * is considered non-extensible. However, the write may be captured * by an inherited setter which means we can't stop the lookup here.
15513. Convert a duk_tval fastint (caller checks) to a 32-bit index.
15514. [key result] -> [result]
15515. * Standard algorithm succeeded without errors, check for exotic post-behaviors. ** Arguments exotic behavior in E5 Section 10.6 occurs after the standard * [[DefineOwnProperty]] has completed successfully. ** Array exotic behavior in E5 Section 15.4.5.1 is implemented partly * prior to the default [[DefineOwnProperty]], but: * - for an array index key (e.g. "10") the final 'length' update occurs here * - for 'length' key the element deletion and 'length' update occurs here
15516. map is reachable through obj
15517. 0 if no used entries
15518. * All defined array-indexed properties are in the array part * (we assume the array part is comprehensive), and all array * entries are writable, configurable, and enumerable. Thus, * nothing can prevent array entries from being deleted.
15519. resume check from proxy target
15520. **comment:** Count actually used array part entries and array minimum size. * NOTE: 'out_min_size' can be computed much faster by starting from the * end and breaking out early when finding first used entry, but this is * not needed now.
label: code-design
15521. arguments MUST have an initialized lexical environment reference
15522. if new_p == NULL, all of these pointers are NULL
15523. If index is not valid, idx will be DUK_NO_ARRAY_INDEX which * is 0xffffffffUL. We don't need to check for that explicitly * because 0xffffffffUL will never be inside bufferobject length.
15524. automatic length update
15525. always grow the array, no sparse / abandon support here
15526. **comment:** remove old value
label: code-design
15527. [...] -> [...]
15528. always in entry part, no need to look up parents etc
15529. * Copy keys and values in the entry part (compacting them at the same time).
15530. E5 Section 15.4.5.1, step 3, steps a - i are implemented here, j - n at the end
15531. no need to compact since we already did that in duk_abandon_array_checked() * (regardless of whether an array part existed or not).
15532. XXX: C recursion limit if proxies are allowed as handler/target values
15533. **comment:** XXX: assertion that entries \geq old_len are already unused

label: code-design

15534. Arrays never have other exotic behaviors.
15535. * Create a new property in the original object. ** Exotic properties need to be reconsidered here from a write * perspective (not just property attributes perspective). * However, the property does not exist in the object already, * so this limits the kind of exotic properties that apply.
15536. Initial value for highest_idx is -1 coerced to unsigned. This * is a bit odd, but (highest_idx + 1) will then wrap to 0 below * for out_min_size as intended.
15537. * Write to array part? ** Note: array abandoning requires a property resize which uses * 'rechecks' valstack for temporaries and may cause any existing * valstack pointers to be invalidated. To protect against this, * tv_obj, tv_key, and tv_val are copies of the original inputs.
15538. copy existing entries as is
15539. value from hook
15540. **comment:** * Shallow fast path checks for accessing array elements with numeric * indices. The goal is to try to avoid coercing an array index to an * (interned) string for the most common lookups, in particular, for * standard Array objects. ** Interning is avoided but only for a very narrow set of cases: * - Object has array part, index is within array allocation, and * value is not unused (= key exists) * - Object has no interfering exotic behavior (e.g. arguments or * string object exotic behaviors interfere, array exotic * behavior does not). ** Current shortcoming: if key does not exist (even if it is within * the array allocation range) a slow path lookup with interning is * always required. This can probably be fixed so that there is a * quick fast path for non-existent elements as well, at least for * standard Array objects.
- label:** code-design
15541. [... put_value varname]
15542. number
15543. Get minimum entry part growth for a certain size.
15544. if accessor without getter, return value is undefined
15545. undefined is accepted
15546. [obj key desc value get set curr_value varname]
15547. key must not already exist in entry part
15548. * Note: currently no fast path for array index writes. * They won't be possible anyway as strings are immutable.
15549. * Object.seal() and Object.freeze() (E5 Sections 15.2.3.8 and 15.2.3.9) ** Since the algorithms are similar, a helper provides both functions. * Freezing is essentially sealing + making plain properties non-writable. ** Note: virtual (non-concrete) properties which are non-configurable but * writable would pose some problems, but such properties do not currently * exist (all virtual properties are non-configurable and non-writable). * If they did exist, the non-configurability does NOT prevent them from * becoming non-writable. However, this change should be recorded somehow * so that it would turn up (e.g. when getting the property descriptor), * requiring some additional flags in the object.
15550. **comment:** * HASPROP variant used internally. ** This primitive must never throw an error, callers rely on this. * In particular, don't throw an error for prototype loops; instead, * pretend like the property doesn't exist if a prototype sanity limit * is reached. ** Does not implement proxy behavior: if applied to a proxy object, * returns key existence on the proxy object itself.
- label:** code-design
15551. **comment:** The fast path for array property put is not fully compliant: * If one places conflicting number-indexed properties into * Array.prototype (for example, a non-writable Array.prototype[7]) * the fast path will incorrectly ignore them. ** This fast path could be made compliant by falling through * to the slow path if the previous value was UNUSED. This would * also remove the need to check for extensibility. Right now a * non-extensible array is slower than an extensible one as far * as writes are concerned. ** The fast path behavior is documented in more detail here: * tests/ecmascript/test-misc-array-fast-write.js
- label:** code-design
15552. * Because buffer values may be looped over and read/written * from, an array index fast path is important.
15553. Note: only numbered indices are relevant, so arr_idx fast reject * is good (this is valid unless there are more than 4**32-1 arguments).
15554. entry allocation updates hash part and increases the key * refcount; may need a props allocation resize but doesn't * 'recheck' the valstack.
15555. * Actual Object.defineProperty() default algorithm.
15556. **comment:** Linear scan: more likely because most objects are small. * This is an important fast path. ** XXX: this might be worth inlining for property lookups.
- label:** code-design
15557. [... value? getter? setter?]
15558. may become sparse...
15559. Get Proxy target object. If the argument is not a Proxy, return it as is. * If a Proxy is revoked, an error is thrown.
15560. **comment:** * Object.defineProperty() related helper (E5 Section 15.2.3.6) ** Inlines all [[DefineOwnProperty]] exotic behaviors. ** Note: Ecmascript compliant [[DefineOwnProperty]](P, Desc, Throw) is not * implemented directly, but Object.defineProperty() serves its purpose. * We don't need the [[DefineOwnProperty]] internally and we don't have a * property descriptor with 'missing values' so it's easier to avoid it * entirely. ** Note: this is only called for actual objects, not primitive values. * This must support virtual properties for full objects (e.g. Strings) * but not for plain values (e.g. strings). Lightfuncs, even though * primitive in a sense, are treated like objects and accepted as target * values.
- label:** code-design
15561. **comment:** * Array needs to grow, but we don't want it becoming too sparse. * If it were to become sparse, abandon array part, moving all * array entries into the entries part (for good). ** Since we don't keep track of actual density (used vs. size) of * the array part, we need to estimate somehow. The check is made * in two parts: * * - Check whether the resize need is small compared to the * current size (relatively); if so, resize without further * checking (essentially we assume that the original part is * "dense" so that the result would be dense enough). * * - Otherwise, compute the resize using an actual density * measurement based on counting the used array entries.
- label:** code-design
15562. * Compute new alloc size and alloc new area. ** The new area is allocated as a dynamic buffer and placed into the * valstack for reachability. The actual buffer is then detached at * the end. ** Note: heap_mark_and_sweep_base_flags are altered here to ensure * no-one touches this object while we're resizing and rehashing it. * The flags must be reset on every exit path after it. Finalizers * and compaction is prevented currently for all objects while it * would be enough to restrict it only for the current object.
15563. **comment:** * Make a copy of tv_obj, tv_key, and tv_val to avoid any issues of * them being invalidated by a valstack resize. ** XXX: this is an overkill for some paths, so optimize this later * (or maybe switch to a stack arguments model entirely).
- label:** code-design
15564. **comment:** re-lookup to update curr.flags * XXX: would be faster to update directly
- label:** code-design
15565. This should not happen because DUK_TAG_OBJECT case checks * for this already, but check just in case.
15566. * Hobject property set/get functionality. ** This is very central functionality for size, performance, and compliance. * It is also rather intricate; see hobject-algorithms.rst for discussion on * the algorithms and memory-management.rst for discussion on refcounts and * side effect issues. ** Notes: * * - It might be tempting to assert "refcount nonzero" for objects * being operated on, but that's not always correct: objects with * a zero refcount may be operated on by the refcount implementation * (finalization) for instance. Hence, no refcount assertions are made. * * - Many operations (memory allocation, identifier operations, etc) * may cause arbitrary side effects (e.g. through GC and finalization). * These side effects may invalidate duk_tval pointers which point to * areas subject to reallocation (like value stack). Heap objects * themselves have stable pointers. Holding heap object pointers or * duk_tval copies is not problematic with respect to side effects; * care must be taken when holding and using argument duk_tval pointers. * * - If a finalizer is executed, it may operate on the the same object * we're currently dealing with. For instance, the finalizer might * delete a certain property which has already been looked up and * confirmed to exist. Ideally finalizers would be disabled if GC * happens during property access. At the moment property table realloc * disables finalizers, and all DECREFs may cause arbitrary changes so * handle DECREF carefully. * * - The order of operations for a DECREF matters. When DECREF is executed, * the entire object graph must be consistent; note that a refzero may * lead to a mark-and-sweep through a refcount finalizer.
15567. **comment:** * Entries part is a bit more complex
- label:** code-design
15568. remove key
15569. array 'length' is always a number, as we coerce it
15570. = IsAccessorDescriptor(Desc)
15571. Reject attempt to change a read-only object.
15572. idx_value may be < 0 (no value), set and get may be NULL
15573. Is whole and within 32 bit range. If the value happens to be 0xFFFFFFFF, * it's not a valid array index but will then match DUK_NO_ARRAY_INDEX.

15574. * Find an existing key from entry part either by linear scan or by * using the hash index (if it exists). ** Sets entry index (and possibly the hash index) to output variables, * which allows the caller to update the entry and hash entries in-place. * If entry is not found, both values are set to -1. If entry is found * but there is no hash part, h_idx is set to -1.

15583. * Internal helper to define a property with specific flags, ignoring * normal semantics such as extensibility, write protection etc. * Overwrites any existing value and attributes unless caller requests * that value only be updated if it doesn't already exists. ** Does not support: * - virtual properties (error if write attempted) * - getter/setter properties (error if write attempted) * - non-default (!= WEC) attributes for array entries (error if attempted) * - array abandoning: if array part exists, it is always extended * - array 'length' updating ** Stack: [... in_val] -> [] ** Used for e.g. built-in initialization and environment record * operations.

15584. for zero size, don't push anything on valstack

15585. [key result]

15586. remaining actual steps are carried out if standard DefineOwnProperty succeeds

15587. curr is accessor -> cannot be in array part

15588. E5 Section 15.5.5.2

15589. equality not actually possible

15590. This is not strictly necessary, but avoids compiler warnings; e.g. * gcc won't reliably detect that no uninitialized data is read below.

15591. Avoid zero copy with an invalid pointer. If obj->p is NULL, * the 'new_a' pointer will be invalid which is not allowed even * when copy size is zero.

15592. ignore result

15593. cannot be e.g. arguments exotic, since exotic 'traits' are mutually exclusive

15594. * Arguments objects have exotic [[DefineOwnProperty]] which updates * the internal 'map' of arguments for writes to currently mapped * arguments. More concretely, writes to mapped arguments generate * a write to a bound variable. ** The [[Put]] algorithm invokes [[DefineOwnProperty]] for existing * data properties and new properties, but not for existing accessors. * Hence, in E5 Section 10.6 ([[DefinedOwnProperty]] algorithm), we * have a Desc with 'Value' (and possibly other properties too), and * we end up in step 5.b.i.

15595. * Helper: handle Array object 'length' write which automatically * deletes properties, see E5 Section 15.4.5.1, step 3. This is * quite tricky to get right. ** Used by duk_hobject_putprop().

15596. **comment:** XXX: is valstack top best place for argument?

label: code-design

15597. XXX: sufficient to check 'strict', assert for 'is function'

15598. Leave 'value' on stack

15599. return value

15600. [... val key] -> [... key val]

15601. a dummy undefined value is pushed to make valstack * behavior uniform for caller

15602. * Found existing inherited plain property. * Do an access control check, and if OK, write * new property to 'orig'.

15603. result: hash_prime(floor(1.2 * e_size))

15604. errors out if out of memory

15605. stack contains value (if requested), 'out_desc' is set

15606. curr and desc are accessors

15607. Must be an object, otherwise TypeError (E5.1 Section 8.10.5, step 1).

15608. **comment:** Downgrade checks are not made everywhere, so 'length' is not always * a fastint (it is a number though). This can be removed once length * is always guaranteed to be a fastint.

label: code-design

15609. * Entries part

15610. second incref for the entry reference

15611. * Not found as a concrete property, check whether a String object * virtual property matches.

15612. out_desc is left untouched (possibly garbage), caller must use return * value to determine whether out_desc can be looked up

15613. **comment:** * Array abandon check; abandon if: * * new_used / new_size < limit * new_used < limit * new_size || limit is 3 bits fixed point * new_used < limit' / 8 * new_size || *8 * 8*new_used < limit' * new_size || :8 * new_used < limit' * (new_size / 8) * * Here, new_used = a_used, new_size = a_size. * * Note: some callers use approximate values for a_used and/or a_size * (e.g. dropping a '+1' term). This doesn't affect the usefulness * of the check, but may confuse debugging.

label: code-design

15614. prev value can be garbage, no decref

15615. * Check whether the property already exists in the prototype chain. * Note that the actual write goes into the original base object * (except if an accessor property captures the write).

15616. step 3.e: replace 'Desc.[[Value]]'

15617. **comment:** NOTE: lightfuncs are coerced to full functions because * lightfuncs don't fit into a property value slot. This * has some side effects, see test-dev-lightfunc-accessor.js.

label: code-design

15618. **comment:** * Object.preventExtensions() and Object.isExtensible() (E5 Sections 15.2.3.10, 15.2.3.13) ** Not needed, implemented by macros DUK_HOBJECT_{HAS,CLEAR,SET}_EXTENSIBLE * and the Object built-in bindings.

label: code-design

15619. [str] -> [substr]

15620. value from target

15621. * New length lower than old length => delete elements, then * update length. ** Note: even though a bunch of elements have been deleted, the 'desc' is * still valid as properties haven't been resized (and entries compacted).

15622. Note: this order matters (final value before deleting map entry must be done)

15623. unconditional

15624. Object.defineProperty() calls [[DefineOwnProperty]] with Throw=true

15625. * Fast path for bufferobject getprop/putprop

15626. XXX: shrink array allocation or entries compaction here?

15627. Value is required to be a number in the fast path so there * are no side effects in write coercion.

15628. * Possible pending array length update, which must only be done * if the actual entry write succeeded.

15629. 0 = no update

15630. Grow array part for a new highest array index.

15631. **comment:** XXX: awkward helpers

label: code-design

15632. * Pre resize assertions.

15633. curr is data, desc is accessor

15634. stack prepped for func call: [... trap handler]

15635. remove hash entry (no decref)

15636. resume write to target

15637. For internal use: get non-accessor entry value

15638. * Internal helpers for managing object 'length'

15639. All the flags fit in 16 bits, so will fit into duk_bool_t.

15640. throw

15641. **comment:** XXX: macro checks for array index flag, which is unnecessary here
label: code-design

15642. [... value this_binding]

15643. Note: actual update happens once write has been completed * without error below. The write should always succeed * from a specification viewpoint, but we may e.g. run out * of memory. It's safer in this order.

15644. Note: 'curr' refers to 'length' propdesc

15645. **comment:** * Abandon array part because all properties must become non-configurable. * Note that this is now done regardless of whether this is always the case * (skips check, but performance problem if caller would do this many times * for the same object; not likely).
label: code-design

15646. varname is still reachable

15647. get varenv for varname (callee's declarative lexical environment)

15648. guaranteed to finish

15649. Leave 'setter' on stack

15650. If 16-bit hash is in use, stuff it into duk_heapheader_string flags.

15651. string is 'eval' or 'arguments'

15652. Slightly smaller code without explicit flag, but explicit flag * is very useful when 'clen' is dropped.

15653. computed live

15654. **comment:** XXX: could add flags for "is valid CESU-8" (EcmaScript compatible strings), "is valid UTF-8", "is valid extended UTF-8" (internal strings are not, * regexp bytecode is), and "contains non-BMP characters". These are not * needed right now.
label: code-design

15655. * For an external string, the NUL-terminated string data is stored * externally. The user must guarantee that data behind this pointer * doesn't change while it's used.

15656. get array index related to string (or return DUK_HSTRING_NO_ARRAY_INDEX); * avoids helper call if string has no array index value.

15657. * Prototypes

15658. string hash

15659. The external string struct is defined even when the feature is inactive.

15660. string is a reserved word (strict)

15661. slower but more compact variant

15662. marker value; in E5 2^32-1 is not a valid array index (2^32-2 is highest valid)

15663. Impose a maximum string length for now. Restricted artificially to * ensure adding a heap header length won't overflow size_t. The limit * should be synchronized with DUK_HBUFFER_MAX_BYTELEN. * * E5.1 makes provisions to support strings longer than 4G characters. * This limit should be eliminated on 64-bit platforms (and increased * closer to maximum support on 32-bit platforms).

15664. string is a reserved word (non-strict)

15665. string is ASCII, clen == blen

15666. * String value of 'blen+1' bytes follows (+1 for NUL termination * convenience for C API). No alignment needs to be guaranteed * for strings, but fields above should guarantee alignment-by-4 * (but not alignment-by-8).

15667. **comment:** should never be called
label: code-design

15668. placed in duk_heapheader_string

15669. length in codepoints (must be E5 compatible)

15670. Note: we could try to stuff a partial hash (e.g. 16 bits) into the * shared heap header. Good hashing needs more hash bits though.

15671. * Heap string representation. * * Strings are byte sequences ordinarily stored in extended UTF-8 format, * allowing values larger than the official UTF-8 range (used internally) * and also allowing UTF-8 encoding of surrogate pairs (CESU-8 format). * Strings may also be invalid UTF-8 altogether which is the case e.g. with * strings used as internal property names and raw buffers converted to * strings. In such cases the 'cflen' field contains an inaccurate value. * * EcmaScript requires support for 32-bit long strings. However, since each * 16-bit codepoint can take 3 bytes in CESU-8, this representation can only * support about 1.4G codepoint long strings in extreme cases. This is not * really a practical issue.

15672. string is a valid array index

15673. string is internal

15674. string data is external (duk_hstring_external)

15675. **comment:** Smaller heapheader than for other objects, because strings are held * in string intern table which requires no link pointers. Much of * the 32-bit flags field is unused by flags, so we can stuff a 16-bit * field in there.
label: code-design

15676. length in bytes (not counting NUL term)

15677. DUK_HSTRING_H_INCLUDED

15678. * Misc

15679. Caller must check character offset to be inside the string.

15680. unsigned

15681. This may throw an error though not for valid E5 strings.

15682. * Misc support functions

15683. !DUK_USE_HSTRING_CLEN

15684. **comment:** Most practical strings will go here.
label: code-design

15685. **comment:** Convenience copies from heap/vm for faster access.
label: code-design

15686. allocation size

15687. idx_bottom and idx_retval are only used for book-keeping of * EcmaScript-initiated calls, to allow returning to an EcmaScript * function properly. They are duk_size_t to match the convention * that value stack sizes are duk_size_t and local frame indices * are duk_idx_t.

15688. next to use, highest used is top - 1

15689. flags field: LLLLLLFT, L = label (24 bits), F = flags (4 bits), T = type (4 bits)

15690. current lexical environment (may be NULL if delayed)

15691. Current compiler state (if any), used for augmenting SyntaxErrors.

15692. No field needed when strings are in ROM.

15693. * Catcher defines

15694. end of valstack allocation (exclusive)

15695. function executes as a constructor (called via "new")

15696. cached: valstack_end - valstack (in entries, not bytes)

15697. internal extra elements assumed on function entry, * always added to user-defined 'extra' for e.g. the * duk_check_stack() call.

15698. **comment:** Built-in-objects; may or may not be shared with other threads, * threads existing in different "compartments" will have different * built-ins. Must be stored on a per-thread basis because there * is no intermediate structure for a thread group / compartment. * This takes quite a lot of space, currently 43x4 = 172 bytes on * 32-bit platforms. * * In some cases the builtins array could be ROM based, but it's * sometimes edited (e.g. for sandboxing) so it's better to keep * this array in RAM.
label: code-design

15699. catch part will catch

15700. Note: DUK_VALSTACK_INITIAL_SIZE must be >= DUK_VALSTACK_API_ENTRY_MINIMUM * + DUK_VALSTACK_INTERNAL_EXTRA so that the initial stack conforms to spare * requirements.

15701. roughly 512 bytes

15702. DUK_USE_ROM_STRINGS

15703. thread has yielded
15704. roughly 256 bytes
15705. who resumed us (if any)
15706. callstack index of related activation
15707. * Flags for `__FILE__` / `__LINE__` registered into tracedata
15708. roughly 1 kB
15709. **comment:** Pointer to bytecode executor's `'curr_pc'` variable. Used to copy * the current PC back into the topmost activation when activation * state is about to change (or "syncing" is otherwise needed). This * is rather awkward but important for performance, see `execution.rst`.
label: code-design
15710. activation prevents yield (native call or "new")
15711. function executes in strict mode
15712. Note: it's nice if size is 2^N (at least for 32-bit platforms).
15713. Sanity limits for stack sizes.
15714. borrowed: full `duk_tval` for function being executed; for lightfuncs
15715. indirect allocs
15716. * Assert context is valid: non-NULL pointer, fields look sane. ** This is used by public API call entrypoints to catch invalid 'ctx' pointers * as early as possible; invalid 'ctx' pointers cause very odd and difficult to * diagnose behavior so it's worth checking even when the check is not 100%.
15717. number of activation records in callstack preventing a yield
15718. activation has active breakpoint(s)
15719. Call stack. `[0,callstack_top[` is GC reachable.
15720. thread not currently running
15721. roughly 1.0 kB -> but rounds up to `DUK_VALSTACK_GROW_STEP` in practice
15722. roughly 128 bytes
15723. (reference is valid as long activation exists)
15724. don't report `__FILE__` / `__LINE__` as fileName/lineNumber
15725. `DUK_HTHREAD_H_INCLUDED`
15726. borrowed reference to catch variable name (or NULL if none)
15727. roughly 0.5 kB
15728. bottom of current frame
15729. Note: it's nice if size is 2^N (not $4 \times 4 = 16$ bytes on 32 bit)
15730. Return value when returning to this activation (points to caller * reg, not callee reg); index is absolute (only set if activation is * not topmost). ** Note: `idx_bottom` is always set, while `idx_retval` is only applicable * for activations below the topmost one. Currently `idx_retval` for * the topmost activation is considered garbage (and it not initialized * on entry or cleared on return; may contain previous or garbage * values).
15731. thread currently running (only one at a time)
15732. top of current frame (exclusive)
15733. number of elements guaranteed to be user accessible * (in addition to call arguments) on Duktape/C function entry.
15734. * Prototypes
15735. activation has tail called one or more times
15736. Current strictness flag: affects API calls.
15737. Backpointers.
15738. roughly 2 kB
15739. values for the state field
15740. needed for stepping
15741. Yield/resume book-keeping.
15742. **comment:** XXX: Valstack, callstack, and catchstack are currently assumed * to have non-NULL pointers. Relaxing this would not lead to big * benefits (except perhaps for terminated threads).
label: code-design
15743. finally part will catch
15744. `idx_base` and `idx_base+1` get completion value and type
15745. Executor interrupt default interval when nothing else requires a * smaller value. The default interval must be small enough to allow * for reasonable execution timeout checking but large enough to keep * impact on execution performance low.
15746. Thread state.
15747. request to create catch binding
15748. nop
15749. start of valstack allocation
15750. next instruction to execute (points to 'func' bytecode, stable pointer), NULL for native calls
15751. * Struct defines
15752. Value stack: these are expressed as pointers for faster stack manipulation. * `[valstack, valstack_top[` is GC-reachable, `[valstack_top, valstack_end[` is * not GC-reachable but kept initialized as 'undefined'.
15753. * Heap thread object representation. ** `duk_hthread` is also the 'context' (`duk_context`) for exposed APIs * which mostly operate on the topmost frame of the value stack.
15754. activation is a direct eval call
15755. Shared object part
15756. Interrupt counter for triggering a slow path check for execution * timeout, debugger interaction such as breakpoints, etc. The value * is valid for the current running thread, and both the init and * counter values are copied whenever a thread switch occurs. It's * important for the counter to be conveniently accessible for the * bytecode executor inner loop for performance reasons.
15757. start value for current countdown
15758. type and control flags, label number
15759. borrowed: function being executed; for bound function calls, this is the final, real function, NULL for lightfuncs
15760. current variable environment (may be NULL if delayed)
15761. Catch stack. `[0,catchstack_top[` is GC reachable.
15762. * Stack constants
15763. **comment:** XXX: for a memory-code tradeoff, remove 'func' and make it's access either a function * or a macro. This would make the activation 32 bytes long on 32-bit platforms again.
label: code-design
15764. * Activation defines
15765. Previous value of 'func' caller, restored when unwound. Only in use * when 'func' is non-strict.
15766. thread resumed another thread (active but not running)
15767. roughly 64 bytes
15768. Bottom of valstack for this activation, used to reset * `valstack_bottom` on return; index is absolute. Note: * `idx_top` not needed because top is set to 'nregs' always * when returning to an EcmaScript activation.
15769. catch or with binding is currently active
15770. resume execution from `pc_base` or `pc_base+1` (points to 'func' bytecode, stable pointer)
15771. countdown state
15772. * Thread defines
15773. thread has terminated
15774. **comment:** Current 'this' binding is the value just below `idx_bottom`. * Previously, 'this' binding was handled with an index to the * (calling) valstack. This works for everything except tail * calls, which must not "cumulate" valstack temps.

label: code-design

15775. * duk_hthread allocation and freeing.

15776. valstack

15777. callstack

15778. * Allocate initial stacks for a thread. Note that 'thr' must be reachable * as a garbage collection may be triggered by the allocation attempts. * Returns zero (without leaking memory) if init fails.

15779. For indirect allocs.

15780. catchstack

15781. **comment:** XXX: relocate

label: code-design

15782. DUK_HOBJECT_FLAG_EXOTIC_STRINGOBJ varies

15783. currently, even for Array.prototype

15784. normal valued properties

15785. 'prototype' property for all built-in objects (which have it) has attributes: * [[Writable]] = false, * [[Enumerable]] = false, * [[Configurable]] = false

15786. Architecture, OS, and compiler strings

15787. DUK_USE_LIGHTFUNC_BUILTINS

15788. Setup builtins from ROM objects. All heaps/threads will share * the same readonly objects.

15789. **comment:** Currently all built-in native functions are strict. * This doesn't matter for many functions, but e.g. * String.prototype.charAt (and other string functions) * rely on being strict so that their 'this' binding is * not automatically coerced.

label: code-design

15790. enable exotic behaviors last

15791. Built-in 'name' is not writable by default. Function '.name' * is writable to allow user code to set a '.name' on a native * function.

15792. initjs data is NUL terminated

15793. **comment:** XXX: try to optimize to 8 (would now be possible, <200 used)

label: code-design

15794. * First create all built-in bare objects on the empty valstack. * * Built-ins in the index range [0,DUK_NUM_BUILTINS-1] have value * stack indices matching their eventual thr->builtins[] index. * * Built-ins in the index range [DUK_NUM_BUILTINS,DUK_NUM_ALL_BUILTINS] * will exist on the value stack during init but won't be placed * into thr->builtins[]. These are objects referenced in some way * from thr->builtins[] roots but which don't need to be indexed by * Duktape through thr->builtins[] (e.g. user custom objects).

15795. [(builtin objects) name func]

15796. chain

15797. By default the global object is read-only which is often much * more of an issue than having read-only built-in objects (like * RegExp, Date, etc). Use a RAM-based copy of the global object * and the global environment object for convenience.

15798. Cast converts magic to 16-bit signed value

15799. Packed or unpacked tval

15800. Currently all built-in native functions are strict. * duk_push_c_function() now sets strict flag, so * assert for it.

15801. **comment:** XXX: magic for getter/setter? use duk_def_prop()?

label: code-design

15802. Object property allocation layout

15803. avoid empty label at the end of a compound statement

15804. Create a fresh object environment for the global scope. This is * needed so that the global scope points to the newly created RAM-based * global object.

15805. Inherit from ROM-based global object: less RAM usage, less transparent.

15806. **comment:** XXX: keep property attributes or tweak them here? * Properties will now be non-configurable even when they're * normally configurable for the global object.

label: code-design

15807. always provideThis=true

15858. **comment:** XXX: other properties of function instances; 'arguments', 'caller'.
 label: code-design
15859. always 0 args
15860. [(builtin objects)]
15861. must be signed
15862. DUK_HOBJECT_FLAG_NATIVEFUNCTION varies
15863. * Encoding constants, must match genbuiltins.py
15864. XXX: ARRAY_PART for Array prototype?
15865. * For top-level objects, 'length' property has the following * default attributes: non-writable, non-enumerable, non-configurable * (E5 Section 15). * * However, 'length' property for Array.prototype has attributes * expected of an Array instance which are different: writable, * non-enumerable, non-configurable (E5 Section 15.4.5.2). * * This is currently determined implicitly based on class; there are * no attribute flags in the init data.
15866. native function properties
15867. all native functions have NEWENV
15868. push operation normalizes NaNs
15869. **comment:** XXX: This won't be shown in practice now * because this code is not run when builtins * are in ROM.
 label: code-design
15870. no prototype
15871. Copy the property table verbatim; this handles attributes etc. * For ROM objects it's not necessary (or possible) to update * refcounts so leave them as is.
15872. no need to decref
15873. **comment:** XXX: Shrink the stacks to minimize memory usage? May not * be worth the effort because terminated threads are usually * garbage collected quite soon.
 label: code-design
15874. **comment:** XXX: store 'bcode' pointer to activation for faster lookup?
 label: code-design
15875. Write bytecode executor's curr_pc back to topmost activation (if any).
15876. Here we could remove references to built-ins, but it may not be * worth the effort because built-ins are quite likely to be shared * with another (unterminated) thread, and terminated threads are also * usually garbage collected quite quickly. Also, doing DECREFs * could trigger finalization, which would run on the current thread * and have access to only some of the built-ins. Garbage collection * deals with this correctly already.
15877. Order of unwinding is important
15878. ptr_curr_pc != NULL only when bytecode executor is active.
15879. unwinds valstack, updating refcounts
15880. DUK_USE_DEBUGGER_SUPPORT
15881. * Thread support.
15882. side effects, possibly errors
15883. Note: this may cause a corner case situation where a finalizer * may see a currently reachable activation whose 'func' is NULL.
15884. avoid warning (unsigned)
15885. unsigned
15886. * Restore 'caller' property for non-strict callee functions.
15887. **comment:** * Note: must use indirect variant of DUK_REALLOC() because underlying * pointer may be changed by mark-and-sweep.
 label: code-design
15888. true, despite side effect resizes
15889. note: any entries above the callstack top are garbage and not zeroed
15890. cannot grow
15891. With lightfuncs, act 'func' may be NULL
15892. The act->prev_caller should only be set if the entry for 'caller' * exists (as it is only set in that case, and the property is not * configurable), but handle all the cases anyway.
15893. func is NULL for lightfunc
15894. must be, since env was created when catcher was created
15895. note: any entries above the catchstack top are garbage and not zeroed
15896. * Update preventcount
15897. avoid side effect issues
15898. current lex_env of the activation (created for catcher)
15899. Note that multiple catchstack entries may refer to the same * callstack entry.
15900. **comment:** * Manipulation of thread stacks (valstack, callstack, catchstack). * * Ideally unwinding of stacks should have no side effects, which would * then favor separate unwinding and shrink check primitives for each * stack type. A shrink check may realloc and thus have side effects. * * However, currently callstack unwinding itself has side effects, as it * needs to DECREF multiple objects, close environment records, etc. * Stacks must thus be unwound in the correct order by the caller. * * (XXX: This should be probably reworked so that there is a shared * unwind primitive which handles all stacks as requested, and knows * the proper order for unwinding.) * * Valstack entries above 'top' are always kept initialized to * "undefined unused". Callstack and catchstack entries above 'top' * are not zeroed and are left as garbage. * * Value stack handling is mostly a part of the API implementation.
 label: code-design
15901. * Unwind debugger state. If we unwind while stepping * (either step over or step into), pause execution.
15902. Note: any entries above the callstack top are garbage and not zeroed. * Also topmost activation idx_retval is garbage (not zeroed), and must * be ignored.

15962. DUK_OP_RETURN flags in A
15963. DUK_OP_CALL flags in A

16270. DUK_TOK_TRUE

16271. * Variant 2

16272. UnaryExpression

16273. Buffer length is bounded to 0xffff automatically, avoid compile warning.

16274. **comment:** * Shared handling for logical AND and logical OR. * * args = (truthval << 8) + rbp * * Truthval determines when to skip right-hand-side. * For logical AND truthval=1, for logical OR truthval=0. * * See doc/compiler.rst for discussion on compiling logical * AND and OR expressions. The approach here is very simplistic, * generating extra jumps and multiple evaluations of truth values, * but generates code on-the-fly with only local back-patching. * * Both logical AND and OR are syntactically left-associated. * However, logical ANDs are compiled as right associative * expressions, i.e. "A && B && C" as "A && (B && C)", to allow * skip jumps to skip over the entire tail. Similarly for logical OR.

label: code-design

16275. No need to assert, buffer size maximum is 0xffff.

16276. Tailcalls are handled by back-patching the TAILCALL flag to the * already emitted instruction later (in return statement parser). * Since A and C have a special meaning here, they cannot be "shuffled".

16277. inserted jump

16278. curr_token follows 'function'

16279. Output shuffle needed after main operation

16280. DUK_TOK_TRY

16281. evaluate to final form (e.g. coerce GETPROP to code), throw away temp

16282. push before advancing to keep reachable

16283. DUK_TOK_GET

16284. init function state: inits valstack allocations

16285. for storing/restoring the varmap binding for catch variable

16286. convenience helpers

16287. * Build function fixed size 'data' buffer, which contains bytecode, * constants, and inner function references. * * During the building phase 'data' is reachable but incomplete. * Only incref's occur during building (no refzero or GC happens), * so the building process is atomic.

16288. omitted

16289. Check statement type based on the first token type. * * Note: expression parsing helpers expect 'curr_tok' to * contain the first token of the expression upon entry.

16290. -> pushes fixed buffer

16291. Not safe to use 'reg_varbind' as assignment expression * value, so go through a temp.

16292. Ensure compact use of temps.

16293. default case exists: go there if no case matches

16294. **comment:** Temporary structure used to pass a stack allocated region through * duk_safe_call().

label: code-design

16295. eat 'do'

16296. * Do-while statement is mostly trivial, but there is special * handling for automatic semicolon handling (triggered by the * DUK_ALLOW_AUTO_SEMI_ALWAYS flag related to a bug filed at: * * https://bugs.ecmascript.org/show_bug.cgi?id=8 * * See doc/compiler.rst for details.

16297. -> [... name index]

16298. max # of values initialized in one MPUTARR set

16299. * Reset function state and perform register allocation, which creates * 'varmap' for second pass. Function prologue for variable declarations, * binding value initializations etc is emitted as a by-product. * * Strict mode restrictions for duplicate and invalid argument * names are checked here now that we know whether the function * is actually strict. See: test-dev-strict-mode-boundary.js. * * Inner functions are compiled during pass 1 and are not reset.

16300. Strict equality is NOT enough, because we cannot use the same * constant for e.g. +0 and -0.

16301. e.g. DUK_OP_PREINCV

16302. reuse 'res' as 'left'

16303. Initial bytecode size allocation.

16304. XXX: patch initial size afterwards?

16305. yes, must set array length explicitly

16306. in-place setup

16307. Does not assume that jump_pc contains a DUK_OP_JUMP previously; this is intentional * to allow e.g. an INVALID opcode be overwritten with a JUMP (label management uses this).

16308. **comment:** Delete semantics are a bit tricky. The description in E5 specification * is kind of confusing, because it distinguishes between resolvability of * a reference (which is only known at runtime) seemingly at compile time * (= SyntaxError throwing).

label: code-design

16309. binding power must be high enough to NOT allow comma expressions directly

16310. flags

16311. _Formals: omitted if function is guaranteed not to need a (non-strict) arguments object

16312. Note: these variables must reside in 'curr_func' instead of the global * context: when parsing function expressions, expression parsing is nested.

16313. implicit_return_value

16314. * Initialize function state for a zero-argument function

16315. * Special name handling

16316. eat 'for'

16317. right associative

16318. init 'curr_token'

16319. allow a constant to be returned

16320. DUK_TOK_LBRACKET

16321. XXX: check num_args

16322. DUK_TOK_LPAREN

16323. directly uses slow accesses

16324. **comment:** It'd be nice to do something like this - but it doesn't * work for closures created inside the catch clause.

label: code-design

16325. duk_parse_stmts() expects curr_tok to be set; parse in "allow regexp literal" mode with current strictness

16326. **comment:** XXX: Shuffling support could be implemented here so that LDINT+LDINTX * would only shuffle once (instead of twice). The current code works * though, and has a smaller compiler footprint.

label: code-design

16327. * Post-increment/decrement will return the original value as its * result value. However, even that value will be coerced using * ToNumber() which is quite awkward. Specific bytecode opcodes * are used to handle these semantics. * * Note that post increment/decrement has a "no LineTerminator here" * restriction. This is handled by duk_expr_lbp(), which forcibly terminates * the previous expression if a LineTerminator occurs before '++'/'--'.

16328. DUK_TOK_LT

16329. If duk_ivalue_toplain_raw() allocates a temp, forget it and * restore next temp state.

16330. catch depth from current func

16331. eat colon

16332. **comment:** XXX: since the enumerator may be a memory expensive object, * perhaps clear it explicitly here? If so, break jump must * go through this clearing operation.

label: code-design

16333. [... pattern flags]

16334. * Init compiler and lexer contexts

16335. DUK_TOK_NEQ

16336. * Code emission helpers * * Some emission helpers understand the range of target and source reg/const * values and automatically emit shuffling code if necessary. This is the * case when the slot in question (A, B, C) is used in the standard way and * for opcodes the emission helpers explicitly understand (like DUK_OP_CALL). * * The standard way is that: * - slot A is a target register * - slot B is a source register/constant * - slot C is a source register/constant * * If a slot is used in a non-standard way the caller must indicate this * somehow. If a slot is used as a target instead of a source (or vice * versa), this can be indicated with a flag to trigger proper shuffling * (e.g. DUK_EMIT_FLAG_B_IS_TARGET). If the value in the slot is not * register/const related at all, the caller must ensure that the raw value * fits into the corresponding slot so as to not trigger shuffling. The * caller must set a "no shuffle" flag to ensure compilation fails if * shuffling were to be triggered because of an internal error. * * For slots B and C the raw slot size is 9 bits but one bit is reserved for * the reg/const indicator. To use the full 9-bit range for a raw value, * shuffling must be disabled with the DUK_EMIT_FLAG_NO_SHUFFLE_{B,C} flag. * Shuffling is only done for A, B, and C slots, not the larger BC or ABC slots. * * There is call handling specific understanding in the A-B-C emitter to * convert call setup and call instructions into indirect ones if necessary.

16337. if num_values > 0, MPUTARR emitted by outer loop after break

16338. **comment:** XXX: would be nice to omit this jump when the jump is not * reachable, at least in the obvious cases (such as the case * ending with a 'break'. * * Perhaps duk_parse_stmt() could provide some info on whether * the statement is a "dead end"? * * If implemented, just set pc_prevstmt to -1 when not needed.

label: code-design

16339. **comment:** Two temporaries are preallocated here for variants 3 and 4 which need * registers which are never clobbered by expressions in the loop * (concretely: for the enumerator object and the next enumerated value). * Variants 1 and 2 "release" these temps.

label: code-design

16358. indirect opcode follows direct

16359. statement parsing

16360. * Function declarations

16361. **comment:** * Parse variant 1 or 2. The first part expression (which differs * in the variants) has already been parsed and its code emitted. * * reg_temps + 0: unused * reg_temps + 1: unused

label: code-design

16362. Valstack should suffice here, required on function valstack init

16363. reg_res should be smallest possible

16364. pushes function template

16365. **comment:** Pick a destination register. If either base value or key * happens to be a temp value, reuse it as the destination. * * XXX: The temp must be a "mutable" one, i.e. such that no * other expression is using it anymore. Here this should be * the case because the value of a property access expression * is neither the base nor the key, but the lookup result.

label: code-design

16366. Note: although there is no 'undefined' literal, undefined * values can occur during compilation as a result of e.g. * the 'void' operator.

16367. Property access expressions are critical for correct LHS ordering, * see comments in duk_expr()!

16368. Identifier, i.e. don't allow reserved words

16369. **comment:** * Emit a final RETURN. * * It would be nice to avoid emitting an unnecessary "return" opcode * if the current PC is not reachable. However, this cannot be reliably * detected; even if the previous instruction is an unconditional jump, * there may be a previous jump which jumps to current PC (which is the * case for iteration and conditional statements, for instance).

label: code-design

16370. **comment:** Parse an inner function, adding the function template to the current function's * function table. Return a function number to be used by the outer function. * * Avoiding O(depth^2) inner function parsing is handled here. On the first pass, * compile and register the function normally into the 'funcs' array, also recording * a lexer point (offset/line) to the closing brace of the function. On the second * pass, skip the function and return the same 'fnum' as on the first pass by using * a running counter. * * An unfortunate side effect of this is that when parsing the inner function, almost * nothing is known of the outer function, i.e. the inner function's scope. We don't * need that information at the moment, but it would allow some optimizations if it * were used.

label: code-design

16371. Slot B

16372. **comment:** * Emit initializers in sets of maximum max_init_values. * Corner cases such as single value initializers do not have * special handling now. * * Elided elements must not be emitted as 'undefined' values, * because such values would be enumerable (which is incorrect). * Also note that trailing elisions must be reflected in the * length of the final array but cause no elements to be actually * inserted.

label: code-design
16427. DUK_TOK_SUPER
16428. **comment:** * Declaration binding instantiation conceptually happens when calling a * function; for us it essentially means that function prologue. The * conceptual process is described in E5 Section 10.5. * * We need to keep track of all encountered identifiers to (1) create an * identifier-to-register map ("varmap"); and (2) detect duplicate * declarations. Identifiers which are not bound to registers still need * to be tracked for detecting duplicates. Currently such identifiers * are put into the varmap with a 'null' value, which is later cleaned up. * * To support functions with a large number of variable and function * declarations, registers are not allocated beyond a certain limit; * after that limit, variables and functions need slow path access. * Arguments are currently always register bound, which imposes a hard * (and relatively small) argument count limit. * * Some bindings in E5 are not configurable (= deletable) and almost all * are mutable (writable). Exceptions are: * * - The 'arguments' binding, established only if no shadowing argument * or function declaration exists. We handle 'arguments' creation * and binding through an explicit slow path environment record. * * - The "name" binding for a named function expression. This is also * handled through an explicit slow path environment record.

16659. jump to next case clause

16660. const

16661. Code emission flags, passed in the 'opcode' field. Opcode + flags * fit into 16 bits for now, so use duk_small_uint.t.

16662. eat 'if'

16663. key encountered as a getter

16664. **comment:** XXX: macros

label: code-design

16665. must have catch and/or finally

16666. DUK_TOK_GT

16667. 'new' MemberExpression

16668. DUK_TOK_BXOR

16669. * Store lexer position for a later rewind

16670. regCatch+0 and regCatch+1 are reserved for TRYCATCH

16671. Function name is an Identifier (not IdentifierName), but we get * the raw name (not recognizing keywords) here and perform the name * checks only after pass 1.

16672. DUK_TOK_DECREMENT

16673. **comment:** The target for this LDCONST may need output shuffling, but we assume * that 'pc_ldconst' will be the LDCONST that we can patch later. This * should be the case because there's no input shuffling. (If there's * no catch clause, this LDCONST will be replaced with a NOP.)

label: code-design

16674. default case control flow patchup; note that if pc_prevcase < 0 * (i.e. no case clauses), control enters default case automatically.

16675. At this point 'res' holds the potential expression value. * It can be basically any ivalue here, including a reg-bound * identifier (if code above deems it safe) or a unary/binary * operation. Operations must be resolved to a side effect free * plain value, and the side effects must happen exactly once.

16676. require a (mutable) temporary as a result (or a const if allowed)

16677. DUK_OP_NONE marks a 'plain' assignment

16678. keep in on valstack, use borrowed ref below

16679. * Parse code after the clause. Possible terminators are * 'case', 'default', and ')'. * * Note that there may be no code at all, not even an empty statement, * between case clauses. This must be handled just like an empty statement * (omitting seemingly pointless JUMPs), to avoid situations like * test-bug-case-fallthrough.js.

16680. res.x1 -> res.x2

16681. number of values in current MPUTARR set

16682. <<

16683. to exit

16684. **comment:** has inner functions which may slow access (XXX: this can be optimized by looking at the inner functions)

label: code-design

16685. Parse formals.

16686. **comment:** XXX: need to determine LHS type, and check that it is LHS compatible

label: code-design

16687. getter/setter

16688. false

16689. register bound variables are non-configurable -> always false

16690. nargs

16691. XXX: init or assert catch depth etc -- all values

16692. **comment:** Flags for intermediate value coercions. A flag for using a forced reg * is not needed, the forced_reg argument suffices and generates better * code (it is checked as it is used).

label: code-design

16693. copy bytecode instructions one at a time

16694. LHS is already side effect free

16695. * Variant 3

16696. DUK_TOK_IMPORT

16697. XXX: range assert

16698. points to LABEL; pc+1 = jump site for break; pc+2 = jump site for continue

16699. * On second pass, skip the function.

16700. **comment:** XXX: hack, remove when const lookup is not O(n)

label: code-design

16701. token closes expression, e.g. ')', ']'

16702. fileName

16703. chain jumps for case * evaluation and checking

16704. needed for line number tracking (becomes prev_token.start_line)

16705. * 'key_obj' tracks keys encountered so far by associating an * integer with flags with already encountered keys. The checks * below implement E5 Section 11.1.5, step 4 for production: ** PropertyNameAndValueList: PropertyNameAndValueList , PropertyAssignment

16706. function call

16707. DUK_TOK_MUL

16708. **comment:** XXX: opcode specific assertions on when consts are allowed
label: code-design

16709. const limits

16710. don't coerce yet to a plain value (variant 3 needs special handling)

16711. The issues below can be solved with better flags

16712. [...] res]

16713. If forced reg, use it as destination. Otherwise try to * use either coerced ispec if it is a temporary. ** When using extraops, avoid reusing arg2 as dest because that * would lead to an LDREG shuffle below. We still can't guarantee * dest != arg2 because we may have a forced_reg.

16714. continue jump

16715. LeftHandSideExpression does not allow empty expression

16716. Don't allow negative zero as it will cause trouble with * LDINT+LDINTX. But positive zero is OK.

16717. First evaluate LHS fully to ensure all side effects are out.

16718. Object literal set/get functions have a name (property * name) but must not have a lexical name binding, see * test-bug-getset-func-name.js.

16719. allow source elements

16720. **comment:** XXX: This now coerces an identifier into a GETVAR to a temp, which * causes an extra LDREG in call setup. It's sufficient to coerce to a * unary ivalue?
label: code-design

16721. eat 'function'

16722. one token before

16723. keep in valstack

16724. Limit checks for bytecode byte size and line number.

16725. Parse a single statement. ** Creates a label site (with an empty label) automatically for iteration * statements. Also "peels off" any label statements for explicit labels.

16726. normal key/value

16727. Note: escaped characters differentiate directives

16728. Setting "no shuffle A" is covered by the assert, but it's needed * with DUK_USE_SHUFFLE_TORTURE.

16729. reject 'in' token (used for for-in)

16730. Note: 0xff != DUK_BC_B_MAX

16731. Function expression. Note that any statement beginning with 'function' * is handled by the statement parser as a function declaration, or a * non-standard function expression/statement (or a SyntaxError). We only * handle actual function expressions (occurring inside an expression) here. ** O(depth^2) parse count for inner functions is handled by recording a * lexer offset on the first compilation pass, so that the function can * be efficiently skipped on the second pass. This is encapsulated into * duk_parse_func_like_fnum().

16732. special RegExp literal handling after IdentifierName

16733. **comment:** XXX: awkward, especially the bunch of separate output values -> output struct?
label: code-design

16734. statement is guaranteed to be terminal (control doesn't flow to next statement)

16735. fall-through jump to next code of next case (backpatched)

16736. Use a fast break/continue when possible. A fast break/continue is * just a jump to the LABEL break/continue jump slot, which then jumps * to an appropriate place (for break, going through ENDLABEL correctly). * The peephole optimizer will optimize the jump to a direct one.

16737. * The length comparisons are present to handle * strings like "use strict\u0000foo" as required.

16738. directive prologue status at entry

16739. * Function declaration, function expression, or (non-standard) * function statement. ** The E5 specification only allows function declarations at * the top level (in "source elements"). An ExpressionStatement * is explicitly not allowed to begin with a "function" keyword * (E5 Section 12.4). Hence any non-error semantics for such * non-top-level statements are non-standard. Duktape semantics * for function statements are modelled after V8, see * test-dev-func-decl-outside-top.js.

16740. Parse argument list. Arguments are written to temps starting from * "next temp". Returns number of arguments parsed. Expects left paren * to be already eaten, and eats the right paren before returning.

16741. * Variant 1 or 3

16742. temp object for tracking / detecting duplicate keys

16743. Opcode slot C is used in a non-standard way, so shuffling * is not allowed.

16744. DUK_TOK_SEMICOLON

16745. DUK_TOK_RSHIFT

16746. * Size-optimized pc->line mapping.

16747. Note: if target_pc1 == i, we'll optimize a jump to itself. * This does not need to be checked for explicitly; the case * is rare and max iter breaks us out.

16748. DUK_TOK_EQ

16749. code emission

16750. strict mode restrictions (E5 Section 12.2.1)

16751. result in csreg

16752. **comment:** Technically return value is not needed because INVLHS will * unconditionally throw a ReferenceError. Coercion is necessary * for proper semantics (consider ToNumber() called for an object). * Use DUK_EXTRAOP_UNP with a dummy register to get ToNumber().
label: code-design

16753. decl type

16754. **comment:** The entries can either be register numbers or 'null' values. * Thus, no need to DECREF them and get side effects. DECREF'ing * the keys (strings) can cause memory to be freed but no side * effects as strings don't have finalizers. This is why we can * rely on the object properties not changing from underneath us.
label: code-design

16755. - A is a source register (it's not a write target, but used * to identify the target object) but can be shuffled. * - B cannot be shuffled normally because it identifies a range * of registers, the emitter has special handling for this * (the "no shuffle" flag must not be set). * - C is a non-register number and cannot be shuffled, but * never needs to be.

16756. PropertyName -> IdentifierName | StringLiteral | NumericLiteral

16757. top-down expression parser

16758. Look up an identifier name in the current varmap, indicating whether the * identifier is register-bound and if not, allocating a constant for the * identifier name. Returns 1 if register-bound, 0 otherwise. Caller can * also check (out_reg_varbind >= 0) to check whether or not identifier is * register bound. The caller must NOT use out_rc_varname at all unless * return code is 0 or out_reg_varbind is < 0; this is because out_rc_varname * is unsigned and doesn't have a "unused" / none value.

16759. E5 Section steps 7-8

16760. **comment:** XXX: unoptimal use of temps, resetting
label: code-design

16761. Any 'res' will do.

16762. is_decl

16763. varmap is already in comp_ctx->curr_func.varmap_idx

16764. DUK_TOK_SWITCH

16765. eat 'try'

16766. b

16767. Note: 0xff != DUK_BC_C_MAX

16768. _Source

16769. Lenient: allow function declarations outside top level in * non-strict mode but reject them in strict mode.
16770. start variant 3/4 left-hand-side code (L1 in doc/compiler.rst example)
16771. COMMA
16772. Parse statements until a closing token (EOF or '}') is found.
16773. XXX: if assertions enabled, walk through all valid PCs * and check line mapping.
16774. The token in the switch has already been eaten here
16775. DUK_TOK_LAND
16776. currently all labels accept a break, so no explicit check for it now
16777. DUK_TOK_NEW
16778. force_no_namebind
16779. DUK_TOK_RBRACKET
16780. * Setup call: target and 'this' binding. Three cases: * * 1. Identifier base (e.g. "foo()") * 2. Property base (e.g. "foo.bar()") * 3. Register base (e.g. "foo()0"); i.e. when a return value is a function
16781. statement does not terminate directive prologue
16782. SHIFT EXPRESSION
16783. **comment:** XXX: awkward and bloated asm -- use faster internal accesses
 label: code-design
16784. approximation, close enough
16785. DUK_TOK_LOR
16786. **comment:** XXX: specific getter
 label: code-design
16787. **comment:** Then evaluate RHS fully (its value becomes the expression value too). * Technically we'd need the side effect safety check here too, but because * we always throw using INVLHS the result doesn't matter.
 label: code-design
16788. First we need to insert a jump in the middle of previously * emitted code to get the control flow right. No jumps can * cross the position where the jump is inserted. See doc/compiler.rst * for discussion on the intricacies of control flow and side effects * for variants 3 and 4.
16789. * Emit initializers in sets of maximum max_init_pairs keys. * Setter/getter is handled separately and terminates the * current set of initializer values. Corner cases such as * single value initializers do not have special handling now.
16790. intentional overlap with earlier memzero
16791. Match labels starting from latest label because there can be duplicate empty * labels in the label set.
16792. Need to set curr_token.t because lexing regexp mode depends on current * token type. Zero value causes "allow regexp" mode.
16793. chain jumps for 'fall-through' * after a case matches.
16794. assumed to also be PC of "LABEL"
16795. * Main switch for statement / source element type.
16796. * Function name (if any) * * We don't check for prohibited names here, because we don't * yet know whether the function will be strict. Function body * parsing handles this retroactively. * * For function expressions and declarations function name must * be an Identifier (excludes reserved words). For setter/getter * it is a PropertyName which allows reserved words and also * strings and numbers (e.g. "{ get 1() { ... } }").
16797. DUK_TOK_DELETE
16798. DUK_TOK_BOR
16799. DUK_TOK_CASE
16800. DUK_TOK_ADD_EQ
16801. **comment:** XXX: optimize temp reg use
 label: code-design
16802. * Compact the function template.
16803. >>>
16804. PRIMARY EXPRESSIONS
16805. left.x1 -> res.x1
16806. num_args
16807. DUK_TOK_ADD
16808. always terminates led()
16809. allocate to reg only (not const)
16810. skip jump conditionally
16811. prevent duk__expr_led() by using a binding power less than anything valid
16812. default clause matches next statement list (if any)
16813. filter out flags from exptop rbp_flags here to save space
16814. eat 'return'
16815. * Parse a function body or a function-like expression, depending * on flags.
16816. **comment:** must be able to emit code, alloc consts, etc.
 label: code-design
16817. **comment:** We want the argument expression value to go to "next temp" * without additional moves. That should almost always be the * case, but we double check after expression parsing. * * This is not the cleanest possible approach.
 label: code-design
16818. slot B is both a target and a source (used by extraops like DUK_EXTRAOP_INSTOF)
16819. FUNCTION EXPRESSIONS
16820. MULTIPLICATIVE EXPRESSION
16821. may be a string constant
16822. Labels can be used for iteration statements but also for other statements, * in particular a label can be used for a block statement. All cases of a * named label accept a 'break' so that flag is set here. Iteration statements * also allow 'continue', so that flag is updated when we figure out the * statement type.
16823. entry_top + 1
16824. **comment:** NEXTENUM needs a jump slot right after the main instruction. * When the JUMP is taken, output spilling is not needed so this * workaround is possible. The jump slot PC is exceptionally * plumbed through comp_ctx to minimize call sites.
 label: code-design
16825. UNARY EXPRESSIONS
16826. Parse a function-like expression, assuming that 'comp_ctx->curr_func' is * correctly set up. Assumes that curr_token is just after 'function' (or * 'set'/'get' etc).
16827. function: always register bound
16828. a statement following a label cannot be a source element * (a function declaration).

 label: code-design
16949. No BC shuffling now.
16950. number
16951. syntactically left-associative but parsed as right-associative
16952. reserve a jumpslot after instr before target spilling, used for NEXTENUM
16953. * Wrap up
16954. at least one opcode emitted
16955. Encode into a single opcode (18 bits can encode 1-2 bytes + length indicator)
16956. relookup after possible realloc
16957. The 'left' value must not be a register bound variable * because it may be mutated during the rest of the expression * and E5.1 Section 11.2.1 specifies the order of evaluation * so that the base value is evaluated first. * See: test-bug-nested-prop-mutate.js.
16958. regexp literal must not follow this token
16959. -> [... func]
16960. automatic semi will be inserted
16961. Special shuffling for INITGET/INITSET, where slot C * identifies a register pair and cannot be shuffled * normally. Use an indirect variant instead.
16962. a label site has been emitted by duk_parse_stmt() automatically * (it will also emit the ENDLABEL).
16963. slot B is a target (default: source)
16964. without finally, the second jump slot is used to jump to end of stmt
16965. forget temp
16966. [... filename &comp_stk]
16967. break/continue with label (label cannot be a reserved word, production is 'Identifier'
16968. Have a catch variable.
16969. * Intermediate value helpers
16970. * Shared assignment expression handling ** args = (opcode << 8) + rbp * * If 'opcode' is DUK_OP_NONE, plain assignment without arithmetic. * Syntactically valid left-hand-side forms which are not accepted as * left-hand-side values (e.g. as in "f0 = 1") must NOT cause a * SyntaxError, but rather a run-time ReferenceError. ** When evaluating X <op>= Y, the LHS (X) is conceptually evaluated * to a temporary first. The RHS is then evaluated. Finally, the * <op> is applied to the initial value of RHS (not the value after * RHS evaluation), and written to X. Doing so concretely generates * inefficient code so we'd like to avoid the temporary when possible. * See: https://github.com/svaarala/duktape/pull/992. ** The expression value (final LHS value, written to RHS) is * conceptually

copied into a fresh temporary so that it won't * change even if the LHS/RHS values change in outer expressions. * For example, it'd be generally incorrect for the expression value * to be the RHS register binding, unless there's a guarantee that it * won't change during further expression evaluation. Using the * temporary concretely produces inefficient bytecode, so we try to * avoid the extra temporary for some known-to-be-safe cases. * Currently the only safe case we detect is a "top level assignment", * for example "x = y + z;", where the assignment expression value is * ignored. * See: test-dev-assign Expr.js and test-bug-assign-mutate-gh381.js.

16971. TRYCATCH, cannot emit now (not enough info)

16972. reset function state (prepare for pass 2)

16973. **comment:** Lookup active label information. Break/continue distinction is necessary to handle switch * statement related labels correctly: a switch will only catch a 'break', not a 'continue'. * * An explicit label cannot appear multiple times in the active set, but empty labels (unlabelled * iteration and switch statements) can. A break will match the closest unlabelled or labelled * statement. A continue will match the closest unlabelled or labelled iteration statement. It is * a syntax error if a continue matches a labelled switch statement; because an explicit label cannot * be duplicated, the continue cannot match any valid label outside the switch. * * A side effect of these rules is that a LABEL statement related to a switch should never actually * catch a continue abrupt completion at run-time. Hence an INVALID opcode can be placed in the * continue slot of the switch's LABEL statement.

label: code-design

16974. Value stack slot limits: these are quite approximate right now, and * because they overlap in control flow, some could be eliminated.

16975. **comment:** NOTE: "get" and "set" are not officially ReservedWords and the lexer * currently treats them always like ordinary identifiers (DUK_TOK_GET * and DUK_TOK_SET are unused). They need to be detected based on the * identifier string content.

label: code-design

16976. **comment:** * Note: currently register bindings must be fixed for the entire * function. So, even though the catch variable is in a register * we know, we must use an explicit environment record and slow path * accesses to read/write the catch binding to make closures created * within the catch clause work correctly. This restriction should * be fixable (at least in common cases) later. * * See: test-bug-catch-binding-2.js. * * XXX: improve to get fast path access to most catch clauses.

label: code-design
17058. silence scan-build warning
17059. varname is popped by above code
17060. always allow 'in', coerce to 'tr' just in case
17061. A top-level assignment is e.g. "x = y". For these it's safe * to use the RHS as-is as the expression value, even if the RHS * is a reg-bound identifier. The RHS ('res') is right associative * so it has consumed all other assignment level operations; the * only relevant lower binding power construct is comma operator * which will ignore the expression value provided here. Usually * the top level assignment expression value is ignored, but it * is relevant for e.g. eval code.
17062. Tail call check: if last opcode emitted was CALL(I), and * the context allows it, change the CALL(I) to a tail call. * This doesn't guarantee that a tail call will be allowed at * runtime, so the RETURN must still be emitted. (Duktape * 0.10.0 avoided this and simulated a RETURN if a tail call * couldn't be used at runtime; but this didn't work * correctly with a thread yield/resume, see * test-bug-tailcall-thread-yield-resume.js for discussion.) * * In addition to the last opcode being CALL, we also need to * be sure that 'rc_val' is the result register of the CALL(I). * For instance, for the expression 'return 0, (function () * { return 1; })', 2' the last opcode emitted is CALL (no * bytecode is emitted for '2') but 'rc_val' indicates * constant '2'. Similarly if '2' is replaced by a register * bound variable, no opcodes are emitted but tail call would * be incorrect. * * This is tricky and easy to get wrong. It would be best to * track enough expression metadata to check that 'rc_val' came * from that last CALL instruction. We don't have that metadata * now, so we check that 'rc_val' is a temporary register result * (not a constant or a register bound variable). There should * be no way currently for 'rc_val' to be a temporary for an * expression following the CALL instruction without emitting * some opcodes following the CALL. This proxy check is used * below. * * See: test-bug-comma-expr-gh131.js. * * The non-standard 'caller' property disables tail calls * because they pose some special cases which haven't been * fixed yet.
17063. DUK_TOK_YIELD
17064. DUK_TOK_LNOT
17065. slot C is a target (default: source)
17066. Match labels starting from latest; once label_id no longer matches, we can * safely exit without checking the rest of the labels (only the topmost labels * are ever updated).
17067. reset bytecode buffer but keep current size; pass 2 will * require same amount or more.
17068. The 'else' ambiguity is resolved by 'else' binding to the innermost * construct, so greedy matching is correct here.
17069. **comment:** not allowed in strict mode, regardless of whether resolves; * in non-strict mode DELVAR handles both non-resolving and * resolving cases (the specification description is a bit confusing).
label: code-design
17070. end switch
17071. DUK_TOK_LE
17072. Use 'res' as the expression value (it's side effect * free and may be a plain value, a register, or a * constant) and write it to the LHS binding too.
17073. **comment:** 'res' setup can be moved to function body level; in fact, two 'res' * intermediate values suffice for parsing of each function. Nesting is needed * for nested functions (which may occur inside expressions).
label: code-design
17074. Parse a single variable declaration (e.g. "i" or "i=10"). A leading 'var' * has already been eaten. These is no return value in 'res', it is used only * as a temporary. * * When called from 'for-in' statement parser, the initializer expression must * not allow the 'in' token. The caller supply additional expression parsing * flags (like DUK_EXPR_FLAG_REJECT_IN) in 'expr_flags'. * * Finally, out_rc_varname and out_reg_varbind are updated to reflect where * the identifier is bound: * * If register bound: out_reg_varbind >= 0, out_rc_varname == 0 (ignore) * If not register bound: out_reg_varbind < 0, out_rc_varname >= 0 * * These allow the caller to use the variable for further assignment, e.g. * as is done in 'for-in' parsing.
17075. XXX: similar coercion issue as in DUK_TOK_PERIOD
17076. borrowed reference
17077. * Statement terminator check, including automatic semicolon * handling. After this step, 'curr_tok' should be the first * token after a possible statement terminator.
17078. bp to use when parsing a top level Expression
17079. Matches both +0 and -0 on purpose.
17080. bp is assumed to be even
17081. The code for writing reg_temps + 0 to the left hand side has already * been emitted.
17082. * Statement value handling. * * Global code and eval code has an implicit return value * which comes from the last statement with a value * (technically a non- "empty" continuation, which is * different from an empty statement). * * Since we don't know whether a later statement will * override the value of the current statement, we need * to coerce the statement value to a register allocated * for implicit return values. In other cases we need * to coerce the statement value to a plain value to get * any side effects out (consider e.g. "foo.bar;").
17083. transfer flags
17084. XXX: valstack handling is awkward. Add a valstack helper which * avoids dup():ing; valstack_copy(src, dst)?

17085. eat 'var'
17086. DUK_TOK_INTERFACE
17087. DUK_TOK_DIV
17088. * Any catch bindings ("catch (e)") also affect identifier binding. * * Currently, the varmap is modified for the duration of the catch * clause to ensure any identifier accesses with the catch variable * name will use slow path.
17089. iteration statements allow continue
17090. reg/const for switch value
17091. unary plus
17092. may be undefined
17093. reg/const for case value
17094. * Function formal arguments, always bound to registers * (there's no support for shuffling them now).
17095. **comment:** NEXTENUM needs a jump slot right after the main opcode. * We need the code emitter to reserve the slot: if there's * target shuffling, the target shuffle opcodes must happen * after the jump slot (for NEXTENUM the shuffle opcodes are * not needed if the enum is finished).

17195. * PLAIN: x1 * ARITH: x1 <op> x2 * PROP: x1.x2 * VAR: x1 (name)

17196. function may call direct eval

17197. catch depth at point of definition

17198. binary arithmetic using extraops; DUK_EXTRAOP_INSTOF etc

17199. **comment:** XXX: optimize to 16 bytes**label:** code-design

17200. binary arithmetic; DUK_OP_ADD, DUK_OP_EQ, other binary ops

17201. function refers to 'arguments' identifier

17202. **comment:** first register that is a temporary (below: variables)**label:** code-design

17203. catch stack depth

17204. maximum loopcount for peephole optimization

17205. value resides in 'valstack_idx'

17206. value resides in a register or constant

17207. Fast jumps (which avoid longjmp) jump directly to the jump sites * which are always known even while the iteration/switch statement * is still being parsed. A final peephole pass "straightens out" * the jumps.

17208. label id allocation (running counter)

17209. 1 GB

17210. current function being compiled (embedded instead of pointer for more compact access)

17211. stats for current expression being parsed

17212. * Prototypes

17213. DUK_IVAL_XXX

17214. **comment:** function makes one or more slow path accesses**label:** code-design

17215. is an actual function (not global/eval code)

17216. array of function templates: [func1, offset1, line1, func2, offset2, line2] * offset/line points to closing brace to allow skipping on pass 2

17217. is a setter/getter

17218. ecmascript compiler limits

17219. curr_token slot2 (matches 'lex' slot2_idx)

17220. borrowed reference

17221. type to represent a straight register reference, with <0 indicating none

17222. **comment:** bit mask which indicates that a regconst is a constant instead of a register**label:** code-design

17223. pc of label statement: * pc+1: break jump site * pc+2: continue jump site

17224. next temporary register to allocate

17225. parsing in "scanning" phase (first pass)

17226. shuffle registers if large number of regs/consts
17227. array
17228. array of formal argument names (-> _Formals)
17229. * Bytecode instruction representation during compilation ** Contains the actual instruction and (optionally) debug info.
17230. prev_token slot2
17231. DUK_JS_COMPILER_H_INCLUDED
17232. status booleans
17233. register for writing value of 'non-empty' statements (global or eval code), -1 is marker
17234. current paren level allows 'in' token
17235. numeric label_id (-1 reserved as marker)
17236. prev_token slot1
17237. reject RegExp literal on next advance() call; needed for handling IdentifierName productions
17238. statement id allocation (running counter)
17239. recursion limit
17240. parenthesis count, 0 = top level
17241. number of formal arguments
17242. register, constant, or value
17243. temp reg handling
17244. h_code: held in bw_code
17245. * Fast paths
17246. **comment:** 'd3' is never NaN, so no need to normalize
label: code-design
17247. * Executor interrupt handling ** The handler is called whenever the interrupt countdown reaches zero * (or below). The handler must perform whatever checks are activated, * e.g. check for cumulative step count to impose an execution step * limit or check for breakpoints or other debugger interaction. ** When the actions are done, the handler must reinits the interrupt * init and counter values. The 'init' value must indicate how many * bytecode instructions are executed before the next interrupt. The * counter must interface with the bytecode executor loop. Concretely, * the new init value is normally one higher than the new counter value. * For instance, to execute exactly one bytecode instruction the init * value is set to 1 and the counter to 0. If an error is thrown by the * interrupt handler, the counters are set to the same value (e.g. both * to 0 to cause an interrupt when the next bytecode instruction is about * to be executed after error handling). ** Maintaining the init/counter value properly is important for accurate * behavior. For instance, executor step limit needs a cumulative step * count which is simply computed as a sum of 'init' values. This must * work accurately even when single stepping.
17248. return value from Duktape.Thread.resume()
17249. Set catcher regs: idx_base+0 = value, idx_base+1 = lj_type.
17250. Result is always fastint compatible.
17251. Handle a BREAK/CONTINUE opcode. Avoid using longjmp() for BREAK/CONTINUE * handling because it has a measurable performance impact in ordinary * environments and an extreme impact in Emscripten (GH-342).
17252. -> [... val this]
17253. Preinc/predec for object properties.
17254. Assume that thr->valstack_bottom has been set-up before getting here.
17255. Sync and NULL early.
17256. * E5 Section 11.4.9
17257. **comment:** Hot variables for interpretation. Critical for performance, * but must add sparingly to minimize register shuffling.
label: code-design
17258. an Ecmascript function
17259. **comment:** XXX: improve check; check against nregs, not against top
label: code-design
17260. -> [... regexp_instance]
17261. Keep throwing an error whenever we get here. The unusual values * are set this way because no instruction is ever executed, we just * throw an error until all try/catch/finally and other catchpoints * have been exhausted. Duktape/C code gets control at each protected * call but whenever it enters back into Duktape the RangeError gets * raised. User exec timeout check must consistently indicate a timeout * until we've fully bubbled out of Duktape.
17262. x >= y --> not (x < y)
17263. A -> flags * B -> base register for call (base -> func, base+1 -> this, base+2 -> arg1 ... base+2+N-1 -> argN) * (for DUK_OP_CALLI, 'b' is indirect) * C -> nargs
17264. Unary plus is used to force a fastint check, so must include * downgrade check.
17265. Duktape.Thread.yield() should prevent
17266. **comment:** should never happen, but be robust
label: code-design
17267. [... enum] -> [...]
17268. A -> register of target object * B -> first register of key/value pair list * C -> number of key/value pairs
17269. **comment:** Note: 'act' is dangerous here because it may get invalidated at many * points, so we re-lookup it multiple times.
label: code-design
17270. XXX: E5.1 Section 11.1.4 coerces the final length through * ToUint32() which is odd but happens now as a side effect of * 'arr_idx' type.
17271. side effects -> don't use tv_x, tv_y after
17272. flags
17273. Relookup and initialize dispatch loop variables. Debugger check.
17274. never here
17275. add_auto_proto
17276. don't re-enter e.g. during Eval
17277. -> [... obj key value]
17278. duk_new() will call the constructor using duk_handle_call(). * A constructor call prevents a yield from inside the constructor, * even if the constructor is an Ecmascript function.
17279. may be < thr->catchstack initially
17280. Longjmp handling has restored jmpbuf_ptr.
17281. valstack top, should match before interpreting each op (no leftovers)
17282. Entry level info.
17283. Input values are signed 48-bit so we can detect overflow * reliably from high bits or just a comparison.
17284. XXX: assert 'c' is an enumerator
17285. -> [val]
17286. **comment:** XXX: could unwind catchstack here, so that call handling * didn't need to do that?
label: code-design
17287. **comment:** XXX: refactor out?
label: code-design
17288. [... env]
17289. B -> register for writing enumerator object * C -> value to be enumerated (register)
17290. cleared before entering catch part
17291. -> [... obj]
17292. no need to unwind catchstack
17293. **comment:** * Arithmetic operations other than '+' have number-only semantics * and are implemented here. The separate switch-case here means a * "double dispatch" of the arithmetic opcode, but saves code space. * * E5 Sections 11.5, 11.5.1, 11.5.2, 11.5.3, 11.6, 11.6.1, 11.6.2, 11.6.3.
label: code-design

17294. When debugger is enabled, we need to recheck the activation * status after returning. This is now handled by call handling * and heap->dbg_force_restart.
17295. thr->heap->lj.value1 is already the value to throw
17296. if boolean matches A, skip next inst
17297. Preinc/preddec for var-by-name, slow path.
17298. A -> target register * B -> bytecode (also contains flags) * C -> escaped source
17299. Sync so that augmentation sees up-to-date activations, NULL * thr->ptr_curr_pc so that it's not used if side effects occur * in augmentation or longjmp handling.
17300. bytecode has a stable pointer
17301. cleared before entering finally
17302. **comment:** Executor interrupt counter check, used to implement breakpoints, * debugging interface, execution timeouts, etc. The counter is heap * specific but is maintained in the current thread to make the check * as fast as possible. The counter is copied back to the heap struct * whenever a thread switch occurs by the DUK_HEAP_SWITCH_THREAD() macro.
label: code-design
17303. Signed shift, named "arithmetic" (asl) because the result * is signed, e.g. 4294967295 << 1 -> -2. Note that result * must be masked.
17304. Overflow of the execution counter is fine and doesn't break * anything here.
17305. Restart bytecode execution, possibly with a changed thread.
17306. Don't allow a zero divisor. Fast path check by * "verifying" with multiplication. Also avoid zero * dividend to avoid negative zero issues (0 / -1 = -0 * for instance).
17307. no need for refcount update
17308. reg count
17309. **comment:** ToBoolean() does not require any operations with side effects so * we can do it efficiently. For footprint it would be better to use * duk_js_toboolen() and then push+replace to the result slot.
label: code-design
17310. * Slow path: potentially requires function calls for coercion
17311. -> [Object defineProperty undefined obj key desc]
17312. DUK_USE_FASTINT
17313. ToNumber() for a fastint is a no-op.
17314. B -> object register * C -> C+0 contains key, C+1 closure (value)
17315. x < y
17316. call_flags
17317. **comment:** XXX: unnecessary copying of values? Just set 'top' to * b + c, and let the return handling fix up the stack frame?
label: code-design
17318. Force interrupt right away if we're paused or in "checked mode". * Step out is handled by callstack unwind.
17319. * Local declarations.
17320. * INITSET/INITGET are only used to initialize object literal keys. * The compiler ensures that there cannot be a previous data property * of the same name. It also ensures that setter and getter can only * be initialized once (or not at all).
17321. If we processed any debug messages breakpoints may have * changed; restart execution to re-check active breakpoints.
17322. Handle a RETURN opcode. Avoid using longjmp() for return handling because * it has a measurable performance impact in ordinary environments and an extreme * impact in Emscripten (GH-342). Return value is on value stack top.
17323. Ecma-to-ecma call possible, may or may not be a tail call. * Avoid C recursion by being clever.
17324. Note: MUST NOT wipe_and_return here, as heap->lj must remain intact
17325. x > y --> y < x
17326. **comment:** XXX: this is now a very unoptimal implementation -- this can be * made very simple by direct manipulation of the object internals, * given the guarantees above.
label: code-design
17327. curr_pc synced by duk_handle_ecma_call_setup()
17328. resumee: [... initial_func] (currently actually: [initial_func])
17329. **comment:** XXX: use duk_is_valid_index() instead?
label: code-design
17330. -> [... obj value]
17331. always normalized
17332. DUK_USE_INTERRUPT_COUNTER
17333. **comment:** writable, not configurable
label: code-design
17334. written by a previous RESUME handling
17335. **comment:** LDINTX is not necessarily in FASTINT range, so * no fast path for now. * * XXX: perhaps restrict LDINTX to fastint range, wider * range very rarely needed.
label: code-design
17336. duk_js_call.c is required to restore the stack reserve * so we only need to reset the top.
17337. **comment:** this is not strictly necessary, but helps debugging
label: code-design
17338. this should never be possible, because the switch-case is * comprehensive
17339. Pre/post inc/dec for register variables, important for loops.
17340. * Avoid nested calls. Concretely this happens during debugging, e.g. * when we eval() an expression. * * Also don't interrupt if we're currently doing debug processing * (which can be initiated outside the bytecode executor) as this * may cause the debugger to be called recursively. Check required * for correct operation of throw intercept and other "exotic" halting * scenarios.
17341. w/o refcounts
17342. fast path
17343. **comment:** XXX: this could be a DUK__CONSTP instead
label: code-design
17344. stable; precalculated for faster lookups
17345. **comment:** 'val' is never NaN, so no need to normalize
label: code-design
17346. may be reg or const
17347. +2 = catcher value, catcher lj_type
17348. **comment:** XXX: because we're dealing with 'own' properties of a fresh array, * the array initializer should just ensure that the array has a large * enough array part and write the values directly into array part, * and finally set 'length' manually in the end (as already happens now).
label: code-design
17349. * Longjmp and other control flow transfer for the bytecode executor. * * The longjmp handler can handle all longjmp types: error, yield, and * resume (pseudotypes are never actually thrown). * * Error policy for longjmp: should not ordinarily throw errors; if errors * occur (e.g. due to out-of-memory) they bubble outwards rather than being * handled recursively.
17350. **comment:** Reg/const access macros: these are very footprint and performance sensitive * so modify with care.
label: code-design
17351. [... obj] -> [...]
17352. If out of catchstack, cat = thr->catchstack - 1; * new_cat_top will be 0 in that case.
17353. duk_xdef_prop() will define an own property without any array * special behaviors. We'll need to set the array length explicitly * in the end. For arrays with elisions, the compiler will emit an * explicit SETALEN which will update the length.
17354. **comment:** Switch to caller's setjmp() catcher so that if an error occurs * during error handling, it is always propagated outwards instead * of causing an infinite loop in our own handler.

label: code-design

17355. **comment:** XXX: remove heap->dbg_exec_counter, use heap->inst_count_interrupt instead?

label: code-design

17356. functions always have a NEWENV flag, i.e. they get a * new variable declaration environment, so only lex_env * matters here.

17357. should not happen

17358. A -> flags * BC -> regCatch; base register for two registers used both during * trycatch setup and when catch is triggered * * If DUK_BC_TRYCATCH_FLAG_CATCH_BINDING set: * regCatch + 0: catch binding variable name (string). * Automatic declarative environment is established for * the duration of the 'catch' clause. ** If DUK_BC_TRYCATCH_FLAG_WITH_BINDING set: * regCatch + 0: with 'target value', which is coerced to * an object and then used as a bindind object for an * environment record. The binding is initialized here, for * the 'try' clause. ** Note that a TRYCATCH generated for a 'with' statement has no * catch or finally parts.

17359. [... constructor arg1 ... argN] -> [retval]

17360. Check for breakpoints only on line transition. * Breakpoint is triggered when we enter the target * line from a different line, and the previous line * was within the same function. * * This condition is tricky: the condition used to be * that transition to -or across- the breakpoint line * triggered the breakpoint. This seems intuitively * better because it handles breakpoints on lines with * no emitted opcodes; but this leads to the issue * described in: <https://github.com/svaarala/duktape/issues/263>.

17361. B -> target register * C -> constant index of identifier name

17362. * Execution timeout check

17363. side effects

17364. E5 Section 11.7.2, steps 7 and 8

17365. updates thread state, minimizes its allocations

17366. **comment:** It might seem that replacing 'thr->heap' with just 'heap' below * might be a good idea, but it increases code size slightly * (probably due to unnecessary spilling) at least on x64.

label: code-design

17367. use_prev_pc

17368. Must restart in all cases because we NULled thr->ptr_curr_pc.

17369. checked by Duktape.Thread.resume()

17370. unsigned

17371. duk.bi_duk_object_yield() and duk.bi_duk_object_resume() ensure all of these are met

17372. E5 Section 11.2.3, step 6.a.i

17373. A -> target register (A, A+1) for call setup * (for DUK_OP_CSREGI, 'a' is indirect) * B -> register containing target function (not type checked here)

17374. Must ensure result is 64-bit (no overflow); a * simple and sufficient fast path is to allow only * 32-bit inputs. Avoid zero inputs to avoid * negative zero issues (-1 * 0 = -0, for instance).

17375. lj.value1 is already set

17376. Dispatch loop.

17377. fall through if overflow etc

17378. this may have side effects, so re-lookup act

17379. Assume interrupt init/counter are properly initialized here.

17380. Continue checked execution if there are breakpoints or we're stepping. * Also use checked execution if paused flag is active - it shouldn't be * because the debug message loop shouldn't terminate if it was. Step out * is handled by callstack unwind and doesn't need checked execution. * Note that debugger may have detached due to error or explicit request * above, so we must recheck attach status.

17381. Set a high interrupt counter; the original executor * interrupt invocation will rewrite before exiting.

17382. The compiler should never emit DUK_OP_REGEXP if there is no * regexp support.

17383. **comment:** XXX: TRYCATCH handling should be reworked to avoid creating * an explicit scope unless it is actually needed (e.g. function * instances or eval is executed inside the catch block). This * rework is not trivial because the compiler doesn't have an * intermediate representation. When the rework is done, the * opcode format can also be made more straightforward.

label: code-design

17384. As a first approximation, buffer values are coerced to strings * for addition. This means that adding two buffers currently * results in a string.

17385. must be ecmascript

17386. **comment:** XXX: does not work if thr->catchstack is NULL

label: code-design

17387. The smallest fastint is no longer 48-bit when * negated. Positive zero becomes negative zero * (cannot be represented) when negated.

17388. allocate catcher and populate it (should be atomic)

17389. E5 Section 11.7.1, steps 7 and 8

17390. No need to check for size of bp_active list, * it's always larger than maximum number of * breakpoints.

17391. YIELDED: Ecmascript activation + Duktape.Thread.yield() activation

17392. * Handling DUK_OP_ADD this way is more compact (experimentally) * than a separate case with separate argument decoding.

17393. INACTIVE: no activation, single function value on valstack

17394. **comment:** * Restart execution by reloading thread state. ** Note that 'thr' and any thread configuration may have changed, * so all local variables are suspect and we need to reinitialize. ** The number of local variables should be kept to a minimum: if * the variables are spilled, they will need to be loaded from * memory anyway. ** Any 'goto restart_execution;' code path in opcode dispatch must * ensure 'curr_pc' is synced back to act->curr_pc before the goto * takes place. ** The interpreter must be very careful with memory pointers, as * many pointers are not guaranteed to be 'stable' and may be * reallocated and relocated on-the-fly quite easily (e.g. by a * memory allocation or a property access). ** The following are assumed to have stable pointers: * - the current thread * - the current function * - the bytecode, constant table, inner function table of the * current function (as they are a part of the function allocation) ** The following are assumed to have semi-stable pointers: * - the current activation entry: stable as long as callstack * is not changed (reallocated by growing or shrinking), or * by any garbage collection invocation (through finalizers) * - Note in particular that ANY DECREF can invalidate the * activation pointer, so for the most part a fresh lookup * is required * * The following are not assumed to have stable pointers at all: * - the value stack (registers) of the current thread * - the catch stack of the current thread * * See execution.rst for discussion.

label: code-design

17395. * Ecmascript bytecode executor. ** Resume execution for the current thread from its current activation. * Returns when execution would return from the entry level activation, * leaving a single return value on top of the stack. Function calls * and thread resumptions are handled internally. If an error occurs, * a longjmp() with type DUK_LJ_TYPE_THROW is called on the entry level * setjmp() jmpbuf. ** Ecmascript function calls and coroutine resumptions are handled * internally (by the outer executor function) without recursive C calls. * Other function calls are handled using duk_handle_call(), increasing * C recursion depth. * * Abrupt completions (= long control transfers) are handled either * directly by reconfiguring relevant stacks and restarting execution, * or via a longjmp. Longjmp-free handling is preferable for performance * (especially Emscripten performance), and is used for: break, continue, * and return. ** For more detailed notes, see doc/execution.rst. ** Also see doc/code-issues.rst for discussion of setjmp(), longjmp(), * and volatile.

17396. Compiler is responsible for selecting property flags (configurability, * writability, etc).

17397. enum_flags

17398. E5 Sections 11.9.1, 11.9.3

17399. * Note: we currently assume that the setjmp() catchpoint is * not re-entrant (longjmp() cannot be called more than once * for a single setjmp()). ** See doc/code-issues.rst for notes on variable assignment * before and after setjmp().

17400. **comment:** * (Re)try handling the longjmp. ** A longjmp handler may convert the longjmp to a different type and * "virtually" rethrow by goto'ing to 'check_longjmp'. Before the goto, * the following must be updated: * - the heap 'lj' state * - 'thr' must reflect the "throwing" thread

label: code-design

17401. Force pause if we were doing "step into" in another activation.

17402. Note: target registers a and a+1 may overlap with DUK_REGP(b) * and DUK_REGCONSTP(c). Careful here.

17403. already set

17404. [... val] -> [... enum]

17405. these are not necessarily 0 or 1 (may be other non-zero), that's ok

17406. +1 = finally
17407. Negative value checked so that a "time jump" works * reasonably. * * Same interval is now used for status sending and * peeking.
17408. Note: 'this' may be bound to any value, not just an object
17409. * Currently only allowed only if yielding thread has only * Ecmascript activations (except for the Duktape.Thread.yield() * call at the callstack top) and none of them constructor * calls. * * This excludes the 'entry' thread which will always have * a preventcount > 0.
17410. + spare
17411. * Process messages and send status if necessary. * * If we're paused, we'll block for new messages. If we're not * paused, we'll process anything we can peek but won't block * for more. Detach (and re-attach) handling is all localized * to duk_debug_process_messages() too. * * Debugger writes outside the message loop may cause debugger * detach1 phase to run, after which dbg_read_cb == NULL and * dbg_detaching != 0. The message loop will finish the detach * by running detach2 phase, so enter the message loop also when * detaching.
17412. must "goto restart_execution", e.g. breakpoints changed
17413. Share yield longjmp handler.
17414. **comment:** * Three possible outcomes: * * A try or finally catcher is found => resume there. * (or) * * The error propagates to the bytecode executor entry * level (and we're in the entry thread) => rethrow * with a new longjmp(), after restoring the previous * catchpoint. * * The error is not caught in the current thread, so * the thread finishes with an error. This works like * a yielded error, except that the thread is finished * and can no longer be resumed. (There is always a * resumer in this case.) * * Note: until we hit the entry level, there can only be * Ecmascript activations.
label: code-design
17415. no need to unwind callstack
17416. unwind to 'yield' caller
17417. 'this binding' is just under bottom
17418. stable
17419. Enter message processing loop for sending Status notifs and * to finish a pending detach.
17420. Duktape.Thread.resume()
17421. +0 = break, +1 = continue
17422. Outer executor with setjmp/longjmp handling.
17423. if debugging disabled
17424. E5 Section 10.4.3
17425. does not modify tv_x
17426. [... func this arg1 ... argN]
17427. Cause an interrupt after executing one instruction.
17428. side effects, perform in-place
17429. 'act' is no longer accessed, scanbuild fix
17430. Ecmascript activation + Duktape.Thread.yield() activation
17431. **comment:** Presence of 'fun' is config based, there's a marginal performance * difference and the best option is architecture dependent.
label: code-design
17432. reg
17433. no compact
17434. restricted to regs
17435. exit bytecode executor by rethrowing an error to caller
17436. **comment:** XXX: side effect handling is quite awkward here
label: code-design
17437. Note: thr->catchstack_top may be 0, so that cat < thr->catchstack * initially. This is OK and intended.
17438. Call setup checks callability.
17439. exit bytecode execution with return value
17440. A -> target reg * B -> object reg/const (may be const e.g. in "'foo'[1]") * C -> key reg/const
17441. There is no eval() special handling here: eval() is never * automatically converted to a lightfunc.
17442. Write curr_pc back for the debugger.
17443. Called for handling both a longjmp() with type DUK_LJ_TYPE_YIELD and * when a RETURN opcode terminates a thread and yields to the resumer.
17444. * Other cases, use C recursion. * * If a tail call was requested we ignore it and execute a normal call. * Since Duktape 0.11.0 the compiler emits a RETURN opcode even after * a tail call to avoid test-bug-tailcall-thread-yield-resume.js. * * Direct eval call: (1) call target (before following bound function * chain) is the built-in eval() function, and (2) call was made with * the identifier 'eval'.
17445. **comment:** Current PC, accessed by other functions through thr->ptr_to_curr_pc. * Critical for performance. It would be safest to make this volatile, * but that eliminates performance benefits; aliasing guarantees * should be enough though.
label: code-design
17446. no refcount changes
17447. 'null' enumerator case -> behave as with an empty enumerator
17448. **comment:** Compared to duk_handle_call(): * - protected call: never * - ignore recursion limit: never
label: code-design
17449. A -> unused (reserved for flags, for consistency with DUK_OP_CALL) * B -> target register and start reg: constructor, arg1, ..., argN * (for DUK_OP_NEWI, 'b' is indirect) * C -> num args (N)
17450. **comment:** XXX: putvar takes a duk_tval pointer, which is awkward and * should be reworked.
label: code-design
17451. bottom of current func
17452. duk__handle_return() is guaranteed never to throw, except * for potential out-of-memory situations which will then * propagate out of the executor longjmp handler.
17453. **comment:** XXX: could use at least one fewer loop counters
label: code-design
17454. A -> flags * B -> return value reg/const * C -> currently unused
17455. Note: left shift, should mask
17456. Ecmascript function
17457. curr_pc synced back above
17458. relookup (side effects)
17459. GH-303
17460. return value from Duktape.Thread.yield()
17461. * Ecmascript modulus (%) does not match IEEE 754 "remainder" * operation (implemented by remainder() in C99) but does seem * to match ANSI C fmod(). * * Compare E5 Section 11.5.3 and "man fmod".
17462. The counter value is one less than the init value: init value should * indicate how many instructions are executed before interrupt. To * execute 1 instruction (after interrupt handler return), counter must * be 0.
17463. unsigned shift
17464. Note: errors are augmented when they are created, not * when they are thrown. So, don't augment here, it would * break re-throwing for instance.
17465. We request a tail call, but in some corner cases * call handling can decide that a tail call is * actually not possible. * See: test-bug-tailcall-preventyield-assert.c.
17466. **comment:** Not necessary to unwind catchstack: return handling will * do it. The finally flag of 'cat' is no longer set. The * catch flag may be set, but it's not checked by return handling.
label: code-design
17467. **comment:** Inner executor, performance critical.
label: code-design
17468. **comment:** This could also be thrown internally (set the error, goto check_longjmp), * but it's better for internal errors to bubble outwards so that we won't * infinite loop in this catchpoint.

label: code-design

17469. * Assuming a register binds to a variable declared within this * function (a declarative binding), the 'this' for the call * setup is always 'undefined'. E5 Section 10.2.1.1.6.

17470. CATCH flag may be enabled or disabled here; it may be enabled if * the statement has a catch block but the try block does not throw * an error.

17471. * If entering a 'catch' block which requires an automatic * catch variable binding, create the lexical environment. * * The binding is mutable (= writable) but not deletable. * Step 4 for the catch production in E5 Section 12.14; * no value is given for CreateMutableBinding 'D' argument, * which implies the binding is not deletable.

17472. XXX: Set 32-bit result (but must then handle signed and * unsigned results separately).

17473. x

17474. lj.value1 already set

17475. A -> object reg * B -> key reg/const * C -> value reg/const * * Note: intentional difference to register arrangement * of e.g. GETPROP; 'A' must contain a register-only value.

17476. at least one activation, ours

17477. XXX: assert idx_base

17478. not caught by anything before entry level; rethrow and let the * final catcher unwind everything

17479. Quite heavy assert: check valstack policy. Improper * shuffle instructions can write beyond valstack_top/end * so this check catches them in the act.

17480. Note: currently the catch binding is handled without a register * binding because we don't support dynamic register bindings (they * must be fixed for an entire function). So, there is no need to * record regbases etc.

17481. * Breakpoint and step state checks

17482. [... env target target]

17483. Don't allow a zero divisor. Restrict both v1 and * v2 to positive values to avoid compiler specific * behavior.

17484. overflow, fall through

17485. restored if ecma-to-ecma setup fails

17486. type

17487. reset longjmp

17488. **comment:** pseudotypes, not used in actual longjumps

label: code-design

17489. borrowed reference; although 'tv1' comes from a register, * its value was loaded using LDCONST so the constant will * also exist and be reachable.

17490. A -> target reg * BC -> inner function index

17491. resumee

17492. **comment:** This macro works when a regconst field is 9 bits, [0,0x1ff]. Adding * DUK_LIKELY/DUK_UNLIKELY increases code footprint and doesn't seem to * improve performance on x64 (and actually harms performance in some tests).

label: code-design

17493. Fast path for the case where the register * is a number (e.g. loop counter).

17494. * Ecmascript bytecode executor.

17495. **comment:** * Four possible outcomes: * * 1. A 'finally' in the same function catches the 'return'. * It may continue to propagate when 'finally' is finished, * or it may be neutralized by 'finally' (both handled by * ENDFIN). * * 2. The return happens at the entry level of the bytecode * executor, so return from the executor (in C stack). * * 3. There is a calling (Ecmascript) activation in the call * stack => return to it, in the same executor instance. * * 4. There is no calling activation, and the thread is * terminated. There is always a resumer in this case, * which gets the return value similarly to a 'yield' * (except that the current thread can no longer be * resumed).

label: code-design

17496. **comment:** XXX: signalling the need to shrink check (only if unwound)

label: code-design

17497. **comment:** 'this' binding is not needed here

label: requirement

17498. DUK_USE_EXEC_TIMEOUT_CHECK

17499. Two lowest bits of opcode are used to distinguish * variants. Bit 0 = inc(0)/dec(1), bit 1 = pre(0)/post(1).

17500. entry level reached

17501. get_value

17502. Note: target registers a and a+1 may overlap with DUK__REGP(b). * Careful here.

17503. **comment:** * Enumeration semantics come from for-in statement, E5 Section 12.6.4. * If called with 'null' or 'undefined', this opcode returns 'null' as * the enumerator, which is special cased in NEXTENUM. This simplifies * the compiler part

label: code-design

17504. signed shift

17505. already declared, must update binding value

17506. **comment:** * To determine whether to use an optimized Ecmascript-to-Ecmascript * call, we need to know whether the final, non-bound function is an * Ecmascript function. * * This is now implemented so that we start to do an ecma-to-ecma call * setup which will resolve the bound chain as the first thing. If the * final function is not eligible, the return value indicates that the * ecma-to-ecma call is not possible. The setup will overwrite the call * target at DUK__REGP(idx) with the final, non-bound function (which * may be a lightfunc), and fudge arguments if necessary. * * XXX: If an ecma-to-ecma call is not possible, this initial call * setup will do bound function chain resolution but won't do the * "effective this binding" resolution which is quite confusing. * Perhaps add a helper for doing bound function and effective this * binding resolution - and call that explicitly? Ecma-to-ecma call * setup and normal function handling can then assume this prestep has * been done by the caller.

label: code-design

17507. ensures callstack_top - 1 >= 0

17508. Don't need to sync curr_pc here; duk_new() will do that * when it augments the created error.

17509. No need to reinit setjmp() catchpoint, as call handling * will store and restore our state.

17510. variable value (function, we hope, not checked here)

17511. x <= y --> not (x > y) --> not (y < x)

17512. mandatory if du.d is a NaN

17513. Typing: use duk_small_(u)int_fast_t when decoding small * opcode fields (op, A, B, C) and duk_(u)int_fast_t when * decoding larger fields (e.g. BC which is 18 bits). Use * unsigned variant by default, signed when the value is used * in signed arithmetic. Using variable names such as 'a', 'b', * 'c', 'bc', etc makes it easier to spot typing mismatches.

17514. **comment:** not needed

label: requirement

17515. **comment:** 'fun' is quite rarely used, so no local for it

label: code-design

17516. Return to the bytecode executor caller which will unwind stacks. * Return value is already on the stack top: [... retval].

17517. idx_retval unsigned

17518. DUK_USE_DEBUGGER_SUPPORT

17519. 'thr' is the current thread, as no-one resumes except us and we * switch 'thr' in that case.

17520. There is a caller; it MUST be an Ecmascript caller (otherwise it would * match entry level check)

17521. 'with' target must be created first, in case we run out of memory

17522. Avoid recursive re-entry; enter when we're attached or * detaching (to finish off the pending detach).

17523. 'this' value: * E5 Section 6.b.i * * The only (standard) case where the 'this' binding is non-null is when * (1) the variable is found in an object environment record, and * (2) that object environment record is a 'with' block. *

17524. not needed, as we exit right away

17525. **comment:** * Binary bitwise operations use different coercions (ToInt32, Uint32) * depending on the operation. We coerce the arguments first using * ToInt32(), and then cast to an 32-bit value if necessary. Note that * such casts must be correct even if there is no native 32-bit type * (e.g., duk_int32_t and duk_uint32_t are

64-bit). ** E5 Sections 11.10, 11.7.1, 11.7.2, 11.7.3

label: code-design

17526. Reconfigure value stack for return to an Ecmascript function at 'act_idx'.

17527. relookup, may have changed

17528. **comment:** unused for label

label: code-design

17529. **comment:** * Arithmetic, binary, and logical helpers. ** Note: there is no opcode for logical AND or logical OR; this is on * purpose, because the evalution order semantics for them make such * opcodes pretty pointless: short circuiting means they are most * comfortably implemented as jumps. However, a logical NOT opcode * is useful. ** Note: careful with duk_tval pointers here: they are potentially * invalidated by any DECREF and almost any API call. It's still * preferable to work without making a copy but that's not always * possible.

label: code-design

17530. **comment:** 'funcs' is quite rarely used, so no local for it

label: code-design

17531. relookup if changed

17532. Shouldn't happen but check anyway.

17533. **comment:** XXX: the best typing needs to be validated by perf measurement: * e.g. using a small type which is the cast to a larger duk_idx_t * may be slower than declaring the variable as a duk_idx_t in the * first place.

label: code-design

17534. -> [... escaped_source bytecode]

17616. guarantees entry_callstack_top - 1 >= 0

17617. may be changed

17618. Rethrow error to calling state.

17619. * Update the interrupt counter

17620. Stepped? Step out is handled by callstack unwind.

17621. **comment:** XXX: does not work if thr->catchstack is allocated but lowest pointer
label: code-design

17622. relookup after side effects (no side effects currently however)

17623. resume: [... initial_func undefined(= this) resume_value]

17624. must relookup act in case of side effects

17625. fastint downgrade check for return values

17626. XXX: optimize reconfig valstack operations so that resize, clamp, and setting * top are combined into one pass.

17627. **comment:** Figure out all active breakpoints. A breakpoint is * considered active if the current function's fileName * matches the breakpoint's fileName, AND there is no * inner function that has matching line numbers * (otherwise breakpoint would be triggered both * inside and outside of the inner function which would * be confusing). Example: * * function foo() { print('foo'); * function bar() { <. breakpoints in these * print('bar'); | lines should not affect * } <- foo() execution * bar(); * } * * We need a few things that are only available when * debugger support is enabled: (1) a line range for * each function, and (2) access to the function * template to access the inner functions (and their * line ranges). * * It's important to have a narrow match for active * breakpoints so that we don't enter checked execution * when that's not necessary. For instance, if we're * running inside a certain function and there's * breakpoint outside in (after the call site), we * don't want to slow down execution of the function.
label: code-design

17628. pre-incremented, points to first jump slot

17629. nop

17630. * NEXTENUM checks whether the enumerator still has unenumerated * keys. If so, the next key is loaded to the target register * and the next instruction is skipped. Otherwise the next instruction * will be executed, jumping out of the enumeration loop.

17631. * Note: lj.value1 is 'value', lj.value2 is 'resume'. * This differs from YIELD.

17632. In-place unary operation.

17633. **comment:** Lookup current thread; use the stable 'entry_thread' for this to * avoid clobber warnings. Any valid, reachable 'thr' value would be * fine for this, so using 'entry_thread' is just to silence warnings.
label: code-design

17634. Thread may have changed, e.g. YIELD converted to THROW.

17635. throw

17636. unreferenced without assertions

17637. For cross-checking during development: ensure dispatch count * matches cumulative interrupt counter init value sums.

17638. valstack should not need changes

17639. [-0x80000000,0x7fffffff]

17640. Catches both doubles and cases where only one argument is a fastint

17641. x == -Infinity

17642. * Note: prototype chain is followed BEFORE first comparison. This * means that the instanceof lval is never itself compared to the * rval.prototype property. This is apparently intentional, see E5 * Section 15.3.5.3, step 4.a. * * Also note: * * js> (function() {}) instanceof Function * true * js> Function instanceof Function * true * * For the latter, h_proto will be Function.prototype, which is the * built-in Function prototype. Because Function.[[Prototype]] is * also the built-in Function prototype, the result is true.

17643. heap pointer comparison suffices

17644. E5 Section 9.3.1

17645. * Get the values onto the stack first. It would be possible to cover * some normal cases without resorting to the value stack (e.g. if * lval is already a string).
17646. truncate towards zero
17647. func support for [[HasInstance]] checked in the beginning of the loop
17648. prefix matches, lengths matter now
17649. Note: undefined from Section 11.8.5 always results in false * return (see e.g. Section 11.8.3) - hence special treatment here.
17650. normal comparison; known: * - both x and y are not NaNs (but one of them can be) * - both x and y are not zero (but one of them can be) * - x and y may be denormal or infinite
17651. mimic semantics for strings
17652. **comment:** At least 'magic' has a significant impact on function * identity.
 label: code-design
17653. implementation specific
17654. x == +Infinity
17655. * Get the values onto the stack first. It would be possible to cover * some normal cases without resorting to the value stack. * * The right hand side could be a light function (as they generally * behave like objects). Light functions never have a 'prototype' * property so E5.1 Section 15.3.5.3 step 3 always throws a TypeError. * * Using duk_require_hobject() is thus correct (except for error msg).
17656. overflow, more than 32 bits -> not an array index
17657. -> x in J-2**32, 2**32[
17658. String-number-buffer/object -> coerce object to primitive (apparently without hint), then try again.
17659. exposed, used by e.g. duk.bi_date.c
17660. Buffer/string -> compare contents.
17661. * ToNumber() (E5 Section 9.3) * * Value to convert must be on stack top, and is popped before exit. * * See: <http://www.cs.indiana.edu/~burger/FP-Printing-PLDI96.pdf> * <http://www.cs.indiana.edu/~burger/fp/index.html> * * Notes on the conversion: * * - There are specific requirements on the accuracy of the conversion * through a "Mathematical Value" (MV), so this conversion is not * trivial. * * - Quick rejects (e.g. based on first char) are difficult because * the grammar allows leading and trailing white space. * * - Quick reject based on string length is difficult even after * accounting for white space; there may be arbitrarily many * decimal digits. * * - Standard grammar allows decimal values ("123"), hex values * ("0x123") and infinities * * - Unlike source code literals, ToNumber() coerces empty strings * and strings with only whitespace to zero (not NaN).
17662. **comment:** Straightforward algorithm, makes fewer compiler assumptions.
 label: code-design
17663. Handle lightfuncs through object coercion for now.
17664. **comment:** unused
 label: code-design

17680. * ToInteger() (E5 Section 9.4)
17681. invalidates tv
17682. * E5 Section 11.8.6 describes the main algorithm, which uses * [[HasInstance]]. [[HasInstance]] is defined for only * function objects: * * - Normal functions: * E5 Section 15.3.5.3 * - Functions established with Function.prototype.bind(): * E5 Section 15.3.4.5.3 * * For other objects, a TypeError is thrown. * * Limited Proxy support: don't support 'getPrototypeOf' trap but * continue lookup in Proxy target if the value is a Proxy.
17683. never here
17684. Note that this is the same operation for strict and loose equality: * - E5 Section 11.9.3, step 1.c (loose) * - E5 Section 11.9.6, step 4 (strict)
17685. DUK_MEMCMP() is guaranteed to return zero (equal) for zero length * inputs so no zero length check is needed.
17686. y == +Infinity
17687. * Same type? * * Note: since number values have no explicit tag in the 8-byte * representation, need the awkward if + switch.
17688. **comment:** Note: reuse variables
 label: code-design
17689. * CheckObjectCoercible() (E5 Section 9.10) * * Note: no API equivalent now.
17690. **comment:** Coerce like a string. This makes sense because addition also treats * buffers like strings.
 label: code-design
17691. NOTE: fmod(x) result sign is same as sign of x, which * differs from what Javascript wants (see Section 9.6).
17692. equals and strict equals
17693. non-strict equality for buffers compares contents
17694. +(function(){}) -> NaN
17695. * Loose equality, strict equality, and SameValue (E5 Sections 11.9.1, 11.9.4, * 9.12). These have much in common so they can share some helpers. * * Future work notes: * * - Current implementation (and spec definition) has recursion; this should * be fixed if possible. * * - String-to-number coercion should be possible without going through the * value stack (and be more compact) if a shared helper is invoked.
17696. Called by duk_hstring.h macros
17697. non-strict equality from here on
17698. +0.0
17699. Better equivalent algorithm. If the compiler is compliant, C and * EcmaScript semantics are identical for this particular comparison. * In particular, NaNs must never compare equal and zeroes must compare * equal regardless of sign. Could also use a macro, but this inlines * already nicely (no difference on gcc, for instance).
17700. * E5 Sections 11.8.7, 8.12.6. * * Basically just a property existence check using [[HasProperty]].
17701. Boolean/any -> coerce boolean to number and try again. If boolean is * compared to a pointer, the final comparison after coercion now always * yields false (as pointer vs. number compares to false), but this is * not special cased.
17702. -> [... lval new_rval]
17703. Using classification has smaller footprint than direct comparison.
17704. coerce lval with ToString()
17705. **comment:** * typeof * * E5 Section 11.4.3. * * Very straightforward. The only question is what to return for our * non-standard tag / object types. * * There is an unfortunate string constant define naming problem with * typeof return values for e.g. "Object" and "object"; careful with * the built-in string defines. The

LC_XXX defines are used for the * lowercase variants now.

label: code-design

17706. IEEE requires that zeros compare the same regardless * of their signed, so if both x and y are zeroes, they * are caught above.

17707. * ToObject() (E5 Section 9.9) * * ==> implemented in the API.

17708. * ToBoolean() (E5 Section 9.2)

17709. follow prototype chain

17710. Difference to non-strict/strict comparison is that NaNs compare * equal and signed zero signs matter.

17711. Ordering should not matter (E5 Section 11.8.5, step 3.a) but * preserve it just in case.

17712. combined algorithm matching E5 Sections 9.5 and 9.6

17713. **comment:** XXX: this is possible without resorting to the value stack

label: code-design

17714. Similar to String comparison.

17715. Slow path

17716. **comment:** XXX: this is a very narrow check, and doesn't cover * zeroes, subnormals, infinities, which compare normally.

label: code-design

17717. **comment:** * Ecmascript specification algorithm and conversion helpers. * * These helpers encapsulate the primitive Ecmascript operation * semantics, and are used by the bytecode executor and the API * (among other places). Note that some primitives are only * implemented as part of the API and have no "internal" helper. * (This is the case when an internal helper would not really be * useful; e.g. the operation is rare, uses value stack heavily, * etc.) * * The operation arguments depend on what is required to implement * the operation: * * - If an operation is simple and stateless, and has no side * effects, it won't take an duk_hthread argument and its * arguments may be duk_tval pointers (which are safe as long * as no side effects take place). * * - If complex coercions are required (e.g. a "ToNumber" coercion) * or errors may be thrown, the operation takes an duk_hthread * argument. This also implies that the operation may have * arbitrary side effects, invalidating any duk_tval pointers. * * - For operations with potential side effects, arguments can be * taken in several ways: * * a) as duk_tval pointers, which makes sense if the "common case" * can be resolved without side effects (e.g. coercion); the * arguments are pushed to the valstack for coercion if * necessary * * b) as duk_tval values * * c) implicitly on value stack top * * d) as indices to the value stack * * Future work: * * - Argument styles may not be the most sensible in every case now. * * - In-place coercions might be useful for several operations, if * in-place coercion is OK for the bytecode executor and the API.

17789. **comment:** * "arguments" and "caller" must be mapped to throwers for strict * mode and bound functions (E5 Section 15.3.5). ** XXX: This is expensive to have for every strict function instance. * Try to implement as virtual properties or on-demand created properties.

label: code-design

17790. lookup name from an open declarative record's registers

17791. env and act may be NULL

17792. [... env callee]

17793. registers are mutable, non-deletable

17794. side effects

17795. -> [... closure template newobj]

17796. * Local result type for duk__get_identifier_reference() lookup.

17797. Identifier found in registers (always non-deletable) * or declarative environment record and non-configurable.

17798. [... env callee varmap key val]

17799. -> [... closure template]

17800. * PUTVAR ** See E5 Sections: * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * 11.13.1 Simple Assignment [example of where the Reference is PutValue'd] * 8.7.2 PutValue (V,W) [see especially step 3.b, undefined -> automatic global in non-strict mode] * 8.12.4 [[CanPut]] (P) * 8.12.5 [[Put]] (P) ** Note: may invalidate any valstack (or object) duk_tval pointers because * putting a value may reallocate any object or any valstack. Caller beware.

17801. must be found: was found earlier, and cannot be inherited

17802. * Not found: write to global object (non-strict) or ReferenceError * (strict); see E5 Section 8.7.2, step 3.

17803. [... closure]

17804. [... env]

17805. [this value] -> [value this]

17806. * Object environment record. ** Binding (target) object is an external, uncontrolled object. * Identifier may be bound in an ancestor property, and may be * an accessor. Target can also be a Proxy which we must support * here.

17807. non-standard

17808. Note: in strict mode the compiler should reject explicit * declaration of 'eval' or 'arguments'. However, internal * bytecode may declare 'arguments' in the function prologue. * We don't bother checking (or asserting) for these now.

17809. always for register bindings

17810. If function creation fails due to out-of-memory, the data buffer * pointer may be NULL in some cases. That's actually possible for * GC code, but shouldn't be possible here because the incomplete * function will be unwound from the value stack and never instantiated.

17811. can't get value, may be accessor

17812. unsigned

17813. writable but not deletable

17814. may be NULL

17815. assertions: env must be closed in the same thread as where it runs

17816. * "length" maps to number of formals (E5 Section 13.2) for function * declarations/expressions (non-bound functions). Note that 'nargs' * is NOT necessarily equal to the number of arguments.

17817. 1 -> needs a PUTVAR

17818. just check 'env'

17819. It's important that duk_xdef_prop() is a 'raw define' so that any * properties in an ancestor are never an issue (they should never be * e.g. non-writable, but just in case).

17820. * Named function expression, name needs to be bound * in an intermediate environment record. The "outer" * lexical/variable environment will thus be: * * a) { funcname: <func>, __prototype: outer_lex_env } * b) { funcname: <func>, __prototype: <globalenv> } (if outer_lex_env missing)

17821. global object doesn't have array part

17822. * Define new property * * Note: this may fail if the holder is not extensible.

17823. * HASVAR: check identifier binding from a given environment record * without traversing its parents. ** This primitive is not exposed to user code as such, but is used * internally for e.g. declaration binding instantiation. ** See E5 Sections: * 10.2.1.1 HasBinding(N) * 10.2.1.2 HasBinding(N) ** Note: strictness has no bearing on this check. Hence we don't take * a 'strict' parameter.

17824. lookup name from current activation record's functions' registers

17825. already closed

17826. -> [... closure template env]
17827. follow parent chain
17828. **comment:** XXX: this is awkward as we use an internal method which doesn't handle * extensibility etc correctly. Basically we'd want to do a [[DefineOwnProperty]] * or Object.defineProperty() here.
label: code-design
17829. **comment:** * Compact the closure, in most cases no properties will be added later. * Also, without this the closures end up having unused property slots * (e.g. in Duktape 0.9.0, 8 slots would be allocated and only 7 used). * A better future solution would be to allocate the closure directly * to correct size (and setup the properties directly without going * through the API).
label: code-design
17830. required if NAMEBINDING set
17831. [... closure template formals]
17832. env[funcname] = closure
17833. Note: we rely on the _Varmap having a bunch of nice properties, like: * - being compacted and unmodified during this process * - not containing an array part * - having correct value types
17834. * GETIDREF: a GetIdentifierReference-like helper. * * Provides a parent traversing lookup and a single level lookup * (for HasBinding). * * Instead of returning the value, returns a bunch of values allowing * the caller to read, write, or delete the binding. Value pointers * are duk_tval pointers which can be mutated directly as long as * refcounts are properly updated. Note that any operation which may * reallocate valstacks or compact objects may invalidate the returned * duk_tval (but not object) pointers, so caller must be very careful. * * If starting environment record 'env' is given, 'act' is ignored. * However, if 'env' is NULL, the caller may identify, in 'act', an * activation which hasn't had its declarative environment initialized * yet. The activation registers are then looked up, and its parent * traversed normally. * * The 'out' structure values are only valid if the function returns * success (non-zero).
17835. Update duk_tval in-place if pointer provided and the * property is writable. If the property is not writable * (immutable binding), use duk_hobject_putprop() which * will respect mutability.
17836. regnum is same
17837. DUK_HOBJECT_FLAG_ARRAY_PART: don't care
17838. XXX: additional conditions when to close variables? we don't want to do it * unless the environment may have "escaped" (referenced in a function closure). * With delayed environments, the existence is probably good enough of a check.
17839. Note: all references inside 'data' need to get their refcounts * upped too. This is the case because refcounts are decreased * through every function referencing 'data' independently.
17840. * Lookup variable and update in-place if found.
17841. -> [... closure template env funcname]
17842. [... closure template val]
17843. **comment:** order: most frequent to least frequent
label: code-design
17844. * Not found in registers, proceed to the parent record. * Here we need to determine what the parent would be, * if 'env' was not NULL (i.e. same logic as when initializing * the record). * * Note that environment initialization is only deferred when * DUK_HOBJECT_HAS_NEWENV is set, and this only happens for: * - Function code * - Strict eval code * * We only need to check _Lexenv here; _Varenv exists only if it * differs from _Lexenv (and thus _Lexenv will also be present).
17845. * Not found (even in global object). * * In non-strict mode this is a silent SUCCESS (!), see E5 Section 11.4.1, * step 3.b. In strict mode this case is a compile time SyntaxError so * we should not come here.
17846. XXX: incref by count (here 2 times)
17847. * Not found (in registers or record objects). Declare * to current variable environment.
17848. since closure has NEWENV, never define DUK_STRIDX_INT_VARENV, as it * will be ignored anyway
17849. implicit this value always undefined for * declarative environment records.
17850. * Conceptually, we look for the identifier binding by starting from * 'env' and following to chain of environment records (represented * by the prototype chain). * * If 'env' is NULL, the current activation does not yet have an * allocated declarative environment record; this should be treated * exactly as if the environment record existed but had no bindings * other than register bindings. * * Note: we assume that with the DUK_HOBJECT_FLAG_NEWENV cleared * the environment will always be initialized immediately; hence * a NULL 'env' should only happen with the flag set. This is the * case for: (1) function calls, and (2) strict, direct eval calls.
17851. * Not found (even in global object)
17852. * Create a new function object based on a "template function" which contains * compiled bytecode, constants, etc, but lacks a lexical environment. * * Ecmascript requires that each created closure is a separate object, with * its own set of editable properties. However, structured property values * (such as the formal arguments list and the variable map) are shared. * Also the bytecode, constants, and inner functions are shared. * * See E5 Section 13.2 for detailed requirements on the function objects; * there are no similar requirements for function "templates" which are an * implementation dependent internal feature. Also see function-objects.rst * for a discussion on the function instance properties provided by this * implementation. * * Notes: * * * Order of internal properties should match frequency of use, since the * properties will be linearly scanned on lookup (functions usually don't * have enough properties to warrant a hash part). * * * The created closure is independent of its template; they do share the * same 'data' buffer object, but the template object itself can be freed * even if the closure object remains reachable.
17853. **comment:** * Identifier access and function closure handling. * * Provides the primitives for slow path identifier accesses: GETVAR, * PUTVAR, DELVAR, etc. The fast path, direct register accesses, should * be used for most identifier accesses. Consequently, these slow path * primitives should be optimized for maximum compactness. * * Ecmascript environment records (declarative and object) are represented * as internal objects with control keys. Environment records have a * parent record ("outer environment reference") which is represented by * the implicit prototype for technical reasons (in other words, it is a * convenient field). The prototype chain is not followed in the ordinary * sense for variable lookups. * * See identifier-handling.rst for more details on the identifier algorithms * and the internal representation. See function-objects.rst for details on * what function templates and instances are expected to look like. * * Care must be taken to avoid duk_tval pointer invalidation caused by * e.g. value stack or object resizing. * * TODO: properties for function instances could be initialized much more * efficiently by creating a property allocation for a certain size and * filling in keys and values directly (and INCREFing both with "bulk incref" * primitives. * * XXX: duk_hobject_getprop() and duk_hobject_putprop() calls are a bit * awkward (especially because they follow the prototype chain); rework * if "raw" own property helpers are added.
label: code-design
17854. **comment:** * Variable already declared, ignore re-declaration. * The only exception is the updated behavior of E5.1 for * global function declarations, E5.1 Section 10.5, step 5.e. * This behavior does not apply to global variable declarations.

17855. assume plain values
17856. SCANBUILD: scan-build produces a NULL pointer dereference warning * below; it never actually triggers because holder is actually never * NULL.
17857. * Function gets no new environment when called. This is the * case for global code, indirect eval code, and non-strict * direct eval code. There is no direct correspondence to the * E5 specification, as global/eval code is not exposed as a * function.
17858. * Some assertions (E5 Section 13.2).
17859. SCANBUILD: NULL pointer dereference, doesn't actually trigger, * asserted above.
17860. ref.value and ref.this_binding invalidated here
17861. * DELVAR * * See E5 Sections: * 11.4.1 The delete operator * 10.2.1.1.5 DeleteBinding (N) [declarative environment record] * 10.2.1.2.5 DeleteBinding (N) [object environment record] * * Variable bindings established inside eval() are deletable (configurable), * other bindings are not, including variables declared in global level. * Registers are always non-deletable, and the deletion of other bindings * is controlled by the configurable flag. * * For strict mode code, the 'delete' operator should fail with a compile * time SyntaxError if applied to identifiers. Hence, no strict mode * run-time deletion of identifiers should ever happen. This function * should never be called from strict mode code!
17862. * Other cases (function declaration, anonymous function expression, * strict direct eval code). The "outer" environment will be whatever * the caller gave us.
17863. **comment:** * Special behavior in E5.1. * * Note that even though parents == 0, the conflicting property * may be an inherited property (currently our global object's * prototype is Object.prototype). Step 5.e first operates on * the existing property (which is potentially in an ancestor) * and then defines a new property in the global object (and * never modifies the ancestor). * * Also note that this logic would become even more complicated * if the conflicting property might be a virtual one. Object * prototype has no virtual properties, though. * * XXX: this is now very awkward, rework.

label: code-design

17864. * Setup environment record properties based on the template and * its flags. * * If DUK_HOBJECT_HAS_NEWENV(fun_temp) is true, the environment * records represent identifiers "outside" the function; the * "inner" environment records are created on demand. Otherwise, * the environment records are those that will be directly used * (e.g. for declarations). * * _Lexenv is always set; _Varenv defaults to _Lexenv if missing, * so _Varenv is only set if _Lexenv != _Varenv. * * This is relatively complex, see doc/identifier-handling.rst.

17865. **comment:** XXX: we could save space by using _Target OR _This. If _Target, assume * this binding is undefined. If _This, assumes this binding is _This, and * target is also _This. One property would then be enough.

label: code-design

17866. Push a new closure on the stack. * * Note: if fun_temp has NEWENV, i.e. a new lexical and variable declaration * is created when the function is called, only outer_lex_env matters * (outer_var_env is ignored and may or may not be same as outer_lex_env).

17867. * Declarative environment record. * * Identifiers can never be stored in ancestors and are * always plain values, so we can use an internal helper * and access the value directly with an duk_tval ptr. * * A closed environment is only indicated by it missing * the "book-keeping" properties required for accessing * register-bound variables.

17868. **comment:** * "name" is a non-standard property found in at least V8, Rhino, smjs. * For Rhino and smjs it is non-writable, non-enumerable, and non-configurable; * for V8 it is writable, non-enumerable, non-configurable. It is also defined * for an anonymous function expression in which case the value is an empty string. * We could also leave name 'undefined' for anonymous functions but that would * differ from behavior of other engines, so use an empty string. * * XXX: make optional? costs something per function.

label: code-design

17869. **comment:** XXX: use helper for size optimization

label: code-design

17870. * Delayed activation environment record initialization (for functions * with NEWENV). * * The non-delayed initialization is handled by duk_handle_call().

17871. [... closure template undefined]

17872. **comment:** XXX: could also copy from template, but there's no way to have any * other value here now (used code has no access to the template).

label: code-design

17873. Note: env_thr != thr is quite possible and normal, so careful * with what thread is used for valstack lookup.

17874. ref.value, ref.this.binding invalidated here by getprop call

17875. lookup results is ignored

17876. **comment:** XXX: duk_hobject_hasprop() would be correct for * non-Proxy objects too, but it is about ~20-25% * slower at present so separate code paths for * Proxy and non-Proxy now.

label: code-design

17877. [... env callee varmap]

17878. env is closed, should be missing _Callee, _Thread, _Regbase

17879. **comment:** * Copy some internal properties directly * * The properties will be writable and configurable, but not enumerable.

label: code-design

17880. **comment:** XXX: use a helper for prototype traversal; no loop check here

label: code-design

17881. ref.holder is global object, holder is the object with the * conflicting property.

17882. * Get holder object

17883. for object-bound identifiers

17884. DUK_HOBJECT_FLAG_NEWENV: handled below

17885. Target may be a Proxy or property may be an accessor, so we must * use an actual, Proxy-aware hasprop check here. * * out->holder is NOT set to the actual duk_hobject where the * property is found, but rather the object binding target object.

17886. **comment:** unused

label: code-design

17887. holder will be set to the target object, not the actual object * where the property was found (see duk_get_identifier_reference()).

17888. * Delayed env creation check

17889. * Delayed initialization only occurs for 'NEWENV' functions.

17890. no prototype, updated below

17891. [... closure template len_value]

17892. [this value]

17893. Here val would be potentially invalid if we didn't make * a value copy at the caller.

17894. **comment:** XXX: slightly awkward

label: code-design

17895. implicit this value always undefined for * declarative environment records.

17896. property attributes for identifier (relevant if value != NULL)

17897. 0 = no throw

17898. * Closing environment records. * * The environment record MUST be closed with the thread where its activation * is. In other words (if 'env' is open): * * - 'thr' must match _env.thread * - 'func' must match _env.callee * - 'regbase' must match _env.regbase * * These are not looked up from the env to minimize code size. * * XXX: should access the own properties directly instead of using the API

17899. * Init/assert flags, copying them where appropriate. Some flags * (like NEWENV) are processed separately below.

17900. compact the prototype

17901. assume keys are compacted

17902. * Try registers

17903. * DECLVAR * * See E5 Sections: * 10.4.3 Entering Function Code * 10.5 Declaration Binding Instantiation * 12.2 Variable Statement * 11.1.2 Identifier Reference * 10.3.1 Identifier Resolution * * Variable declaration behavior is mainly discussed in Section 10.5, * and is not discussed in the execution semantics (Sections 11-13). * * Conceptually declarations happen when code (global, eval, function) * is entered, before any user code is executed. In practice, register- * bound identifiers are 'declared' automatically (by virtue of being * allocated to registers with the initial value 'undefined'). Other * identifiers are declared in the function prologue with this primitive. * * Since non-register bindings eventually back to an internal object's * properties, the 'prop_flags' argument is used to specify binding * type: * * - Immutable binding: set DUK_PROPDESC_FLAG_WRITABLE to false * - Non-deletable binding: set DUK_PROPDESC_FLAG_CONFIGURABLE to false * - The flag DUK_PROPDESC_FLAG_ENUMERABLE should be set, although it * doesn't really matter for internal objects * * All bindings are non-deletable mutable bindings except: * * - Declarations in eval code (mutable, deletable) * - 'arguments' binding in strict function code (immutable) * - Function name binding of a function expression (immutable) * * Declarations may go to declarative environment records (always * so for functions), but may also go to object environment records * (e.g. global code). The global object environment has special * behavior when re-declaring a function (but not a variable); see * E5.1 specification, Section 10.5, step 5.e. * * Declarations always go to the 'top-most' environment record, i.e. * we never check the record chain. It's not an error even if a * property (even an immutable or non-deletable one) of the same name * already exists. * * If a declared variable already exists, its value needs to be updated * (if possible). Returns 1 if a PUTVAR needs to be done by the caller; * otherwise returns 0.

17904. for register-bound and declarative env identifiers

17905. [... closure template name]

17906. * Check whether already declared. * * We need to check whether the binding exists in the environment * without walking its parents. However, we still need to check * register-bound identifiers and the prototype chain of an object * environment target object.

17907. bound functions are never in act 'func'

17908. **comment:** XXX: copy flags using a mask

label: code-design

17909. Although NAMEBINDING is not directly needed for using * function instances, it's needed by bytecode dump/load * so copy it too.

17910. **comment:** XXX: more accurate?

label: code-design

17911. irrelevant when out->value == NULL

17912. **comment:** XXX: if duk_hobject_define_property_internal() was updated * to handle a pre-existing accessor property, this would be * a simple call (like for the ancestor case).

17945. One digit octal escape, digit validated.
17946. ('
17947. DUK_USE_REGEXP_SUPPORT
17948. escaped NonEscapeCharacter
17949. The E5.1 specification does not seem to allow IdentifierPart characters * to be used as identity escapes. Unfortunately this includes '\$', which * cannot be escaped as '\$'; it needs to be escaped e.g. as '\u0024'. * Many other implementations (including V8 and Rhino, for instance) do * accept '\$' as a valid identity escape, which is quite pragmatic. * See: test-regexp-identity-escape-dollar.js.
17950. mark range 'direct', bypass canonicalization (see Wiki)
17951. **comment:** * Lexer for source files, ToNumber() string conversions, RegExp expressions, * and JSON. ** Provides a stream of Ecmascript tokens from an UTF-8/CESU-8 buffer. The * caller can also rewind the token stream into a certain position which is * needed by the compiler part for multi-pass scanning. Tokens are * represented as duk_token structures, and contain line number information. * Token types are identified with DUK_TOK_* defines. ** Characters are decoded into a fixed size lookup window consisting of * decoded Unicode code points, with window positions past the end of the * input filled with an invalid codepoint (-1). The tokenizer can thus * perform multiple character lookups efficiently and with few sanity * checks (such as access outside the end of the input), which keeps the * tokenization code small at the cost of performance. ** Character data in tokens, such as identifier names and string literals, * is encoded into CESU-8 format on-the-fly while parsing the token in * question. The string data is made reachable to garbage collection by * placing the token-related values in value stack entries allocated for * this purpose by the caller. The characters exist in Unicode code point * form only in the fixed size lookup window, which keeps character data * expansion (of especially ASCII data) low. * * Token parsing supports the full range of Unicode characters as described * in the E5 specification. Parsing has been optimized for ASCII characters * because ordinary Ecmascript code consists almost entirely of ASCII * characters. Matching of complex Unicode codepoint sets (such as in the * IdentifierStart and IdentifierPart productions) is optimized for size, * and is done using a linear scan of a bit-packed list of ranges. This is * very slow, but should never be entered unless the source code actually * contains Unicode characters. ** Ecmascript tokenization is partially context sensitive. First, * additional future reserved words are recognized in strict mode (see E5 * Section 7.6.1.2). Second, a forward slash character ('/) can be * recognized either as starting a RegExp literal or as a division operator, * depending on context. The caller must provide necessary context flags * when requesting a new token. ** Future work: * * * Make line number tracking optional, as it consumes space. * * * Add a feature flag for disabling UTF-8 decoding of input, as most * source code is ASCII. Because of Unicode escapes written in ASCII, * this does not allow Unicode support to be removed from e.g. * duk_unicode_is_identifier_start() nor does it allow removal of CESU-8 * encoding of e.g. string literals. * * * Add a feature flag for disabling Unicode compliance of e.g. identifier * names. This allows for a build more than a kilobyte smaller, because * Unicode ranges needed by duk_unicode_is_identifier_start() and * duk_unicode_is_identifier_part() can be dropped. String literals * should still be allowed to contain escaped Unicode, so this still does * not allow removal of CESU-8 encoding of e.g. string literals. * * * Character lookup tables for codepoints above BMP could be stripped. * * * Strictly speaking, E5 specification requires that source code consists * of 16-bit code units, and if not, must be conceptually converted to * that format first. The current lexer processes Unicode code points * and allows characters outside the BMP. These should be converted to * surrogate pairs while reading the source characters into the window, * not after tokens have been formed (as is done now). However, the fix * is not trivial because two characters are decoded from one codepoint. * * * Optimize for speed as well as size. Large if-else ladders are (at * least potentially) slow.
label: code-design

17952. * Parse a RegExp token. The grammar is described in E5 Section 15.10. * Terminal constructions (such as quantifiers) are parsed directly here. ** 0xffffffffU is used as a marker for "infinity" in quantifiers. Further, * DUK_MAX_RE_QUANT_DIGITS limits the maximum number of digits that * will be accepted for a quantifier.
17953. "/=" and not in regexp mode
17954. Note: if DecimalLiteral starts with a '0', it can only be * followed by a period or an exponent indicator which starts * with 'e' or 'E'. Hence the if-check above ensures that * OctalIntegerLiteral is the only valid NumericLiteral * alternative at this point (even if y is, say, '9').
17955. '('
17956. * Intern the temporary byte buffer into a valstack slot * (in practice, slot1 or slot2).
17957. Fast path.
17958. '/'

18000. Not enough data to provide a full window, so "scroll" window to * start of buffer and fill up the rest.
18001. * Parse Ecmascript source InputElementDiv or InputElementRegExp * (E5 Section 7), skipping whitespace, comments, and line terminators. * * Possible results are: * (1) a token * (2) a line terminator (skipped) * (3) a comment (skipped) * (4) EOF * * White space is automatically skipped from the current position (but * not after the input element). If input has already ended, returns * DUK_TOK_EOF indefinitely. If a parse error occurs, uses an DUK_ERROR() * macro call (and hence a longjmp through current heap longjmp context). * Comments and line terminator tokens are automatically skipped. * * The input element being matched is determined by regexp_mode; if set, * parses a InputElementRegExp, otherwise a InputElementDiv. The * difference between these are handling of productions starting with a * forward slash. * * If strict_mode is set, recognizes additional future reserved words * specific to strict mode, and refuses to parse octal literals. * * The matching strategy below is to (currently) use a six character * lookup window to quickly determine which production is the -longest- * matching one, and then parse that. The top-level if-else clauses * match the first character, and the code blocks for each clause * handle -all- alternatives for that first character. Ecmascript * specification uses the "longest match wins" semantics, so the order * of the if-clauses matters. * * Misc notes: * * * Ecmascript numeric literals do not accept a sign character. * Consequently e.g. "-1.0" is parsed as two tokens: a negative * sign and a positive numeric literal. The compiler performs * the negation during compilation, so this has no adverse impact. * * * There is no token for "undefined": it is just a value available * from the global object (or simply established by doing a reference * to an undefined value). * * * Some contexts want Identifier tokens, which are IdentifierNames * excluding reserved words, while some contexts want IdentifierNames * directly. In the latter case e.g. "while" is interpreted as an * identifier name, not a DUK_TOK WHILE token. The solution here is * to provide both token types: DUK_TOK WHILE goes to 't' while * DUK_TOK_IDENTIFIER goes to '_nores', and 'slot1' always contains * the identifier / keyword name. * * * Directive prologue needs to identify string literals such as * "use strict" and 'use strict', which are sensitive to line * continuations and escape sequences. For instance, "use\u0020strict" * is a valid directive but is distinct from "use strict". The solution * here is to decode escapes while tokenizing, but to keep track of the * number of escapes. Directive detection can then check that the * number of escapes is zero. * * * Multi-line comments with one or more internal LineTerminator are * treated like a line terminator to comply with automatic semicolon * insertion.
18002. got lineterm preceding non-whitespace, non-lineterm token
18003. **comment:** XXX: this duplicates functionality in duk_regexp.c where a similar loop is * required anyway. We could use that BUT we need to update the regexp compiler * 'nranges' too. Work this out a bit more cleanly to save space.

18049. E5 Section 15.10.2.11
18050. Keep current size
18051. 0=base, 1=esc, 2=class, 3=class+esc
18052. **comment:** Throwing an error this deep makes the error rather vague, but * saves hundreds of bytes of code.
label: code-design
18053. XXX: potential issue with signed pointers, p_end < p.
18054. lookup shorthands (note: assume context variable is named 'lex_ctx')
18055. **comment:** Zero 'count' is also allowed to make call sites easier. * Arithmetic in bytes generates better code in GCC.
label: code-design
18056. numeric value of a hex digit (also covers octal and decimal digits)
18057. DecimalEscape, only '\0 is allowed, no leading zeroes are allowed
18058. XXX: optimize by adding the token numbers directly into the * always interned duk_hstring objects (there should be enough * flag bits free for that)?
18059. ';'
18060. '/' and not in regexp mode
18061. * Lexing helpers
18062. EOF
18063. whether to use macros or helper function depends on call count
18064. **comment:** (advance << 8) + token_type, updated at function end, * init is unnecessary but suppresses "may be used uninitialized" warnings.
label: code-design
18065. first, parse regexp body roughly
18066. Production allows 'DecimalDigits', including leading zeroes
18067. Does not allow e.g. 2**31-1, but one more would allow overflows of u32.
18068. '*'
18069. **comment:** * DecimalLiteral, HexIntegerLiteral, OctalIntegerLiteral * "pre-parsing", followed by an actual, accurate parser step. * * Note: the leading sign character ('+' or '-') is -not- part of * the production in E5 grammar, and that the a DecimalLiteral * starting with a '0' must be followed by a non-digit. Leading * zeroes are syntax errors and must be checked for. * * XXX: the two step parsing process is quite awkward, it would * be more straightforward to allow numconv to parse the longest * valid prefix (it already does that, it only needs to indicate * where the input ended). However, the lexer decodes characters * using a lookup window, so this is not a trivial change.
label: code-design
18070. ']'
18071. **comment:** XXX: better coercion
label: code-design
18072. '!'
18073. check final character validity

18074. * The escapes are same as outside a character class, except that '\b' has a * different meaning, and '\B' and backreferences are prohibited (see E5 * Section 15.10.2.19). However, it's difficult to share code because we * handle e.g. "\n" very differently: here we generate a single character * range for it.

18075. * Init lexer context

18076. Here 'x' is a Unicode codepoint

18077. How much to advance before next loop; note that next loop * will advance by 1 anyway, so -1 from the total escape * length (e.g. len("\uXXXX") - 1 = 6 - 1). As a default, * 1 is good.

18078. '>'

18079. Note: '\b' in char class is different than outside (assertion), * '\B' is not allowed and is caught by the duk_unicode_is_identifier_part() * check below.

18080. PatternCharacter, all excluded characters are matched by cases above

18081. skip opening slash on first loop

18082. Reuse buffer as is unless buffer has grown large.

18083. **comment:** DUK__ADVANCECHARS(lex_ctx, 2) would be correct here, but it unnecessary
label: code-design

18084. Note: duk_uint8_t type yields larger code

18085. DUK_USE_LEXER_SLIDING_WINDOW

18086. '-' as a range indicator

18087. Two digit octal escape, digits validated. * * The if-condition is a bit tricky. We could catch e.g. *\039' in the three-digit escape and fail it there (by * validating the digits), but we want to avoid extra * additional validation code.

18088. not LS/PS

18089. ""

18090. Slow path.

18091. No other escape beginning with a digit in strict mode

18092. invalid codepoint encoding or codepoint

18093. IdentityEscape, with dollar added as a valid additional * non-standard escape (see test-regexp-identity-escape-dollar.js). * Careful not to match end-of-buffer (<0) here.

18094. '&'

18095. **comment:** packed advance/token number macro used by multiple functions
label: code-design

18096. fast paths for space and tab

18097. Although these could be parsed as PatternCharacters unambiguously (here), * E5 Section 15.10.1 grammar explicitly forbids these as PatternCharacters.

18098. clipped codepoint

18099. fall through to error

18100. * Shared exit path

18101. val2 = min count, val1 = max count

18102. ch is a literal character here or -1 if parsed entity was * an escape such as "\s".

18103. DUK__L0() cannot be a digit, because the loop doesn't terminate if it is

18104. line terminator will be handled on next round

18105. part of string

18106. **comment:** This would be nice, but parsing is faster without resetting the * value slots. The only side effect is that references to temporary * string values may linger until lexing is finished; they're then * freed normally.
label: code-design

18107. '!'
18108. '^'

18109. * Append a Unicode codepoint to the temporary byte buffer. Performs * CESU-8 surrogate pair encoding for codepoints above the BMP. * Existing surrogate pairs are allowed and also encoded into CESU-8.

18110. eat backslash on entry

18111. E5 Section 7.3, treat the following as newlines: * LF * CR [not followed by LF] * LS * PS * * For CR LF, CR is ignored if it is followed by LF, and the LF will bump * the line number.

18112. E5 Section 7.3, treat the following as newlines: * LF * CR [not followed by LF] * LS * PS * * For CR LF, CR is ignored if it is followed by LF, and the LF will bump * the line number.

18113. **comment:** Period followed by a digit can only start DecimalLiteral * (handled in slow path). We could jump straight into the * DecimalLiteral handling but should avoid goto to inside * a block.
label: code-design

18114. IdentityEscape

18115. could also just pop?

18116. ''

18117. adv = 2 - 1 default OK

18118. eat '{' on entry

18119. Zero 'count' is also allowed to make call sites easier.

18120. Note: 'e' and 'E' are also accepted here.

18121. Zero escape (also allowed in non-strict mode)

18122. **comment:** * Advance lookup window by N characters, filling in new characters as * necessary. After returning caller is guaranteed a character window of * at least DUK__LEXER_WINDOW_SIZE characters. * * The main function duk__advance_bytes() is called at least once per every * token so it has a major lexer/compiler performance impact. There are two * variants for the main duk__advance_bytes() algorithm: a sliding window * approach which is slightly faster at the cost of larger code footprint, * and a simple copying one. * * Decoding directly from the source string would be another lexing option. * But the lookup window based approach has the advantage of hiding the * source string and its encoding effectively which gives more flexibility * going forward to e.g. support chunked streaming of source from flash. * * Decodes UTF-8/CESU-8 leniently with support for code points from U+0000 to * U+10FFFF, causing an error if the input is unparseable. Leniency means: * * * Unicode code point validation is intentionally not performed, * except to check that the codepoint does not exceed 0x10ffff. * * * In particular, surrogate pairs are allowed and not combined, which * allows source files to represent all SourceCharacters with CESU-8. * Broken surrogate pairs are allowed, as Ecmascript does not mandate * their validation. * * * Allow non-shortest UTF-8 encodings. * * Leniency here causes few security concerns because all character data is * decoded into Unicode codepoints before lexer processing, and is then * re-encoded into CESU-8. The source can be parsed as strict UTF-8 with * a compiler option. However, Ecmascript source characters include -all- * 16-bit unsigned integer codepoints, so leniency seems to be appropriate. * * Note that codepoints above the BMP are not strictly SourceCharacters, * but the lexer still accepts them as such. Before ending up in a string * or an identifier name, codepoints above BMP are converted into surrogate * pairs and then CESU-8 encoded, resulting in 16-bit Unicode data as * expected by Ecmascript. * * An alternative approach to dealing with invalid or partial sequences * would be to skip them and replace them with e.g. the Unicode replacement * character U+FFFD. This has limited utility because a replacement character * will most likely cause a parse error, unless it occurs inside a string. * Further, Ecmascript source is typically pure ASCII. * * See: * * http://en.wikipedia.org/wiki=UTF-8 * http://en.wikipedia.org/wiki/CESU-8 * http://tools.ietf.org/html/rfc3629 * http://en.wikipedia.org/wiki=UTF-8#Invalid_byte_sequences * * Future work: * * * Reject other invalid Unicode sequences (see Wikipedia entry for examples) * in strict UTF-8 mode. * * * Size optimize. An attempt to use a 16-byte lookup table for the first * byte resulted in a code increase though. * * * Is checking against maximum 0x10ffff really useful? 4-byte encoding * imposes a certain limit anyway. * * * Support chunked streaming of source code. Can be implemented either * by streaming chunks of bytes or chunks of codepoints.
label: code-design

18123. * E5 Section 7.4, allow SourceCharacter (which is any 16-bit * code point).

18124. **comment:** not necessary to init, disabled for faster parsing
label: code-design

18125. Section 7.8.3 (note): NumericLiteral must be followed by something other than * IdentifierStart or DecimalDigit.

18126. unreachable

18127. **comment:** never reached, but avoids warnings of * potentially unused variables.

label: code-design

18128. switch

18129. Track number of escapes; count not really needed but directive * prologues need to detect whether there were any escapes or line * continuations or not.

18130. free some memory

18131. **comment:** XXX: naming is inconsistent: ATOM_END_GROUP ends an ASSERT_START_LOOKAHEAD**label:** code-design

18132. 'advtok' indicates how much to advance and which token id to assign * at the end. This shared functionality minimizes code size. All * code paths are required to set 'advtok' to some value, so no default * init value is used. Code paths calling DUK_ERROR() never return so * they don't need to set advtok.

18133. marker: copy t if not changed

18134. eat opening quote on first loop

18135. '

18136. Note: intentionally allow leading zeroes here, as the * actual parser will check for them.

18137. input offset tracking

18138. Constants for duk_lexer_ctx.buf.

18139. token type (with reserved word identification)

18140. valstack slot for 2nd token value

18141. Lexer context. Same context is used for Ecmascript and Regexp parsing.

18142. identifier names (E5 Section 7.6)

18143. token was preceded by a lineterm

18144. token type (with reserved words as DUK_TOK_IDENTIFIER)

18145. number of tokens parsed

18146. Regexp tokens

18147. Sanity checks for string and token defines

18148. A regexp token value.

18149. number of escapes and line continuations (for directive prologue)

18150. * Lexer defines.

18151. Lexer codepoint with additional info like offset/line number

18152. **comment:** "get" and "set" are tokens but NOT ReservedWords. They are currently * parsed and identifiers and these defines are actually now unused.**label:** code-design

18153. A token value. Can be memcpy()'d, but note that slot1/slot2 values are on the valstack. * Some fields (like num, str1, str2) are only valid for specific token types and may have * stale values otherwise.

18154. input linenum at input_offset (not window[0]), init to 1

18155. DUK_USE_REGEXP_SUPPORT

18156. returned after EOF (infinite amount)

18157. unicode code points, window[0] is always next, points to 'buffer'

18158. bufwriter for temp accumulation

18159. input offset for window leading edge (not window[0])

18160. Convert heap string index to a token (reserved words)

18161. token allows automatic semicolon insertion (eof or preceded by newline)

18162. named "arithmetic" because result is signed

18163. start byte offset of token in lexer input

18164. A structure for 'snapshotting' a point for rewinding

18165. temp accumulation buffer

18166. * Prototypes

18167. reserved words: additional future reserved words in strict mode

18168. valstack slot for 1st token value

18169. numeric value of token

18170. exclusive

18171. reserved words: keywords

18172. string 1 of token (borrowed, stored to ctx->slot1_idx)

18173. reserved words: future reserved words

18174. input byte length

18175. unicode code points, window[0] is always next

18176. "null", "true", and "false" are always reserved words. * Note that "get" and "set" are not!

18177. DUK_LEXER_H_INCLUDED

18178. valstack slot for temp buffer

18179. currently 6 characters of lookup are actually needed (duk_lexer.c)

18180. token type

18181. numeric value (character, count)

18182. punctuators (unlike the spec, also includes "/" and "=")

18183. inclusive

18184. maximum token count before error (sanity backstop)

18185. start line of token (first char)

18186. literals (E5 Section 7.8), except null, true, false, which are treated * like reserved words (above).

18187. input string (may be a user pointer)

18188. Sanity check

18189. * A token is interpreted as any possible production of InputElementDiv * and InputElementRegExp, see E5 Section 7 in its entirety. Note that * the E5 "Token" production does not cover all actual tokens of the * language (which is explicitly stated in the specification, Section 7.5). * Null and boolean literals are defined as part of both ReservedWord * (E5 Section 7.6.1) and Literal (E5 Section 7.8) productions. Here, * null and boolean values have literal tokens, and are not reserved * words. * * Decimal literal negative/positive sign is -not- part of DUK_TOK_NUMBER. * The number tokens always have a non-negative value. The unary minus * operator in "-1.0" is optimized during compilation to yield a single * negative constant. * * Token numbering is free except that reserved words are required to be * in a continuous range and in a particular order. See genstrings.py.

18190. string 2 of token (borrowed, stored to ctx->slot2_idx)

18191. thread; minimizes argument passing

18192. Pad significand with "virtual" zero digits so that Dragon4 will * have enough (apparent) precision to work with.

18193. need to normalize, may even cancel to 0

18194. Zero special case: fake requested number of zero digits; ensure * no sign bit is printed. Relative and absolute fixed format * require separate handling.

18195. This may happen even after the fast path check, if exponent is * not balanced (e.g. "0e1"). Remember to respect zero sign.

18196. * seeeeeeee eeeeefff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H * * s sign bit * eee... exponent field * fff... fraction * * ieee value = 1.ffff... * 2^(e - 1023) (normal) * = 0.ffff... * 2^(-1022) (denormal) * * algorithm v = f * b^e

18197. Note: 'count' is currently not adjusted by rounding (i.e. the * digits are not "chopped off". That shouldn't matter because * the digit position (absolute or relative) is passed on to the * convert-and-push function.

18198. (>= e 0) AND (not (= f (expt b (- p 1)))) * * be <- (expt b e) == b^e * r <- (* f be 2) == 2 * f * b^e [if b==2 -> f * b^(e+1)] * s <- 2 * m+ <- be == b^e * m- <- be == b^e * k <- 0 * B <- B * low_ok <- round * high_ok <- round

18199. DUK_USE_64BIT_OPS

18200. zero handled by caller

18201. Don't check for Infinity unless the context allows it. * 'Infinity' is a valid integer literal in e.g. base-36: * * parseInt('Infinity', 36) * 1461559270678

18202. borrow literal Infinity from builtin string

18203. $d \leftarrow (\text{quotient } (* r B) s)$ (in range 0...B-1)
18204. exponential notation forced
18205. $mp \leftarrow b/(e+1)$
18206. input radix
18207. **comment:** * The string conversion here incorporates all the necessary Ecmascript * semantics without attempting to be generic. nc_ctx->digits contains * nc_ctx->count digits (≥ 1), with the topmost digit's 'position' * indicated by nc_ctx->k as follows: * * digits="123" count=3 k=0 --> 0.123 * digits="123" count=3 k=1 --> 1.23 * digits="123" count=3 k=5 --> 12300 * digits="123" count=3 k=-1 --> 0.0123 * * Note that the identifier names used for format selection are different * in Burger-Dybvig paper and Ecmascript specification (quite confusingly * so, because e.g. 'k' has a totally different meaning in each). See * documentation for discussion. * * Ecmascript doesn't specify any specific behavior for format selection * (e.g. when to use exponent notation) for non-base-10 numbers. * * The bigint space in the context is reused for string output, as there * is more than enough space for that (>1kB at the moment), and we avoid * allocating even more stack.
label: code-design
18208. 0 or -1
18209. **comment:** XXX: this could be optimized; there is only one call site now though
label: code-design
18210. $x \leftarrow y + z$
18211. exponent digit
18212. **comment:** XXX: this could be optimized
label: code-design
18213. * Convert and push final string.
18214. $mm \leftarrow b^e$
18215. e.g. 12.3 --> digits="123" k=2 --> 1.23e1
18216. **comment:** This is essentially the 'scale' algorithm, with recursion removed. * Note that 'k' is either correct immediately, or will move in one * direction in the loop. There's no need to do the low/high checks * on every round (like the Scheme algorithm does). * * The scheme algorithm finds 'k' and updates 's' simultaneously, * while the logical algorithm finds 'k' with 's' having its initial * value, after which 's' is updated separately (see the Burger-Dybvig * paper, Section 3.1, steps 2 and 3). * * The case where $m^+ == m^-$ (almost always) is optimized for, because * it reduces the bigint operations considerably and almost always * applies. The scale loop only needs to work with m^+ , so this works.
label: code-design
18217. **comment:** Currently about $7*152 = 1064$ bytes. The space for these * duk__bigints is used also as a temporary buffer for generating * the final string. This is a bit awkward; a union would be * more correct.
label: code-design
18218. $s \leftarrow 2$
18219. (quotient-remainder (* r B) s) using a dummy subtraction loop
18220. * Scan number and setup for Dragon4. * * The fast path case is detected during setup: an integer which * can be converted without rounding, no net exponent. The fast * path could be implemented as a separate scan, but may not really * be worth it: the multiplications for building 'f' are not * expensive when 'f' is small. * * The significand ('f') must contain enough bits of (apparent) * accuracy, so that Dragon4 will generate enough binary output digits. * For decimal numbers, this means generating a 20-digit significand, * which should yield enough practical accuracy to parse IEEE doubles. * In fact, the Ecmascript specification explicitly allows an * implementation to treat digits beyond 20 as zeroes (and even * to round the 20th digit upwards). For non-decimal numbers, the * appropriate number of digits has been precomputed for comparable * accuracy. * * Digit counts: * * [dig_lzero] * | * .+---[dig_prec]----. * || | *
0000123.45678901234567890e+123456 * | | | | * `---[dig_frac]-----`---+---| * [dig_whole] [dig_expt] * * dig_frac and dig_expt are -1 if not present * dig_lzero is only computed for whole number part * * Parsing state * * Parsing whole part dig_frac < 0 AND dig_expt < 0 * Parsing fraction part dig_frac >= 0 AND dig_expt < 0 * Parsing exponent part dig_expt >= 0 (dig_frac may be < 0 or >= 0) * * Note: in case we hit an implementation limit (like exponent range), * we should throw an error, NOT return NaN or Infinity. Even with * very large exponent (or significand) values the final result may be * finite, so NaN/Infinity would be incorrect.
18221. 12 to 21
18222. $r \leftarrow (2 * f) * b^{(e+1)}$
18223. 31 to 36
18224. This upper value has been experimentally determined; debug build will check * bigint size with assertions.
18225. **comment:** unused
label: code-design
18226. $x \leftarrow y * z$
18227. Leading zero is not counted towards precision digits; not * in the integer part, nor in the fraction part.
18228. $\text{expt} == -1023 \rightarrow \text{bitstart}=0$ (leading 1); * $\text{expt} == -1024 \rightarrow \text{bitstart}=-1$ (one left of leading 1), etc
18229. **comment:** $m^+ != m^-$ (very rarely)
label: code-design
18230. * Dragon4 slow path digit generation.
18231. free-form
18232. interpret e.g. '0x' and '0xg' as a NaN (= parse error)
18233. Maximum number of digits generated.
18234. * Exposed number-to-string API * * Input: [number] * Output: [string]
18235. http://en.wikipedia.org/wiki/Exponentiation_by_squaring
18236. empty ("") is allowed in some formats (e.g. Number()), as zero
18237. $r \leftarrow (\text{remainder } (* r B) s)$
18238. if 1, doing a fixed format output (not free format)
18239. $tc1 = \text{true}$, $tc2 = \text{false}$
18240. Leading zero.
18241. $m^+ \leftarrow (* m^+ B)$
18242. `toString()` conditions
18243. Digit generation
18244. significant from precision perspective
18245. Loop structure ensures that we don't compute $t1^2$ unnecessarily * on the final round, as that might create a bignum exceeding the * current DUK_BL_MAX_PARTS limit.
18246. Most common cases first.
18247. Ignore digits beyond a radix-specific limit, but note them * in expt_adj.
18248. Return value: $<0 \iff x < y \iff 0 \iff x == y \iff >0 \iff x > y$
18249. no net exponent
18250. needed for inf: causes mantissa to become zero, * and rounding to be skipped.
18251. carry
18252. add E
18253. A 32-bit unsigned integer formats to at most 32 digits (the * worst case happens with radix == 2). Output the digits backwards, * and use a memmove() to get them in the right place.
18254. Fast path the binary case
18255. Infinity
18256. low to high
18257. $x \leftarrow (1 << y)$
18258. absolute position for digit considered for rounding
18259. $r \leftarrow (* r B) * s \leftarrow s * m^+ \leftarrow (* m^+ B) * m^- \leftarrow (* m^- B) * k \leftarrow (-k 1)$
18260. $r \leftarrow (* f 2) * s \leftarrow (* (\text{expt } b (- e)) 2) == b^{(-e)} * 2$ [if $b == 2 \rightarrow b^{(1-e)}]$ * $m^+ \leftarrow 1 * m^- \leftarrow 1 * k \leftarrow 0 * B \leftarrow B * \text{low_ok} \leftarrow \text{round} * \text{high_ok} \leftarrow \text{round}$

18261. tc1 = false, tc2 = false
18262. r <- r * s <- (* s B) * m+ <- m+ * m- <- m- * k <- (+ k 1)
18263. + 1 for rounding
18264. t1 <- (* r B)
18265. Both inputs are zero; cases where only one is zero can go * through main algorithm.
18266. Exponent without a sign or with a +/- sign is accepted * by all call sites (even JSON.parse()).
18267. * Convert binary digits into an IEEE double. Need to handle * denormals and rounding correctly.
18268. allow e.g. '0x0009' and '00077'
18269. tc1 = false, tc2 = true
18270. add AC*2^32
18271. large context; around 2kB now
18272. mp <- b^e
18273. s <- b^(e-1) * 2
18274. Would be nice to bulk clear the allocation, but the context * is 1-2 kilobytes and nothing should rely on it being zeroed.
18275. x <- x + y, use t as temp
18276. setup many variables in nc_ctx
18277. add BC*2^16
18278. Note: if 'x' is zero, x->n becomes 0 here
18279. **comment:** * Dragon4 setup. * * Convert double from IEEE representation for conversion; * normal finite values have an implicit leading 1-bit. The * slow path algorithm doesn't handle zero, so zero is special * cased here but still creates a valid nc_ctx, and goes * through normal formatting in case special formatting has * been requested (e.g. forced exponential format: 0 -> "0e+0").
label: code-design
18280. * Multiply + add + carry for 32-bit components using only 16x16->32 * multiplies and carry detection based on unsigned overflow. * * 1st mult, 32-bit: (A*2^16 + B) * 2nd mult, 32-bit: (C*2^16 + D) * 3rd add, 32-bit: E * 4th add, 32-bit: F * * (AC*2^16 + B) * (C*2^16 + D) + E + F * = AC*2^32 + AD*2^16 + BC*2^16 + BD + E + F * = AC*2^32 + (AD + BC)*2^16 + (BD + E + F) * = AC*2^32 + AD*2^16 + BC*2^16 + (BD + E + F)
18281. (-Number.MAX_VALUE).toString(2).length == 1025, + spare
18282. position of highest digit changed
18283. * Round-up limit. * * For even values, divides evenly, e.g. 10 -> roundup_limit=5. * * For odd values, rounds up, e.g. 3 -> roundup_limit=2. * If radix is 3, 0/3 -> down, 1/3 -> down, 2/3 -> up.
18284. Note: computes with 'idx' in assertions, so caller beware. * 'idx' is preincremented, i.e. '1' on first call, because it * is more convenient for the caller.
18285. * Digit generation loop. * * Different termination conditions: * * 1. Free format output. Terminate when shortest accurate * representation found. * * 2. Fixed format output, with specific number of digits. * Ignore termination conditions, terminate when digits * generated. Caller requests an extra digit and rounds. * * 3. Fixed format output, with a specific absolute cut-off * position (e.g. 10 digits after decimal point). Note * that we always generate at least one digit, even if * the digit is below the cut-off point already.
18286. number of digits changed
18287. **comment:** No NUL term checks in this debug code.
label: code-design
18288. triggers garbage digit check below
18289. digit count
18290. impose a reasonable exponent limit, so that exp * doesn't need to get tracked using a bigint.
18291. interpret e.g. '09' as '0', not NaN
18292.toFixed()
18293. * Tables generated with src/gennumdigits.py. * * duk_str2num_digits_for_radix indicates, for each radix, how many input * digits should be considered significant for string-to-number conversion. * The input is also padded to this many digits to give the Dragon4 * conversion enough (apparent) precision to work with. * * duk_str2num_exp_limits indicates, for each radix, the radix-specific * minimum/maximum exponent values (for a Dragon4 integer mantissa) * below and above which the number is guaranteed to underflow to zero * or overflow to Infinity. This allows parsing to keep bigint values * bounded.
18294. Detect zero special case.
18295. Number and (minimum) size of bigints in the nc_ctx structure.
18296. Careful with borrow condition: * - If borrow not subtracted: 0x12345678 - 0 - 0xffffffff = 0x12345679 (> 0x12345678) * - If borrow subtracted: 0x12345678 - 1 - 0xffffffff = 0x12345678 (== 0x12345678)
18297. **comment:** Note: not honoring round-to-even should work but now generates incorrect * results. For instance, 1e23 serializes to "a000...", i.e. the first digit * equals the radix (10). Scaling stops one step too early in this case. * Don't know why this is the case, but since this code path is unused, it * doesn't matter.
label: code-design
18298. r <- (2 * f) * b^e
18299. -Infinity
18300. * Exponent notation for non-base-10 numbers isn't specified in EcmaScript * specification, as it never explicitly turns up: non-decimal numbers can * only be formatted with Number.prototype.toString([radix]) and for that, * behavior is not explicitly specified. * * Logical choices include formatting the exponent as decimal (e.g. binary * 100000 as 1e+5) or in current radix (e.g. binary 100000 as 1e+101). * The Dragon4 algorithm (in the original paper) prints the exponent value * in the target radix B. However, for radix values 15 and above, the * exponent separator 'e' is no longer easily parseable. Consider, for * instance, the number ".faecee+1c".
18301. Start position (inclusive) and end position (exclusive)
18302. * Preliminaries: trim, sign, Infinity check * * We rely on the interned string having a NUL terminator, which will * cause a parse failure wherever it is encountered. As a result, we * don't need separate pointer checks. * * There is no special parsing for 'NaN' in the specification although * 'Infinity' (with an optional sign) is allowed in some contexts. * Some contexts allow plus/minus sign, while others only allow the * minus sign (like JSON.parse()). * * Automatic hex number detection (leading '0x' or '0X') and octal * number detection (leading '0' followed by at least one octal digit) * is done here too.
18303. denormal
18304. max possible
18305. fixed-format
18306. Count is incremented before DUK_DRAGON4_OUTPUT_PREINC() call * on purpose, which is taken into account by the macro.
18307. Sometimes this assert is not true right now; it will be true after * rounding. See: test-bug-numconv-mantissa-assert.js.
18308. IEEE exp without bias
18309. Exponent handling: if exponent format is used, record exponent value and * fake k such that one leading digit is generated (e.g. digits=123 -> "1.23"). * * toFixed() prevents exponent use; otherwise apply a set of criteria to * match the other API calls (toString(), toPrecision, etc).

18522. * Create normalized 'source' property (E5 Section 15.10.3).
18523. * Compilation
18524. set by atom case clauses
18525. value of re_ctx->captures at start of atom
18526. remove the original 'template' atom
18527. * Flags parsing (see E5 Section 15.10.4.1).
18528. * Init lexer
18529. -> [... escaped_source]
18530. Special case: original qmin was zero so there is nothing * to repeat. Emit an atom copy but jump over it here.
18531. insert the required matches (qmin) by copying the atom
18532. expect_eof
18533. coerce to string
18534. * Range parsing is done with a special lexer function which calls * us for every range parsed. This is different from how rest of * the parsing works, but avoids a heavy, arbitrary size intermediate * value type to hold the ranges. * * Another complication is the handling of character ranges when * case insensitive matching is used (see docs for discussion). * The range handler callback given to the lexer takes care of this * as well. * * Note that duplicate ranges are not eliminated when parsing character * classes, so that canonicalization of * * [0-9a-fA-Fx-{}] * * creates the result (note the duplicate ranges): * * [0-9A-FA-FX-Z-{}] * * where [x-{}] is split as a result of canonicalization. The duplicate * ranges are not a semantics issue: they work correctly.
18535. +1 for opcode
18536. * Finalize stack
18537. always at least the header
18538. Unescaped '/' ANYWHERE in the regexp (in disjunction, * inside a character class, ...) => same escape works.
18539. * Emit compiled regexp header: flags, ncaptures * (insertion order inverted on purpose)
18540. Note: successive characters could be joined into string matches * but this is not trivial (consider e.g. '/xyz+/'; see docs for * more discussion).
18541. complete 'sub atom'
18542. * Create a RegExp instance (E5 Section 15.10.7). * * Note: the output stack left by duk_regexp_compile() is directly compatible * with the input here. * * Input stack: [escaped_source bytecode] (both as strings) * Output stack: [RegExp]
18543. XXX: the insert helpers should ensure that the bytecode result is not * larger than expected (or at least assert for it). Many things in the * bytecode, like skip offsets, won't work correctly if the bytecode is * larger than say 2G.
18544. char length of the atom parsed in this loop
18545. * Regexp compilation. * * See doc/regexp.rst for a discussion of the compilation approach and * current limitations. * * Regexp bytecode assumes jumps can be expressed with signed 32-bit * integers. Consequently the bytecode size must not exceed 0x7fffffffL. * The implementation casts duk_size_t (buffer size) to duk_(u)int32_t * in many places. Although this could be changed, the bytecode format * limit would still prevent regexps exceeding the signed 32-bit limit * from working. * * XXX: The implementation does not prevent bytecode from exceeding the * maximum supported size. This could be done by limiting the maximum * input string size (assuming an upper bound can be computed for number * of bytecode bytes emitted per input byte) or checking buffer maximum * size when emitting bytecode (slower).
18546. silence scan-build warning
18547. **comment:** * Canonicalize a range, generating result ranges as necessary. * Needs to exhaustively scan the entire range (at most 65536 * code points). If 'direct' is set, caller (lexer) has ensured * that the range is already canonicalization compatible (this * is used to avoid unnecessary canonicalization of built-in * ranges like \W, which are not affected by canonicalization). * * NOTE: here is one place where we don't want to support chars * outside the BMP, because the exhaustive search would be * massively larger.

18550. re_ctx->captures at the start of the atom parsed in this loop
18551. special helper for emitting u16 lists (used for character ranges for built-in char classes)
18552. mark as complex (capture handling)
18553. [... regexp_object]
18554. negative -> no atom matched on previous round
18555. * Parse regexp Disjunction. Most of regexp compilation happens here. * * Handles Disjunction, Alternative, and Term productions directly without * recursion. The only constructs requiring recursion are positive/negative * lookaheads, capturing parentheses, and non-capturing parentheses. * * The function determines whether the entire disjunction is a 'simple atom' * (see doc/regexp.rst discussion on 'simple quantifiers') and if so, * returns the atom character length which is needed by the caller to keep * track of its own atom character length. A disjunction with more than one * alternative is never considered a simple atom (although in some cases * that might be the case). * * Return value: simple atom character length or < 0 if not a simple atom. * Appends the bytecode for the disjunction matcher to the end of the temp * buffer. * * Regexp top level structure is: * * Disjunction = Term* * | Term* | Disjunction * * Term = Assertion * | Atom * | Atom Quantifier * * An empty Term sequence is a valid disjunction alternative (e.g. /\|/). * * Notes: * * * Tracking of the 'simple-ness' of the current atom vs. the entire * disjunction are separate matters. For instance, the disjunction * may be complex, but individual atoms may be simple. Furthermore, * simple quantifiers are used whenever possible, even if the * disjunction as a whole is complex. * * * The estimate of whether an atom is simple is conservative now, * and it would be possible to expand it. For instance, captures * cause the disjunction to be marked complex, even though captures * -can- be handled by simple quantifiers with some minor modifications. * * * Disjunction 'tainting' as 'complex' is handled at the end of the * main for loop collectively for atoms. Assertions, quantifiers, * and !' tokens need to taint the result manually if necessary. * Assertions cannot add to result char length, only atoms (and * quantifiers) can; currently quantifiers will taint the result * as complex though.
18556. TypeError if fails
18557. a complex (new) atom taints the result
18558. finish up pending jump and split for last alternative
18559. duplicate zeroing, expect for (possible) NULL init
18560. patch in range count later
18561. patch pending jump and split
18562. * Args validation
18563. atom_char_length, atom_start_offset, atom_start_offset reflect the * atom matched on the previous loop. If a quantifier is encountered * on this loop, these are needed to handle the quantifier correctly. * new_atom_char_length etc are for the atom parsed on this round; * they're written to atom_char_length etc at the end of the round.
18564. regexp support disabled
18565. * Simple atom * * If atom_char_length is zero, we'll have unbounded execution time for e.g. * /(0*x/.exec('x'). We can't just skip the match because it might have some * side effects (for instance, if we allowed captures in simple atoms, the * capture needs to happen). The simple solution below is to force the * quantifier to

match at most once, since the additional matches have no effect. ** With a simple atom there can be no capture groups, so no captures need * to be reset.

18566. offset is now target of the pending split (right after jump)

18567. re_ctx->captures at start and end of atom parsing. * Since 'captures' indicates highest capture number emitted * so far in a DUK_REOP_SAVE, the captures numbers saved by * the atom are:]start_captures,end_captures].

18568. add a new pending match jump for latest finished alternative

18569. [... pattern flags escaped_source buffer]

18570. parse ranges until character class ends

18571. Call sites don't need the result length so it's not accumulated.

18572. XXX: return type should probably be duk_size_t, or explicit checks are needed for * maximum size.

18573. 'taint' result as complex -- this is conservative, * as lookaheads do not backtrack.

18574. prefer jump

18575. Number of characters that the atom matches (e.g. 3 for 'abc'), * -1 if atom is complex and number of matched characters either * varies or is not known.

18576. * The handling here is a bit tricky. If a previous ']' has been processed, * we have a pending split1 and a pending jump (for a previous match). These * need to be back-patched carefully. See docs for a detailed example.

18577. Note: can be safely scanned as bytes (undecoded)

18578. **comment:** pre-check how many atom copies we're willing to make (atom_copies not needed below)

label: requirement

18579. match fail

18580. * Helpers for dealing with the input string

18584. split1: prefer direct execution (no jump)

18585. [... re_obj input bc]

18586. must fit into duk_small_int_t

18587. note: caller 'sp' is intentionally not updated here

18588. * Byte-based matching would be possible for case-sensitive * matching but not for case-insensitive matching. So, we * match by decoding the input and bytecode character normally. ** Bytecode characters are assumed to be already canonicalized. * Input characters are canonicalized automatically by * duk_inp_get_cp() if necessary. ** There is no opcode for matching multiple characters. The * regexp compiler has trouble joining strings efficiently * during compilation. See doc/regexp.rst for more discussion.

18589. must have start and end

18590. * No match, E5 Section 15.10.6.2, step 9.a.i - 9.a.ii apply, regardless * of 'global' flag of the RegExp. In particular, if lastIndex is invalid * initially, it is reset to zero.

18591. * Regexp recursive matching function. ** Returns 'sp' on successful match (points to character after last matched one), * NULL otherwise. ** The C recursion depth limit check is only performed in this function, this * suffices because the function is present in all true recursion required by * regexp execution.

18592. **comment:** not really necessary

label: code-design

18593. E5 Sections 15.10.2.8, 7.3

18594. match: keep wiped/resaved values

18595. no regexp instance should exist without a non-configurable bytecode property

18596. Note: not necessary to check p against re_ctx->input_end: * the memory access is checked by duk_inp_get_cp(), while * valid compiled regexps cannot write a saved[] entry * which points to outside the string.

18597. **comment:** integer, but may be +/- Infinite, +/- zero (not NaN, though)

label: code-design

18598. Note: if encoding ends by hitting end of input, we don't check that * the encoding is valid, we just assume it is.

18599. advance by one character (code point) and one char_offset

18600. TypeError if wrong; class check, see E5 Section 15.10.6

18601. fall through

18602. Note: allow backtracking from p == ptr_end

18603. **comment:** * Note: ** - duk_match_regexp() is required not to longjmp() in ordinary "non-match" * conditions; a longjmp() will terminate the entire matching process. ** - Clearing saved[] is not necessary because backtracking does it ** - Backtracking also rewinds ctx.recursion back to zero, unless an * internal/limit error occurs (which causes a longjmp()) ** - If we supported anchored matches, we would break out here * unconditionally; however, ECMAScript regexps don't have anchored * matches. It might make sense to implement a fast bail-out if * the regexp begins with '^' and sp is not 0: currently we'll just * run through the entire input string, trivially failing the match * at every non-zero offset.

label: code-design

18604. never here

18605. * Regexp instance check, bytecode check, input coercion. ** See E5 Section 15.10.6.

18606. * Get starting character offset for match, and initialize 'sp' based on it. ** Note: lastIndex is non-configurable so it must be present (we check the * internal class of the object above, so we know it is). User code can set * its value to an arbitrary (garbage) value though; E5 requires that lastIndex * be coerced to a number before using. The code below works even if the * property is missing: the value will then be coerced to zero. ** Note: lastIndex may be outside Uint32 range even after ToInteger() coercion. * For instance, ToInteger(+Infinity) = +Infinity. We track the match offset * as an integer, but pre-check it to be inside the 32-bit range before the loop. * If not, the check in E5 Section 15.10.6.2, step 9.a applies.

18607. * Matching complete, create result array or return a 'null'. Update lastIndex * if necessary. See E5 Section 15.10.6.2. ** Because lastIndex is a character (not byte) offset, we need the character * length of the match which we conveniently get as a side effect of interning * the matching substring (0th index of result array). ** saved[0] start pointer (~ byte offset) of current match * saved[1] end pointer (~ byte offset) of current match (exclusive) * char_offset start character offset of current match (->.index of result) * char_end_offset end character offset (computed below)

18608. Assumes that saved[0] and saved[1] are always * set by regexp bytecode (if not, char_end_offset * will be zero). Also assumes clen reflects the * correct char length.

18609. char_offset in [0, h_input->clen] (both ends inclusive), checked before entry

18610. backref n -> saved indices [n*2, n*2+1]

18611. Note: ctx.steps is intentionally not reset, it applies to the entire unanchored match

18612. buffer is automatically zeroed

18613. [... res_obj re_obj input bc saved_buf]

18614. **comment:** Note: don't bail out early, we must read all the ranges from * bytecode. Another option is to skip them efficiently after * breaking out of here. Prefer smallest code.

label: code-design

18615. NB: 'length' property is automatically updated by the array setup loop

18616. * Regexp executor. ** Safety: the ECMAScript executor should prevent user from reading and * replacing regexp bytecode. Even so, the executor must validate all * memory accesses etc. When an invalid access is detected (e.g. a 'save' * opcode to invalid, unallocated index) it should fail with an internal * error but not cause a segmentation fault. ** Notes: ** - Backtrack counts are limited to unsigned 32 bits but should * technically be duk_size_t for strings longer than 4G chars. * This also requires a regexp bytecode change.

18617. avoid calling at end of input, will DUK_ERROR (above check suffices to avoid this)

18618. [... re_obj input] -> [... re_obj input bc]

18619. idx is unsigned, < 0 check is not necessary

18620. * Helpers for UTF-8 handling ** For bytecode readers the duk_uint32_t and duk_int32_t types are correct * because they're used for more than just codepoints.

18621. [... res_obj]

label: code-design

18623. * Exposed matcher function which provides the semantics of RegExp.prototype.exec(). ** RegExp.prototype.test() has the same semantics as exec() but does not return the * result object (which contains the matching string and capture groups). Currently * there is no separate test() helper, so a temporary result object is created and * discarded if test() is needed. This is intentional, to save code space. ** Input stack: [... re_obj input] * Output stack: [... result]

18624. canonicalized by compiler

18625. not a wordchar

18626. Note: if atom were to contain e.g. captures, we would need to * re-match the atom to get correct captures. Simply quantifiers * do not allow captures in their atom now, so this is not an issue.

18627. -> [... re_obj input bc saved_buf lastIndex]

18628. * Note: ** - Intentionally attempt (empty) match at char_offset == k_input->clen ** - Negative char_offsets have been eliminated and char_offset is duk_uint32_t * -> no need or use for a negative check

18629. fail: restore saves

18630. [... re_obj input bc saved_buf]

18631. ToInteger(lastIndex)

18632. **comment:** XXX: these last tricks are unnecessary if the function is made * a genuine native function.
label: code-design

18633. capture is 'undefined', always matches!

18634. **comment:** Wipe capture range and save old values for backtracking. ** XXX: this typically happens with a relatively small idx_count. * It might be useful to handle cases where the count is small * (say <= 8) by saving the values in stack instead. This would * reduce memory churn and improve performance, at the cost of a * slightly higher code footprint.
label: code-design

18635. **comment:** * Needs a save of multiple saved[] entries depending on what range * may be overwritten. Because the regexp parser does no such analysis, * we currently save the entire saved array here. Lookaheads are thus * a bit expensive. Note that the saved array is not needed for just * the lookahead sub-match, but for the matching of the entire sequel. ** The temporary save buffer is pushed on to the valstack to handle * errors correctly. Each lookahead causes a C recursion and pushes * more stuff on the value stack. If the C recursion limit is less * than the value stack spare, there is no need to check the stack. * We do so regardless, just in case.
label: code-design

18636. signed integer encoding needed to work with UTF-8

18637. Captures which are undefined have NULL pointers and are returned * as 'undefined'. The same is done when saved[] pointers are insane * (this should, of course, never happen in practice).

18638. * Byte matching for back-references would be OK in case- * sensitive matching. In case-insensitive matching we need * to canonicalize characters, so back-reference matching needs * to be done with codepoints instead. So, we just decode * everything normally here, too. ** Note: back-reference index which is 0 or higher than * NCapturingParens (= number of capturing parens in the * -entire- regexp) is a compile time error. However, a * backreference referring to a valid capture which has * not matched anything always succeeds! See E5 Section * 15.10.2.9, step 5, sub-step 3.

18639. Get a (possibly canonicalized) input character from current sp. The input * itself is never modified, and captures always record non-canonicalized * characters even in case-insensitive matching.

18640. force_global

18641. match: keep saves

18642. * Basic context initialization. ** Some init values are read from the bytecode header * whose format is (UTF-8 codepoints): * uint flags * uint nsaved (even, 2n+2 where n = num captures)

18643. regexp support disabled

18644. Backtrack utf-8 input and return a (possibly canonicalized) input character.

18645. [... re_obj input bc saved_buf res_obj val]

18646. lastIndex must be ignored for non-global regexps, but get the * value for (theoretical) side effects. No side effects can * really occur, because lastIndex is a normal property and is * always non-configurable for RegExp instances.

18647. **comment:** XXX: Array size is known before and (2 * re_ctx.nsaved) but not taken * advantage of now. The array is not compacted either, as regexp match * objects are usually short lived.
label: code-design

18648. and even number

18649. read header

18650. * Match loop. ** Try matching at different offsets until match found or input exhausted.

18651. * E5 Section 15.10.2.6. The previous and current character * should -not- be canonicalized as they are now. However, * canonicalization does not affect the result of IsWordChar() * (which depends on Unicode characters never canonicalizing * into ASCII characters) so this does not matter.

18652. [... re_obj input bc saved_buf res_obj]

18653. **comment:** This variant is needed by String.prototype.split(); it needs to perform * global-style matching on a cloned RegExp which is potentially non-global.

label: code-design

18841. NULL is allowed, no output

18842. invalidates h_buf pointer

18843. Decode helper. Return zero on error.

18844. * Unicode range matcher * * Matches a codepoint against a packed bitstream of character ranges. * Used for slow path Unicode matching.

18845. 31 bits

18846. * Canonicalize() abstract operation needed for canonicalization of individual * codepoints during regexp compilation and execution, see E5 Section 15.10.2.8. * Note that codepoints are canonicalized one character at a time, so no context * specific rules can apply. Locale specific rules can apply, though.

18847. * Fast path tables

18848. * Regexp range tables

18849. 1111 110x 10xx xxxx 10xx xxxx 10xx xxxx 10xx xxxx [31 bits]

18850. Small variant; roughly 150 bytes smaller than the fast variant.

18851. cp == -1 (EOF) never matches and causes return value 0

18852. * Complex case conversion helper which decodes a bit-packed conversion * control stream generated by unicode/extract_caseconv.py. The conversion * is very slow because it runs through the conversion data in a linear * fashion to save space (which is why ASCII characters have a special * fast path before arriving here). * * The particular bit counts etc have been determined experimentally to * be small but still sufficient, and must match the Python script * (src/extract_caseconv.py). * * The return value is the case converted codepoint or -1 if the conversion * results in multiple characters (this is useful for regexp Canonicalization * operation). If 'buf' is not NULL, the result codepoint(s) are also * appended to the hbuffer. * * Context and locale specific rules must be checked before consulting * this function.

18853. Encode to CESU-8; 'out' must have space for at least * DUK_UNICODE_MAX_CESU8_LENGTH bytes; codepoints above U+10FFFF * will encode to garbage but won't overwrite the output buffer.

18854. default: no change

18855. * Final sigma context specific rule. This is a rather tricky * rule and this handling is probably not 100% correct now. * The rule is not locale/language specific so it is supported.

18856. Must match src/extract_chars.py, generate_match_table3()

18857. * E5 Section 7.3 * * A LineTerminatorSequence essentially merges <CR> <LF> sequences * into a single line terminator. This must be handled by the caller.

18858. 1:1 or special conversions, but not locale/context specific: script generated rules

18859. 10xx xxxx -> invalid

18860. * Unicode letter is now taken to be the categories: * * Lu, Ll, Lt, Lm, Lo * * (Not sure if this is exactly correct.) * * The ASCII fast path consists of: * * 0x0041 ... 0x005a ['A' ... 'Z'] * 0x0061 ... 0x007a ['a' ... 'z']

18861. Capital sigma occurred at "end of word", lowercase to * U+03C2 = GREEK SMALL LETTER FINAL SIGMA. Otherwise * fall through and let the normal rules lowercase it to * U+03C3 = GREEK SMALL LETTER SIGMA.

18862. 0x10...0x1f

18863. Align 'p' to 4; the input data may have arbitrary alignment. * End of string check not needed because blen >= 16.

18864. This seems like a good overall approach. Fast path for ASCII in 4 byte * blocks.

18865. on first round, skip

18866. surrogate pairs get encoded here

18867. **comment:** XXX: could add a fast path to process chunks of input codepoints, * but relative benefit would be quite small.

18947. DUK_UTIL_H_INCLUDED
18948. **comment:** XXX: Rework to use an always-inline function?
label: code-design

18949. Insert a reserved area somewhere in the buffer; caller fills it. * Evaluates to a (duk_uint_t *) pointing to the start of the reserved * area for convenience.
18950. No difference between raw/ensure because the buffer shrinks.
18951. Initialization and finalization (compaction), converting to other types.
18952. Miscellaneous.
18953. **comment:** XXX: add temporary duk__p pointer here too; sharing
label: code-design

18954. 'ptr' is evaluated both as LHS and RHS.
18955. Safe write calls which will ensure space first.
18956. must match genhashsizes.py
18957. * Bitstream decoder
18958. Append bytes from a slice already in the buffer.
18959. Note: assumes that duk_util_probe_steps size is 32
18960. * Bitstream encoder
18961. Fast write calls which assume you control the spare beforehand. * Multibyte write variants exist and use a temporary write pointer * because byte writes alias with anything: with a stored pointer * explicit pointer load/stores get generated (e.g. gcc -Os).
18962. Insert bytes in the middle of the buffer from a slice already * in the buffer. Source offset is interpreted "before" the operation.
18963. Make underlying buffer compact to match DUK_BW_GET_SIZE().
18964. No duk_bw_remove_ensure_slice(), functionality would be identical.
18965. Reset to zero size, keep current limit.
18966. Remove a slice from inside buffer.
18967. remaining
18968. **comment:** Note: cannot read more than 24 bits without possibly shifting top bits out. * Fixable, but adds complexity.
label: code-design

18969. * Bitstream decoder.
18970. If ctx->offset >= ctx->length, we "shift zeroes in" * instead of croaking.
18971. Decode a one-bit flag, and if set, decode a value of 'bits', otherwise return * default value. Return value is signed so that negative marker value can be * used by caller as a "not present" value.
18972. Extract 'top' bits of curval; note that the extracted bits do not need * to be cleared, we just ignore them on next round.
18973. Decode 'bits' bits from the input stream (bits must be 1...24). * When reading past bitstream end, zeroes are shifted in. The result * is signed to match duk_bd_decode_flagged.
18974. If buffer has been exhausted, truncate bitstream
18975. **comment:** This limitation would be fixable but adds unnecessary complexity.
label: code-design

18976. * Bitstream encoder.
18977. buffer size is >= 1
18978. * Fast buffer writer with spare management.
18979. overflow
18980. for manual torture testing: tight allocation, useful with valgrind
18981. Target is before source. Source offset is expressed as * a "before change" offset. Account for the memmove.
18982. point to start of 'reserved area'
18983. not reachable
18984. Don't support "straddled" source now.
18985. **comment:** * Macro support functions for reading/writing raw data. * * These are done using memcpy to ensure they're valid even for unaligned * reads/writes on platforms where alignment counts. On x86 at least gcc * is able to compile these into a bswap+mov. "Always inline" is used to * ensure these macros compile to minimal code. * * Not really bufwriter related, but currently used together.
label: code-design

18986. Make buffer compact, matching current written size.
18987. **comment:** * Macro support functions (use only macros in calling code)
label: code-design

18988. We could do this operation without caller updating bw_ctx->ptr, * but by writing it back here we can share code better.

18989. This is important to ensure dynamic buffer data pointer is not * NULL (which is possible if buffer size is zero), which in turn * causes portability issues with e.g. memmove() and memcpy().

18990. Resize target buffer for requested size. Called by the macro only when the * fast path test (= there is space) fails.

18991. **comment:** Portability workaround is required for platforms without * unaligned access. The replacement code emulates little * endian access even on big endian architectures, which is * OK as long as it is consistent for a build.
label: code-design

18992. DUK_USE_STRHASH_DENSE

18993. * Hash function duk_util_hashbytes(). ** Currently, 32-bit MurmurHash2. ** Don't rely on specific hash values; hash function may be endianness * dependent, for instance.

18994. 'magic' constants for Murmurhash2

18995. prediction corrections for prime list (see genhashsizes.py)

18996. hash size ratio goal, must match genhashsizes.py

18997. Awkward inclusion condition: drop out of compilation if not needed by any * call site: object hash part or probing stringtable.

18998. * Round a number upwards to a prime (not usually the nearest one). ** Uses a table of successive 32-bit primes whose ratio is roughly * constant. This keeps the relative upwards 'rounding error' bounded * and the data size small. A simple 'predict-correct' compression is * used to compress primes to one byte per prime. See genhashsizes.py * for details. ** The minimum prime returned here must be coordinated with the possible * probe sequence steps in duk_hobject and duk_heap stringtable.

18999. prediction: portable variant using doubles if 64-bit values not available

label: code-design
19212. fixed or dynamic, garbage collected byte buffer
19213. * Thread management
19214. * Double NaN manipulation macros related to NaN normalization needed when * using the packed duk_tval representation. NaN normalization is necessary * to keep double values compatible with the duk_tval format. * * When packed duk_tval is used, the NaN space is used to store pointers * and other tagged values in addition to NaNs. Actual NaNs are normalized * to a specific quiet NaN. The macros below are used by the implementation * to check and normalize NaN values when they might be created. The macros * are essentially NOPs when the non-packed duk_tval representation is used. * * A FULL check is exact and checks all bits. A NOTFULL check is used by * the packed duk_tval and works correctly for all NaNs except those that * begin with 0x7ff0. Since the 'normalized NaN' values used with packed * duk_tval begin with 0x7ff8, the partial check is reliable when packed * duk_tval is used. The 0x7ff8 prefix means the normalized NaN will be a * quiet NaN regardless of its remaining lower bits. * * The ME variant below is specifically for ARM byte order, which has the * feature that while doubles have a mixed byte order (32107654), unsigned * long long values has a little endian byte order (76543210). When writing * a logical double value through a ULL pointer, the 32-bit words need to be * swapped; hence the #ifdefs below for ULL writes with DUK_USE_DOUBLE_ME. * This is not full ARM support but suffices for some environments.
19215. either not a NaN

19220. set writable (effective if DUK_DEFPROP_HAVE_WRITABLE set)
19221. UnsupportedError
19222. **comment:** Internal API call flags, used for various functions in this file. * Certain flags are used by only certain functions, but since the flags * don't overlap, a single flags value can be passed around to multiple * functions. * * The unused top bits of the flags field are also used to pass values * to helpers (duk_get_part_helper() and duk_set_part_helper()). * * (Must be in-sync with genbuiltins.py.)
label: code-design
19223. There are currently no native functions to yield/resume, due to the internal * limitations on coroutine handling. These will be added later.
19224. Concrete macros for NaN handling used by the implementation internals. * Chosen so that they match the duk_tval representation: with a packed * duk_tval, ensure NaNs are properly normalized; with a non-packed duk_tval * these are essentially NOPs.
19225. (internal) no source string on stack
19226. * Function (method) calls
19227. plain
19228. Ecmascript string: CESU-8 / extended UTF-8 encoded
19229. internal flag: don't zero allocated buffer
19230. use strict (outer) context for global, eval, or function code
19231. in non-packed representation we don't care about which NaN is used
19232. * Union for accessing double parts, also serves as packed duk_tval
19233. include date part in string conversion result
19234. internal flag: dynamic buffer
19235. Ecmascript null
19236. enumerate non-enumerable properties in addition to enumerable
19237. **comment:** XXX: replace with RangeError?
label: code-design
19238. * Push operations * * Push functions return the absolute (relative to bottom of frame) * position of the pushed value for convenience. * * Note: duk_dup() is technically a push.
19239. string
19240. * ROM pointer compression
19241. * Union to access IEEE double memory representation, indexes for double * memory representation, and some macros for double manipulation. * * Also used by packed duk_tval. Use a union for bit manipulation to * minimize aliasing issues in practice. The C99 standard does not * guarantee that this should work, but it's a very widely supported * practice for low level manipulation. * * IEEE double format summary: * * seeeeeeee eeeeefff ffffffff ffffffff ffffffff ffffffff ffffffff * A B C D E F G H * * s sign bit * eee... exponent field * fff... fraction * * See http://en.wikipedia.org/wiki/Double_precision_floating-point_format. * * NaNs are represented as exponent 0x7ff and mantissa != 0. The NaN is a * signaling NaN when the highest bit of the mantissa is zero, and a quiet * NaN when the highest bit is set. * * At least three memory layouts are relevant here: * * A B C D E F G H Big endian (e.g. 68k) DUK_USE_DOUBLE_BE * H G F E D C B A Little endian (e.g. x86) DUK_USE_DOUBLE_LE * D C B A H G F E Mixed/cross endian (e.g. ARM) DUK_USE_DOUBLE_ME * * ARM is a special case: ARM double values are in mixed/cross endian * format while ARM duk_uint64_t values are in standard little endian * format (H G F E D C B A). When a double is read as a duk_uint64_t * from memory, the register will contain the (logical) value * E F G H A B C D. This requires some special handling below. * * Indexes of various types (8-bit, 16-bit, 32-bit) in memory relative to * the logical (big endian) order: * * byte order duk_uint8_t duk_uint16_t duk_uint32_t * BE 01234567 0123 01 * LE 76543210 3210 10 * ME (ARM) 32107654 1032 01 * * Some processors may alter NaN values in a floating point load+store. * For instance, on X86 a FLD + FSTP may convert a signaling NaN to a * quiet one. This is catastrophic when NaN space is used in packed * duk_tval values. See: misc/clang_aliasing.c.
19242. * Helper macros for reading/writing memory representation parts, used * by duk_numconv.c and duk_tval.h.
19243. string conversion: use 'T' instead of '' as a separator
19244. Ecmascript number: double
19245. TypeError
19246. Support array for ROM pointer compression. Only declared when ROM * pointer compression is active.
19247. **comment:** Although extra/top could be an unsigned type here, using a signed type * makes the API more robust to calling code calculation errors or corner * cases (where caller might occasionally come up with negative values). * Negative values are treated as zero, which is better than casting them * to a large unsigned number. (This principle is used elsewhere in the * API too.)
label: code-design
19248. * Misc conversion
19249. Ecmascript object: includes objects, arrays, functions, threads
19250. URIError
19251. all doubles are considered normalized
19252. AUTHORS.rst
19253. day within month: 0 to 30

19254. setter: call is a time setter (affects hour, min, sec, ms); otherwise date setter (affects year, month, day-in-month)
19255. (internal) no filename on stack
19256. compile eval code (instead of global code)
19257. One problem with this macro is that expressions like the following fail * to compile: "(void) duk_error(...)". But because duk_error() is noreturn, * they make little sense anyway.
19258. set setter (given on value stack)
19259. prefer number, unless input is a Date, in which * case prefer string (E5 Section 8.12.8)
19260. Part indices for internal breakdowns. Part order from DUK_DATE_IDX_YEAR * to DUK_DATE_IDX_MILLISECOND matches argument ordering of EcmaScript API * calls (like Date constructor call). Some functions in duk.bi_date.c * depend on the specific ordering, so change with care. 16 bits are not * enough for all parts (year, specifically). * * (Must be in-sync with genbuiltins.py.)
19261. E == 0x7ff, F == 8 => normalized NaN
19262. Enumeration flags for duk_enum()
19263. year
19264. * Other state related functions
19265. This should not really happen, but would indicate x64.
19266. **comment:** Minimize warnings for unused internal functions with GCC >= 3.1.1 and * Clang. Based on documentation it should suffice to have the attribute * in the declaration only, but in practice some warnings are generated unless * the attribute is also applied to the definition.

19317. Unsigned index variant.
19318. External provider already defined.
19319. Byte order varies, so rely on autodetect.
19320. DUK_USE_UNION_INITIALIZERS: required from compilers, so no fill-in.
19321. **comment:** Special naming to avoid conflict with e.g. DUK_FREE() in duk_heap.h * (which is unfortunately named). May sometimes need replacement, e.g. * some compilers don't handle zero length or NULL correctly in realloc().
 label: code-design
19322. empty
19323. --- MSVC ---

19324. We're generally assuming that we're working on a platform with a 32-bit * address space. If DUK_SIZE_MAX is a typecast value (which is necessary * if SIZE_MAX is missing), the check must be avoided because the * preprocessor can't do a comparison.

19325. 64-bit constants. Since LL / ULL constants are not always available, * use computed values. These values can't be used in preprocessor * comparisons; flag them as such.

19326. --- x86 ---

19327. --- MIPS 32-bit ---

19328. XXX: add feature options to force basic types from outside?

19329. Array index values, could be exact 32 bits. * Currently no need for signed duk_arriidx_t.

19330. SIZE_MAX may be missing so use an approximate value for it.

19331. DUK_F_BCC

19332. Complex condition broken into separate parts.

19333. POSIX

19334. If not provided, use safe default for alignment.

19335. * Date provider selection * * User may define DUK_USE_DATE_GET_NOW() etc directly, in which case we'll * rely on an external provider. If this is not done, revert to previous * behavior and use Unix/Windows built-in provider.

19336. Cannot determine byte order.

19337. --- Cygwin ---

19338. !defined(DUK_USE_BYTEORDER) && defined(__BYTE_ORDER__)

19339. More or less standard endianness predefines provided by header files. * The ARM hybrid case is detected by assuming that __FLOAT_WORD_ORDER * will be big endian, see: <http://lists.mysql.com/internals/443>. * On some platforms some defines may be present with an empty value which * causes comparisons to fail: <https://github.com/svaarala/duktape/issues/453>.

19340. !defined(DUK_USE_BYTEORDER)

19341. **comment:** For custom platforms allow user to define byteorder explicitly. * Since endianness headers are not standardized, this is a useful * workaround for custom platforms for which endianness detection * is not directly supported. Perhaps custom hardware is used and * user cannot submit upstream patches.
label: code-design

19342. **comment:** Don't know how to declare unreachable point, so don't do it; this * may cause some spurious compilation warnings (e.g. "variable used * uninitialized").
label: code-design

19343. Good default is a bit arbitrary because alignment requirements * depend on target. See <https://github.com/svaarala/duktape/issues/102>.

19344. --- Windows ---

19345. User provided InitJS.

19346. These have been tested from VS2008 onwards; may work in older VS versions * too but not enabled by default.

19347. Error codes are represented with platform int. High bits are used * for flags and such, so 32 bits are needed.

19348. Intermediate define for 'have inttypes.h'

19349. build is not C99 or C++11, play it safe

19350. GCC: test not very accurate; enable only in relatively recent builds * because of bugs in gcc-4.4 (<http://lists.debian.org/debian-gcc/2010/04/msg00000.html>)

19351. Intel x86 (32-bit), x64 (64-bit) or x32 (64-bit but 32-bit pointers), * define only one of DUK_F_X86, DUK_F_X64, DUK_F_X32. *
<https://sites.google.com/site/x32abi/>

19352. Enabled with debug/assertions just so that any issues can be caught.

19353. C99 or compatible

19354. --- Mac OSX, iPhone, Darwin ---

19355. C99 or above

19356. MinGW. Also GCC flags (DUK_F_GCC) are enabled now.

19357. This detection is not very reliable.

19358. Support for 48-bit signed integer duk_tval with transparent semantics.

19359. GCC and Clang provide endianness defines as built-in predefines, with * leading and trailing double underscores (e.g. __BYTE_ORDER__). See * output of "make gcpredefs" and "make clangpredefs". Clang doesn't * seem to provide __FLOAT_WORD_ORDER__; assume not mixed endian for clang. *
<http://gcc.gnu.org/onlinedocs/cpp/Common-Predefined-Macros.html>

19360. 64-bit type detection is a bit tricky. * * ULLONG_MAX is a standard define. __LONG_LONG_MAX__ and __ULONGLONG_MAX__ * are used by at least GCC (even if system headers don't provide ULLONG_MAX). * Some GCC variants may provide __LONG_LONG_MAX__ but not __ULONGLONG_MAX__. * * ULL / LL constants are rejected / warned about by some compilers, even if * the compiler has a 64-bit type and the compiler/system headers provide an * unsupported constant (ULL/LL)! Try to avoid using ULL / LL constants. * As a side effect we can only check that e.g. ULONG_MAX is larger than 32 * bits but can't be sure it is exactly 64 bits. Self tests will catch such * cases.

19361. Convert any input pointer into a 'void **', losing a const qualifier. * This is not fully portable because casting through duk_uintptr_t may * not work on all architectures (e.g. those with long, segmented pointers).

19362. Small integers (16 bits or more) can fall back to the 'int' type, but * have a typedef so they are marked "small" explicitly.

19363. **comment:** Most portable, potentially wastes space
label: code-design

19364. PowerPC

19365. --- Solaris ---

19366. **comment:** Technically C99 (C++11) but found in many systems. On some systems * __STDC_LIMIT_MACROS and __STDC_CONSTANT_MACROS must be defined before * including stdint.h (see above).
label: code-design

 label: code-design
19443. --- VBCC ---
19444. On some systems SIZE_MAX can be smaller than max unsigned 32-bit value * which seems incorrect if size_t is (at least) an unsigned 32-bit type. * However, it doesn't seem useful to error out compilation if this is the * case.
19445. **comment:** On other platforms use layout 2, which requires some padding but * is a bit more natural than layout 3 in ordering the entries. Layout * 3 is currently not used.
 label: code-design
19446. VS2005+ should have variadic macros even when they're not C99.
19447. illumos / Solaris
19448. DUK_COMPILING_DUKTAPE
19449. DUK_OPT_FORCE_BYTEORDER
19450. QNX
19451. since gcc-4.5
19452. **comment:** Windows 32-bit and 64-bit are currently the same.
 label: code-design
19453. This is optionally used by panic handling to cause the program to segfault * (instead of e.g. abort()) on panic. Valgrind will then indicate the C * call stack leading to the panic.
19454. IEEE float/double typedef.
19455. --- ARM 32-bit ---
19456. **comment:** XXX: This is technically not guaranteed because it's possible to configure * an x86 to require aligned accesses with Alignment Check (AC) flag.
 label: code-design
19457. TinyC
19458. **comment:** Note: the funny looking computations for signed minimum 16-bit, 32-bit, and * 64-bit values are intentional as the obvious forms (e.g. -0x80000000L) are * -not- portable. See code-issues.txt for a detailed discussion.
 label: code-design
19459. These are necessary wild guesses.
19460. Already provided above
19461. Atari ST TOS. __TOS__ defined by PureC. No platform define in VBCC * apparently, so to use with VBCC user must define __TOS__ manually.
19462. Byte order is big endian but cannot determine IEEE double word order.
19463. --- Flashplayer (Crossbridge) ---
19464. MIPS byte order varies so rely on autodetection.
19465. stdint.h not available
19466. **comment:** The most portable way to figure out local time offset is gmtime(), * but it's not thread safe so use with caution.
 label: requirement
19467. Codepoint type. Must be 32 bits or more because it is used also for * internal codepoints. The type is signed because negative codepoints * are used as internal markers (e.g. to mark EOF or missing argument). * (X)UTF-8/CESU-8 encode/decode take and return an unsigned variant to * ensure duk_uint32_t casts back and forth nicely. Almost everything * else uses the signed one.
19468. DUK_USE_VARIADIC_MACROS: required from compilers, so no fill-in.
19469. TOS on M68K is always big endian.
19470. don't use strftime() for now
19471. **comment:** not sure, not needed with C99 anyway
 label: requirement
19472. C++ doesn't have standard designated union initializers ({ .foo = 1 }).
19473. --- Emscripten ---
19474. nop
19475. DLL build detection
19476. **comment:** Avoid custom date parsing and formatting for portability.

19477. Workaround for older C++ compilers before including <inttypes.h>, * see e.g.: https://sourceware.org/bugzilla/show_bug.cgi?id=15366
19478. * Compiler autodetection
19479. --- SPARC 32-bit ---
19480. --- Clang ---
19481. On some platforms int is 16-bit but long is 32-bit (e.g. PureC)
19482. **comment:** * Byte order and double memory layout detection ** Endianness detection is a major portability hassle because the macros * and headers are not standardized. There's even variance across UNIX * platforms. Even with "standard" headers, details like underscore count * varies between platforms, e.g. both __BYTE_ORDER and _BYTE_ORDER are used * (Crossbridge has a single underscore, for instance). ** The checks below are structured with this in mind: several approaches are * used, and at the end we check if any of them worked. This allows generic * approaches to be tried first, and platform/compiler specific hacks tried * last. As a last resort, the user can force a specific endianness, as it's * not likely that automatic detection will work on the most exotic platforms. ** Duktape supports little and big endian machines. There's also support * for a hybrid used by some ARM machines where integers are little endian * but IEEE double values use a mixed order (12345678 -> 43218765). This * byte order for doubles is referred to as "mixed endian".
 label: code-design
19483. **comment:** Check whether we should use 64-bit integers or not. ** Quite incomplete now. Use 64-bit types if detected (C99 or other detection) * unless they are known to be unreliable. For instance, 64-bit types are * available on VBCC but seem to misbehave.
 label: code-design
19484. VS2013+ supports union initializers but there's a bug involving union-inside-struct: * <https://connect.microsoft.com/VisualStudio/feedback/details/805981> * The bug was fixed (at least) in VS2015 so check for VS2015 for now: * <https://blogs.msdn.microsoft.com/vcblog/2015/07/01/c-compiler-front-end-fixes-in-vs2015/> * Manually tested using VS2013, CL reports 18.00.31101, so enable for VS2013 too.
19485. no user declarations
19486. DUK_CONFIG_H_INCLUDED
19487. BCC (Bruce's C compiler): this is a "torture target" for compilation
19488. Generic Unix (includes Cygwin)
19489. There was a curious bug where test-bi-date-canceling.js would fail e.g. * on 64-bit Ubuntu, gcc-4.8.1, -m32, and no -std=c99. Some date computations * using doubles would be optimized which then broke some corner case tests. * The problem goes away by adding 'volatile' to the datetime computations. * Not sure what the actual triggering conditions are, but using this on * non-C99 systems solves the known issues and has relatively little cost * on other platforms.
19490. C99 / C++11 and above: rely on va_copy() which is required. * Omit parenthesis on macro right side on purpose to minimize differences * to direct use.
19491. C99 types
19492. DUK_SIZE_MAX (= SIZE_MAX) is often reliable
19493. --- PowerPC 64-bit ---
19494. See: /opt/qnx650/target/qnx6/usr/include/sys/platform.h
19495. --- SPARC 64-bit ---
19496. On platforms without any alignment issues, layout 1 is preferable * because it compiles to slightly less code and provides direct access * to property keys.
19497. Strict C99 case: DUK_UINTPTR_MAX (= UINTPTR_MAX) should be very reliable
19498. autodetect platform

19499. **comment:** NetBSD 6.0 x86 (at least) has a few problems with pow() semantics, * see test-bug-netbsd-math-pow.js. Use NetBSD specific workaround. * (This might be a wider problem; if so, generalize the define name.)
label: code-design
19500. autodetect architecture
19501. In VBCC (0.0 / 0.0) results in a warning and 0.0 instead of NaN. * In MSVC (VS2010 Express) (0.0 / 0.0) results in a compile error. * Use a computed NaN (initialized when a heap is created at the * latest).
19502. Clang: assume we have __va_copy() in non-C99 mode.
19503. --- Bruce's C compiler ---
19504. Same as 'duk_int_t' but guaranteed to be a 'fast' variant if this * distinction matters for the CPU. These types are used mainly in the * executor where it might really matter.
19505. vbcc + AmigaOS may be missing these
19506. C99 or C++11, no known issues
19507. **comment:** XXX: DUK_LIKELY, DUK_UNLIKELY for msvc?
label: code-design
19508. Initial fix: disable secure CRT related warnings when compiling Duktape * itself (must be defined before including Windows headers). Don't define * for user code including duktape.h.
19509. varargs
19510. * Fill-ins for platform, architecture, and compiler
19511. e.g. strptime
19512. **comment:** Note: PRS and FMT are intentionally left undefined for now. This means * there is no platform specific date parsing/formatting but there is still * the ISO 8601 standard format.
label: code-design
19513. vsnprintf() is technically not part of C89 but usually available.
19514. Rely on autodetection for byte order, alignment, and packed tval.
19515. AmigaOS + M68K seems to have math issues even when using GCC cross * compilation. Use replacements for all AmigaOS versions on M68K * regardless of compiler.
19516. Byte order is little endian but cannot determine IEEE double word order.
19517. C++
19518. MIPS. Related defines: __MIPSEB__, __MIPSEL__, __mips_isa_rev, __LP64__
19519. VBCC is missing the built-ins even in C99 mode (perhaps a header issue).
19520. __MSC_VER
19521. **comment:** Macro for suppressing warnings for potentially unreferenced variables. * The variables can be actually unreferenced or unreferenced in some * specific cases only; for instance, if a variable is only debug printed, * it is unreferenced when debug printing is disabled.
label: code-design
19522. Byte order varies, rely on autodetection.
19523. Use __setjmp() on Apple by default, see GH-55.
19524. TI-Nspire (using Ndless)
19525. --- PowerPC 32-bit ---
19526. Some math functions are C99 only. This is also an issue with some * embedded environments using uclibc where uclibc has been configured * not to provide some functions. For now, use replacements whenever * using uclibc.
19527. Most portable
19528. Boolean values are represented with the platform 'int'.
19529. Shared includes: stdint.h is C99
19530. BSD variant
19531. Old uclibcs have a broken memcpy so use memmove instead (this is overly wide * now on purpose): <http://lists.uclibc.org/pipermail/uclibc-cvs/2008-October/025511.html>
19532. date.h is omitted, and included per platform
19533. * Architecture autodetection
19534. The most portable current time provider is time(), but it only has a * one second resolution.
19535. Convenience, e.g. gcc 4.5.1 == 40501; <http://stackoverflow.com/questions/6031819/emulating-gccs-built-in-unreachable>
19536. defined(DUK_USE_BYTEORDER)
19537. In VBCC (1.0 / 0.0) results in a warning and 0.0 instead of infinity. * Use a computed infinity (initialized when a heap is created at the * latest).
19538. For now, hash part is dropped if and only if 16-bit object fields are used.
19539. MSVC dllexport/dllimport: appropriate __declspec depends on whether we're * compiling Duktape or the application.
19540. **comment:** On Windows, assume we're little endian. Even Itanium which has a * configurable endianness runs little endian in Windows.
label: code-design
19541. **comment:** Compiler specific hackery needed to force struct size to match alignment, * see e.g. duk_hbuffer.h. * * <http://stackoverflow.com/questions/11130109/c-struct-size-alignment>
label: code-design
19542. Index values must have at least 32-bit signed range.
19543. **comment:** Workaround for GH-323: avoid inlining control when compiling from * multiple sources, as it causes compiler portability trouble.
label: code-design
19544. byte order
19545. Linux
19546. Based on 'make checkalign' there are no alignment requirements on * Linux SH4, but align by 4 is probably a good basic default.
19547. MSVC preprocessor defines: <http://msdn.microsoft.com/en-us/library/b0084kay.aspx> * __MSC_FULL_VER includes the build number, but it has at least two formats, see e.g. * BOOST_MSVC_FULL_VER in http://www.boost.org/doc/libs/1_52_0/boost/config/compiler/visualc.hpp
19548. ARM
19549. Fast variants of small integers, again for really fast paths like the * executor.
19550. **comment:** When C99 types are not available, we use heuristic detection to get * the basic 8, 16, 32, and (possibly) 64 bit types. The fast/least * types are then assumed to be exactly the same for now: these could * be improved per platform but C99 types are very often now available. * 64-bit types are not available on all platforms; this is OK at least * on 32-bit platforms. * * This detection code is necessarily a bit hacky and can provide typedefs * and defines that won't work correctly on some exotic platform.
label: code-design
19551. **comment:** * Cleanups (all statement parsing flows through here). * * Pop label site and reset labels. Reset 'next temp' to value at * entry to reuse temps.
label: code-design
19552. **comment:** * Reference counting helper macros. The macros take a thread argument * and must thus always be executed in a specific thread context. The * thread argument is needed for features like finalization. Currently * it is not required for INCREF, but it is included just in case. * * Note that 'raw' macros such as DUK_HEAPHDR_GET_REFCOUNT() are not * defined without DUK_USE_REFERENCE_COUNTING, so caller must #ifdef * around them.

19659. **comment:** XXX: compression (as an option)
label: code-design
19660. * Environment record creation and 'arguments' object creation. * Named function expression name binding is handled by the * compiler; the compiled function's parent env will contain * the (immutable) binding already. ** This handling is now identical for C and Ecmascript functions. * C functions always have the 'NEWENV' flag set, so their * environment record initialization is delayed (which is good). ** Delayed creation (on demand) is handled in duk_js_var.c.
19661. **comment:** * Declaration binding instantiation conceptually happens when calling a * function; for us it essentially means that function prologue. The * conceptual process is described in E5 Section 10.5. ** We need to keep track of all encountered identifiers to (1) create an * identifier-to-register map ("varmap"); and (2) detect duplicate * declarations. Identifiers which are not bound to registers still need * to be tracked for detecting duplicates. Currently such identifiers * are put into the varmap with a 'null' value, which is later cleaned up. ** To support functions with a large number of variable and function * declarations, registers are not allocated beyond a certain limit; * after that limit, variables and functions need slow path access. * Arguments are currently always register bound, which imposes a hard * (and relatively small) argument count limit. ** Some bindings in E5 are not configurable (= deletable) and almost all * are mutable (writable). Exceptions are: ** - The 'arguments' binding, established only if no shadowing argument * or function declaration exists. We handle 'arguments' creation * and binding through an explicit slow path environment record. ** - The "name" binding for a named function expression. This is also * handled through an explicit slow path environment record.

19664. * Replace lexical environment for global scope ** Create a new object environment for the global lexical scope. * We can't just reset the _Target property of the current one, * because the lexical scope is shared by other threads with the * same (initial) built-ins.
19665. force_global
19666. NB: use 's' as temp on purpose
19667. Not odd, or y == -Infinity
19668. * Global object built-ins
19669. A bunch of helpers (for size optimization) that combine duk_expr()/duk_exprtop() * and result conversions. ** Each helper needs at least 2-3 calls to make it worth while to wrap.
19670. Value stack: these are expressed as pointers for faster stack manipulation. * [valstack, valstack_top[is GC-reachable, [valstack_top, valstack_end[is * not GC-reachable but kept initialized as 'undefined'.
19671. Output a specified number of digits instead of using the shortest * form. Used for toPrecision() andtoFixed().
19672. [body formals], formals is comma separated list that needs to be parsed
19673. bytecode execution
19674. thisArg
19675. * Not found
19676. XXX: duk_uarridx_t?
19677. E5 Section 9.4, ToInteger()
19678. force_new
19679. duk_js_call.c is required to restore the stack reserve * so we only need to reset the top.

19680. * __FILE__ / __LINE__ entry, here 'pc' is line number directly. * Sometimes __FILE__ / __LINE__ is reported as the source for * the error (fileName, lineNumber), sometimes not.

19681. avoid dereference after potential callstack realloc

19682. * Pass 2

19683. compensate for eval() call

19684. set values into ret array

19685. * Pick an object from the head (don't remove yet).

19686. fast path

19687. **comment:** Fast exit if indices are identical. This is valid for a non-existent property, * for an undefined value, and almost always for ToString() coerced comparison of * arbitrary values (corner cases where this is not the case include e.g. a an * object with varying ToString() coercion). ** The specification does not prohibit "caching" of values read from the array, so * assuming equality for comparing an index with itself falls into the category of * "caching". ** Also, compareFn may be inconsistent, so skipping a call to compareFn here may * have an effect on the final result. The specification does not require any * specific behavior for inconsistent compare functions, so again, this fast path * is OK.

label: code-design

19688. **comment:** XXX: this could be a DUK__CONSTP instead

label: code-design

19689. [... this tracedata sep this]

19690. * After arguments, allocate special registers (like shuffling temps)

19691. [ToObject(this) item1 ... itemN arr item(i)]

19692. The implementation for computing of start_pos and end_pos differs * from the standard algorithm, but is intended to result in the exactly * same behavior. This is not always obvious.

19693. This behavior mostly mimics Node.js now.

19694. **comment:** XXX: typing (duk_hcompiledfunction has duk_uint32_t)

label: code-design

19695. **comment:** XXX: because we're dealing with 'own' properties of a fresh array, * the array initializer should just ensure that the array has a large * enough array part and write the values directly into array part, * and finally set 'length' manually in the end (as already happens now).

label: code-design

19696. This may happen even after the fast path check, if exponent is * not balanced (e.g. "0e1"). Remember to respect zero sign.

19697. Encode a fastint from duk_tval ptr, no value stack effects.

19698. 'has'

19699. DUK_TOK_COMMA

19700. 'void'

19701. bufwriter for code

19702. * Abandon array failed, need to decref keys already inserted * into the beginning of new_e_k before unwinding valstack.

19703. * UTF-8 / XUTF-8 / CESU-8 constants

19704. when going backwards, we decrement cpos 'early'; * 'p' may point to a continuation byte of the char * at offset 'cpos', but that's OK because we'll * backtrack all the way to the initial byte.

19705. DUK_TOK_IDENTIFIER

19706. * Regexp recursive matching function. ** Returns 'sp' on successful match (points to character after last matched one), * NULL otherwise. ** The C recursion depth limit check is only performed in this function, this * suffices because the function is present in all true recursion required by * regexp execution.

19707. **comment:** Use recursion_limit to ensure we don't overwrite js_ctx->visiting[] * array so we don't need two counter checks in the fast path. The * slow path has a much larger recursion limit which we'll use if * necessary.

label: code-design

19708. [... func varmap enum key value this]

19709. 1: toDateString

19710. **comment:** Fill offset handling is more lenient than in Node.js.

label: code-design

19711. Positive if local time ahead of UTC.

19712. With this check in place fast paths won't need read-only * object checks. This is technically incorrect if there are * setters that cause no writes to ROM objects, but current * built-ins don't have such setters.

19713. save stack top

19714. Insert an empty jump in the middle of code emitted earlier. This is * currently needed for compiling for-in.

19715. Treat like a debugger statement: ignore when not attached.

19716. 'import'

19717. Duktape/C API guaranteed entries (on top of args)

19718. avoid warning (unsigned)

19719. Helper which can be called both directly and with duk_safe_call().

19720. [... template]

19721. -> [buffer]

19722. **comment:** XXX: Here a "slice copy" would be useful.

label: code-design

19723. Must ensure result is 64-bit (no overflow); a * simple and sufficient fast path is to allow only * 32-bit inputs. Avoid zero inputs to avoid * negative zero issues (-1 * 0 = -0, for instance).

19724. duk_unicode_ids_m_let_noa[]

19725. Don't intercept a DoubleError, we may have caused the initial double * fault and attempting to intercept it will cause us to be called * recursively and exhaust the C stack.

19726. **comment:** * Node.js Buffer.prototype.equals() * Node.js Buffer.prototype.compare() * Node.js Buffer.compare()

label: requirement

19727. indirect allocs

19728. Lightfuncs are always considered strict.

19729. implies DUK_HOBJECT_IS_BUFFEROBJECT

19730. safe, because matched (NUL causes a break)

19731. * Packed tval sanity

19732. longjmp type

19733. should be first on 64-bit platforms

19734. **comment:** * XXX: duk_uint_fast32_t should probably be used in many places here.

19786. no fractions in internal time
19787. ditto
19788. [key] -> []
19789. Track number of escapes; count not really needed but directive * prologues need to detect whether there were any escapes or line * continuations or not.
19790. [buf? res]
19791. **comment:** Duktape 0.11.0 and prior tried to optimize the resize by not * counting the number of actually used keys prior to the resize. * This worked mostly well but also caused weird leak-like behavior * as in: test-bug-object-prop-alloc-unbounded.js. So, now we count * the keys explicitly to compute the new entry part size.
label: code-design
19792. undefined -> skip (replaced with empty)
19793. eat opening quote on first loop
19794. **comment:** * Array built-ins * Note that most Array built-ins are intentionally generic and work even * when the 'this' binding is not an Array instance. To ensure this, * Array algorithms do not assume "magical" Array behavior for the "length" * property, for instance. ** XXX: the "Throw" flag should be set for (almost?) all [[Put]] and * [[Delete]] operations, but it's currently false throughout. Go through * all put/delete cases and check throw flag use. Need a new API primitive * which allows throws flag to be specified. ** XXX: array lengths above 2G won't work reliably. There are many places * where one needs a full signed 32-bit range ([-0xffffffff, 0xffffffff], * i.e. -33- bits). Although array 'length' cannot be written to be outside * the unsigned 32-bit range (E5.1 Section 15.4.5.1 throws a RangeError if so) * some intermediate values may be above 0xffffffff and this may not be always * correctly handled now (duk_uint32_t is not enough for all algorithms). * * For instance, push() can legitimately write entries beyond length 0xffffffff * and cause a RangeError only at the end. To do this properly, the current * push() implementation tracks the array index using a 'double' instead of a * duk_uint32_t (which is somewhat awkward). See test-bi-array-push-maxlen.js. * * On using "put" vs. "def" prop * ===== * * Code below must be careful to use the appropriate primitive as it matters * for compliance. When using "put" there may be inherited properties in * Array.prototype which cause side effects when values are written. When * using "define" there are no such side effects, and many test262 test cases * check for this (for real world code, such side effects are very rare). * Both "put" and "define" are used in the E5.1 specification; as a rule, * "put" is used when modifying an existing array (or a non-array 'this' * binding) and "define" for setting values into a fresh result array. * * Also note that Array instance 'length' should be writable, but not * enumerable and definitely not configurable: even Duktape code internally * assumes that an Array instance will always have a 'length' property. * Preventing deletion of the property is critical.
